ABSTRACT
The Beckmann fragmentation reaction, considered to be a special type of the Beckmann rearrangement only occurs in particular when α-carbon of the oxime is substituted with alkyl or aryl groups which are capable of stabilizing a carbocation formed when a nitrile group results. In this project, the oxime of dialkyl 2-(3-oxocyclohexyl)malonate are undergone derivatization with p-toluenesulfonyl chloride or 2,4-dinitrofluorobenzene. The tosyloxime or oxime ether with no substituents at α-carbon of the oxime derivatives was on treatment with base NaH or CsCO$_3$ initiates the Beckmann fragmentation, wherein this reaction the carbocation formed on α-carbon atom simultaneously attacked by dialky malonate carbon as a nucleophile in the same basic condition and results in the carbon-carbon bond formation as to substituted cyclopropane rings. The strained substituted cyclopropane rings occurred in many complex natural products including terpenoids, steroids, alkaloids pheromones, fatty acid metabolites and unusual amino acids. Some Natural products with cyclopropane motifs not only furnished fascinating structures, but also exhibited versatile biological activities, such as cytotoxic, anti-HIV, antimicrobial, antiviral, and immunosuppressive effects.

Keywords: Oxime, Oxime Ether, Tosyloxime, Cyclopropane, Beckmann Fragmentation etc.

INTRODUCTION
The intermolecular cyclopropanation reactions were reported by many researchers wherein olefins are treated with activated methylene in presence of heavy metal as catalyst$^1$. The Beckmann fragmentation through the C-C bond breaking and C-C bond making leads to the intramolecular cyclopropanation with a very good yield to 1,1,2-trisubstituted cyclopropane ring without the use of any heavy metals as a catalyst. The concept of cyclopropanation was an unintended result,$^{2-5}$ when we tried to synthesized anti-Bredt’s imine compounds as listed in Fig.-1. According to Bredt’s rule$^6$ in the carbon bicyclic system, carbon-carbon double bonds at the bridgeheads cannot exist for the small ring size.$^7$ But, there are reports of anti-Bredt’s rule compounds,$^8-12$ wherein the bicyclic compound has an unsaturated center at the bridgehead position, although isolation of these compounds was limited.$^{13}$ The examples of bicyclic imines, in which carbon-nitrogen double bond having the similar geometry to its olefinic analog are also reported and these anti-Bredt imine compounds have been isolated including A, B and C$^{14}$ (Fig.-1).

Fig.-1: Anti-Bredt Imines$^{14}$

The methodology$^3$ for the synthesis of 2,2,5-trisubstituted pyrrolidine was already developed and the same concept was applied to synthesize the anti-Bredt’s compound 4 (Scheme-1). In this methodology, it was thought that when tosyloxime 3 or oxime ether when treated with base the malonate group can act as...
nucleophilic carbon in the basic condition and tosyl group as good leaving group makes nitrogen atom as electrophile leads to ring closure as anticipated anti-Bredt’s compound 4 (Scheme 1) but instead of the anti-Bredt compound 4, the Beckmann fragmentation\textsuperscript{15-17} product 5 was obtained in a high yield of 74% (Scheme-2). The malonate nucleophilic carbon attacked on α-carbon atom instead of the nitrogen atom of the tosyl oxime and this resulted in the formation of the Beckmann fragmentation product as a substituted cyclopropane ring. The reaction was repeated; changing the base to anhydrous CsCO\textsubscript{3} in dry CH\textsubscript{2}Cl\textsubscript{2}, but gave the same results and no conditions which gave the anti-Bredt product could be identified. The cyclopropane ring is a highly strained system but preferred instead of the five-membered ring system confirmed by the \textit{1}H NMR and mass spectra (Scheme 2). The same Beckmann fragmentation was exploited for various substitutions with changing the active methylene group as dialkyl malonate, ethyl 2-cyanoacetate and ethyl 2-nitroethanolate.

