COXETER ELEMENTS FOR VANISHING CYCLES OF TYPES $A_{\frac{1}{2}\infty}$ AND $D_{\frac{1}{2}\infty}$

KYOJI SAITO

Abstract. We introduce two real entire functions $f_{A_{\frac{1}{2}\infty}}$ and $f_{D_{\frac{1}{2}\infty}}$ in two variables. Both of them have only two critical values 0 and 1, and the associated maps $\mathbb{C}^2 \to \mathbb{C}$ define topologically locally trivial fibrations over $\mathbb{C} \setminus \{0, 1\}$. All critical points are ordinary double points, and the associated vanishing cycles span the middle homology group of the general fiber, whose intersection diagram forms bi-partitely decomposed quivers of type $A_{\frac{1}{2}\infty}$ and $D_{\frac{1}{2}\infty}$, respectively. Coxeter elements of type $A_{\frac{1}{2}\infty}$ and $D_{\frac{1}{2}\infty}$, acting on the middle homology group, are introduced as the product of the monodromies around 0 and 1. We describe the spectra of the Coxeter elements by embedding the middle homology group into a Hilbert space. The spectra turn out to be strongly continuous on the interval $(-\frac{1}{2}, \frac{1}{2})$ except at 0 for type $D_{\frac{1}{2}\infty}$.

References

1Present paper is planned as the first part of a paper “Primitive forms of types $A_{\frac{1}{2}\infty}$ and $D_{\frac{1}{2}\infty}$” in preparation. We publish the present part (the spectra of Coxeter elements) separately, because of its own independent interest.
1. Introduction

We introduce two particular entire transcendental functions in two variables, which we will call the functions of types $A_{\infty}^{1,2}$ and $D_{\infty}^{1,2}$, respectively. They are introduced in the hope that some period maps associated with them should contribute to the understanding of KP- and KdV-hierarchies. For this purpose, we need to develop a theory of primitive forms for these transcendental functions by analogy with the classical theory of primitive forms for polynomial local singularities \[Sa1\], where the data of spectrum of Coxeter elements is basic. Therefore, as a first step, in the present paper, we study the spectrum of the large circle monodromy, called the Coxeter element, acting on the lattice of vanishing cycles of these functions. The goal is to show that the spectrum is contained in the interval $(\frac{1}{2}, \frac{3}{2})$.

We are still in early stage in studying transcendental functions in such geometric contexts. Many of classical algebraic tools are not available due to the lack of compactness/finiteness nature of them. However, the transcendency of the functions which we study in the present paper as the test cases, is still not “wild”, and we handle them by “hand”. Even though each step of the calculation is elementary, we want to be cautious and will proceed with the calculations in down to earth fashion.

Let us explain the contents of the paper in more details. We first explain a classical analogue of the present work \([Sa2, \S 2.5, 3]\), and then make some comparisons between the classical case and the present case.

For a Dynkin graph $\Gamma^W$ of type $W \in \{ A_{l \in \mathbb{Z}_{\geq 1}}, D_{l \in \mathbb{Z}_{\geq 4}}, E_6, E_7, E_8 \}$, there exists a real polynomial $f^W(x, y, z)$ with the following i)-iii).

1. All critical points of $f^W$ are Morse (i.e. Hessians at the critical points are non-degenerate), and $f^W$ has only two critical values 0 and 1.
2. The map $f^W : \mathbb{C}^3 \to \mathbb{C}$ is a locally trivial fibration over $\mathbb{C} \setminus \{0, 1\}$.

Let us denote by $X_t$ the fiber $f^{-1}_W(t)$ over a point $t \in \mathbb{C}$.

\[1\] In the classical theory, a primitive form is defined on the universal unfolding of a function having an isolated critical point. Whereas, in the present program, the “generating center of the unfolding” is these functions of types $A_{\frac{1}{2}, \infty}$ and $D_{\frac{1}{2}, \infty}$, where there is not yet a general framework available.

\[2\] This is a consequence of a result in \([Sa2, \S 2.5, 3]\)(\([Sa3, \S 6.5\) Remark 19 and \[\S 8.9\) Remark 27]). Let us briefly recall the result. For each simply-laced Dynkin type $W$, there exists two parameter family $f_W(x, y, z, R, S)$ of real polynomials of type $W$, having only two critical values and having properties ii) and iii) (choose $f_W$ such that its deformation class $[f_W]$ belongs to the vertex orbit line $O$ in the deformation parameter space $T_W$ of simple polynomials of type $W$). Then, fix the parameter values of $(R, S)$ to re-size the critical values to \{0, 1\}. In particular, if $W = A_l$, the polynomial is given by (Chebyshev polynomial in $x$) + $y^2 + z^2$.

Instead of the formulation in 3-variables as given here, we may formulate results in 2-variables by replacing an intersection diagram by a quiver diagram (see \[\S 3.3\).
iii) For \( t \in (0, 1) \), let \( \{ \gamma_0^{(i)} \}_{i \in C_0} \) (resp. \( \{ \gamma_1^{(i)} \}_{i \in C_1} \)) be the set of cycle in the middle homology group \( H_2(X_t, \mathbb{Z}) \) which vanish at a critical point in the fiber \( X_0 \) as \( t \downarrow 0 \) (resp. \( X_1 \) as \( t \uparrow 1 \)). Then, a) the union \( \{ \gamma_0^{(i)} \}_{i \in C_0} \cup \{ \gamma_1^{(i)} \}_{i \in C_1} \) forms a basis of \( H_2(X_t, \mathbb{Z}) \), b) the intersection diagram of the basis gives a bi-partite decomposition of the Dynkin graph \( \Gamma_W \).

In the first half of the present paper, we show that the functions of type \( A_{1\infty} \) and \( D_{1\infty} \) satisfy exactly the properties parallel to i), ii) and iii) by replacing \( \Gamma_W \) by the infinite quivers of type \( A_{1\infty} \) and \( D_{1\infty} \) introduced in §3.2. This fact explains the naming of the functions. Here we should note that the middle homology group is of infinite rank.

In the classical polynomial \( f_W \) case, the product of the two monodromies of the fibration around 0 and around 1, acting on the lattice \( H_2(X_t, \mathbb{Z}) \), is called the Coxeter element. The eigenvalues of the Coxeter elements are given by the set \( \exp(2\pi\sqrt{-1}m_i h) \) (\( i = 1, \ldots, l \)), where \( h \in \mathbb{Z}_{>0} \) is the Coxeter number of type \( W \) and \( 0 < m_1 < m_2 < \cdots < m_l < h \) are called exponents (see [Bo, ch.V, §6,n°2]). The data of exponents, or equivalently, the spectrum \( \frac{m_i}{h} \) (\( i = 1, \ldots, l \)) are quite important both for the Lie theory of type \( W \) [Bo] and for the primitive forms of type \( W \) [Sa1]. For instance, the fact that the spectrum is contained in the interval \( (-\frac{1}{2}, \frac{1}{2}) \) means that the primitive form is of “simple type” of dimension \( d \) (see Remark at the end of §3 and [Sa4]). However, the eigenvalues of the Coxeter element alone are not sufficient to recover the spectrum due to an ambiguity modulo integers. The clue to recover the spectrum is the study of eigenvalues of the intersection form on the root lattice, as will be described in §4 in the present paper.

Returning to the transcendental functions of types \( A_{1\infty} \) and \( D_{1\infty} \), in analogy with the classical case, we introduce the Coxeter element as the product of the local monodromy around 0 and around 1. In order to be able to discuss about the “eigenvalues” of the Coxeter element, we embed the “lattice” into the Hilbert space (see §4.1) such that the simple root basis turn to the ortho-normal basis of the Hilbert space.

The main result of the present paper is that the spectrum of the Coxeter element is given by the function \( \theta - \frac{1}{2} \) on the interval \( \theta \in [0, 1] \) with a Stieltjes measure \( \xi_{W,\theta} \) which is strongly continuous (§4 Theorem 7). Actually, \( \xi_{W,0} = \xi_{W,1} = 0 \) (i.e. there is no discrete spectrum at \( \theta = 0, 1 \)) so that the spectrum is contained in the open interval \( (\frac{-1}{2}, \frac{1}{2}) \).

This is what was expected from the analogy with classical theory.

---

3This viewpoint is already implicitly in [Bo] ch.V,§6,n°2]. The Hilbert space lies between the homology group \( H_3(X_t, \mathbb{C}) \) and the cohomology group \( H^3(X_t, \mathbb{C}) \) (i.e. a sort of “intersection cohomology group”, See end of §4.2), which fit with our original intention to develop a period map theory for this cohomology groups.
2. Functions of types $A_{2\infty}$ and $D_{2\infty}$

We introduce functions of type $A_{2\infty}$ and $D_{2\infty}$ and associated fibrations.

2.1. Definition of $f_{A_{2\infty}}$ and $f_{D_{2\infty}}$.

**Definition.** The function $f_{W}$ of type $W \in \{A_{2\infty}, D_{2\infty}\}$ is a real entire function in two variables $x$ and $y$ given by

(2.1.1) \[ f_{A_{2\infty}}(x, y) := xs^2(x) - y^2 = 1 - c^2(x) - y^2 \]

(2.1.2) \[ f_{D_{2\infty}}(x, y) := xs^2(x) - xy = 1 - c^2(x) - xy^2. \]

Here $s(x)$ and $c(x)$ are real entire functions in a variable $x$ given by

(2.1.3) \[ s(x) := \frac{\sin \sqrt{x}}{\sqrt{x}} = \prod_{n=1}^{\infty} \left( 1 - \frac{x}{n^2 \pi^2} \right) \]

(2.1.4) \[ c(x) := \cos \sqrt{x} = \prod_{n=1}^{\infty} \left( 1 - \frac{4x}{(2n-1)^2 \pi^2} \right). \]

2.2. Real level sets $X_{A_{2\infty},0,R}$ and $X_{D_{2\infty},0,R}$.

We introduce the real level-0 set of the function $f_{W}$ of type $W$ by

$X_{W,0,R} := R^2 \cap f_{W}^{-1}(0).$

Conceptual figures of them are drawn in the following.

---

4 In the present paper, the expression “of type $W$” automatically implies $W \in \{A_{2\infty}, D_{2\infty}\}$. Meaning for this name is given in §3.2 Quiver and its Remark.

5 We mean by a real entire function of $n$-variables a holomorphic function on $\mathbb{C}^n$ which is real valued on the real form $\mathbb{R}^n$ of $\mathbb{C}^n$.

6 In the sequel of the present paper, we shall freely use the following equalities: $c(0) = s(0) = 1$, $xs^2(x) + c^2(x) = 1$, $s'(x) = \frac{1}{2x}(c(x) - s(x))$ and $c'(x) = -\frac{1}{2}s(x)$ without referring to them explicitly (here $f'(x)$ is the differentiation of $f(x)$).
Terminology 1. By a bounded connected component (bcc for short) of type $W$, we mean a bounded connected component of $\mathbb{R}^2 \setminus X_{W,0,\mathbb{R}}$.

2. By a node of type $W$, we mean a point on the real curve $X_{W,0,\mathbb{R}}$ where two local smooth irreducible components are crossing normally.

3. We say that a node of type $W$ is adjacent to a bcc of type $W$ if the node belongs to the closure of the bcc.

We state some immediate observations on the level set $X_{W,0,\mathbb{R}}$, which can be easily verified by a use of absolutely convergent infinite products (2.1.3) and (2.1.4).

Observation 1. For $n = 0, 1, 2, \cdots$, there exists exactly one bounded connected component of type $W$, containing the interval $(n^2 \pi^2, (n+1)^2 \pi^2)$ on the $x$-axis and contained in the domain $(n^2 \pi^2, (n+1)^2 \pi^2) \times \mathbb{R}$.

