Pseudo–Mirizzi syndrome resulting from traumatic hematoma of the duodenum: A case report

Adam Colton, Pawanjit Dhillon, Delphine Engel, Mumtaz Tabbaa, Andrew McCague

ABSTRACT

Introduction: Traumatic hematoma of the duodenum is a rare occurrence. This case represents a rare case of an extramural duodenal hematoma leading to compression on the common bile duct and a Pseudo–Mirizzi syndrome.

Case Report: A 28-year-old male developed a duodenal hematoma after his all-terrain vehicle collided with a tree. He later developed hyperbilirubinemia attributed to a Pseudo–Mirizzi syndrome caused by the hematoma.

Conclusion: This is a rare case of a traumatic duodenal hematoma causing a Pseudo–Mirizzi syndrome.
Pseudo–Mirizzi syndrome resulting from traumatic hematoma of the duodenum: A case report

ABSTRACT

Introduction: Traumatic hematoma of the duodenum is a rare occurrence. This case represents a rare case of an extramural duodenal hematoma leading to compression on the common bile duct and a Pseudo–Mirizzi syndrome. Case Report: A 28-year-old male developed a duodenal hematoma after his all-terrain vehicle collided with a tree. He later developed hyperbilirubinemia attributed to a Pseudo–Mirizzi syndrome caused by the hematoma. Conclusion: This is a rare case of a traumatic duodenal hematoma causing a Pseudo–Mirizzi syndrome.

Keywords: Pseudo–Mirizzi syndrome, Duodenal hematoma, Trauma, Vehicle collide

INTRODUCTION

Traumatic hematoma of the duodenum is a rare occurrence [1, 2]. It is thought that the retroperitoneal location of this organ may offer a greater amount of protection when faced with blunt abdominal trauma [3]. Cases described in literature occur predominantly in children and most involve the diagnosis of intramural hematomas of the duodenum which cause patients to present because of onset of gastrointestinal symptoms consistently with gastric outlet obstruction such as abdominal pain, nausea and vomiting [4]. The case presented here varies from the typical presentation, in that an extramural duodenal hematoma lead to elevation in bilirubin in an otherwise healthy adult male. Reports of traumatic hematoma causing external compressive forces on adjacent structures such as the pancreas and biliary tree are sparsely found in trauma literature and will be discussed here.

CASE REPORT

A 28-year-old male was admitted to our institution two days after an all-terrain vehicle (ATV) accident where the patient struck a tree and was hit in the abdomen by his handle bars. There was no loss of consciousness at the time of the incident and the patient remained ambulatory at the scene. He presented to the emergency department complaining of abdominal ecchymosis that was getting progressively worse. On admission, the patient denied any abdominal pain, distention, nausea or vomiting and was reporting good appetite with normal bowel movements.

On examination, the patient was found to have dark periumbilical ecchymosis (presumed to have a positive
“Cullen’s sign”) but abdomen was soft, tender and non-distended with bowel sounds present in all four quadrants. His white blood cell count was 9,200 cells/mm³, hemoglobin 14.3 mg/dl, and platelets 195,000/μL. Complete metabolic panel showed elevated total bilirubin level of 1.5 mg/dl but otherwise unremarkable findings with lipase of 54 U/L. Radiographic results demonstrated evidence of a large hematoma in the peripancreatic/periduodenal region extending into the mesentery on computed tomographic (CT) scan which was treated conservatively (Figure 1). Serial lab investigations were obtained later that morning showing a total bilirubin level further elevated to 1.9 mg/dL. At this point, our gastroenterologist was consulted for further assessment. The patient underwent an ERCP with sphincterotomy and stent placement later that day.

Follow-up laboratory findings showed further elevation of total bilirubin level to 2.5 mg/dL with elevated lipase to 10,203 U/L (normal range 23–300 U/L) suggesting post-ERCP pancreatitis. However, the patient remained asymptomatic. Serial lipase levels showed down-trending over the next 24 hours to 1,631 U/L at time of discharge the following day. At one year follow-up, the patient had no additional episodes of biliary obstruction.

DISCUSSION

In the present patient, computed tomography scan showed evidence of a large duodenal hematoma. Initial concern for expanding traumatic hematoma causing obstruction of the common bile duct, leading to worsening hyperbilirubinemia and subsequent cholestatic complications such as obstructive jaundice, was supported by serial bilirubin levels trending upward. This led to gastroenterology consultation and subsequent ERCP with stent placement to ensure patency of biliary tree.

Studies on duodenal hematomas have tended towards those “intramural” which often present with symptoms of abdominal pain, vomiting and other symptoms typical of obstructive gastropathy [3, 4]. However, very little research has been done on indications for preventative stent placement in the case of traumatic extramural duodenal hematoma as is seen in this case [5]. It may be postulated that conservative management may have been sufficient in this patient, given his lack of overt symptomatology [6]. Larger discussion of the role of conservative management in this type of case may be warranted. Consideration for serial CT scans to assess for expansion of extramural duodenal hematomas may be a reasonable option in this scenario, especially in settings without readily available ERCP capabilities [7]. Further, in event that follow-up imaging yields signs of rapid hematoma expansion, surgical intervention would likely take precedent over attempts at endoscopy guided procedural stenting, so the role of non-surgical intervention may be limited [8]. It may be important for trauma surgeons to weigh the risks, benefits and costs of preventative use of biliary stenting in cases of non-intramural duodenal hematomas resulting in asymptomatic hyperbilirubinemia.

CONCLUSION

Here we presented a rare case of an extramural traumatic duodenal hematoma leading to extrinsic compression on the common bile duct and likely pancreatic duct leading to obstructive hyperbilirubinemia. Though duodenal hematomas are not uncommon in trauma, the Pseudo–Mirizzi syndrome presented in this patient makes this a rare case. Conservative management should be attempted unless signs of ongoing bleeding or prolonged obstruction are seen.

About Edorium Journals
Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.*

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.*

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

* Terms and condition apply. Please see Edorium Journals website for more information.

We welcome you to interact with us, share with us, join us and of course publish with us.