\textbf{EXPERIMENTAL}

\textbf{General Procedure for the Preparation of Michael Adduct}

The 7.50 mmol of cyclohex-2-enone (0.72 ml) was added drop-wise to a well-stirred mixture of 6.25 mmol Diethyl malonate (0.95 ml) and 9.37 mmol of anhydrous K\textsubscript{2}CO\textsubscript{3} (1.29 g) in dry CH\textsubscript{2}Cl\textsubscript{2} 20ml and the mixture was stirred for 15 hr at r.t. or till completion of the reaction by TLC\textsuperscript{18}. Water and EtOAc were added sequentially and the organic layers were separated, washed with 1 M HCl, water, brine and dried over Na\textsubscript{2}SO\textsubscript{4}. The concentration of the organic layer gave the crude product, which was purified by flash column chromatography (eluting with EtOAc : petrol) to afford the Michael adduct product 1.

\textbf{General Procedure for Preparation Oxime of Michael Adduct}

To the solution of 3.90 mmol Michael adduct ketone 1 (1g) in 20 ml EtOH has added 7.81 mmol of NH\textsubscript{2}OH·HCl (531mg) and 9.75 mmol of Et\textsubscript{3}N (984mg) and the reaction mixture was heated to reflux for 2 hr. The progress of the reaction was monitored by TLC and on completion of the reaction mixture was allowed to cool to room temperature\textsuperscript{19}. EtOH was removed under reduced pressure and the residue was dissolved in EtOAc and H\textsubscript{2}O added. The organic layer was separated, washed with brine and dried over Na\textsubscript{2}SO\textsubscript{4}. The concentration of the organic layer gave the crude product, which was purified by flash column chromatography (eluting with EtOAc : petrol) to afford the oxime product 2.

\textbf{General Procedure for Preparation Tosyl Oxime From Oxime}

The stirring solution 3.69 mmol of 2 oxime (1g) in dry 20 ml CH\textsubscript{2}Cl\textsubscript{2} at 0 °C was treated with 7.38 mmol of Et\textsubscript{3}N or pyridine (745mg or 583mg) followed by slow addition 5.53 mmol of \textit{p}-toluenesulphonyl.
chloride (1.05g). The reaction was further stirred for 2 hr and progress was monitored by TLC and after completion of the reaction, (1 M) HCl was added and the product was extracted by CH$_2$Cl$_2$ and the extracts were washed with saturated NaHCO$_3$ and dried over Na$_2$SO$_4$. The concentration of CH$_2$Cl$_2$ gave the crude product which was purified by flash column chromatography (eluting with EtOAc : petrol) to afford the tosyl oxime product 3.

**General Procedure for Cyclopropanation through Beckmann Fragmentation**

To the solution, 2.35 mmol of compound 3 tosyloxime (1g) in dry THF at room temperature, 7.05 mmol of NaNH (169 mg, 60% dispersion in mineral oil) was added and heated to reflux for 30 min to 1 hr and the progress of the reaction was monitored by TLC. After completion of the reaction, saturated NH$_4$Cl was added and the Beckmann fragmentation product as substituted cyclopropane was extracted by EtOAc. The extracts were dried over Na$_2$SO$_4$, the concentration of reaction mixture gave the crude product which was purified by flash column chromatography (eluting with EtOAc: petrol) to afford 1,1,2-trisubstituted cyclopropane ring as products 4.

(±)Diethyl 2-(3-oxocyclohexyl)malonate, 1

![Diethyl 2-(3-oxocyclohexyl)malonate](image)

