Abstract
A very short and efficient stereoselective total synthesis of a macrocyclic ketone, 11β-methoxycurvularin was achieved by employing the Sharpless asymmetric epoxidation, formation of propargyl alcohols from an epoxy-chloride, and intramolecular Friedel-Crafts acylation as the key steps.

Keywords: Sharpless epoxidation, epoxy chloride, propargyl alcohol, intramolecular Friedel-Crafts acylation

Introduction
11β-Methoxycurvularin (5) was first isolated from the mycelium of hybrid strain ME-005 which is a polyketide metabolite of various Curvularia, Pencillium, Alternaria, and Cochiobolous species. It was found to exhibit cytotoxicity¹ and antimicrobial activities²,³ against four types of human cancer cell lines such as [NCI-H460, MCF-7, SF-268, 41A Pa Ca-2].⁴ It also shows some effect in the spindle formation of embryos of sea urchin cells to give barrel like spindles and terminate the first step of cell division, which is a promising tool for anticancer drug discovery. Furthermore, it also shows binding affinity with tubulins.⁵

Structurally, 11β-methoxycurvularin shows different configuration at C-11 in the 12-membered lactone ring. The first total synthesis of these natural products has been reported by Liang et al.⁶ which led to a revision of the spectroscopic data of the originally proposed structures (4 and 5).
We herein report a new synthetic route for the stereoselective total synthesis of 11(β)-methoxycurvularin. Our approach utilizes mainly the Sharpless asymmetric epoxidation to introduce absolute stereocentre at C-11 for the construction of the key fragment 8, which in turn comes from a commercially available homopropargyl alcohol 12.

Accordingly, the aromatic portion was expected to arise from the readily available 3,5-dimethoxyphenylacetic acid 7.8 Retrosynthesis of the 12-membered lactone ring 5 led to a known compound 6 along with the key fragment 8, which in turn could be prepared from 9 and 10 in 65% yield. The fragment 9 was synthesized from homopropargyl alcohol 12 in seven steps.
Thus treatment of homopropargyl alcohol 12 with BnBr in the presence of NaH\textsuperscript{9,10} gave the benzyl ether 13 (Scheme 2) which upon reaction with paraformaldehyde in the presence of magnesium turnings and ethyl bromide gave the alcohol 14 in 72% yield. Reduction of 14 with LAH furnished an allyl alcohol 15, which was then subjected to the Sharpless asymmetric epoxidation\textsuperscript{11,12} by using titanium isopropoxide, L(+)DIPT, 4.5 M TBHP to afford the epoxide with 95% ee. This chiral epoxide was then converted into propargyl alcohol 17 which was subsequently protected as its methyl ether 9 by using NaH and MeI in 85% yield. Regioselective ring opening of (S)-methyloxirane 10 with 9 using n-BuLi, BF\textsubscript{3}OEt\textsubscript{2} gave the secondary homopropargyl alcohol 8 in 65% overall yield.\textsuperscript{13}

**Scheme 2.** Synthesis of the ynol 8.

As shown in the Scheme 3, the esterification\textsuperscript{7} of 8 with 3,5-dimethoxyphenylacetic acid 7 using DCC and DMAP at room temperature afforded compound 18 in 80% yield. Subsequent deprotection of the benzyl group and reduction of the triple bond were achieved by hydrogenation using 10% Pd/C\textsuperscript{14} in ethyl acetate to afford the alcohol 19 in 70% yield. Oxidation of 19 using Jones reagent\textsuperscript{15,16} (CrO\textsubscript{3}, H\textsubscript{2}O, H\textsubscript{2}SO\textsubscript{4}; acetone, 0°-rt) gave the desired carboxylic acid 6 in 80% yield.

Intramolecular Friedel-Crafts acylation of 6 was achieved using a mixture of trifluoroacetic acid and trifluoroacetic anhydride\textsuperscript{17-20} to give a macrolide 20 in 50% yield. Finally, the deprotection of 20 with freshly prepared Al\textsubscript{3} in benzene gave the target molecule, 11β-methoxycurvularin 5 in 65% yield as colorless oil.
Reagents and conditions: (i) DCC, DMAP, DCM, 80%; (ii) 10% Pd/C, EtOAc, 70%; (iii) CrO₃, acetone, H₂SO₄, 80%; (iv) TFA, TFAA, 50%; (v) AlI₃, TBAI, benzene, 15 °C, 65%.

