Wortham, MD1; Shikha Garg, MD1; Lindsay Kim, MD3; COVID-NET Surveillance Team

On October 26, 2020, this report was posted as an MMWR Early Release on the MMWR website (https://www.cdc.gov/mmwr).

Health care personnel (HCP) can be exposed to SARS-CoV-2, the virus that causes coronavirus disease 2019 (COVID-19), both within and outside the workplace, increasing their risk for infection. Among 6,760 adults hospitalized during March 1–May 31, 2020, for whom HCP status was determined by the COVID-19–Associated Hospitalization Surveillance Network (COVID-NET), 5.9% were HCP. Nursing-related occupations (36.3%) represented the largest proportion of HCP hospitalized with COVID-19. Median age of hospitalized HCP was 49 years, and 89.8% had at least one underlying medical condition, of which obesity was most commonly reported (72.5%). A substantial proportion of HCP with COVID-19 had indicators of severe disease: 27.5% were admitted to an intensive care unit (ICU), 15.8% required invasive mechanical ventilation, and 4.2% died during hospitalization. HCP can have severe COVID-19–associated illness, highlighting the need for continued infection prevention and control in health care settings as well as community mitigation efforts to reduce transmission.

COVID-NET conducts population-based surveillance for laboratory-confirmed COVID-19–associated hospitalizations among persons of all ages in 98 counties in 13 states (1). Hospitalized patients who are residents of the surveillance catchment area and have a positive SARS-CoV-2 molecular test result during their hospitalization or within 14 days before admission are included in COVID-NET. SARS-CoV-2 testing is performed at the discretion of the health care providers or according to hospital testing policies. Trained surveillance officers conduct medical chart abstractions for COVID-19 patients using a standardized case report form, which includes HCP status. Data on HCP status collected by sites representing 98* counties in 13 states (California, Colorado, Connecticut, Georgia, Maryland, Michigan, Minnesota, New Mexico, New York, Ohio, Oregon, Tennessee, and Utah) are included in this analysis. HCP were defined as persons working in health care settings, home health care services, or health care occupations within other settings (e.g., school nurses) who have potential for exposure to patients or infectious materials (2). HCP were stratified into two groups for analyses according to presumed level of patient contact (i.e., those generally expected and those generally not expected to have direct patient contact) based on reported occupation.†

* Counties represented in analysis: California (Alameda, Contra Costa, and San Francisco counties); Colorado (Adams, Arapahoe, Denver, Douglas, and Jefferson counties); Connecticut (Middlesex and New Haven counties); Georgia (Clayton, Cobb, DeKalb, Douglas, Fulton, Gwinnett, Newton, and Rockdale counties); Maryland ( Allegany, Anne Arundel, Baltimore, Baltimore City, Calvert, Caroline, Carroll, Cecil, Charles, Dorchester, Frederick, Garrett, Harford, Howard, Kent, Montgomery, Prince George’s, Queen Anne’s, St. Mary’s, Somerset, Talbot, Washington, Wicomico, and Worcester counties); Michigan (Clinton, Eaton, Genesee, Ingham, and Washtenaw counties); Minnesota (Anoka, Carver, Dakota, Hennepin, Ramsey, Scott, and Washington counties); New Mexico (Bernalillo, Chavez, Doña Ana, Grant, Luna, San Juan, and Santa Fe counties); New York (Albany, Columbia, Greene, Greene, Livingston, Monroe, Montgomery, Ontario, Orleans, Rensselaer, Saratoga, Schenectady, Schoharie, Wayne, and Yates counties); Ohio (Delaware, Fairfield, Franklin, Hocking, Licking, Madison, Morrow, Perry, Pickaway, and Union counties); Oregon (Clackamas, Multnomah, and Washington counties); Tennessee (Cheatham, Davidson, Dickson, Robertson, Rutherford, Sumner, Williamson, and Wilson counties); and Utah (Salt Lake County).

