Abstract
In this paper we present a rule-based technique for the automatic extraction of Bangla compound verbs from raw text corpora. In our work we have (a) proposed rules through which a system could automatically identify Bangla CVs from texts. These rules will be established on the basis of syntactic interpretation of sentences, (b) we shall explain problems of CV identification subject to the semantics and pragmatics of Bangla language, (c) finally, we have applied these rules on two different Bangla corpuses to extract CVs. The extracted CVs were manually evaluated by linguistic experts where our system and achieved an accuracy of around 70%.

Keywords: Compound Verbs, Automatic Extraction, Vector Verbs
1 Introduction

Compound verbs (henceforth CV) are special type of complex predicates consisting of a sequence of two or more verbs acting as a single verb and express a single expression of meaning. However, not all verb sequences are considered as compound verbs. A compound verb consists of a sequence of two verbs, V1 and V2 such that V1 is a common verb with /-e/ [non-finite] inflection marker and V2 is a finite verb that indicates orientation or manner of the action or process expressed by V1 (Dasgupta, 1977). The verb V1 is known as pole and V2 is called as vector. For example, in the sentence "রুটিগুল খেয়ে পেলা (’ruTigulo kheYe phela/) ‘bread-plural-the eat and drop-pres. Imp’ ‘Eat the breads’, the verb sequence “kheYe phela” is an example of CV.

Identification of compound verbs from sentences is useful in many NLP applications including Wordnet development, Information Retrieval, and Machine Translation. However, automatic identification of compound verbs from a given text document is not a trivial task. As mentioned in (Dasgupta, 1977), a sequence of two or more verbs does not always guarantees to be a compound verb. Depending on the context a verb sequence may or may not act as CV. Thus, automatic identification of compound verbs is extremely important and a challenging task.

This paper deals with the rule-based automatic identification of these types of Bangla CV, where V1 is a pole and V2 is a vector. In our work (a) we shall propose rules through which a system could automatically identify Bangla CVs from texts and these rules will be established on the basis of syntactic interpretation of sentences, (b) we shall explain problems of CV identification subject to the semantics and pragmatics of Bangla language, (c) finally we shall make a statistical evaluation of our rules.

The rest of the paper is organized as follows: In section 2 we first perform the linguistic study and the related concepts of the compound verb and different issues related to the automatic extraction of CVs. Section 3 briefly discuss about the different related works done in this area. Section 4 discuss about the different linguistic rules that can be applied to extract CVs from text corpuses. Section 5 presents the experimentations, evaluations and results of our work.

2 Background

An important feature of CV is that the vector verb has no independent meaning. The Vector verb only can affect/support the pole to express some certain pragmatic expression. Linguists call this process of semantic nullification, *process of grammaticalization*. Considering the previous example, if we have a CV like “দোয়া খেলে”, we, or any native speaker of Bangla, must not differentiate those two verbs to comprehend the meaning for the each. Bangla native speakers have the sense that the combination ‘দোয়া খেলে’ produces a common meaning which is almost but not really same to the central meaning of the verb ‘ঘা’ [khaa: ‘eat’]. And the meaning of the 2nd verb, ‘ফেল’ [phel: ‘drop’] is being bleached out. This second or the vector verb is functionally attached to the pole and grammatically subservient and both the two verbs produce a single meaning.

This is true that each of the verbs of this phrase can be used as a pole or as an independent verb in different contexts. Native speakers are pragmatically competent to understand the phrase duly depending on the certain contexts. If one says in Bangla, “রুটিগুল কেয়েক খেয়ে ফেলে দোয়া” (/ruTigulor kaYekaTaa kheYe phele daaol/), it means “Eat some of the breads and reject the rest of breads.” The same combination of the root verbs, “ঘা” (eat) and “ফেল” (drop) plays a different role. The interesting thing can be pointed out that there is another one verb “দোয়া” is being
attached on the right side of the combination 'খেলে খপলর' and the '�পলর' is containing an infinite inflection /-e/. It means 'খেলে' (phele) is no more playing role of a vector. There the combination of CV is being shifted from 'খা' (eat) and '�ফল' (drop) to '�ফল' (drop) and 'খলে' (give). The new CV has a new vector 'খলে' (give), which has lost its meaning. There about twenty two verbs are used as vectors which support poles to describe its action in CVs.

### 2.1 Why Compound Verbs Occur?

Now a psycho-cognitive question arises. Why do the speakers intend to speak a half-hearted semantically bliched out vector verb with a main verb, when she has an option to manage her expression with a pole? We have to say that the poles always do nothing in such cases where speakers need to realize specific genres of daily speech, though it is a question of natural language survey. We have to consider some examples [(8) to (11)], where the poles cannot cover up the specification necessary for the conversation.