Scheme 3

Conclusions

In summary, we have successfully demonstrated an efficient total synthesis of 11β-methoxycurvularin in a highly stereoselective manner. The synthesis utilizes the Sharpless asymmetric epoxidation, and an intramolecular Friedel-crafts acylation to construct 12-membered macrocyclic lactone ring system.

Experimental Section

General. The reactions were conducted under N₂ atmosphere using anhydrous solvents such as DCM, THF. All reactions were monitored by thin layer chromatography (TLC) using silica-coated plates and visualizing under UV light. Yields refer to chromatographically pure products by ¹H and ¹³C NMR. Air sensitive reagents were transferred by a syringe or with a double-ended needle. Evaporation of the solvent was performed at reduced pressure using a Buchi rotary evaporator. ¹H NMR spectra were recorded on Varian FT-200MHz (Gemini) and Bruker UXNMR FT-300MHz (Avance) in CDCl₃. Chemical shift values were reported in ppm relative to tetramethylsilane (δ 0.0) as an internal standard. Mass spectra were recorded under electron impact at 70eV on LC-MS (Agilent Technologies). Column chromatography was performed on silica gel (60-120 mesh) supplied by Acme Chemical Co., India. Thin-layer chromatography was performed on Merck 60 F-254 silica gel plates. Optical rotations were measured with JASCO DIP-370 polarimeter.
[(But-3-ynyloxy)methyl]benzene (13). To a suspension of NaH (1.13 g, 27.85 mmol) in THF (50 mL), was added alcohol 12 (1.5 g, 21.42 mmol) at 0°C. After stirring for 20 min, BnBr (3.66 g, 21.42 mmol) was added slowly and the resulting mixture was stirred for another 4 h. After completion, the reaction was quenched with ice-cold H2O (20 mL) and extracted with EtOAc (2×50 mL). The combined organic layers were dried over anhydrous Na2SO4. The solvent was evaporated under reduced pressure and the residue was purified by column chromatography (EtOAc/hexanes 1:9) to afford compound 13 as a yellow oily liquid (3.1 g, 93%).

IR (neat) νmax: 3031, 2916, 2865, 2120, 1454, 1363, 1204, 1028, 820, 739, 698 cm−1. 1H NMR (CDCl3, 500 MHz): δ 7.21-7.31 (m, 5H), 4.52 (s, 2H), 3.56 (t, J6.8 Hz, 2H), 2.46 (td, J2.9, 6.8 Hz, 2H), 1.88 (t, J2.9 Hz, 1H). EI-MS: m/z: 159 (M_H).

5-(Benzyloxy)pent-2-yn-1-ol (14). To a suspension of Mg metal (2.5 g, 15.62 mmol) in dry THF (50 mL) was added ethyl bromide (1.7 mL, 23.43 mmol) at 0°C. The mixture was stirred for 30 min at room temperature and then compound 13 in dry THF was added at 0°C. After stirring for 2 h at room temperature, paraformaldehyde was added slowly at 0°C. The resulting mixture was stirred for another 5-6 h. After completion, the reaction was quenched with saturated NH4Cl (20 mL) and extracted with EtOAc (2 × 50 mL) and dried over Na2SO4. The solvent was evaporated under reduced pressure and the residue was purified by column chromatography (EtOAc/hexanes, 2:8) as eluent to afford compound 14 as a colourless oily liquid (1.65 g (72%).

IR (neat) νmax: 3064, 3031, 2865, 2359, 1958, 1718, 1417, 1363, 1273, 1137, 1014, 744, 699 cm−1. 1H NMR (CDCl3, 300 MHz): δ 7.20 -7.35 (m, 5H), 4.52 (s, 2H), 4.16 (s, 2H), 3.54 (t, J6.8 Hz, 2H), 2.49 (t, J6.8 Hz, 2H), 1.89-195 (bs, 1H). 13C NMR (CDCl3, 75 MHz): δ 137.3, 127.8, 127.2, 127.1, 81.7, 79.4, 72.2, 67.7, 50.0, 19.5. EI-MS: m/z: 189 [M-H].