† HCP generally expected to have direct patient contact included nurse (115), CNA/nursing assistant/nurse aide (50), patient aide/care aide/caregiver/patient care assistant (25), home health personnel (17), phlebotomist/technician (16), social work/behavioral health/counseling (16), physician (15), physical therapist/occupational therapist/chiropractor (nine), dentist/dental hygienist (seven), emergency medical services personnel/paramedic (seven), medical assistant (six), nursing home/long-term careisted living staff members (three), respiratory therapist (three), and other (four). HCP generally not expected to have direct patient contact included home health care aides (22), housekeeping/maintenance staff members (13), nursing home/long-term careisted living staff members, role unspecified (12), food service (seven), pharmacist/pharmacy staff members, role unspecified (six), environmental services (three), laboratory staff members, role unspecified (one), security (one), other (five), and unspecified (75). HCP categorized as “role unspecified” were those for whom only a location of work was indicated with no other detail about occupation; all such HCP were assumed generally not to have direct patient contact and were classified according to their location of work.
Because of high case counts, nine of 13 sites conducted in-depth medical chart abstractions for an age-stratified random sample of all reported COVID-19 patients hospitalized during March 1–May 31. Six sites completed chart abstractions for all patients aged <50 years (including all pregnant patients), 20% of patients aged 50–64 years, and 10% of patients aged ≥65 years. Three sites completed abstractions for 10% of patients aged ≥18 years, in addition to all pregnant patients. The remaining four sites completed chart abstractions for all reported patients. As of September 12, chart abstractions were complete for 86% of sampled patients identified through COVID-NET. Descriptive statistics were calculated for all sampled HCP aged ≥18 years hospitalized with COVID-19 during March 1–May 31, 2020, for whom full chart abstraction was completed. Weights were applied to reflect the probability of being sampled for complete chart abstraction; weighted percentages and unweighted case counts are presented throughout this report. Analyses were conducted using SAS (version 9.4; SAS Institute), and 95% confidence intervals (CIs) were generated using the Taylor series linearization method in SUDAAN (version 11; RTI International). COVID-NET activities were determined by CDC to meet the requirements of public health surveillance. All sites participating in COVID-NET obtained approval from their respective state and local Institutional Review Boards, as applicable.

During March 1–May 31, 2020, COVID-NET received reports of 28,972 hospitalized adult patients, 8,515 of whom were sampled for complete chart abstraction (Figure 1). HCP status was documented for 6,760 sampled patients, 438 of whom were HCP, yielding a weighted estimate of 5.9% (95% CI = 5.1%–6.8%). The median age of HCP hospitalized with COVID-19 was 49 years (interquartile range [IQR] = 38–57 years), and 71.9% were female; 52.0% were non-Hispanic Black (Black), 27.4% were non-Hispanic White, and 8.6% were Hispanic or Latino persons (Table). More than two thirds (67.4%) of HCP hospitalized with COVID-19 worked in occupations in which they were generally expected to have direct patient contact; 36.3% of HCP hospitalized with COVID-19 worked in nursing-related occupations, including nurses (27.8%) and certified nursing assistants (CNAs) (8.5%). Patient aides and caregivers (6.6%) accounted for the next largest proportion of HCP hospitalized with COVID-19 (Figure 2).

Overall, 89.8% of HCP hospitalized with COVID-19 had documentation of at least one underlying condition (Table). The most commonly reported conditions included obesity (body mass index ≥30 kg per m²) (72.5%), hypertension (40.6%), and diabetes (30.9%). Compared with HCP generally expected to have direct patient contact, those generally not expected to have direct patient contact had higher prevalences of obesity (80.9% versus 68.3%) and cardiovascular disease (excluding hypertension) (23.5% versus 8.4%). Among female HCP aged 18–49 years hospitalized with COVID-19, 9.6% were pregnant during hospitalization. Upon hospital admission, 96.6% of HCP reported COVID-19–associated signs and symptoms; shortness of breath (79.0%), cough (76.6%), and fever or chills (73.9%) were those most commonly reported.

The median length of hospitalization among HCP with COVID-19 was 4 days (IQR = 3–9 days). COVID-19 investigational treatments were administered to 48.2% of HCP hospitalized with COVID-19. Overall, 27.5% of HCP were admitted to an ICU for a median of 6 days (IQR = 3–20 days), and 15.8% required invasive mechanical ventilation. Pneumonia was a documented discharge diagnosis for 56.7% of HCP hospitalized with COVID-19 and acute respiratory failure for 42.9%. Sixteen (4.2%) HCP with COVID-19 died during hospitalization.