2. For $n = 1, 2, 3, \cdots$, the point $c^{(n)}_{W,0} := (n^2 \pi^2, 0)$ on the $x$-axis is a node of type $W$, which is adjacent to two bcc containing the interval $((n-1)^2 \pi^2, n^2 \pi^2)$ and the interval $(n^2 \pi^2, (n+1)^2 \pi^2)$.

2.3. Fibrations over $\mathbb{C} \setminus \{0,1\}$. 

For each type $W \in \{A_{2\infty}, D_{4\infty}\}$, let us consider a holomorphic map (2.3.5)
\[
    f_W : X_W \longrightarrow \mathbb{C},
\]
where the domain $X_W := \mathbb{C}^2$ of $f_W$ is regarded as a contractible Stein manifold equipped with the real form $\mathbb{R}^2$. The fiber $X_{W,t} := f_W^{-1}(t)$ over $t \in \mathbb{C}$ is an open Riemann surface, closely embedded in $\mathbb{C}^2$.

Remark. As we shall see in sequel, the fiber $X_{W,t}$ ($t \in \mathbb{C}$) has infinite genus. It is “wild” in the sense that the closure $\bar{X}_{W,t}$ in $\mathbb{P}^2_{\mathbb{C}}$ is equal to $X_{W,t} \cup \mathbb{P}^1_{\mathbb{C}}$ (i.e. the “ends” of $X_{W,t}$ is the $\mathbb{P}^1_{\mathbb{C}}$, this fact can be easily shown by the value distribution theory of one variable). By putting (2.3.6)
\[
    X_W := X_W \cup (\mathbb{P}^1_{\mathbb{C}} \times \mathbb{C}) := \cup_{t \in \mathbb{C}} (X_{W,t}, t) \subset \mathbb{P}^2_{\mathbb{C}} \times \mathbb{C},
\]
we obtain a proper map, i.e. a “compactification” of (2.3.5):
\[
    \bar{f}_W : X_W \longrightarrow \mathbb{C}.
\]
However, the spaces $\bar{X}_{W,t}$ and $\bar{X}_W$ are not manifolds with boundary (note that their “boundaries” $\mathbb{P}^1_{\mathbb{C}}$ and $\mathbb{P}^1_{\mathbb{C}} \times \mathbb{C}$, respectively, have the same dimension as the “interior” $X_{W,t}$ and $X_W$).

By a lack of tools to handle such objects at present, we shall not use this compactification in the present paper. Nevertheless, in the following Theorem 3, we show that $f_W$ induces a locally topologically trivial fibration over $\mathbb{C} \setminus \{0,1\}$. The proof is an elementary handwork, however it is not standard due to the transcendental nature of $f_W$ mentioned. Therefore, we write the proof down to the earth fasion.
Theorem. For each type $W \in \{ A_{1/2}, D_{1/2}, \infty \}$, we have the followings.

1. The function $f_W$ has only two critical values 0 and 1. That is, the set of critical points $C_W$ of $f_W$ is contained in two fibers $X_{W,0}$ and $X_{W,1}$.

2. i) The critical set $C_W$ lies in the real form $R^2$ of $X_W$.
   
   ii) The Hessian form of $f_W|_{R^2}$ at a critical point is non-degenerate. More precisely, the Hessian form is indefinite at a point in $C_{W,0} := C_W \cap X_{W,0}$ and is negative definite at a point in $C_{W,1} := C_W \cap X_{W,1}$.

   iii) We have the natural bijections:
   
   \[
   C_{W,0} \simeq \{ \text{nodes of type } P \} \quad (\text{identity map}),
   \]
   
   \[
   C_{W,1} \simeq \{ \text{bcc's of type } W \} \quad (c \mapsto B_c := \text{the bcc containing } c)
   \]

3. The restriction of the map $f_W$ to the smooth fibers:
   
   \[
   f_W|_{X_W \setminus (X_{W,0} \cup X_{W,1})} : X_W \setminus (X_{W,0} \cup X_{W,1}) \to \mathbb{C} \setminus \{0, 1\}
   \]
   is a topologically locally trivial fibration.

Proof. 1. We proceed direct calculations separately for each type.

$A_{1/2}$: The defining equations for $C_{A_{1/2}}$ are $\partial_x f_{A_{1/2}} = cs = 0$, $\partial_y f_{A_{1/2}} = -2y = 0$. Hence, $C_{A_{1/2}} = \{(x, 0) \mid s(x) = 0 \text{ or } c(x) = 0\}$, where we have

\[
f_{A_{1/2}}(x, 0) = \begin{cases} 
0 & \text{if } s(x) = 0, \\
1 & \text{if } c(x) = 0.
\end{cases}
\]

$D_{1/2}$: The defining equations for $C_{D_{1/2}}$ are $\partial_x f_{D_{1/2}} = cs - y^2 = 0$, $\partial_y f_{D_{1/2}} = -2xy = 0$. Hence, $C_{D_{1/2}} = \{(0, \pm 1)\} \cup \{(x, 0) \mid s(x) = 0 \text{ or } c(x) = 0\}$, where we have

\[
f_{D_{1/2}}(0, \pm 1) = 0 \quad \text{and} \quad f_{D_{1/2}}(x, 0) = \begin{cases} 
0 & \text{if } s(x) = 0, \\
1 & \text{if } c(x) = 0.
\end{cases}
\]

2. i) Due to the descriptions of $C_W$ in 1., we have only to show that the zero loci of $s(x) = 0$ and $c(x) = 0$ are real numbers. This follows from the fact that the infinite product expressions (2.1.3) and (2.1.4) are absolutely convergent and the zero loci of $s(x) = 0$ and $c(x) = 0$ are given by the union of zero locus of factors of the expressions, respectively.

ii) Let us calculate the Hessian at a critical point.

The statement for the two critical points $(0, \pm 1)$ on $X_{D_{1/2},0}$ can be verified directly. The other critical points are on the $x$-axis, i.e. one always has $y = 0$. Since $\partial_x \partial_y f_W|_{y=0} = 0$ for each type $W \in \{ A_{1/2}, D_{1/2}, \infty \}$,
the Hessian is a diagonal matrix of the form
\[
[\partial_x(c(x)s(x)), -2]_{\text{diag}} \quad \text{for type } P = A_{\frac{1}{2}\infty},
\]
\[
[\partial_x(c(x)s(x)), -2x]_{\text{diag}} \quad \text{for type } P = D_{\frac{1}{2}\infty},
\]
where the second diagonal component is always negative. We calculate the sign of the first diagonal component by
\[
\partial_x(c(x)s(x)) \mid_{c=0} = -\frac{1}{2}s^2 < 0 \quad \text{and} \quad \partial_x(c(x)s(x)) \mid_{s=0} = \frac{1}{2x} > 0,
\]
implying the statement ii).

iii) Combining the explicit descriptions of the set \(C_{W,0} \), \(C_{W,1} \) in Proof of 1. with Observations 2. and 3. in §2.2, the correspondences are defined and are injective (see Figure 1 and 2.). So, we need only to show their surjectivity. But, this is again trivial since i) any node of a curve is a critical point of the defining equation of the curve, where Hessian is indefinite, and ii) inside of any bounded connected component of a complement of a real curve in \(\mathbb{R}^2 \), there exists at least a point where \(f_W \) takes local maximum, then the Hessian at the point should be negative definite since we saw in 2. ii) that it is already non-degenerate.

3. Let us show that the fibration (2.3.10) is locally topologically trivial. Since our map is neither proper nor extendable to a suitably stratified proper map (recall Remark 1.3.), we cannot use standard technique such as Thom-Ehresmann theorems. Instead, we use an elementary fact that \(X_{W,t} \) is a ramified covering space: namely, in view of the equations (2.3.8) and (2.3.9), the projection map \((x, y) \in \mathbb{C}^2 \mapsto x \in \mathbb{C} \) to the \(x\)-plane induces a proper and ramified double covering maps \(\pi_{W,t} \):

\[
X_{A_{\frac{1}{2}\infty},t} \to \mathbb{C} \quad (t \in \mathbb{C}) \quad \text{and} \quad X_{D_{\frac{1}{2}\infty},t} \to \mathbb{C} \setminus \{0\} \quad (t \in \mathbb{C} \setminus \{0\}),
\]

(for \(X_{D_{\frac{1}{2}\infty},0} \), see [7].) Let us denote by \(C_W \) the base space of this covering, i.e. \(C_W := \mathbb{C} \) if \(W = A_{\frac{1}{2}\infty} \) and \(:= \mathbb{C} \setminus \{0\} \) if \(W = D_{\frac{1}{2}\infty} \). In view of the defining equation of \(X_{W,t} \), the covering is ramifying at \(X_{W,t} \cap \{y = 0\} \), i.e. at solutions \(x \in C_w \) of the equation

\[
xs^2(x) - t = 0,
\]
which, apparently, has infinitely many solutions, depending on \(t \in \mathbb{C} \).

We, now, state an elementary but a crucial fact on the function \(xs^2 \).

---

7 Since the fiber \(X_{D_{\frac{1}{2}\infty},0} \) contains an irreducible component \(L := \{x = 0\} \), the map on \(X_{D_{\frac{1}{2}\infty},0} \) is not a covering, but its restriction to \(X_{D_{\frac{1}{2}\infty},0} \setminus L \) is a covering.
Fact. The correspondence \( \pi : C_W \to C \), \( x \mapsto t := xs^2(x) = \sin^2(\sqrt{x}) \) is ramifying exactly and only at the inverse images of the points 0 and 1, and induces a (topological) covering map over \( C \setminus \{0, 1\} \).

Proof of Fact. The critical points of the map \( t = xs^2(x) \) are given by the equation \( s(x)c(x) = 0 \), and are exactly the points where \( t = 0 \) or 1 (recall Proof of 1.). Thus, the restricted map \( \pi' := \pi|_{\pi^{-1}(C \setminus \{0, 1\})} \) over \( C \setminus \{0, 1\} \) is a locally homeomorphism. To see that \( \pi' \) is a covering (i.e. a proper map on each component of an inverse image of a simply connected open subset of \( C \setminus \{0, 1\} \)), we need to show that the inverse map of \( xs^2(x) = t \) as a multivalued function in \( t \) is analytically continuable everywhere on the set \( C \setminus \{0, 1\} \). Since the equation is equivalent to \( \sqrt{t} = \pm \sin^{-1}(\sqrt{t}) \), this fact follows from the fact that the multivalued function \( \sin^{-1}(u) \) has singular points (i.e. points where the function cannot be analytically continued) only at \( u = \pm 1 \), easily seen from the integral expression \( \sin^{-1}(u) = \int_0^u \frac{du}{\sqrt{1 - u^2}} \).

Owing to Fact, we find a disc neighbourhood \( \mathcal{U} \) for any \( t_0 \in C \setminus \{0, 1\} \) so that \( \pi^{-1}(\mathcal{U}) \) decomposes into components homeomorphic to \( U \). For each \( x_i \in \pi^{-1}(t_0) \) \( (i \in I \) index set), let \( s_i(t) \) be the function on \( t \in \mathcal{U} \), defining a section of \( \pi \) such that \( s_i(t_0) = x_i \) (actually, \( s_i(t) = (\sqrt{x_i} + \int_{\sqrt{t_0}}^{\sqrt{t}} \frac{du}{\sqrt{1 - u^2}})^2 \) for choices of \( \sqrt{t_0} \) and \( \sqrt{x_i} \) such that \( \sqrt{t_0} = \sin(\sqrt{x_i}) \)) and path of integral in the connected component of \( \pm \sqrt{t} \) containing \( \sqrt{t_0} \).