(8) তুমি কি কাজ টাকা অমালের হাতে দিতে পেরেছে?  
Expression: “Could you give the money to Amal yesterday?”

(9) তুমি কি কাজ টাকা অমালের হাতে দিয়ে উঠতে পেরেছে?  
Expression: “Could you at last give the money to Amal yesterday? Or something like: “Had you managed your time to give the money to Amal yesterday?”

(10) তুমি কাজটা করেছো।  
Expression: You have done the job.

(11) তুমি কাজটা করে ফেলো।  
Expression: You have finished the job.

(8)-(9) and (10)-(11) are the pairs of sentences, where (9) and (11) have CVs, whereas (8) and (10) have not. The expressions are indicating the differences between CV and non-CV. Some verbs feel lonely. They cannot take the risks of such expressions, which go beyond the physical property of the language. Hook (1974) shows that, a CV can tackle sometimes aspectual or modal expressions in Hindi.

The speech act of vector can be discussed under the area of pragmatics. Ancient Indian tradition of grammar proposed more than one way of understanding meaning of speech. According to such Indian grammatical discourse, native speakers have the potential to under meaning depending on some lakshans (indication) of the components. A word or a speech unit has this power of conceiveing intended meaning (lakshana shakti). Vectors also have the power. Let us consider again some examples below.

(12) অমাল গান গাইলো।  
“Amal sang song.”

(13) অমাল গান গেয়ে উঠলো।  
“Amal started to sing song.”

(14) অমাল সময় হঠাৎ গান গাইলো।  
“At that time, suddenly Amal sang song.”
Now we need to focus on the above sentence (12) which is a simple sentence. Speaker states that “Amal sang song”. Sentence (13) has a complex predicate /geYe uThalo/. Sentence like (13) expresses that there is a reason for which Amal started to sing song. This sentence also deserves sentential extension with such words like “emana samaYa haThat.h” (at that time suddenly) to relate the reason for which Amal started to sing song [(15)]. Therefore, we see there is a question of appropriateness we have to face regarding understanding the semantics of the vectors. As “uThalo” refer to the sudden reason behind fact of Amal’s singing in past, it cannot be appear in future. That is why the sentence (17) is unacceptable to Bengali speakers. So CV is very specific for its use in the social discourses.

2.2 Challenges in Automatic CV Extraction

Now allow us to turn to the question of identification. We have understood that a couple of verbs (V1+V2) can be considered as a CV when the second verb helps to express some pragmatic specification of the first verb (pole) and when the second verb has no independent meaning. We recognize a CV as we have the pragmatic competence. But how do we refer that pragmatic sense which is beyond the physical property? How does a machine understand that these compound components are CV and these are not? After POS-tagger describes a sentence, how can a machine annotate CV, as there are so many possibilities where more than one verb occurs immediately in a syntagmatic order?

This paper tries to reveal such syntactic conditions for the identification of CV without applying pragmatics. And we have targeted to fix certain properties for the CV that a system can easily identify. This has to be said that these conditions will work well to a trained or supervised data but not for the all. However, the easiest way to identify a CV is to mark the vectors in a language first. Let us consider following non-semantic or non-pragmatic conditions to identify a CV in Bangla:

(a) Verb (V1) + verb (V2).
(b) V1 ends with an inflection -e/ (not –te of course).
(c) V2 is a marked vector.

But these conditions (18) do not properly handle the situations. We have discussed little earlier that all the verb plus verb is not CV. V1 with /-e/-ending is also a common form of infinitive in Bangla. For example, consider (19).

রাবি ভাত খেয়ে কল্পনা।
/rabi bhaata kheYe balabe/
“Eating rice Rabi will say.”

“kheYe balabe” in this sentence (19) is not a CV, though there V1 ends with /-e/. And for (18)/(c), this is said that the vectors, usually, are poles (normal verbs). This is very difficult to
identify a verb as a vector, if we do not have the idea of context or the information about its position in a V+V sequence. If a machine understands that the second position in a V+V is for the vectors and if such a vector, machine finds from the list it may identify that this V+V is a CV. But, even in Bangla, there are many options, where a vector-listed verb plays a role of pole. In those cases, V+V are to be sub-categorized as Pole + Pole, not as Pole + Vector. Table 1 describes a list of 16 vector verbs as proposed by (Paul, 2003).