**Discussion**

During March 1–May 31, 2020, HCP accounted for approximately 6% of adults hospitalized with COVID-19 for whom HCP status was documented in COVID-NET. The median age of hospitalized HCP (49 years) was substantially lower than that previously reported for hospitalized adults (62 years) (3). More than two thirds (67.4%) of HCP hospitalized with COVID-19 were generally expected to have direct patient contact, and over one third (36.3%) were in nursing-related occupations. Similar to the proportion of underlying conditions among all hospitalized adults reported to COVID-NET during March–May, approximately 90% of hospitalized HCP reported at least one underlying condition, with obesity being the most common and reported for over two thirds (72.5%) of patients. A high proportion of hospitalized HCP had indications of severe disease; approximately one in four were admitted to an ICU, and approximately 4% died. The proportion of HCP with these severe clinical outcomes was similar to that of adults aged 18–64 years hospitalized with COVID-19 during March–May.

Findings from this analysis are comparable to those reported among HCP with COVID-19 in China, which found that nursing-related occupations accounted for the largest proportion of COVID-19 cases among HCP (4). COVID-NET does not specifically collect information on exposure history; however, nurses are frontline workers and might be at particular risk for exposure because of their frequent and close

FIGURE 1. Selection of cases for analysis of COVID-19–associated hospitalizations among health care personnel (HCP)* — COVID-NET, 13 states,† March 1–May 31, 2020

28,972 hospitalized adult cases identified by COVID-NET with admission date during March 1–May 31, 2020

- Unsampled cases (n = 20,457)
- Excluded cases from one site (no clinical data available) (n = 73)
- Excluded cases for whom medical chart abstraction was not complete (n = 1,181)
- Excluded cases for whom HCP status was not documented in the medical chart (n = 377)
- Excluded cases for whom HCP status was missing (n = 124)
- Excluded non-HCP (n = 6,322)

8,442 sampled cases from included sites

- Excluded cases for whom medical chart abstraction was not complete (n = 1,181)
- Excluded cases for whom HCP status was not documented in the medical chart (n = 377)
- Excluded cases for whom HCP status was missing (n = 124)

8,515 sampled cases

- Excluded cases from one site (no clinical data available) (n = 73)
- Excluded cases for whom medical chart abstraction was not complete (n = 1,181)
- Excluded cases for whom HCP status was not documented in the medical chart (n = 377)
- Excluded cases for whom HCP status was missing (n = 124)

28,972 hospitalized adult cases identified by COVID-NET with admission date during March 1–May 31, 2020

Abbreviations: COVID-19 = coronavirus disease 2019; COVID–NET = COVID–19–Associated Hospitalization Surveillance Network.
* All case counts are unweighted.
† Sites located in the following 13 states: California, Colorado, Connecticut, Georgia, Maryland, Michigan, Minnesota, New Mexico, New York, Ohio, Oregon, Tennessee, and Utah.
## TABLE. Demographic and clinical characteristics of health care personnel (HCP) with COVID-19-associated hospitalizations, overall and by type of patient contact* — COVID-NET, 13 states,† March 1—May 31, 2020