We can find a differentiable map \( \varphi : \mathcal{U} \times C_W \to C_W \) such that i) \( \varphi(t_0, x) = x \), ii) for each \( t \in U \), the \( \varphi_t := \varphi(t, \cdot) \) is a diffeomorphism of \( C_W \), and iii) for each \( i \in I \), \( \varphi_t(s_i(t)) \) is constant (equal to \( s_i(t_0) = x_i \)). The diffeomorphism \( \varphi_t \) can be uniquely lifted to a diffeomorphism \( \hat{\varphi}_t : X_{W,t} \cong X_{W,t_0} \) of the double covers such that \( \varphi_t \circ \pi_{W,t} = \pi_{W,t_0} \circ \hat{\varphi}_t \). The \( \hat{\varphi}_t \) gives the local trivialization of (2.3.10).

This completes a proof of Theorem 1., 2. and 3.

3. Vanishing cycles of types \( A_{\frac{1}{2}\infty} \) and \( D_{\frac{1}{2}\infty} \)

We show that the middle homology group of a generic fiber of the map (2.3.5) has basis consisting of vanishing cycles. The intersection form among them forms the principal quiver\(^8\) of type \( A_{\frac{1}{2}\infty} \) or \( D_{\frac{1}{2}\infty} \).

3.1. Middle homology groups. In the present paragraph, we describe the middle homology group of the general fibers of (2.3.10) in terms of vanishing cycles of the function \( f_W \) of type \( W \in \{A_{\frac{1}{2}\infty}, D_{\frac{1}{2}\infty}\} \).

\(^8\) We mean by a quiver an oriented graph. It is called principal, if the set of vertices's has a bipartite decomposition \( \Gamma_0 \sqcup \Gamma_1 \) such that the head (resp. tail) of any edge belongs to \( \Gamma_0 \) (resp. \( \Gamma_1 \)) (e.g. Figure 3 and 4). See [Sa2,3].
Vanishing cycles: For a critical point \( c \in C_W = C_{W,0} \sqcup C_{W,1} \), we define an oriented 1-cycle \( \gamma_{W,c} \) in \( X_{W,t} \) for \( t \in (0,1) \) as follows.

Due to Theorem 2, we can choose holomorphic local coordinates \((u, v)\) in a neighborhood \( \mathfrak{U} \) of \( c \) in \( X_W \) such that i) \( u \) and \( v \) are real valued on \( \mathfrak{U}_R := \mathfrak{U} \cap \mathbb{R}^2 \), ii) \( \frac{\partial (u,v)}{\partial (x,y)}|_{\mathfrak{U}_R} > 0 \) and iii) \( f_W|_{\mathfrak{U}} = u^2 - v^2 \) if \( c \in C_{W,0} \) and \( f_W|_{\mathfrak{U}} = 1 - u^2 - v^2 \) if \( c \in C_{W,1} \). Then, define cycles:

\[
\gamma_{W,c} := \begin{cases} 
\left( \sqrt{t} \cos(\theta), \sqrt{-1} \sqrt{t} \sin(\theta) \right) & (0 \leq \theta \leq 2\pi), \text{ if } c \in C_{W,0} \\
\left( \sqrt{1-t} \cos(\theta), \sqrt{1-t} \sin(\theta) \right) & (0 \leq \theta \leq 2\pi), \text{ if } c \in C_{W,1}.
\end{cases}
\]

Fact. The oriented cycle \( \gamma_{W,c} \) in the surface \( X_{W,t} \) is, up to free homotopy, unique and independent of a choice of coordinates \((u, v)\).

Definition. We shall denote the homology class in \( H_1(X_{W,t}, \mathbb{Z}) \) of the cycle \( \gamma_{W,c} \) by the same \( \gamma_{W,c} \), and call it the vanishing cycle of the function \( f_W \) at the critical point \( c \in C_W \) (vanishing along the path \( t \downarrow 0 \) or \( t \uparrow 1 \)).

Sign convention of intersection numbers of 1-cycles on \( X_{W,t} \).

i) Let \( I \) be the skew symmetric intersection form between two oriented 1-cycles on a oriented surface. Then we define the convention of the sign of intersection number locally as follows:

\[
\begin{align*}
I(\gamma_1, \gamma_2) &= 1 \text{ if } \begin{array}{c}
\gamma_1 \prec \gamma_2 \\
\gamma_2 \prec \gamma_1
\end{array}, \\
I(\gamma_1, \gamma_2) &= -1 \text{ if } \begin{array}{c}
\gamma_1 \succ \gamma_2 \\
\gamma_2 \succ \gamma_1
\end{array}.
\end{align*}
\]

ii) The orientation of the surface \( X_{W,t} \) is \( \sqrt{-1} dz \wedge d\bar{z} = 2dx \wedge dy \) for a local holomorphic coordinate \( z = x + iy \) on \( X_{W,t} \). Eg. Cycles \( \gamma_x \) and \( \gamma_y \) locally homotopic to \( x \)-axis and \( y \)-axis intersects with \( I(\gamma_x, \gamma_y) = 1 \) at \( z=0 \).

Theorem. 4. The middle homology group of \( X_{W,t} \), \( t \in (0,1) \) is given by

\[
H_1(X_{W,t}, \mathbb{Z}) \simeq H_W := H_{W,0} \oplus H_{W,1},
\]

where

\[
H_{W,0} := \bigoplus_{c \in C_{W,0}} \mathbb{Z} \gamma_{W,c},
\]

\[
H_{W,1} := \bigoplus_{c \in C_{W,1}} \mathbb{Z} \gamma_{W,c}
\]

are formally defined free abelian group spanned by vanishing cycles.

5. Let \( I_W : H_1(X_{W,t}, \mathbb{Z}) \times H_1(X_{W,t}, \mathbb{Z}) \to \mathbb{Z} \) be the intersection form on the middle homology group. Then we have

\[
I_W = J_W - \dagger J_W
\]

where \( J_W \) and \( \dagger J_W \) are integral bilinear forms on \( H_W \) given by
\[ J_W(\gamma_{W,c}, \gamma_{W,c'}) := \begin{cases} 
1 & \text{if } c = c', \\
-1 & \text{if } c \in C_{W,0}, \ c' \in C_{W,1} \text{ and } c \in \overline{B}_{c'}, \\
0 & \text{else}, 
\end{cases} \]

and
\[ \mathcal{I}_W(\gamma_{W,c}, \gamma_{W,c'}) := \begin{cases} 
1 & \text{if } c = c', \\
-1 & \text{if } c \in C_{W,0}, \ c' \in C_{W,1} \text{ and } c \in \overline{B}_{c'}, \\
0 & \text{else}. 
\end{cases} \]

**Remark.** The meaning to use the form \( J_W \) shall be clarified in §3.3.

**Proof.** We first calculate intersection numbers between vanishing cycles \( \gamma_{W,c} \) and \( \gamma_{W,c'} \) as given in 5.

Suppose both critical points \( c, c' \) belong to \( C_{W,0} \) (resp. \( C_{W,1} \)). If \( c \neq c' \) then we, for \( t \) close enough to 0 (resp. 1), the supports of the vanishing cycles are close to \( c \) and \( c' \) so that they are disjoint, i.e. \( \gamma_{W,c} \cap \gamma_{W,c'} = \emptyset \) and we get \( I_W(\gamma_{W,c}, \gamma_{W,c'}) = 0 \). Then, this equality holds for any \( t \in (0, 1) \). If \( c = c' \), then \( I_W(\gamma_{W,c}, \gamma_{W,c}) = 0 \) due to skew-symmetry of \( I_W \).

Next, we consider a cycle \( \gamma_{W,c} \) for \( c \in C_{W,0} \) and a cycle \( \gamma_{W,c'} \) for \( c' \in C_{W,1} \). From their expressions in (3.1.13), we observe the following two facts:

i) The cycle \( \gamma_{W,c} \) intersects only with each of connected component of \( \mathbb{R}^3 \setminus X_{W,0} \mathbb{R} \) adjacent to \( c \) at one point \( (u, v) = (\varepsilon \sqrt{t}, 0) \) for \( \varepsilon \in \{ \pm 1 \} \).

ii) The underlying set \( |\gamma_{W,c'}| \) is presented by a circle of radius \( 1-t \) in the bcc \( B_{c'} \) containing \( c' \), i.e. it is equal to \( \{(u', v') \in B_{c'} \mid f_W(u', v') = t\} \).

These means that cycles \( \gamma_{W,c} \) and \( \gamma_{W,c'} \) for the same \( t \in (0, 1) \) intersect if and only if the critical point \( c \) is adjacent to the bounded component \( B_{c'} \), and, then, they intersect transversely at one point, say \( p \). Let \( (u', v') \) be the coordinates for the cycle \( \gamma_{W,c'} \) in (3.1.13). Then, by an orientation preserving orthogonal linear transformation of the coordinates, the intersection point \( p \) may be given by \( (u', v') = (\sqrt{1-t}, 0) \)

We determine the sign of the intersection as follows: in a neighbourhood of \( p \), we have an equality \( f_W = u'^2 - v'^2 = 1 - u'^2 - v'^2 \). Then the differentiation at \( p \) of the equation gives \( df|_p = \varepsilon \sqrt{1-t} du'|_p = -\sqrt{1-t} du'|_p \).

Since \( du \land dv|_p = cdu' \land dv'|_p \) for some positive \( c \in \mathbb{R}_{>0} \), we get

a) \( \left. \frac{\partial u}{\partial v'} \right|_p = c \frac{\sqrt{t}}{\sqrt{1-t}} \).

On the other hand, since \( du \) and \( du' \) are co-normal vectors to \( X_{W,t} \) at \( p \) (i.e. \( df|_p // du|_p // du'|_p \)), we use \( dv \) and \( dv' \) as for complex coordinates of the 1-dimensional complex tangent space \( T(X_{W,t})_p \) at \( p \), which are compatible with the sign convention ii) of the surface \( X_{W,t} \).
Using these coordinates, the infinitesimal direction $\frac{\partial}{\partial \theta}|_p$ of $\gamma_{W,c}$ at $p$ is evaluated by
\[ b) \quad \frac{\partial v}{\partial \theta}|_p = \varepsilon \sqrt{-1} \sqrt{1 - t} \]
and the infinitesimal direction $\frac{\partial}{\partial \theta'}|_p$ of $\gamma_{c',1}$ at $p$ is evaluate by
\[ c) \quad \frac{\partial v'}{\partial \theta'}|_p = \sqrt{1 - t}. \]
Combining a), b) and c), we obtain that the angle from the cycle $\gamma_{W,c}$ to the cycle $\gamma_{c',1}$ at their intersection point $p$ is given by the angle of the complex number
\[ d) \quad \left( \frac{\partial v}{\partial \theta}|_p / \frac{\partial v'}{\partial \theta'}|_p \right) = \sqrt{-\frac{1}{\varepsilon}}, \]
i.e. the angle is $\frac{\pi}{2}$. Then due to our sign convention, we obtain
\[ I_W(\gamma_{W,c}, \gamma_{W,c'}) = -1 \quad \text{and} \quad I_W(\gamma_{c',1}, \gamma_{W,c}) = 1, \]
which is independent of the sign $\varepsilon \in \{\pm 1\}$. Thus, (3.1.17) is shown.