Following the general procedure, 23.4 mmol of cyclohex-2-enone (2.26ml) was added to a solution 19.5 mmol of diethyl malonate (2.97ml) and 29.8 mmol of anhydrous K$_2$CO$_3$ (3.92g) in dry CH$_2$Cl$_2$ (30mL) and the mixture was stirred at r.t. to give crude product which was purified by flash column chromatography to afford adduct 2 (4.10g, 82%) as a colourless oil; R$_f$ = 0.53 (EtOAc : petrol, 4:6); $\nu_{\text{max}}$(film)/cm$^{-1}$ 2982, 1731, 1448, 1423, 1297, 1229, 1156, 1061, 965; δ$_{\text{H}}$(400 MHz; CDCl$_3$); Me$_2$Si 1.23 (6H, t, J 7.1 Hz, 2 × OCH$_2$CH$_2$), 1.47, 1.65 (2H, m, COCH$_2$), 1.90 (2H, m, COCH$_2$CH$_2$CH$_2$), 2.23 (2H, m, COCH$_2$CH$_2$CH$_2$), 2.39 (2H, m, COCH$_2$CH$_2$), 2.49 (1H, m, COCH$_2$CH$_2$), 3.26 (1H, d, J 7.9 Hz CH(COOEt)$_2$), 4.17 (4H, q, J 7.1 Hz, 2 × OCH$_2$CH$_2$)$_2$; δ$_{\text{C}}$(100 MHz; CDCl$_3$); Me$_2$Si 13.5 (OCH$_2$CH$_2$), 23.9 (COCH$_2$CH$_2$), 26.2 (COCH$_2$CH$_2$), 37.4 (COCH$_2$CH$_3$), 40.4 (COCH$_2$CH$_2$CH$_2$), 44.5 (COCH$_2$CH$_2$), 56.3 (CH(COOEt)$_2$), 60.9 (OCH$_2$CH$_3$), 167.2, 167.3 (2 × COO), 209.1 (CO); m/z (ESI$^-$) 535 ([2M+Na]$^-$, 85%), 279 ([M+Na]$^+$, 60%), 255 ([M-H]$^-$, 100%), HRMS (ESI$^-$) C$_{13}$H$_{20}$NaO$_5$$^-$ ([M+Na]$^-$) requires 279.1203; found 279.1199.

(±)Diethyl 2-(3-(hydroxyimino)cyclohexyl)malonate, 2

![Diethyl 2-(3-(hydroxyimino)cyclohexyl)malonate](image)

Following the general procedure, to the solution 14.9 mmol of adduct 1 (3.82g) in EtOH (40ml), 22.4 mmol of NH$_2$OH.HCl (1.54g) and 29.8 mmol of Et$_3$N (3.01g) was added and heated to reflux for 1 hr to give crude product which was purified by flash column chromatography to afford oxime 2 (3.82 g, 94%) as a colourless oil; R$_f$ = 0.45, 0.37 (EtOAc : petrol, 4:6); $\nu_{\text{max}}$(film)/cm$^{-1}$ 3240, 2938, 1731, 1448, 1369, 1233, 1156, 1096, 966, 862; (major isomer) δ$_{\text{H}}$(400 MHz; CDCl$_3$); Me$_2$Si 1.17 (6H, t, J 7.1 Hz, 2 × OCH$_2$CH$_2$), 1.34 (2H, m, CCH$_3$CH$_2$CH$_2$), 1.70 (2H, m, CCH$_3$CH$_2$CH$_2$), 1.93 (2H, m, CCH$_3$CH$_2$CH$_2$), 2.26 (2H, m, CCH$_3$CH$_2$), 3.11 (1H, m, CCH$_3$CH$_2$), 3.19 (1H, d, J 8.3 Hz CH(COOEt)$_2$), 4.11 (4H, q, J 7.1 Hz, 2 × OCH$_2$CH$_2$)$_2$; δ$_{\text{C}}$(100 MHz; CDCl$_3$); Me$_2$Si 14.0 (OCH$_2$CH$_2$), 23.7, 23.8 (CCH$_2$CH$_2$), 25.1, 27.8 (CCH$_2$CH$_2$), 29.4, 29.5 (CCH$_2$CH$_2$), 31.6, 35.5 (CCH$_2$CH$_2$), 36.7, 37.7
(CCH₂CH₂), 56.9, 57.0 (CH₃COOEt₂), 61.3, 61.4 (OCH₂CH₂), 158.4, 158.7 \( (C=NOH) \), 168.0, 168.1, 168.2 (2 x COO); m/z (ESI⁺) 565 ([2M+Na⁺], 100%), 294 ([M+Na⁺], 50%), 270 ([M-H]⁻, 100%), HRMS (ESI⁺) C₁₃H₂₂NNaO₅⁺ ([M+Na⁺]) requires 294.1312; found 294.1310.