(E)-5-(Benzyloxy)pent-2-en-1-ol (15). To a suspension of LiAlH4 (540 mg, 14.21 mmol) in THF (30 mL) was added a solution of 14 (1.8 g, 9.47 mmol) in THF (10 mL) in a dropwise manner. After stirring the mixture for 2 h at reflux, water was added. The resulting mixture was filtered through a short pad of Celite and washed with EtOAc (3 × 50 mL). The filtrate was dried over anhydrous Na2SO4. The solvent was removed and the residue was purified on silica gel column using (EtOAc/hexanes 2:8) as the eluent to afford 15 as a colourless oil (1.65 g (90 %)

IR (neat) νmax: 2862, 2359, 1686, 1453, 1363, 1309, 1205, 1098, 971, 910, 739, 698 cm−1. 1H NMR: (CDCl3, 300 MHz): δ 7.21 -7.33 (m, 5H), 5.68 (td, J4.53, 18.8 Hz, 2H), 4.48 (s, 2H), 4.04 (d, J2.83 Hz, 2H), 3.52 (t, J2.83 Hz, 2H), 2.34 (td, J2.8, 4.5 Hz, 2H). 13C NMR: (CDCl3, 75 MHz): δ 137.8, 130.9, 128.0, 127.3, 127.2, 72.4, 69.2, 62.6, 32.2. EI-MS: m/z: 191 [M-H].

[(2S,3S)-3-[2-(Benzyloxy)ethyl]oxiran-2-yl]methanol (11). To a suspension of 4Å molecular sieves (1.5 g) in 30 mL CH2Cl2 were added L-(+)-diisopropyl tartrate (0.18 mL, 0.782 mmol), Ti(OiPr)4 (0.22 mL, 0.782 mmol), and ¹BuOOH (4.5 M in toluene (2.6 ml, 11.71 mmol) sequentially at -27°C. The mixture was stirred for 30 min and compound 15 (2.06 g, 10 mmol) was then added. The reaction mixture was stored overnight (12 h) in the freezer at -25°C without stirring. The reaction was then warmed to 25°C and quenched by the addition of 10% NaOH/saturated aqueous NaCl (4.0 mL). Upon further warming to -10°C the mixture was diluted with Et2O (100 mL) and then treated with MgSO4 (4.0 g) and Celite (1.0 g) and was
stirred for an additional 15 min. The resulting mixture was then allowed to settle for 1 h before filtration through Celite using Et₂O and then concentrated under reduced pressure. The residue was purified on silica gel column chromatography using (EtOAc/hexanes, 3:7) as eluent to afford compound 11 as colourless oil (1.63 g, 70 %).

ESI-MS: \( m/z \): 458 [M+NH\(_4\)]. HRMS calcd for \( C_{21}H_{25}NO_6Na \) 410.1575, found 410.1579.

\( \alpha \rbracket D_{27} +9.1 \ (c, 0.8, \text{CHCl}_3) \. \] IR (neat) \( \nu_{\text{max}} \): 3447, 2928, 1721, 1596, 1458, 1301, 1267, 1198, 1165, 1035, 765, 637 cm\(^{-1}\).  \( ^1\)H NMR (CDCl\(_3\), 500 MHz): \( \delta \) 6.75 (s, 2H), 6.30 (s, 1H), 4.81-4.94 (m, 1H), 3.78 (s, 6H), 3.49 (m, 1H), 3.45 (s, 2H), 3.30 (s, 3H), 2.47 (dd, \( J \ 15.7, 6.3 \) Hz, 1H), 2.35 (dd, \( J \ 15.7, 5.3 \) Hz, 1H), 1.21–1.61 (m, 6H), 1.98 (d, \( J \ 6.2 \) Hz, 3H), 3.17U-3.74 (m, 2H), 3.52 (s, 1H), 3.47 (s, 1H), 3.30 (s, 2H), 1.24-1.64 (m, 8H), 1.21 (d, \( J \ 6.2 \) Hz, 3H).  

ESI-MS: \( m/z \): 286[M+NH\(_4\)]. HRMS calcd for \( C_{19}H_{21}O_7Na \) 391.1732, found 391.1714.

\( 3,5\rbracket S\),7\rbracket S\)-7-[2-(3,5-Dimethoxyphenyl)acetoxy]-3-methoxyoctanoic acid (6): Compound 19 (15 mg, 0.38 mmol) was taken in 5 mL of distilled acetone at 0 °C. Then a freshly prepared Jones reagent was added slowly at the same temperature until the orange brown color persists. The mixture was allowed to attain room temperature and the stirring was continued for further 30 min. The mixture was then quenched with water and extracted with EtOAc. Purification by silica gel column chromatography gave the acid 6 (100 mg, 80%).