Finally in the following i)-v), we prove 4.

i) Let us first show a natural isomorphism.
\[ (3.1.20) \quad H_1(X_{W,0}, \mathbb{Z}) \simeq H_{W,1}. \]

**Proof of (3.1.20).** We first show that $X_{W,0,\mathbb{R}}$ is a deformation retract of $X_{W,0}$. For the proof of it, recall the double cover expression of $X_{W,0}$ over $C_w$, used in the proof of **Theorem 3**. In case of type $W = A_{2,\infty}$, the deformation retract of the plane $C_W$ to the half real axis $\mathbb{R}_{\geq 0}$ induces the retract of the covering space $X_{W,0}$ to its real form $X_{w,0,\mathbb{R}}$. In case of type $W = D_{2,\infty}$, we do the retraction irreducible-componentwisely to the real axis $\mathbb{R}$ (details are left to the reader). Thus, in view of Figure 1 and 2, we have a natural isomorphism:
\[ H_1(X_{W,0}, \mathbb{Z}) \simeq H_{W,1}. \]

ii) Using the double cover expressions of fibers $X_{W,t}$ in the proof of **Theorem 3**, we can show that $f_W^{-1}([0, t])$ ($t \in (0, 1)$) retracts to its subset $X_{W,0}$. Then composing with the inclusion map $X_{W,t} \subset f_W^{-1}([0, t])$, we get an exact sequence
\[ H_{W,0} \rightarrow H_1(X_{w,t}, \mathbb{Z}) \rightarrow H_1(X_{W,0}, \mathbb{Z}) \rightarrow 0, \]
where the restriction of $r$ to the submodule $H_{W,1}$ composed with the isomorphism (3.1.20) induces the identity on $H_{W,1}$. This implies that $H_{W,1}$ is a factor of $H_1(X_{W,0}, \mathbb{Z})$.

iii) What remains to show is that $H_{W,0}$ is injectively embedded in $H_1(X_{W,t}, \mathbb{Z})$. This can be partially shown by using the non-degeneracy of the intersection relations (3.1.18) as follows.
Let $\gamma \in H_{W,0}$ be a non-zero element, whose image in $H_1(X_{W,t}, \mathbb{Z})$ is zero. Then solving the relation $I_W(\gamma, \gamma_{W,c}) = 0$ for $c = c_{W,1} \in C_{W,1}$ (see Notation in §3.2) from large enough $n \in \mathbb{Z}_{>0}$ back wards to 1, we see successive vanishings of the coefficients of $\gamma$, and finally see that $\gamma$, up to a constant factor, is equal to $\gamma_{D,0}^+ - \gamma_{D,0}^-$ (see §3.2 for Notation $\gamma_{D,0}^+$ and $\gamma_{D,0}^-$). In order to show that this is not possible, we prepare a fact.

iv) **Fact.** The function $f_W$ of type $W$ is invariant by the involution $\sigma : X_W \to X_W$, $(x, y) \mapsto (x, -y)$ on its domain, i.e. $f_W \circ \sigma = f_W$. The induced involution on the surface $X_{W,t}$, denoted again by $\sigma$, is equivariant with the covering map $\pi_{W,t}$ (2.3.11), i.e. $\pi_{W,t} \circ \sigma = \pi_{W,t}$. Then, one has $\sigma_* (\gamma_{W,c}) = -\gamma_{W,c}$ for all $c \in C_W$, except for the following two cases

$$\sigma_* (\gamma_{D,0}^+) = -\gamma_{D,0}^- \quad \text{and} \quad \sigma_* (\gamma_{D,0}^-) = -\gamma_{D,0}^+.$$  

**Proof of Fact.** Except for the cases $\gamma_{D,0}^+$ and $\gamma_{D,0}^-$, we can choose the coordinate in (3.1.13) in such manner that $\sigma(u, v) = (u, -v)$. \hfill \Box

v) Assuming $\gamma_{D,0}^+ = \gamma_{D,0}^-$, let us show a contradiction. Consider the homomorphism $(\pi_D)_* : H_1(X_{D,t}, \mathbb{Z}) \to H_1(C_D, \mathbb{Z}) \simeq \mathbb{Z}$. Above **Fact.** implies $(\pi_D)_*(\gamma_{D,0}^+) = (\pi_D \circ \sigma)_*(\gamma_{D,0}^+) = (\pi_D)_* \circ \sigma_*(\gamma_{D,0}^+) = -(\pi_D)_*(\gamma_{D,0}^-)$ which, by the assumption, is equal to $-(\pi_D)_*(\gamma_{D,0}^-)$. Thus, we get $(\pi_D)_*(\gamma_{D,0}^+) = 0$. This contradicts to the fact that $(\pi_D)_*(\gamma_{D,0}^+)$ generates $H_1(C_D, \mathbb{Z}) \simeq \mathbb{Z}$ (observed easily from the fact that the equation $x = 0$ defines i) a branch of $X_{D,0,\mathbb{R}}$ at the nodal point $c_{D,0}^+$ and also ii) the puncture in $C_D$, and from the description of $\gamma_{D,0}^+$ in (3.1.13)).

This completes a proof of Theorem 4. and 5. \hfill \Box

**Remark.** In the step v) in above proof, we may use a $\sigma$-invariant form $\omega := \text{Res}_{\left[\frac{ydx}{yD-t}\right]}$. Since $\int_{\gamma_{D,0}^+} \omega = \int_{\gamma_{D,0}^-} \sigma^* (\omega) = \int_{\gamma_{D,0}^+} \omega = -\int_{\gamma_{D,0}^-} \omega$, the assumption $\gamma_{D,0}^+ = \gamma_{D,0}^-$ implies $\int_{\gamma_{D,0}^-} \omega = 0$. On the other hand, $\omega = \text{Res}_{\left[\frac{ydx}{yD-t}\right]} \frac{dx}{2\pi i} |_{X_{D,t}}$, and hence $\int_{\gamma_{D,0}^+} \omega = \pm \sqrt{-1} \pi \neq 0$. A contradiction!

### 3.2. Quivers of type $A_{\infty}$ and $D_{\infty}$.

We encode homological data of vanishing cycles of $f_W$ in a quiver $\Gamma_W$.

**Definition.** A quiver $\Gamma_W$ of type $W \in \{A_{\infty}, D_{\infty}\}$ is defined by

i) The set of vertices of $\Gamma_W$ is in bijective with $\{\gamma_{W,c} \mid c \in C_{W,0} \cup C_{W,1}\}$.

ii) We put an oriented edge from $\gamma_{W,c}$ to $\gamma_{W,c'}$ if and only if $c \in C_{W,0}$, $c' \in C_{W,1}$ and $c \in B_{c'}$, that is, when $J_W(\gamma_{W,c}, \gamma_{W,c'}) = -1$. 

Let us fix a numbering of elements in \( C_{W,0} \cup C_{W,1} \) as follows.

\[
C_{A,0} = \{ c_{A,0}^{(n)} := (n^2 \pi^2, 0) \}_{n \in \mathbb{Z}_0} \\
C_{A,1} = \{ c_{A,1}^{(n)} := ((n - \frac{1}{2})^2 \pi^2, 0) \}_{n \in \mathbb{Z}_0} \\
C_{D,0} = \{ c_{D,0}^{(n)} := (n^2 \pi^2, 0) \}_{n \in \mathbb{Z}_0} \cup \{ c_{D,0}^+ := (0,1), c_{D,0}^- := (0,-1) \} \\
C_{D,1} = \{ c_{D,1}^{(n)} := ((n - \frac{1}{2})^2 \pi^2, 0) \}_{n \in \mathbb{Z}_0}.
\]

According to them, the vertices of the quiver \( \Gamma_W \) are numbered as below.

\[
\Gamma_{A_\infty^1} : \begin{array}{cccccc}
\gamma^{(1)}_{A,1} \rightarrow & \gamma^{(1)}_{A,0} & \leftarrow & \gamma^{(2)}_{A,0} & \leftarrow & \gamma^{(3)}_{A,1} & \rightarrow & \cdots \\
\gamma^+_{D,0} & \leftarrow & \gamma^{(1)}_{D,1} & \rightarrow & \gamma^{(1)}_{D,0} & \leftarrow & \gamma^{(2)}_{D,0} & \leftarrow & \gamma^{(2)}_{D,1} & \rightarrow & \cdots \\
\gamma^-_{D,0} & \leftarrow & \gamma^{(1)}_{D,1} & \rightarrow & \gamma^{(1)}_{D,0} & \leftarrow & \gamma^{(2)}_{D,0} & \leftarrow & \gamma^{(2)}_{D,1} & \rightarrow & \cdots 
\end{array}
\]

Note that the decomposition of the critical set \( C_W \) into \( C_{W,0} \cup C_{W,1} \) gives arise the bi-partite (or principal) decomposition of the quiver \( \Gamma_W \).

### 3.3. Suspensions to higher dimensions.

In this subsection, we briefly describe the suspensions of the results in previous subsections to higher dimensional cases.

For a type \( W \in \{ A_{\infty^1}, D_{\infty^2} \} \) and \( d \in \mathbb{Z}_{\geq 1} \), let us introduce the \( d \)-th suspension \( f_W^{(d)} \) of \( f_W \) (where \( f_W^{(1)} = f_W \)) as the entire functions in \( d + 1 \)-variables \( x, y \) and \( z = (z_2, \cdots, z_d) \) defined by

\[
f_W^{(d)}(x, y, z) := f_W(x, y) - z_2^2 - \cdots - z_d^2.
\]

Then, replacing the function \( f_W \) by \( f_W^{(d)} \) and the domain \( X_W = \mathbb{C}^2 \) by \( X_W^{(d)} = \mathbb{C}^2 \times \mathbb{C}^{d-1} \), we obtain a holomorphic map \( X_W \rightarrow X_W^{(d)} \) whose fibers, denoted by \( X_{W,t}^{(d)} \) \((t \in \mathbb{C})\), are Stein variety of complex dimension \( d \).

Replacing, further, the real form \( \mathbb{R}^2 \) of \( X_W \) by the real form \( \mathbb{R}^2 \times \mathbb{R}^{d-1} \) of \( X_W^{(d)} \), Theorem 1., 2., 3. in §1.3 hold completely parallely for \( f_W^{(d)} \), where the set of critical points of \( f_W^{(d)} \) is bijective to that of \( f_W \) by the natural embedding \( X_W \subset X_W^{(d)} \) so that we identify them. Then the signature of Hessians of \( f_W^{(d)} \) at points of \( C_{W,0} \) is \( 1, d \) and that at points of \( C_{W,1} \) is \( 0, d+1 \). The suspended fibration shall be referred by \( (2.3.10)^{(d)} \). The proof are reduced to the original case \( d = 1 \).
Applying $d-1$-times suspension $S$ on a homology class $\gamma$ in $H_1(X_{W,t}, \mathbb{Z})$, we obtain an element $S^{d-1}\gamma$ of the middle homology group $H_d(X_{W,t}^{(d)}, \mathbb{Z})$ of the $d$-dimensional fiber $X_{W,t}^{(d)}$. In particular, the suspension $S^{d-1}\gamma_{W,c}$ of a vanishing cycle $\gamma_{W,c}$ of $f_W$ at a critical point $c \in C_W$ is a vanishing cycle of $f_W^{(d)}$ at the same critical point, which, for simplicity, we shall denote again by $\gamma_{W,c}$. Then replacing $H_1(X_{W,t}, \mathbb{Z})$ by the middle homology group $H_d(X_{W,t}^{(d)}, \mathbb{Z})$, Theorem 4. in §2.1 holds completely parallely, where we keep notations (3.1.14) and (3.1.15).

The intersection form $I^{(d)}_W$ on the middle $(=d)$-dimensional homology group is well known to be symmetric or skew-symmetric according as cycles are even or odd dimensional (i.e. according as $d$ is even or odd). It is also well known that $I^{(d)}_W(\gamma_{W,c}, \gamma_{W,c}) = (-1)^{\frac{d}{2}}$ for even $d$-dimensional vanishing cycles. Therefore, the formula (3.1.17) of the intersection form in Theorem 5. need to be slightly modified as in the following theorem, where we keep the notation $J_W$ and $t_J_W$ together with the formulae (3.1.18) and (3.1.19).

