Changes have been made only to the Supplementary Data file. No changes were made to any of the results contained in the supplement.

On page 1 of the Word document, there is a description of the employed regression models. In the context of the main formula at the beginning, the definition of the second employed link function $g(m)$ was changed, reflecting that for the two binary outcomes we analyzed, the statistical model was changed during the review process upon request of the reviewers (from a logistic regression to a Poisson regression). In addition, the main formula has been edited in a mathematically equivalent way. A small number of typographical errors have been corrected in the Word file. Supplementary Table 2 was slightly moved to allow room for the legend. Finally, in Supplementary Figure 1, a typo in the axis annotations was corrected.