(±)Diethyl 2-(3-(tosyloxyimino)cyclohexyl)malonate, 3

Following the general procedure, to the solution 0.60 mmol of tosyl oxime was added 1.80 mmol of NaH (43 mg, 60% dispersion in mineral oil) and heated to reflux for 30 min. Following the general procedure, to the solution 5.09 mmol of oxime 3 (1.82 g, 84%) as colourless a oil; \( R_f = 0.59 \) (EtOAc : petrol, 4:6); \( \nu_{\max}(\text{film})/\text{cm}^{-1} \) 2938, 2700, 1517, 1459, 1382, 1135, 1032, 817, 732; (major isomer) \( \delta_0(400 \text{ MHz; CDCl}_3; \text{MeSi}) 1.23 \) (6H, t, J 7.6 Hz, 2 × OCH₂CH₂), 1.47 (2H, m, CCH₂CH₂CH₂), 1.86 (2H, m, CCH₂CH₂CH₂), 2.03 (2H, m, CCH₂CH₂CH₂), 2.28 (2H, m, CCH₂CH₂), 2.39 (3H, s, ArCH₃), 2.49 (1H, m, CCH₂CH₂) 3.26 (1H, t, J 7.9 Hz CH₂COOEt), 4.16 (4H, q, J 7.1 Hz, 2 × OCH₂CH₂), 7.29 (2H, d, J 8.1 Hz, ArH), 7.79 (2H, d, J 8.1 Hz, ArH); \( \delta (100 \text{ MHz; CDCl}_3; \text{MeSi}) 13.5 \) (OCH₂CH₂), 21.1 (ArCH₃), 23.9 (CCH₂CH₂), 28.2 (CCH₂CH₂), 37.4 (CCH₂), 40.4 (CCH₂CH₂CH₂), 44.5 (CCH₂), 56.3 (CH₂COOEt₂), 60.9 (OCH₂CH₂), 128.1, 128.9, 132.1, 144.2 (ArC), 167.1 (C=NOTs), 167.3, 167.5 (2 x COO); m/z (ESI⁻) 873 ([2M+Na⁺], 100%), 448 ([M+Na⁺], 80%), HRMS (ESI⁻) C₂₉H₂₇NNaO₅S⁻ ([M+Na⁺]) requires 448.1400; found 448.1400.

(±)Diethyl 2-(3-cyanopropyl)cyclopropane-1,1-dicarboxylate, 5

Following the general procedure, to the solution 0.60 mmol of tosyl oxime 3 (256 mg) in dry THF (10 ml) was added 1.80 mmol of NaH (43 mg, 60% dispersion in mineral oil) and heated to reflux for 30 min, instead ring closure pyrroline as bicyclic anti-Bredt’s compound, we have isolated Beckman fragmentation product which was purified by flash column chromatography to afford substituted cyclopropane 5 (113 mg, 74%) as a colourless oil; \( R_f = 0.49 \) (EtOAc : petrol, 4:6); \( \nu_{\max}(\text{film})/\text{cm}^{-1} \) 2938, 2256, 1731, 1431, 1447, 1369, 1156, 1096, 1030, 967, 916, 862; \( \delta (100 \text{ MHz; CDCl}_3; \text{MeSi}) 1.24, 1.27 \) (6H, t, J 7.6 Hz, 2 × OCH₂CH₂), 1.33 (2H, m, NCCCH₂CH₂), 1.39 (1H, m, CHCHHC), 1.55 (1H, m, CHCHC), 1.74 (1H, m, CHCHHC), 1.82 (2H, m, NCCCH₂CH₂), 2.33 (2H, t, J 7.1 Hz NCCCH₂CH₂), 4.11, 4.21 (4H, q, J 7.1 Hz, 2 × OCH₂CH₂); \( \delta (100 \text{ MHz; CDCl}_3; \text{MeSi}) 13.8 \) (OCH₂CH₂), 16.5 (NCCCH₂CH₂), 20.3 (CHCHC), 24.5 (NCCCH₂CH₂), 26.4 (CHCHC), 27.3 (NCCCH₂CH₂), 33.8 (C(COOEt₂)), 61.3 (OCH₂CH₂), 118.9 (CN), 167.6, 169.8 (2 x COO); m/z (ESI⁻) 276 ([M+Na⁺], 100%), HRMS (ESI⁻) C₁₃H₁₇NNaO₅⁻ ([M+Na⁺]) requires 276.1206; found 276.1207.