**Theorem 5**(d). Let $I^{(d)}_W : H_d(X_{W,t}^{(d)}, \mathbb{Z}) \times H_d(X_{W,t}^{(d)}, \mathbb{Z}) \to \mathbb{Z}$ be the intersection form on middle-homology groups of the fibers of the fibration (2.3.10)$^{(d)}$. Then we have the following 4-periodic expression.

$$I^{(d)}_W = (-1)^{\frac{d}{2}} J_W - (-1)^{\frac{d-1}{2}} t_{J_W}.$$  

(3.3.22)

The proof of Theorem is standard, and is omitted. Actually, the form $I^{(d)}_W$ is symmetric for $d$ even and is skew symmetric for $d$ odd.

**Remark.** We may regard that the form $J_W$ is an infinite rank analogue of a *Seifert matrix* with respect to a “suitable compactification” of the three-fold $f_W^{-1}(S^1)$, where $S^1$ is a circle in the base space $C$ of (2.3.5) which encloses the two points 0 and 1. However, we do not pursue any further this analogy (see §1.3 Remark and the next subsection §2.4).

3.4. Monodromy Transformations and Coxeter elements.

The fundamental group $\pi_1(C \setminus \{0,1\}, t_0)$ with $t_0 \in (0,1)$ of the base space of the fibration (2.3.10)$^{(d)}$ has two generators $g_0$ and $g_1$ which are presented by circular paths in $C \setminus \{0,1\}$ starting at $t_0$ and turning once around the point 0 and 1 counterclockwise, respectively. Let $\sigma^{(d)}_{W,0}$ (resp. $\sigma^{(d)}_{W,1}$) be the monodromy action of $g_0$ (resp. $g_1$) on the middle homology group (3.1.14)$^{(d)}$ of the fiber of the family (2.3.10)$^{(d)}$, which preserves the intersection form (3.3.22). Though the singular fibers $X_{W,0}^{(d)}$ and $X_{W,1}^{(d)}$ have infinitely many critical points, we can apply Picard-Lefschetz
Note that $\sigma$ in independent of the suspensions for $d$.

The Coxeter element is, up to the sign factor $(-1)^d$, the product

$$\sigma_{W,0}^{(d)}(u) = u + (-1)^{d-1} \sum_{c \in C_{W,0}} I_W(u, \gamma_{W,c}) \gamma_{W,c}$$

$$= u + \sum_{c \in C_{W,0}} \left((-1)^{d-1} J_w(u, \gamma_{w,c}) - J_w(\gamma_{W,c}, u)\right) \gamma_{W,c}$$

$$= \begin{cases} (-1)^{d-1} u & \text{if } u \in H_{W,0} \\ u - \sum_{c \in C_{W,0}} J_w(\gamma_{W,c}, u) \gamma_{w,c} & \text{if } u \in H_{W,1} \end{cases}$$

(3.4.23)

Note that $\sigma_{W,0}^{(d)} = \sigma_{W,0}^{(d+2)}$ and $\sigma_{W,1}^{(d)} = \sigma_{W,1}^{(d+2)}$ for $d \in \mathbb{Z}_{\geq 1}$.

**Note.** Let $d$ be even. Then the reflections $\sigma_{W,0}^{(d)}$, $\sigma_{W,1}^{(d)}$ are involutive:

(3.4.25) $$\sigma_{W,0}^{(d)}(u) = \sigma_{W,1}^{(d)}(u) = (\sigma_{W,0}^{(d)})^{-1} = (\sigma_{W,1}^{(d)})^{-1} = \text{id}_{H_{W}}.$$  

In the next section, we shall see that the eigenvalues in a suitable sense of the product $\sigma_{W,0}^{(d)} \circ \sigma_{W,1}^{(d)}$ is "dense" in the unit circle $S^1$ in $\mathbb{C}^\times$, and hence $\sigma_{W,0}^{(d)} \circ \sigma_{W,1}^{(d)}$ is of infinite order. As a consequence, there is no more relations among $\sigma_{W,0}^{(d)}$ and $\sigma_{W,1}^{(d)}$, and the monodromy group is isomorphic to $\mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/2\mathbb{Z}$.

**Definition.** In analogy with the classical simple singularities, let us call the product of the two monodromy transformations $\sigma_{W,0}^{(d)}$ and $\sigma_{W,1}^{(d)}$ a **Coxeter element**. Two Coxeter elements depending on the order of the product are conjugate to each other. We fix one order as follows and call the product the Coxeter element.

(3.4.26)

$$Cox_W^{(d)}(u) := \sigma_{W,0}^{(d)} \circ \sigma_{W,1}^{(d)}(u)$$

$$= \begin{cases} (-1)^{d-1} \left(u + \sum_{c \in C_{W,1}} J_w(u, \gamma_{w,c}) \gamma_{w,c}\right) & \text{if } u \in H_{W,0} \\ - \sum_{c \in C_{W,1}} \sum_{d \in C_{W,0}} J_w(u, \gamma_{w,c}) J_w(\gamma_{W,d}, \gamma_{w,c}) \gamma_{W,d} & \text{if } u \in H_{W,0} \\ (-1)^{d-1} \left(u - \sum_{c \in C_{W,0}} J_w(\gamma_{W,c}, u) \gamma_{w,c}\right) & \text{if } u \in H_{W,1} \end{cases}$$

Observation. The Coxeter element is, up to the sign factor $(-1)^d$, independent of the suspensions for $d \in \mathbb{Z}_{\geq 1}$.
Remark. It is well-known that a classical Coxeter element for a root system of finite type $W$ is semisimple of finite order, and $\frac{1}{2\pi \sqrt{-1}} \log$ of its eigenvalues, referred as spectra and given by $\frac{m_i}{h}$ ($i = 1, \ldots, n$), play an important role in Lie theory (Bo). They appear also as exponents of the primitive forms associated with simple polynomials of type $W$ [Sa1] and the fact they lie in the interval $(0, 1)$ for the case $d = 2$ characterize that they are primitive forms associated with simple polynomials [Sa4].

The Coxeter elements of types $A_{\frac{1}{2}}\infty$ and $D_{\frac{1}{2}}\infty$ are no longer of finite order. However, in the next section, we show that they are diagonalizable in a suitable sense and the spectra for them are introduced. Then, the sign factor $(-1)^{d-1}$ in (3.4.26) of the Coxeter element $Cox_d$ is lifted to the shift of the spectra by $\frac{d-1}{2}$ and of the spectra so that the spectra of $Cox_d$ is contained in the interval $(\frac{d}{2} - 1, \frac{d}{2})$. The spectra should play a key role for primitive forms of type $A_{\frac{1}{2}}\infty$ and $D_{\frac{1}{2}}\infty$ in a forthcoming paper, where the shift of the spectra corresponds to the $\frac{d-1}{2}$-shift of the primitive forms in the semi-infinite Hodge filtration.

4. Spectra of Coxeter Elements of Types $A_{\frac{1}{2}}\infty$ and $D_{\frac{1}{2}}\infty$

We study spectra of the Coxeter element $Cox_d$ for $W \in \{A_{\frac{1}{2}}\infty, D_{\frac{1}{2}}\infty\}$. For the purpose, we extend the domain of the Coxeter element to the completion of $H_{W, C} := H_W \otimes \mathbb{Z} C$ with respect to the $l^2$-norm with the orthonormal basis $\{\gamma_{W,c}\}_{c \in C_W}$. The Coxeter element action on this space is diagonalizable (in a suitable sense), and its “eigenvalues” take values in the unit circle $S^1 \subset \mathbb{C} \times$. We want to determine $\frac{1}{2\pi \sqrt{-1}} \log$ of the “eigenvalues”, called the spectra of the Coxeter element. Actually, it is calculated by a help of the intersection form $\hat{I}_W$, since it, as a positive symmetric operator, has only positive real eigenvalues. It turns out that we get a continuous spectra on the interval $(\frac{d}{2} - 1, \frac{d}{2})$.

4.1. Hilbert space $\mathcal{H}_{W,C}$.

Consider $C$-vector spaces obtained by the complexification of the $\mathbb{Z}$-lattices $H_{W,0}$, $H_{W,1}$ and $H_W$ (recall (3.1.14), (3.1.15) and (3.1.16)):

\begin{equation}
H_{W,0,C} := H_{W,0} \otimes \mathbb{Z} C, H_{W,1,C} := H_{W,1} \otimes \mathbb{Z} C \quad \text{and} \quad H_{W,C} := H_W \otimes \mathbb{Z} C.
\end{equation}

We equip them with a hermitian inner product $\langle \cdot, \cdot \rangle$ defined by

\begin{equation}
\langle \sum_{c \in C_W} a_c \gamma_{W,c}, \sum_{c \in C_W} b_c \gamma_{W,c} \rangle := \sum_{c \in C_W} a_c \overline{b}_c,
\end{equation}

where $a_c, b_c$ ($c \in C_W$) are complex numbers. Then, the $l^2$-completions of the spaces with respect to this inner product are separable Hilbert
spaces, denoted by $\mathcal{H}_{W,0,C}$, $\mathcal{H}_{W,1,C}$ and $\mathcal{H}_{W,C}$, respectively. We have the orthogonal direct sum decomposition:

\[(4.1.29) \quad \mathcal{H}_{W,C} = \mathcal{H}_{W,0,C} \oplus \mathcal{H}_{W,1,C}.\]

Let us denote by $\pi_0$ and $\pi_1$ the orthogonal projections of the space $\mathcal{H}_{W,C}$ to the subspaces $\mathcal{H}_{W,0,C}$ and $\mathcal{H}_{W,1,C}$, respectively, so that the sum

$$\text{id}_{\mathcal{H}_{W,C}} = \pi_0 + \pi_1$$

is the identity map on $\mathcal{H}_{W,C}$.

Remark that the lattice $\mathcal{H}_{W}$ is self-dual: $\text{Hom}_{\mathbb{Z}}(\mathcal{H}_{W}, \mathbb{Z}) \cap \mathcal{H}_{W,C} = \mathcal{H}_{W}$.

**Convention.** In the sequel of the present paper, we freely identify a continuous bilinear form $A$ on $\mathcal{H}_{W,C}$ (resp. $\mathcal{H}_{W}$) and a continuous endomorphism $\dot{A}$ on $\mathcal{H}_{W,C}$ (resp. $\mathcal{H}_{W}$) by the following relations:

$$A(\xi, \eta) = \langle \dot{A}(\xi), \eta \rangle \quad \text{and} \quad \sum_{c \in C_W} A(u, \gamma_{W,c}) \gamma_{W,c} = \dot{A}(u).$$

Transposes $\dot{A}$ of $A$ and $\dot{(\dot{A})}$ of $\dot{A}$ are defined by the relations $\dot{A}(\xi, \eta) = A(\eta, \xi)$ and $\langle \dot{A}(u), v \rangle = \langle u, \dot{\dot{A}}(v) \rangle$, respectively. Then, $\dot{(\dot{A})} = (\dot{A})$.