\( \alpha \rbracket D_{27} +9.1 \ (c, 0.8, \text{CHCl}_3) \. \] IR (neat) \( \nu_{\text{max}} \): 3447, 2928, 1721, 1596, 1458, 1301, 1267, 1198, 1165, 1035, 765, 637 cm\(^{-1}\).  \( ^1\)H NMR (CDCl\(_3\), 500 MHz): \( \delta \) 6.75 (s, 2H), 6.30 (s, 1H), 4.81-4.94 (m, 1H), 3.78 (s, 6H), 3.49 (m, 1H), 3.45 (s, 2H), 3.30 (s, 3H), 2.47 (dd, \( J \ 15.7, 6.3 \) Hz, 1H), 2.35 (dd, \( J \ 15.7, 5.3 \) Hz, 1H), 1.21–1.61 (m, 6H), 1.98 (d, \( J \ 6.2 \) Hz, 3H), 3.17U-3.74 (m, 2H), 3.52 (s, 1H), 3.47 (s, 1H), 3.30 (s, 2H), 1.24-1.64 (m, 8H), 1.21 (d, \( J \ 6.2 \) Hz, 3H).  

ESI-MS: \( m/z \): 286[M+NH\(_4\)]. HRMS calcd for \( C_{19}H_{21}O_7Na \) 391.1732, found 391.1714.
Hz, 1H), 2.16 (t, J 6.7 Hz, 1H), 1.90 – 1.73 (m, 2H), 1.51 -1.36 (m, 4H), 1.13 (d, J 6.3 Hz, 3H).

$^{13}$C NMR (CDCl$_3$, 75 MHz): $\delta$ 198.3, 170.2, 160.7, 157.3, 156.2, 133.0, 122.3, 106.3, 97.5, 72.7, 55.3, 55.1, 55.0, 39.3, 34.0, 39.9, 24.1, 20.1. ESI-MS: m/z: 373 [M+Na]. HRMS caclcd for C$_{19}$H$_{26}$O$_6$Na 373.1629, found 373.1627.

(4$S$,8$R$)-11,13-Dihydroxy-8-methoxy-4-methyl-4,5,6,7,8,9-hexahydro-1$H$-benzo[d][1]oxacyclocododecine-2,10-dione (5). To a stirred solution of iodine (1.1 g, 4.33 mmol) in dry benzene (10 mL) was added Al powder (167 mg, 4.70 mmol). The mixture was refluxed for 0.5 h and cooled to 10 °C. To this mixture Bu$_4$NI (253 mg) and a solution of compound 20 (50 mg, 0.14 mmol) in dry benzene (4 mL) were added. The mixture was stirred for 15 min at 10 °C and quenched with 2 M HCl at 0 °C. The mixture was then extracted with ethyl acetate (3 × 20 mL), the organic phase was washed with NaHCO$_3$ solution followed by brine solution and dried over Na$_2$SO$_4$ and concentrated in vacuo. The residue was purified by column chromatography (EtOAc/hexanes, 2 : 1) gave the compound 5 as a colorless oil (30 mg, 65%). $[^{[\alpha]}]_D$$_{27}$ -3.0 (c, 1.0, EtOH). IR (neat) $\nu_{\text{max}}$: 3390, 2921, 2850, 1709, 1618, 1532, 1319, 1258, 1157, 1028, 976, 841, 750, 643 cm$^{-1}$; $^1$H NMR: (CDCl$_3$, 300 MHz): $\delta$ 6.50 (s, 1H), 6.19 (s, 1H), 4.90 (t, J 6.2 Hz, 1H), 3.87 (d, J 15.7 Hz, 1H), 3.71 (d, J 14.09 Hz, 1H), 3.57 (d, J 16.3 Hz, 1H), 3.30 (d, J 5.1 Hz, 1H), 3.25 (s, 3H), 3.12 (dd, J 14.11, 8.1 Hz, 1H), 1.51 – 1.83 (m, 6H), 1.21 (d, J 5.1 Hz, 3H). $^{13}$C NMR, (CDCl$_3$, 75 MHz): $\delta$ 170.7, 160.2, 157.3, 133.0, 117.2, 112.4, 101.7, 73.9, 72.1, 54.1, 49.2, 41.0, 31.2, 30.4, 19.2, 17.2. ESI-MS: m/z: 345 [M+Na]. HRMS calcd for C$_{17}$H$_{22}$O$_6$Na 345.1307, found 345.1311.