| Characteristic | Overall (N = 438) | Unweighted no. (weighted %) | 95% CI | Direct patient contact (N = 293) | Unweighted no. (weighted %) | 95% CI | No direct patient contact (N = 145) | Unweighted no. (weighted %) | 95% CI |
|---------------|------------------|----------------------------|--------|---------------------------------|----------------------------|--------|---------------------------------|----------------------------|--------|
| **Type of patient contact** | | | | | | | | | |
| Direct patient contact | 293 (67.4) | (59.9–74.1) | | | | | | | |
| No direct patient contact | 145 (32.6) | (25.9–40.1) | | | | | | | |
| **Age group (N = 438)** | | | | | | | | | |
| 18–49 yrs | 278 (46.4) | (38.1–53.7) | | | | | | | |
| 50–64 yrs | 139 (46.1) | (38.9–53.5) | | | | | | | |
| ≥65 yrs | 21 (7.5) | (4.1–13.3) | | | | | | | |
| Median age in years (IQR) | 49 (38–57) | | | | | | | | |
| **Race/Ethnicity (N = 438)** | | | | | | | | | |
| White, non-Hispanic | 142 (27.4) | (21.5–34.1) | | | | | | | |
| Black, non-Hispanic | 184 (52.0) | (44.5–59.5) | | | | | | | |
| Hispanic or Latino | 48 (8.6) | (5.3–13.8) | | | | | | | |
| Asian or Pacific Islander, non-Hispanic | 39 (6.8) | (4.2–10.8) | | | | | | | |
| Multiple races | 1 (0.1) | (0.0–0.7) | | | | | | | |
| Unknown | 12 (2.3) | (0.7–4.9) | | | | | | | |
| **Sex (N = 438)** | | | | | | | | | |
| Male | 131 (28.1) | (21.8–35.3) | | | | | | | |
| Female | 307 (71.9) | (64.7–78.2) | | | | | | | |
| **Underlying conditions (N = 438)** | | | | | | | | | |
| Any underlying condition§ | 377 (89.8) | (85.0–93.3) | | | | | | | |
| Obesity (n = 396) | 270 (72.5) | (65.2–78.7) | | | | | | | |
| Hypertension | 158 (40.6) | (33.5–48.2) | | | | | | | |
| Chronic metabolic disease | 136 (36.7) | (29.6–44.3) | | | | | | | |
| Diabetes | 115 (30.9) | (24.3–38.3) | | | | | | | |
| Chronic lung disease | 125 (26.7) | (20.6–33.9) | | | | | | | |
| Asthma | 92 (18.3) | (13.3–24.7) | | | | | | | |
| Cardiovascular disease¶ | 45 (13.3) | (8.7–19.9) | | | | | | | |
| Pregnancy (n = 189)** | 34 (9.6) | (6.5–14.0) | | | | | | | |
| Immunocompromised condition | 28 (7.0) | (4.1–11.8) | | | | | | | |
| **Signs and symptoms upon admission (N = 438)** | | | | | | | | | |
| Any symptoms | 411 (96.6) | (94.8–98.0) | | | | | | | |
| Shortness of breath | 339 (79.0) | (72.0–84.5) | | | | | | | |
| Cough | 324 (76.6) | (69.7–82.3) | | | | | | | |
| Fever/Chills | 323 (73.9) | (66.7–80.1) | | | | | | | |
| Muscle aches/Myalgias | 177 (35.9) | (29.2–43.3) | | | | | | | |
| Nausea/Vomiting | 145 (31.6) | (25.0–39.1) | | | | | | | |
| Congested/Runny nose | 65 (14.6) | (10.2–20.5) | | | | | | | |
| Sore throat | 66 (14.2) | (9.7–20.3) | | | | | | | |
| Abdominal pain | 46 (14.5) | (9.4–21.8) | | | | | | | |
| Anosmia/Decreased smell | 40 (9.4) | (5.7–15.1) | | | | | | | |
| Dysgeusia/Decreased taste | 36 (6.8) | (5.9–11.6) | | | | | | | |
| Wheezing | 29 (7.2) | (2.4–11.8) | | | | | | | |
| **Hospital length of stay (median days, IQR)** | | | | | | | | | |

Abbreviations: BIPAP = bilevel positive airway pressure; CI = confidence interval; COVID–19 = coronavirus disease 2019; COVID–NET = COVID–19–Associated Hospitalization Surveillance Network; CPAP = continuous positive airway pressure; CT = computed tomography; ICU = intensive care unit; IQR = interquartile range; MRI = magnetic resonance imaging.

* Received HCP were categorized as those generally expected and those generally not expected to have direct patient contact based on HCP type.
† Sites located in the following 13 states: California, Colorado, Connecticut, Georgia, Maryland, Michigan, Minnesota, New Mexico, New York, Ohio, Oregon, Tennessee, and Utah.
‡ Defined as any of the following: chronic lung disease, chronic metabolic disease, blood disorder/hemoglobinopathy, cardiovascular disease, neurologic disorder, immunocompromised condition, renal disease, gastrointestinal/liver disease, rheumatologic/autoimmune/inflammatory condition, obesity (body mass index ≥30 kg/m²), and pregnancy.
§ Excluding hypothermia.
¶ Pregnancy was assessed among female patients aged 18–49 years; two pregnant patients were admitted to the ICU and one required invasive mechanical ventilation.
** Given with at least one other COVID–19 investigational treatment.
†† Not given for human immunodeficiency virus infection.
‡‡ Includes treatments administered as off-label, for compassionate use, or as part of randomized controlled trials (RCTs) for which the patient might have received treatment or a placebo: hydroxychloroquine (two), remdesivir (six), tocilizumab (one), and sarilumab (two).
**** Highest level of respiratory support for each patient that needed respiratory support.