### 4.2. Extendability of $I_{(d)}^{W}$ and $\text{Cox}_{(d)}^{W}$ on $\mathcal{H}_{W}$.

In order to calculate the eigenvalues of the intersection forms $I_{(d)}^{W}$ and the Coxeter elements $\text{Cox}_{(d)}^{W}$, we use the identification mentioned at the end of §3.1. Before we do this, we need to check that they are continuously extendable to the completion $\mathcal{H}_{W,C}$. This is achieved by using the extendabilities of the endomorphisms $\dot{J}_{W}$, $\dot{\dot{J}}_{W}$ associated with the bilinear forms (3.1.18) and (3.1.19). Put

\[
\dot{J}_{W}(u) := \begin{cases} 
\sum_{c \in C_W} J(u, \gamma_{W,c}) \gamma_{W,c} & \text{if } u \in H_{W,0} \\
u + \sum_{c \in C_{W,1}} J_W(u, \gamma_{W,c}) \gamma_{W,c} & \text{if } u \in H_{W,1}
\end{cases}
\]

(4.2.30)

\[
\dot{\dot{J}}_{W}(u) := \begin{cases} 
\sum_{c \in C_W} \dot{J}(u, \gamma_{W,c}) \gamma_{W,c} & \text{if } u \in H_{W,0} \\
u & \text{if } u \in H_{W,1}
\end{cases}
\]

(4.2.31)

which are endomorphisms on $H_{W,C}$, since the quiver $\Gamma_{W}$ in §2.2 is locally finite, i.e. any vertex is connected with only finite number of other vertexes. The inverse action of $\dot{J}_{W}$ (resp. $\dot{\dot{J}}_{W}$) on $H_{W,C}$ can be obtained by just replacing “+” by “−” in RHS of (4.2.30) (resp. (4.2.31)).
Assertion 1. The endomorphisms $\mathring{j}_W$, $t\mathring{j}_W$ and their inverses $\mathring{j}_W^{-1}$, $t\mathring{j}_W^{-1}$ acting on $H_{W,C}$ are extendable to bounded endomorphisms on $\overline{H}_{W,C}$. The extensions are transpose to each other.

Proof. We show only the extendability of the domain of endomorphisms $\mathring{j}_W$, $t\mathring{j}_W$ and their inverses $\mathring{j}_W^{-1}$, $t\mathring{j}_W^{-1}$ from $H_{W,C}$ to $\overline{H}_{W,C}$, where the extensions are denoted by the same notation. Then the relations $t(\mathring{j}_W) = t\mathring{j}_W$, $\mathring{j}_W t\mathring{j}_W^{-1} = \text{id}_{H_W}$, etc. are automatically preserved for the extensions.

The quivers $\Gamma_{A_{\frac{1}{2}}}$ and $\Gamma_{D_{\frac{1}{2}}}$ show that any critical point $c \in C_{W,0}$ is adjacent to at most two bdd components. In view of (4.2.30), this implies the inequality $\| \mathring{j}_W(u) - u \| \leq 2 \| u \|$. Hence $\mathring{j}_W$ is extendable to a bounded endomorphism on $\overline{H}_{W,C}$, denoted by the same $\mathring{j}_W$.

We observe also that, to any bdd component, at most 3 critical points in $C_{W,0}$ are adjacent (actually, 3 occurs only one bdd component for the critical point $c_{D,1}^{(1)}$ of type $D_{\frac{1}{2}}$). In view of (4.2.31), we get an inequality $\| t\mathring{j}_W(u) - u \| \leq 3 \| u \|$, implying again the extendability of $t\mathring{j}_W$ to a bounded endomorphism on $\overline{H}_{W,C}$, denoted by the same $t\mathring{j}_W$.

Similar arguments shows the extendability of the inverses.

An immediate consequence of Assertion 1 is that the endomorphism (3.3.22)*

$$j_W^{(d)} := (-1)^{\frac{d}{2}} \mathring{j}_W - (-1)^{\frac{d-1}{2}} t\mathring{j}_W$$

defined on $H_{W,C}$ is extendable to a bounded endomorphism on $\overline{H}_{W,C}$.

Another important consequence of Assertion 1 is the following.

Corollary. The Coxeter element $Cox_W^{(d)}$ ($d \in \mathbb{Z}_{\geq 1}$) defined on $H_{W,C}$ is extendable to an invertible bounded automorphism on $\overline{H}_{W,C}$.

Proof. Let us, first, show a formula:

(4.2.32) $Cox_W^{(d)} = (-1)^{d-1} (t\mathring{j}_W)^{-1} \mathring{j}_W$,

on $H_W$ by a direct calculation using formulae (3.4.26), (4.2.30) and

(4.2.30)$^{-1}$ $(t\mathring{j}_W)^{-1}(u) = \begin{cases} u & \text{if } u \in H_{W,0} \\ u - \sum_{c \in C_{W,0}} J_W(\gamma_{W,c}, u) \gamma_{W,c} & \text{if } u \in H_{W,1}. \end{cases}$

Then, RHS of (4.2.32) is extendable to a bounded operator on $\overline{H}_{W,C}$.

Invertibility of $Cox_W^{(d)}$ follows from that of $\mathring{j}_W$ and $t\mathring{j}_W$.

Remark. Let $\tilde{H}_{W,C} := \text{Hom}_C(H_{W,C}, C)$ be the (formal) dual vector space of $H_{W,C}$. The contragradient actions on $\tilde{H}_{W,C}$ of the endomorphisms $\mathring{j}_W$, $t\mathring{j}_W$, $\tilde{I}_W^{(d)}$, $\tilde{I}_W^{(d)}$, $\tilde{J}_W^{(d)}$, $\tilde{J}_W^{(d)}$, $\tilde{Cox}_W^{(d)}$ and $\tilde{Cox}_W^{(d)}$ on $H_{W,C}$ shall be denoted, as usual, by the super script "$t(-)$ " such that " $tt(-)$ = (-) ".
On the other hand, by regarding \( \{ \gamma_{W,c} \}_{c \in C_W} \) as the self-dual basis, \( \tilde{H}_{W,C} \) is identified with the direct product \( \prod_{c \in C_W} C \gamma_{W,c} \) so that we have natural inclusions of \( C \)-vector spaces:

\[
H_{W,C} \subset \Pi_{W,C} \subset \tilde{H}_{W,C}.
\]

Then it is easy to verify that the extensions of \( \dot{J}_W, \dot{I}_W, \dot{j}^{(d)}_W, \dot{i}^{(d)}_W, \text{Cox}_W^{(d)} \) and \( \text{Cox}_W^{(d)} \) to the spaces \( \Pi_{W,C} \) and \( \tilde{H}_{W,C} \) are naturally compatible with respect to the above inclusions. The relationships between these extensions and the transpositions are given as follows:

\[
\dot{I}_W := \dot{I}_W^{(d)} = \dot{J}_W + \dot{i}^{(d)}_W.
\]

However, the bilinear form \( I_{W,C} \) itself is no longer extendable to \( \tilde{H}_{W,C} \) and the endomorphism \( \dot{I}_W \) on \( \tilde{H}_{W,C} \) has non-trivial kernel.

### 4.3. Spectral decomposition of \( I_{W,d}^{(d)} \) for even \( d \).

Using the fact (3.3.22), the bilinear form \( I_{W,d}^{(d)} \) is symmetric for even \( d \).

Let us consider the operator for the cases \( W \in \{ A_{\frac{d}{\infty}}, D_{\frac{d}{\infty}} \} \) and all \( \lambda \in C \):

\[
\dot{I}_W := \dot{I}_W^{(d)} = \dot{J}_W + \dot{i}^{(d)}_W.
\]

We, first, determine the point spectrum of the symmetric operator \( \dot{I}_W \) on \( \Pi_{W,C} \). Let us consider following two eigenspaces for \( \lambda \in C \):

\[
\dot{H}_{W,\lambda} := \{ \xi \in \tilde{H}_{W,C} \mid \dot{I}_W(\xi) = \lambda \xi \} \quad \text{and} \quad \Pi_{W,\lambda} := \dot{H}_{W,\lambda} \cap \Pi_{W,C}.
\]

**Assertion 2.** For each type \( W \in \{ A_{\frac{d}{\infty}}, D_{\frac{d}{\infty}} \} \) and all \( \lambda \in C \), we have

\[
\dim_C \dot{H}_{W,\lambda} = 1 \quad \text{and} \quad \dim_C \Pi_{W,\lambda} = 0,
\]

except for the case \( W = D_{\frac{d}{\infty}} \) and \( \lambda = 2 \), where we have

\[
\dim_C \dot{H}_{D_{\frac{d}{\infty}},2} = 2 \quad \text{and} \quad \dim_C \Pi_{D_{\frac{d}{\infty}},2} = 1,
\]

and \( \Pi_{D_{\frac{d}{\infty}},2} \) is spanned by the vector \( \gamma_{D,0}^+ - \gamma_{D,0}^- \).

**Proof.** This is shown by solving the equation \( \dot{I}_W(\xi) = \lambda \xi \) for the coefficients of \( \xi = \sum_{c \in C_W} a_c \gamma_{W,c} \in \dot{H}_{W,C} \) formally and inductively according to the following labeling and ordering of coefficients:

- For \( A_{\frac{d}{\infty}} \):
  \[
  a_0 \rightarrow a_1 \leftarrow a_2 \rightarrow a_3 \leftarrow a_4 \rightarrow a_5 \leftarrow \cdots
  \]
- For \( D_{\frac{d}{\infty}} \):
  \[
  b_0^+ \leftarrow b_1 \rightarrow b_2 \leftarrow b_3 \rightarrow b_4 \leftarrow b_5 \rightarrow \cdots
  \]

Details of the calculation are omitted. Results are summarized as:

**A** \( \frac{1}{2} \infty \): The space \( \dot{H}_{A_{\frac{1}{2} \infty},\lambda} \) for any \( \lambda \in C \) is spanned by

\[
\text{We choose } d \equiv 0 \mod 4 \text{ so that the form } I_W \text{ is positive and symmetric, defining a "root lattice structure of infinite rank" on } H_W \text{ (cf. Proof of Assertion 3.).}
$\hat{\xi}_{A\frac{1}{2}\infty, \lambda} : a_n = \frac{\exp((n+1)\sqrt{-1}\pi\theta) - \exp(-(n+1)\sqrt{-1}\pi\theta)}{\exp(\sqrt{-1}\pi\theta) - \exp(-\sqrt{-1}\pi\theta)}$ \quad (n \geq 0)

where $\theta$ is any complex number satisfying $\lambda = 4\sin^2(\frac{\pi}{2}\theta)$. In case $\lambda = 0$ or 4 (i.e. when $\theta \in \mathbb{Z}$), we interpret this formula as $a_n = \pm (n+1)$.

$D_{\frac{1}{2}\infty}$: For all $\lambda \in \mathbb{C}$, let us introduce a vector

$\hat{\xi}_{D_{\frac{1}{2}\infty}, \lambda} : b_0^+ = 1, b_0^- = 1, b_n = \exp(n\sqrt{-1}\theta) + \exp(-n\sqrt{-1}\theta)$ \quad (n \geq 1)

where $\theta$ is any complex number satisfying the equation $\lambda = 4\sin^2(\frac{\pi}{2}\theta)$. Then, the space $\hat{H}_{D_{\frac{1}{2}\infty}, \lambda}$ for any $\lambda \neq 2$ is spanned by $\hat{\xi}_{D_{\frac{1}{2}\infty}, \lambda}$. The space $\hat{H}_{D_{\frac{1}{2}\infty}, 2}$ is spanned by $\hat{\xi}_{D_{\frac{1}{2}\infty}, 2}$ and

$\gamma_{D, 0}^+ - \gamma_{D, 0}^- : b_0^+ = 1, b_0^- = -1, b_n = 0$ \quad (n \geq 1).