| Sl. No. | Vector Verb | Transliteration | General Meaning | Example |
|--------|-------------|-----------------|-----------------|---------|
| 1      | যা         | /yaa/           | Go              | সকল থেকে বুঝি পড়ে যাচ্ছে। |
| 2      | আস্       | /aas.h/         | Come            | বছরদিন ধরে রবি কাজ করে আসছে। |
| 3      | পড়্    | /pa.D.h/        | Fall            | রবি আজ সকাল সকাল ফুঁ থেকে উঠে পড়ল। |
| 4      | ফেল্    | /phel.h/        | Drop            | রবি কথাপ্ত বলে ফেলল। |
| 5      | দে        | /de/            | Give            | রবি বিক্ষুটা খেলা না ফেলে দিলো। |
| 6      | নে        | /ne/            | Take            | রবি তাঙ্গোতাঙ্গো হচ্ছের কাজ করা দেয় নিল। |
| 7      | মর্       | /mar.h/         | Die             | তুমি শামলের জন্য মিঠে ডেও মর্যাদা। |
| 8      | বস্       | /bas.h/         | Seat            | রবি সকলের সামনে কথাপ্ত বলে বসলো। |
| 9      | উঠ্       | /uTh.h/         | Get up          | তুমি কি ভোর বাবাকে কথাপ্ত বলে উঠতে পারলে? |
| 10     | তুল’     | /tul/           | Lift            | তুমি কি মানুষকে জাগিয়ে তুলবে কাজ করবে? |
| 11     | ছাড়’     | /chhaa.D.h/     | Leave           | রবি কাজটি করে ছাড়লো। |
| 12     | রাখ্     | /raakh.h/       | Put down        | মোহর সকাল সকাল কাজ গুঁড়িয়ে রেখেছে। |
| 13     | অন্       | /aan.h/         | Bring           | কাজটি প্রয় দেয় করে এনেছি। |
| 14     | পাটা      | /paaThaa/       | Send            | তিনি বলে পাটিয়েছেন। |

3 Related works

Recent trends in computational linguistics revisit several old issues from hardcore linguistics or traditional grammar. CV is one such issue, natural language scientists have the scope to use it in the computational aspect and experiment through a large linguistic corpus. CV issues in Indian language perspective have been reviewed by many Indian researchers, such as (Alsena, 1991; Abbi, 1991, 1992; Gopalkrishnan and Abbi, 1992; Butt, 1993; Butt, 1995) with a special focus to Hindi (Burton-Page, 1957; Hook, 1974), Urdu (Butt, 1995), Bangla (Sarkar, 1975; Paul, 2003, 2004, 2010), Kashmiri (Kaul, 1985) and Oriya (Mohanty, 1992, 2010).

Paul (2004) has attempted to work on a constraint-based and semantically-grounded account of Bangla CV within the HPSG (Head-Driven Phrase Structure Grammar) framework (Paul, 2010). An automatic extraction of Hindi CV was presented in (Chakrabarty et al., 2008). They analyses
the Hindi complex predicate system and provides scope of linguist test for identification of Hindi CV. Chakrabarty and Paul, both have conceptualized vector and used an incomplete list of those vectors. An automatic extraction of Bangla complex predicates have been performed by (Das et.al, 2010). The system uses the vectors as proposed in the literature of (Paul, 2003). To the best of our knowledge, this is the only attempt made to extract Bangla CV from the text corpuses.

4 Compound Verb Identification Grammar and Formal Rules

Apart from all and keeping (18) in our mind we can certify some more rules for the identification of CV in Bangla. This section is basically an overall revisit of our entire dialogues. To identify a CV we can follow the following condition:

(I) The common identification of a CV: Verb + Verb [V1 (+/-e/) + V2 (-so many inflectional endings according to the tense, aspect, modality and so on)].

(II) Noun + Verb combination is not a Compound Verb, it may be considered as Composite Verb (For Example, হাসি পেল, রাগ করলো, যুষ পেল.)

(III) V1+V2 = CV and v2 has no meaning. V2 is grammatically subservient, i.e., v2 serves or acts in a subordinate capacity and formally attached to the v1. On the other hand v1 is grammatically central. (Hook, 1974; Dasgupta, 1977)

(IV) As V2 plays a role of an essentially subordinate of V1, it cannot even take a modifier.

(V) V1, i.e., a pole must not immediately be followed by a V2, i.e. a vector. For example, কাজটা করে(v1) ভুমি চিক ফেলবে(v2). This implies possibilities of such following combinations too:
N+P+N+V = CV
N+P+V+N = CV

(VI) CV collapses if there is an adverb in between V1 and V2. For example, *ফইটো পড়ে (v1) তাড়াতাড়ি (adv) ফেল (v2)।

(VII) If there is a sequence like V+V+V, then first two verbs should be (normally) poles. <v1+v2+v3 = pole + pole + vector>.

(VIII) Direct question to a vector is not allowed. Consider an example,

Amal story book-sing-the read (inf) drop-future
Amal will finish the story book.

One cannot ask question to the vector of the combination, 'পড়ে ফেলবে';

* অমল কি ফেলবে?
One must ask completely;
অমল কি পড়ে ফেলবে?
This proves CV (V1 + V2) is a single entity and as V2 is subservient, it cannot take a question directly. 