To decrease the risk for SARS-CoV-2 transmission in health care facilities, CDC recommends that HCP use face masks (i.e., medical masks, such as surgical or procedure masks) at all times while they are in health care facilities, including patient-care areas, staff member rooms, and areas where other HCP might be present (2). In addition, in areas with moderate to substantial community transmission of SARS-CoV-2, CDC
recommends that HCP wear eye protection for all patient care encounters. An N95-equivalent or higher-level respirator is recommended for aerosol-generating procedures and certain surgical procedures to provide optimal protection against potentially infectious respiratory secretions and aerosols (2).

Similar to the distribution of the U.S. health care workforce overall, a majority of hospitalized HCP in this report were female (5). However, compared with previously reported demographic characteristics of U.S. HCP with COVID-19, HCP identified by COVID-NET were older, and a larger proportion were Black (6). Given that COVID-NET conducts surveillance specifically for hospitalized patients, these differences might reflect the association between increased age and severe outcomes associated with SARS-CoV-2 infection as well as disproportionate effects among Black populations (1,3,7,8).

These results are consistent with previously reported data suggesting that underlying conditions, including obesity, diabetes, and cardiovascular disease, are risk factors for COVID-19–associated hospitalization and ICU admission (3,9,10). Among the approximately 90% of HCP in this analysis with at least one underlying condition, obesity was most commonly reported. A recent study found that obesity was highly associated with risk for death among COVID-19 patients who sought health care, even after adjusting for other obesity-related underlying conditions (10). The findings in this report highlight the need for prevention and management of obesity through evidence-based clinical care as well as policies, systems, and environmental changes to support HCP in healthy lifestyles to reduce their risk for poor COVID-19–related outcomes.§§

**FIGURE 2. Weighted percentage of personnel types*,† among reported health care personnel (HCP) with COVID-19–associated hospitalizations (N = 438) — COVID–NET, 13 states,§ March 1–May 31, 2020**

Abbreviations: CNA = certified nursing assistant; COVID-19 = coronavirus disease 2019; COVID–NET = COVID–19–Associated Hospitalization Surveillance Network; EMS = emergency medical services; HR = human resources; OT = occupational therapist; PCA = patient care assistant; PT = physical therapist.

* HCP categorized as "unspecified" or "other" have not been included in the figure but are included in the denominator.
† Error bars represent 95% confidence intervals.
§ Sites located in the following 13 states: California, Colorado, Connecticut, Georgia, Maryland, Michigan, Minnesota, New Mexico, New York, Ohio, Oregon, Tennessee, and Utah.
The findings in this report are subject to at least five limitations. First, HCP status is determined through medical chart review, and although chart abstractions were completed on all sampled cases, abstraction was pending at the time of analysis for approximately 14% of sampled cases hospitalized during March–May. Thus, the proportion of identified HCP among all adults hospitalized with COVID-19 from March–May might represent an overestimate or underestimate of HCP in this population. Second, because of small sample sizes for some variables, some estimates might be unstable, as evidenced by wider confidence intervals. Third, although COVID-NET collects HCP status, data on the degree, frequency, and duration of contact with patients are not collected. HCP were stratified by presumed level of patient contact, based on general understanding of health care professions; the level of patient contact for some HCP might have thus been misclassified. Fourth, COVID-NET does not collect data regarding exposure history. It is unknown whether HCP were exposed to SARS-CoV-2 in the workplace or community, highlighting the need for community prevention efforts as well as infection prevention and control measures in health care settings. Finally, laboratory confirmation is dependent on clinician-ordered testing and hospital testing policies for SARS-CoV-2; as a result, COVID-19–associated hospitalizations might have been underestimated.

Findings from this analysis of data from a multisite surveillance network highlight the prevalence of severe COVID-19–associated illness among HCP and potential for transmission of SARS-CoV-2 among HCP, which could decrease the workforce capacity of the health care system. HCP, regardless of any patient contact, should adhere strictly to recommended infection prevention and control guidance at all times in health care facilities to reduce transmission of SARS-CoV-2, including proper use of recommended personal protective equipment, hand hygiene, and physical distancing (2). Community mitigation and prevention efforts in households and congregate settings are also necessary to reduce overall SARS-CoV-2 transmission. Continued surveillance of hospitalized HCP is necessary to document the prevalence and characteristics of COVID-19 among this population. Further understanding of exposure risks for SARS-CoV-2 infection among HCP is important to inform additional prevention strategies for these essential workers.