The norm $\langle \hat{\xi}_{W, \lambda}, \hat{\xi}_{W, \lambda} \rangle$ for any $W \in \{A_{\frac{1}{2}\infty}, D_{\frac{1}{2}\infty}\}$ and any $\lambda \in \mathbb{C}$ is unbounded, whereas $\gamma_{D, 0}^+ - \gamma_{D, 0}^-$ has the bounded norm=2. □

**Corollary.** The point spectrum of $\hat{I}_{A_{\frac{1}{2}\infty}}$ on $\overline{H}_{W, \mathbb{C}}$ is empty, and that of $\hat{I}_{D_{\frac{1}{2}\infty}}$ consists of a single eigenvalue $\lambda = 2$ with multiplicity 1. In particular, the operator $\hat{I}_W$ for any $W \in \{A_{\frac{1}{2}\infty}, D_{\frac{1}{2}\infty}\}$ is non-degenerate on $\overline{H}_{W, \mathbb{C}}$ in the sense that $\ker(\hat{I}_W) \cap \overline{H}_{W, \mathbb{C}} = \{0\}$.

**Remark.** By introducing the double cover of the $\lambda$-plane by $\mu := \exp(\pi\sqrt{-1}\theta) \in \mathbb{C} \setminus \{0\}$ with the relation $2 - \lambda = \mu + \mu^{-1}$, the base $\hat{\xi}_{W, \lambda}$ in the proof of Assertion 2 can be expressed in terms of Laurent polynomials in $\mu$. The reader may be puzzled by the use of $\theta$ instead of $\mu$ in the above proof. We used the parameter $\theta$ since it shall parametrize the spectra of Coxeter elements in the next paragraph. We remark also that $\lambda \in [0, 4] \Leftrightarrow \theta \in \mathbb{R}$.

For a symmetric operator $\hat{I}_W$ on $\overline{H}_{W, \mathbb{C}}$, the greatest lower bound and the least upper bound are defined as the maximal real number $m$ and the minimal real number $M$ satisfying the following inequalities, respectively (see [R-N, §104]).

(4.3.37) \quad m(\xi, \xi) \leq \langle I_W(\xi), \xi \rangle = I_W(\xi, \xi) \leq M(\xi, \xi) \quad \forall \xi \in \overline{H}_{W, \mathbb{C}}

**Assertion 3.** The greatest lower bound $m$ and the least upper bound $M$ of $\hat{I}_W$ for both $W \in \{A_{\frac{1}{2}\infty}, D_{\frac{1}{2}\infty}\}$ is given by $m = 0$ and $M = 4$.

**Proof.** For the definition of $m$ and $M$, it is sufficient to run $\xi$ only in $H_W$ in the defining relation (4.3.37), since $\overline{H}_{W, \mathbb{C}}$ is dense in $\overline{H}_{W, \mathbb{C}}$. Any $\xi \in H_W$ is contained in a sublattice $L$ of $H_W$ generated by the vertices of a finite (connected) subdiagram $\Gamma$ of $\Gamma_W$ (recall §2.2). Actually, $\Gamma$ is
COXETER ELEMENTS FOR VANISHING CYCLES OF TYPES $A_{\frac{1}{2},\infty}$ AND $D_{\frac{1}{2},\infty}$

a diagram of type either $A_l$ or $D_l$ for some $l \in \mathbb{Z}_{>0}$ and $I_W|_L$ gives a root lattice structure of that type on $L$. That is, $\{I_W(\gamma_{w,c}, \gamma_{w,d})\}_{c,d\in \Gamma \subset C_W}$ is the Cartan matrix of type $\Gamma$. In particular, the eigenvalues of $I_W|_L$ is given by $4 \sin^2\left(\frac{\pi}{2} \frac{m}{h}\right)$ ($i=1, \cdots, l=\text{rank}(L)$), where $m_i$ are the exponents and $h$ is the Coxeter number of the root system of type $\Gamma$ ([Bo ch.V, §6,n°2]). Since the smallest and the largest exponent of the (finite) root system are $1$ and $h-1$, respectively, the minimal and the maximal of the eigenvalues are $4 \sin^2\left(\frac{\pi}{2} \frac{1}{h}\right)$ and $4 \cos^2\left(\frac{\pi}{2} \frac{1}{h}\right)$, respectively. Since $h \to \infty$ according as $\Gamma$ "exhaust" $\Gamma_w$, we obtain

$$m = \inf_{\Gamma \subset \Gamma_w} 4 \sin^2\left(\frac{\pi}{2} \frac{1}{h}\right) = \lim_{h \to \infty} 4 \sin^2\left(\frac{\pi}{2} \frac{1}{h}\right) = 0.$$  

$$M = \sup_{\Gamma \subset \Gamma_w} 4 \cos^2\left(\frac{\pi}{2} \frac{1}{h}\right) = \lim_{h \to \infty} 4 \cos^2\left(\frac{\pi}{2} \frac{1}{h}\right) = 4.$$

We apply the spectral decomposition theory of bounded symmetric operators (see [R-N] §107 Theorem) to the operator $\hat{I}_W$. Let us reformulate the result in [ibid] by adjusting the notation to our setting.

**Theorem 6.** For each type $W \in \{A_{\frac{1}{2},\infty}, D_{\frac{1}{2},\infty}\}$, there exists a unique spectral family $\{E_{W,\lambda}\}_{\lambda \in \mathbb{R}}$ (i.e. a family of projection operator) on $\overline{H}_{W,C}$ satisfying the following a), b), c):

a) For $\lambda \leq \mu$, one has $E_{W,\lambda} \leq E_{W,\mu}$ ($\leftrightarrow$ $E_{W,\lambda} E_{W,\mu} = E_{W,\lambda}$).

b) The family is strongly continuous with respect to $\lambda$, i.e.

$$E_{W,\lambda+0} := \lim_{\mu \to 0} E_{W,\lambda+\mu} = E_{W,\lambda-0} := \lim_{\mu \to 0} E_{W,\lambda-\mu},$$

for all $\lambda$ except at $\lambda = 2$ for type $W = D_{\frac{1}{2},\infty}$. We have

$$E_{D_{\frac{1}{2},\infty},2+0} - E_{D_{\frac{1}{2},\infty},2-0} = \eta_d$$

where $\eta_d$ is the projection: $\pi_{D_{\frac{1}{2},\infty},C} \to \pi_{D_{\frac{1}{2},\infty},2} = C(\gamma_{D,0}^+ - \gamma_{D,0}^-)$.

c) One has $E_{W,\lambda} = 0$ for $\lambda \leq 0$ and $E_{w,\lambda} = \text{Id}_{\overline{H}_{w,C}}$ for $\lambda \geq 4$.

so that following (4.3.39) holds.

$$\hat{I}_W = \int_{0}^{4} \lambda^r dE_{W,\lambda} \quad (\text{for} \quad r = 0, 1, 2, \cdots).$$

where the integral is in the sense of Lebesgue-Stieltjes.

---

10 Here, we mean by a *projection operator* an orthogonal projection map from $\overline{H}_{W,C}$ to its closed subspace such that the real form $\overline{H}_{W,R}$ is mapped into itself. The fact that $E_{W,\lambda}$ is real, is not explicitly stated in the literature [R-N], but follows trivially from its construction and from the fact that $\hat{I}_w$ is real.

11 Furthermore, [R-N] §107 Theorem, for any complex valued continuous function $u(\lambda)$ on the interval $[0, 4]$, we have an equality $u(\hat{I}_W) = \int_{0}^{4} u(\lambda) dE_{W,\lambda}$ between
4.4. Spectra of Coxeter elements.

Recall that $\lambda \in [0, 4]$ in §4.3 Theorem 6 is the parameter for the spectra of the intersection form $I_W := I_W^{(d)}$ for $d \equiv 0 \mod 4$. What is wonderful, is the fact that this parameter gives a clue to parametrize the spectra $\theta$ of the Coxeter elements $Cox_W^{(d)}$ for all $d \in \mathbb{Z}_{\geq 1}$. In order to achieve this, we re-parametrize $\lambda$ by a new parameter $\theta$ and by the relation (which we once used in a proof of Assertion 2.)

$$\lambda = 4 \sin^2 \left( \frac{\theta \pi}{2} \right) \quad \text{for} \quad 0 \leq \theta \leq 1. \tag{4.4.40}$$

Let us introduce a Stieltjes measure on the interval $\theta \in [0, 1]$:

$$\xi_{W,\theta} := U_\theta \cdot dE_{W,\lambda} \cdot U_\theta^{-1} \tag{4.4.41}$$

for each $W \in \{A_{\infty}, D_{\infty}^2\}$, where

(i) $\{E_{W,\lambda}\}_{\lambda \in [0, 4]}$ is the spectral family in §4.3 Theorem 6,

(ii) $U_\theta$ $(0 \leq \theta \leq 1)$ is a family of unitary operators on $\overline{H}_{W,C}$ given by

$$U_\theta := \exp \left( -\frac{\pi}{2} \sqrt{-1} \theta \right) \pi_0 - \exp \left( \frac{\pi}{2} \sqrt{-1} \theta \right) \pi_1, \tag{4.4.42}$$

where $\pi_i$ $(i = 0, 1)$ is the orthogonal projections to the subspace $\overline{H}_{W,C,i}$.

**Theorem 7.** We have the following a) and b).

a) The $\xi_{W,\theta}$ is a Stieltjes measure on $\theta \in [0, 1]$, which is strongly continuous except at $\theta = \frac{1}{2}$ for the type $D_{\infty}^2$. We have

$$\xi_{D_{\infty}^2, \theta}^{1+0} - \xi_{D_{\infty}^2, \theta}^{-1} = \eta_D, \tag{4.4.43}$$

where we recall (4.3.38) for $\eta_D$.

b) The following two formulae hold:

$$\text{Cox}_W^{(d)} \cdot \xi_{W,\theta} = \exp \left( 2\pi \sqrt{-1} \left( \theta + \frac{d - 2}{2} \right) \right) \xi_{W,\theta}, \tag{4.4.44}$$

and

$$\int_{\theta=0}^{\theta=1} \xi_{W,\theta} = \frac{1}{2} \hat{I}_W. \tag{4.4.45}$$

**Proof.** a) The first half of the statement is obvious. Since $\overline{H}_{D_{\infty}^2,2}$ is a subspace of $\overline{H}_{D_{\infty}^2,0}$, we have $\pi_0 \eta_D = \eta_D \pi_0 = \eta_D$ and $\pi_1 \eta_D = \eta_D \pi_1 = 0$. Then, LHS of (4.4.43) is given by $U_\theta dE_{D_{\infty}^2,2+0} U^{-1} - U_\theta dE_{D_{\infty}^2,2-0} U^{-1} = U_\theta (dE_{D_{\infty}^2,2+0} - dE_{D_{\infty}^2,2-0}) U^{-1} = U_\theta \eta_D U^{-1} = \eta_D$ (c.f. (4.3.38)).

 bounded operators, where LHS is defined by a (monotone decreasing) polynomial approximation of $u$ and RHS is given by the norm-limit of the Stieltjes type summation. Then, for any $\xi, \eta \in \overline{H}_{W,C}$, we have $\langle u(\hat{I}_W) \xi, \eta \rangle = \int_0^4 u(\lambda) d\langle E_{W,\lambda} \xi, \eta \rangle$. 

b) 1. Proof of (4.4.44).
Consider the infinitesimal form of the formula (4.3.39) for \( r = 1 \):

\[
(4.4.46) \quad \dot{J}_W \cdot dE_{W,\lambda} = \lambda dE_{W,\lambda}.
\]

Substitute the decomposition \( dE_{W,\lambda} = \pi_0 \cdot dE_{W,\lambda} + \pi_1 \cdot dE_{W,\lambda} \) in this formula. Then, using (4.3.33), the LHS is equal to

\[
\dot{J}_W \cdot dE_{W,\lambda} = (\dot{J}_W + t J_w)(\pi_0 \cdot dE_{W,\lambda} + \pi_1 \cdot dE_{W,\lambda})
\]

\[
= 2 \pi_0 \cdot dE_{W,\lambda} + 2 \pi_1 \cdot dE_{W,\lambda}
\]

\[
+ (\dot{J}_W - id)(\pi_0 \cdot dE_{W,\lambda}) + (\dot{J}_W - id)(\pi_1 \cdot dE_{W,\lambda})
\]

\[
+ (t J_w - id)(\pi_0 \cdot dE_{w,\lambda}) + (t J_w - id)(\pi_1 \cdot dE_{w,\lambda}).
\]