(±)-ethyl 1-methyl 2-(3-cyanopropyl)cyclopropane-1,1-dicarboxylate, 9

Following the general procedure, to the solution 0.29 mmol of tosyl oxime 8 (120 mg) in dry THF (5ml) was added 0.87 mmol of NaH (21 mg, 60% dispersion in mineral oil) and heated to reflux for 30 min, cyclopropanation product was isolated as competing Beckman fragmentation reaction which was purified by flash column chromatography to afford substituted cyclopropane 9 (47 mg, 69%) as a colourless oil; \( R_f = 0.49 \) (EtOAc : petrol, 4:6).
1,1,2-Trisubstituted Cyclopropane

was added 0.70 mmol of NaH (16 mg, 60% dispersion in mineral oil) and heated to reflux for 30 min, resulting in the formation of (±) Ethyl 1-cyano-2-(3-cyanopropyl)cyclopropanecarboxylate, 25.

Following the general procedure, to the solution 0.98 mmol of NaH (23 mg, 60% dispersion in mineral oil) and heated to reflux for 30 min, cyclopropanation product was isolated as competing Beckman fragmentation reaction which was purified by flash column chromatography to afford substituted cyclopropane.

Following the general procedure, to the solution 0.32 mmol of tosyl oxime was added 0.90 mmol of NaH (21 mg, 60% dispersion in mineral oil) and heated to reflux for 30 min, cyclopropanation product was isolated as competing Beckman fragmentation reaction which was purified by flash column chromatography to afford substituted cyclopropane.

Following the general procedure, to the solution 0.30 mmol of tosyl oxide 12 (136 mg) in dry THF (5ml) was added 0.90 mmol of NaH (21 mg, 60% dispersion in mineral oil) and heated to reflux for 30 min, cyclopropanation product was isolated as competing Beckman fragmentation reaction which was purified by flash column chromatography to afford substituted cyclopropane.

Following the general procedure, to the solution 0.32 mmol of tosyl oxime 16 (160 mg) in dry THF (5ml) was added 0.98 mmol of NaH (23 mg, 60% dispersion in mineral oil) and heated to reflux for 30 min, cyclopropanation product was isolated as competing Beckman fragmentation reaction which was purified by flash column chromatography to afford substituted cyclopropane.

Following the general procedure, to the solution 0.24 mmol of tosyl oxide 24 (89 mg) in dry THF (5 ml) was added 0.70 mmol of NaH (16 mg, 60% dispersion in mineral oil) and heated to reflux for 30 min, cyclopropanation product was isolated as competing Beckman fragmentation reaction which was purified by flash column chromatography to afford substituted cyclopropane.

(±)-1-tert-Butyl 1-ethyl 2-(3-cyanopropyl)cyclopropane-1,1-dicarboxylate, 13

Following the general procedure, to the solution 0.30 mmol of tosyl oxide 12 (136 mg) in dry THF (5ml) was added 0.90 mmol of NaH (21 mg, 60% dispersion in mineral oil) and heated to reflux for 30 min, cyclopropanation product was isolated as competing Beckman fragmentation reaction which was purified by flash column chromatography to afford substituted cyclopropane 13 (49 mg, 58%) as a colourless oil; $R_f = 0.50$ (EtOAc : petrol, 4:6); $\eta_{max}(\text{film})/cm^{-1}$ 2935, 2250, 1735, 1739, 1432, 1449, 1369, 1194, 1158. δH(400 MHz; CDCl3; Me2Si) 1.1 (9H, s, tBu), 1.27 (3H, t, J 7.0 Hz, OCH2CH2), 1.33 (2H, m, NCCH2CH2CH3), 1.33 (1H, m, CHCH/C), 1.59 (1H, m, CHCH/C), 1.75 (1H, m, CHCH/C), 1.82 (2H, m, NCCH2CH2CH3), 2.33 (2H, t, J 7.0 Hz NCCH2CH2CH3), 4.20 (2H, q, J 7.0 Hz, OCH2CH2); δC(100 MHz; CDCl3; Me2Si) 13.1 (tBu), 13.7 (OCH2CH2), 16.5 (OCH2CH2), 20.6 (CH2C), 24.11 (NCCH2CH2CH3), 26.7 (CH2C), 27.3 (NCCH2CH2CH3), 33.9 (C(COOOR)), 60.1 (OCH3), 61.3 (OCH2CH3), 118.9 (CN), 167.5, 169.9 (2 x COO); m/z (ESI+) 262 ([M+Na]+, 100%), HRMS (ESI+) C13H17NNaO4⁺ ([M+Na]⁺) requires 262.1055; found 262.1109.