(IX) Bangla CV does not allow double negation like English

5 Experimentation and Results

Based on the CV extraction technique discussed in the earlier section, we try to identify Bangla CVs from the Rabindra-Rachanabali \(^1\) and Bankim Rachanabali \(^2\) corpus. The Rabindra-Rachanabali corpus has a collection of 176000 Bangla sentences and the Bankim-Rachanabali corpus has a collection of 34000 sentences. These sentences were POS (part of Speech) tagged using the Bangla POS tagger\(^3\). From the POS tagged corpus, we have identified all possible sentences containing multiple verbs. We consider the verb + verb combinations within these sentences, as potential CVs. Altogether 26500 sentences containing the potential CVs are identified from the corpus (see Table 1).

| Table 1: Corpus Statistics |
|----------------------------|
| Total No. of Sentence in Corpus | 2,10,000 |
| Total Number of V+V sequence | 26500 |
| Total No. of CV Annotated Sentence | 6500 |
| Total No. of CVs (identified manually) | 895 |

| Table 2: Results of the Compound Verb Extraction Module |
|--------------------------------------------------------|
| No. of V+V correctly identified as CV by the system (True Positive) | 313 | 427 |
| No. of V+V correctly identified as Not-CV by the system (True Negative) | 197 | 197 |
| No. of V+V falsely identified as CV by the system (False Positive) | 201 | 160 |
| No. of V+V falsely identified as non-CV by the system (False Negative) | 184 | 111 |
| Precision (%) | 61 | 72 |
| Recall (%) | 63 | 79 |
| F-Measure (%) | 62 | 75 |
| Accuracy (%) | 57 | 70 |

Out of these 26500 Bangla sentences, we have manually annotated 6500 sentences using a Linguist. We then applied the CV extraction rules, mentioned in the previous section. The extracted CVs are then compared with the manually evaluated gold standard data. The summary of the results obtained are depicted in table 2.

\(^1\)www.rabindra-rachanabali.nltr.org
\(^2\)www.bankim-rachanabali.nltr.org
\(^3\)www.nltr.org/downloads/
The result from table 2 implies that, we have a precision of around 61% and a recall value of 63%. The F-measure is coming out to be 62% whereas the overall accuracy of the system comes to be 57%.

The results of table 2 imply that a lot of anomalous verb sequences have been incorrectly identified as CV by the present system. A close observation over the result reveals some interesting findings that may play some crucial role during the extraction of Bangla CV. Our result shows that, whenever a pole is attached with a suffix “-te” the V1+V2 sequence does not belongs to the CV group irrespective of whether V2 belongs to the pre-defined list of vectors. Thus, we have incorporated an additional rule on the system that checks whether a pole verb contains a suffix “-te” along with its vector counterpart. We further observe that, the loss in precision was also caused due to high error in POS tagging. We identified around 30% of errors are generated due to incorrect POS tags. Thus, when measures were taken to eliminate these errors we reached an accuracy of around 70%.

Further, we perform the analysis for each of the individual vector verbs. The result shows that not all vector verbs are equally responsible to form compound verbs. It has been observed that in most of the cases, vector verbs like, তোলে, বেড়ানো, and মরা have a higher tendency of forming compound verbs as compared to vectors like, আসা, থাকা and দেখা. Figure 1 presents the graph that shows the percentage of cases for which different vectors form the compound verb structure.

![Figure 1: The role of different vector verbs in CV formation](image)

We further classify the vector verbs according to their frequencies. Depending on the frequency, we categorize the list of vectors into the following four different classes:

- **Class-I**: Frequently occurring vectors with high precision like, ফেঁা and উঠা.
- **Class-II**: Less frequent vectors with high precision like, ফাঁা and ফেডানা.
- **Class-III**: Frequently occurring vectors with low precision like, যাওয়া and আসা.
- **Class-IV**: Less frequent vectors with low precision like, আ া and রাখা.

We have considered the low frequency vectors to be those for which the frequency is below the average frequency. We observe that, the vectors belonging to class-III are very frequent but have
a very low probability of being a CV. Similar effects have been found for vectors belonging to class-IV. We also observed that low frequency vectors have a higher tendency to construct the CV where as high frequency words do not tend to construct CVs.

**Conclusion**

In the present work we try to automatically extract the Bangla Compound verbs from the literary documents belonging to Rabindra Rachanabali and Bankim Rachanabali. These corpuses have been chosen because of the varied type of text contents. In order to extract the CV we have used the vector verb list as provided by (Paul, 2003). We observe that vector verbs cannot identify the occurrence of compound verbs alone. There are several other features responsible for a verb + verb combination to be a CV. We also saw that, frequencies as well as the type of a vector are very much responsible in order to classify a V+V combination as CV.

In the next stage of our work, we will try to enhance the existing model of CV identification and try to apply the information content measures to identify the degree of compositionality of a given CV.