On the other hand, recalling (4.2.30) and (4.2.31), we know that

\[
(\dot{J}_W - id)(\pi_1 \cdot dE_{W,\lambda}) = 0, \quad (\dot{J}_W - id)(\pi_0 \cdot dE_{W,\lambda}) \in \text{Hom}(\overline{H}_{W,C}, \overline{H}_{W,C,1}),
\]

\[
(t J_w - id)(\pi_0 \cdot dE_{W,\lambda}) = 0, \quad (t J_w - id)(\pi_1 \cdot dE_{W,\lambda}) \in \text{Hom}(\overline{H}_{W,C}, \overline{H}_{W,C,0}).
\]

Equating this with \( \lambda dE_{W,\lambda} = \lambda \pi_0 \cdot dE_{W,\lambda} + \lambda \pi_1 \cdot dE_{W,\lambda} \) (4.4.45), we obtain

\[
(\dot{J}_W - id)(\pi_1 \cdot dE_{W,\lambda}) = (\lambda - 2) \pi_0 dE_{W,\lambda}, \quad (\dot{J}_W - id)(\pi_0 dE_{W,\lambda}) = (\lambda - 2) \pi_1 dE_{W,\lambda}.
\]

Rewriting these together in matrix expressions, we obtain

\[
(4.4.47) \quad \dot{J}_W \begin{pmatrix} \pi_0 \cdot dE_{W,\lambda} \\ \pi_1 \cdot dE_{W,\lambda} \end{pmatrix} = \begin{pmatrix} 1 & \lambda - 2 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} \pi_0 \cdot dE_{W,\lambda} \\ \pi_1 \cdot dE_{W,\lambda} \end{pmatrix}.
\]

\[
(4.4.48) \quad t J_w \begin{pmatrix} \pi_0 \cdot dE_{W,\lambda} \\ \pi_1 \cdot dE_{W,\lambda} \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ \lambda - 2 & 1 \end{pmatrix} \begin{pmatrix} \pi_0 \cdot dE_{W,\lambda} \\ \pi_1 \cdot dE_{W,\lambda} \end{pmatrix}.
\]

and, hence, also

\[
(t J_w)^{-1} \begin{pmatrix} \pi_0 \cdot dE_{W,\lambda} \\ \pi_1 \cdot dE_{W,\lambda} \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 2 - \lambda & 1 \end{pmatrix} \begin{pmatrix} \pi_0 \cdot dE_{W,\lambda} \\ \pi_1 \cdot dE_{W,\lambda} \end{pmatrix}.
\]

Thus, combining these with the expression (4.2.32), we obtain

\[
(4.4.49) \quad Cox_W^{(d)} \begin{pmatrix} \pi_0 \cdot dE_{W,\lambda} \\ \pi_1 \cdot dE_{W,\lambda} \end{pmatrix} = (-1)^{d-1} \begin{pmatrix} 1 & \lambda - 2 \\ 2 - \lambda & 1 - (\lambda - 2)^2 \end{pmatrix} \begin{pmatrix} \pi_0 \cdot dE_{W,\lambda} \\ \pi_1 \cdot dE_{W,\lambda} \end{pmatrix}.
\]

Substitute \( \lambda \) in the RHS matrix by the expression (4.4.40):

\[
(-1)^{d-1} \begin{pmatrix} 1 & \lambda - 2 \\ 2 - \lambda & 1 - (\lambda - 2)^2 \end{pmatrix} = (-1)^{d-1} \begin{pmatrix} 1 & -2 \cos(\pi \theta) \\ 2 \cos(\pi \theta) & \sin^2(\pi \theta) - 3 \cos^2(\pi \theta) \end{pmatrix}.
\]

We see that the matrix is semi-simple for any \( \theta \). The eigenvalues are

\[
\exp \left( \pm 2 \pi \sqrt{-1} \left( \theta + \frac{d - 2}{2} \right) \right),
\]

and associated row eigenvectors (independent of \( n \)) are

\[
\left( \exp \left( \pm \frac{\pi}{2} \sqrt{-1} \theta \right), -\exp \left( \pm \frac{\pi}{2} \sqrt{-1} \theta \right) \right).
\]
Therefore, by introducing the unitary operators
\[ U_{\pm \theta} := \exp \left( \pm \frac{\pi}{2} \sqrt{-1} \theta \right) \pi_0 - \exp \left( \pm \frac{\pi}{2} \sqrt{-1} \theta \right) \pi_1 \]
satisfying relations: \( U_{\pm \theta} = U_{\pm \theta} = U_{\mp \theta} \) and \( U_{\pm \theta} \cdot U_{\mp \theta} = \Omega W_{\mp \theta} \), we introduce a Stieltjes measure on \([0, 4] := \{ \lambda \in \mathbb{R} | 0 \leq \lambda \leq 4 \} \simeq [0, 1] := \{ \theta \in \mathbb{R} | 0 \leq \theta \leq 1 \} \):
\[ (4.4.51) \quad \xi_{W, \theta} := U_{\pm \theta} \cdot W_{\mp \theta} \cdot U_{\pm \theta} \]
Then, from \( (4.4.49) \), we obtain
\[ (4.4.52) \quad C_{\tau_{W, \theta}} = \exp \left( \pm 2 \pi \sqrt{-1} \left( \theta + \frac{d - 2}{2} \right) \right) \xi_{W, \theta} \]
Putting \( \xi_{W, \theta} := \xi_{W, \theta} \), we obtain \( (4.4.43) \).

b) 2. Proof of \( (4.4.45) \).
Using \( (4.4.41) \) and \( (4.4.42) \), we decompose \( \xi_{W, \theta} \) into 4 pieces:
\[ \pi_0 d W_{W, \theta} \cdot \pi_0 + \pi_1 d W_{W, \theta} \cdot \pi_1 - \exp(\pi \sqrt{-1} \theta) \pi_1 d W_{W, \theta} \cdot \pi_0 - \exp(-\pi \sqrt{-1} \theta) \pi_0 d W_{W, \theta} \pi_1 \]
The first two terms are integrated easily by
\[ \int_{\theta=0}^{\theta=1} \pi_0 d W_{W, \theta} \cdot \pi_0 = \pi_0 \left( \int_{\theta=0}^{\theta=1} d W_{W, \theta} \right) \pi_0 = \pi_0 \cdot \Omega W_{W, \theta} \cdot \pi_0 = \pi_0, \]
\[ \int_{\theta=0}^{\theta=1} \pi_1 d W_{W, \theta} \cdot \pi_1 = \pi_1 \left( \int_{\theta=0}^{\theta=1} d W_{W, \theta} \right) \pi_1 = \pi_1 \cdot \Omega W_{W, \theta} \cdot \pi_1 = \pi_1. \]
The third and fourth terms are integrated by the use of Footnote 8.
First, we introduce bounded nilpotent operators \( \tilde{K}_W : \Omega W_{W, \theta} \rightarrow \Omega W_{W, \theta} \) and \( \frac{1}{i} \tilde{K}_W : \Omega W_{W, \theta} \rightarrow \Omega W_{W, \theta} \), by \( \tilde{K}_W := \Omega W_{W, \theta} - \lambda \) and \( \frac{1}{i} \tilde{K}_W := \Omega W_{W, \theta} + \lambda \) so that we have \( \tilde{K}_W^2 = \frac{1}{i} \tilde{K}_W = 0 \) and \( \tilde{I}_W = 2 \Omega W_{W, \theta} - \tilde{K}_W - \frac{1}{i} \tilde{K}_W \).
Then
\[ \int_{\theta=0}^{\theta=1} \exp(\pi \sqrt{-1} \theta) \pi_0 - \exp(-\pi \sqrt{-1} \theta) \pi_0 = \pi_1 \left( \int_{\theta=0}^{\theta=1} \left[ 1 - 2 \sin^2 \left( \frac{\pi}{2} \theta \right) + \sqrt{-1} \left( 1 - \sin^2 \left( \frac{\pi}{2} \theta \right) \right) \right] d W_{W, \theta} \right) \pi_0 \]
\[ = \pi_1 \left( \int_{\theta=0}^{\theta=1} \left( 1 - \frac{1}{2} + \sqrt{-1} \frac{1}{2} \right) \right) d W_{W, \theta} \pi_0 \]
\[ = \pi_1 \left( \int_{\theta=0}^{\theta=1} \left( 1 - \frac{1}{2} + \sqrt{-1} \frac{1}{2} \right) \right) \pi_0 \]
After sandwiching by \( \pi_0 \) and \( \pi_0 \), the first and the second terms turn out to be \( \pi_1 \cdot \Omega W_{W, \theta} \cdot \pi_0 = 0 \) and \( \pi_1 \cdot \frac{1}{i} \tilde{K}_W \cdot \pi_0 = - \frac{1}{i} \tilde{K}_W \), respectively. The third term turns out to be zero, since the operator
\[ \left( 4 \Omega W_{W, \theta} - \frac{1}{i} \tilde{K}_W \right) \pi_0 = \sqrt{4 \Omega W_{W, \theta} - \frac{1}{i} \tilde{K}_W - \frac{1}{i} \tilde{K}_W - \frac{1}{i} \tilde{K}_W} \]
\[ = \sqrt{4 \Omega W_{W, \theta} - \frac{1}{i} \tilde{K}_W - \frac{1}{i} \tilde{K}_W - \frac{1}{i} \tilde{K}_W - \frac{1}{i} \tilde{K}_W} \]

\[ \text{In the present paper, } \sqrt{X} \text{ takes the positive branch for a positive object } X. \]
preserves the decomposition \([4.1.29]\) so that it does not have the “cross” term sandwiched by \(\pi_1\) and \(\pi_0\). Thus, we get
\[
\int_{\theta=0}^{\theta=1} \exp(-\pi \sqrt{-1} \theta) \pi_1 \cdot dE_{w,\lambda} \cdot \pi_0 = \frac{iK_W}{2}.
\]
Similarly, we obtain also
\[
\int_{\theta=0}^{\theta=1} \exp(\pi \sqrt{-1} \theta) \pi_0 \cdot dE_{w,\lambda} \cdot \pi_1 = \frac{tK_W}{2}.
\]
These altogether show the formula \((4.4.45)\) \(\square\)

**Corollary.** Let \(\varphi(\theta) = \sum_{m \in \mathbb{Z}} a_m \exp(2\pi \sqrt{-1} m(\theta + \frac{d-2}{2}))\) be an absolutely convergent Fourier expansion of a complex valued continuous function on the interval \(\theta \in [0, 1]\). Then, we have
\[
(4.4.53) \quad 2 \int_{\theta=0}^{\theta=1} \varphi(\theta) \cdot \xi_{W,\theta} = \sum_{m \in \mathbb{Z}} a_m (\text{Cox}_W^{(d)})^m \cdot \dot{I}_W.
\]

**Remark.** Due to the integral formula \((4.4.45)\), we get a factor \(\dot{I}_W\) at the end of the formula \((4.4.53)\). Since \(\dot{I}_W\) is not invertible by a bounded operator (recall the comment at the end of §4.2), the meaning of this factor is unclear. It would be desirable to ask:

**Question:** Can \(\xi_{W,\theta}\) be divisible by \(\dot{I}_W\) from the right (c.f. §4.3 Corollary to Assertion 2)?

**Acknowledgements.** The author is grateful to Hikosaburo Komatsu and Serge Richard for discussions to clarify the spectral analysis in §4.