(±)-1-Benzyl 1-ethyl 2-(3-cyanopropyl)cyclopropane-1,1-dicarboxylate, 17

Following the general procedure, to the solution 0.32 mmol of tosyl oxide 16 (160 mg) in dry THF (5ml) was added 0.98 mmol of NaH (23 mg, 60% dispersion in mineral oil) and heated to reflux for 30 min, cyclopropanation product was isolated as competing Beckman fragmentation reaction which was purified by flash column chromatography to afford substituted cyclopropane 17 (69 mg, 67%) as a colourless oil; $R_f = 0.51$ (EtOAc : petrol, 4:6); $\eta_{max}(\text{film})/cm^{-1}$ 3078, 2939, 2252, 1731, 1735, 1432, 1438, 1359, 1172, 1157. δH(400 MHz; CDCl3; Me2Si) 1.23 (3H, t, J 7.0 Hz, OCH2CH2), 1.31 (2H, m, NCCH2CH2CH3), 1.38 (1H, m, CHCHHC), 1.55 (1H, m, CHCH/C), 1.78 (1H, m, CHCHHC), 1.82 (2H, m, NCCH2CH2CH3), 2.34 (2H, t, J 7.0 Hz NCCH2CH2CH3), 4.21 (2H, q, J 7.0 Hz, OCH2CH2); 4.38 (2H, OCH2Ph), 7.2-7.5 (5H, m, ArH) δC(100 MHz; CDCl3; Me2Si) 13.9 (OCH2CH2), 16.5 (NCCH2CH2CH3), 20.76 (CH2C), 24.4 (NCCH2CH2CH3), 26.5 (CH2C), 27.4 (NCCH2CH2CH3), 33.8 (C(COOOR)), 61.3 (OCH2CH3), 60.9 (OCH2Ph), 118.9 (CN), 123, 125, 127, 149, (ArC), 167.7, 173.2 (2 x COO); m/z (ESI+) 304 ([M+Na]⁺, 100%), HRMS (ESI+) C13H17NNaO4⁺ ([M+Na]⁺) requires 304.1525; found 304.1208.

(±)-Ethyl 1-cyano-2-(3-cyanopropyl)cyclopropanecarboxylate, 25

Following the general procedure, to the solution 0.24 mmol of tosyl oxide 24 (89 mg) in dry THF (5 ml) was added 0.70 mmol of NaH (16 mg, 60% dispersion in mineral oil) and heated to reflux for 30 min, cyclopropanation product was isolated as competing Beckman fragmentation reaction which was purified by flash column chromatography to afford substituted cyclopropane.

1,1,2-Trisubstituted Cyclopropane

Nandkishor Chandan
by flash column chromatography to afford substituted cyclopropane 25 (17 mg, 36%) as a colourless oil; Rf = 0.39 (EtOAc : petrol, 4:6); tmax (film/cm²) 2937, 2254, 2210, 1733, 1433, 1436, 1357, 1157. δ (400 MHz; CDCl₃; MeSi) 1.22 (3H, t, J 7.0 Hz, OCH₂CH₃), 1.31 (2H, m, NCCH₂CH₂CH₃), 1.43 (1H, m, CHCH₂); 1.55 (1H, m, CHCH₂), 1.79 (1H, m, CHH₂), 1.88 (2H, m, NCCH₂CH₂CH₃), 2.35 (2H, t, J 7.0 Hz NCCH₂CH₂CH₃), 4.20 (2H, q, J 7.0 Hz, OCH₂CH₃); δc(100 MHz; CDCl₃; MeSi) 13.8 (OCH₂CH₃), 16.6 (NCCH₂CH₂CH₃), 20.84 (CH₂CH₃), 24.4 (NCCH₂CH₂CH₃), 26.6 (CH₂CH₃), 27.4 (NCCH₂CH₂CH₃), 34.7 (COOR), 61.3 (OCH₂CH₃), 118.9, 120.2 (CN), 173.2 (COO); m/z (ESI⁺) 229 ([M+Na⁺], 100%), HRMS (ESI⁺) C₁₉H₂₂NaO₃²⁺ ([M+Na⁺]) requires 229.0953; found 229.1117.

The instruments used for the data analysis are NMR instruments with models are AVG400/AVF400/AVF400 and IR-Spectrometer used FTS6000/FTS7000 and for mass spectra, we used LC-MS LCT.

**RESULTS AND DISCUSSION**

The diethyl malonate was reacted with cyclohex-2-enone, in the presence of anhydrous K₂CO₃, in dry CH₂Cl₂ heated to reflux for 5 hr and afforded the Michael adduct 17-28 in a very high yield of 82%. This Michael adduct was then readily converted into the corresponding oxime, by using standard conditions (NH₂OH.HCl and base Et₃N in EtOH, heated to reflux for 1 hr) and gave oxime 2 again in a very high yield of 94%. The resultant oxime was easily converted into the tosyl oxime (p-toluensulfonyl chloride and base Et₃N in dry CH₂Cl₂) stirred at r.t. for 2 hr and afforded the tosyl oxide 3 in a high yield of 84% (Scheme 3). The tosyl oxide 3 was treated with base (NaH, in dry THF or anhydrous Cs₂CO₃ in dry CH₂Cl₂ heated to reflux for 30 min) and gave the Beckmann fragmentation product as the substituted cyclopropane ring. The Beckmann fragmentation reaction was repeated with ethyl methyl malonate, tert-butyl ethyl malonate, benzyl ethyl malonate and cyclohex-2-enone in the same sequence as the first Michael addition reaction of dialkyl malonate and cyclohex-2-enone in presence of mild base as anhydrous K₂CO₃ gave good yields. The same adducts then converted into oximes (NH₂OH.HCl and base Et₃N in EtOH, heated to reflux for 5 hr) in good yield and further oximes were derivatized with p-toluenesulfonyl chloride or 2,4-dinitrofluorobenzene to tosyl oximes or oxime ethers in good yield 28-34. The tosyl oximes or oxime ether on treatment with NaH, in dry THF or anhydrous Cs₂CO₃ in dry CH₂Cl₂ heated to reflux for 30 min gave good yield of Beckmann fragmentation products as 1,1,2-trisubstituted cyclopropanes. (Schemes 4). It was observed that the bulk of the ester group suppressed the attack of nucleophilic carbon leads to the lowering of the yield which was observed in the case of compounds 13 and 17 tert-butyl ester and benzyl ester respectively. Hence compound 5 and compound 9 as diethyl or ethyl methyl ester have moderately high and same yield.

![Scheme-3: Synthesis of Oxime Derivatives](image)

Reagents and conditions: (a) anhydrous K₂CO₃, CH₂Cl₂, reflux; (b) NH₂OH.HCl, Et₃N; (c) pTsCl, Et₃N, CH₂Cl₂, rt; (d) i) NaH, dry THF, reflux, 30 min; ii) anhydrous Cs₂CO₃, CH₂Cl₂, reflux.

The cyclopropanation through the Beckmann fragmentation reaction was also tested with ethyl 2-cyanoacetate, ethyl 2-nitroacetate and cyclohex-2-enone. The Michael addition reaction of ethyl 2-cyanoacetate, ethyl 2-nitroacetate and cyclohex-2-enone in presence of mild base as anhydrous K₂CO₃ gave good yields. The same adducts then converted into oximes (NH₂OH.HCl and base Et₃N in EtOH, heated to reflux for 5 hr) in good yield and further oximes were derivatized with p-toluenesulfonyl chloride or 2,4-dinitrofluorobenzene to tosyl oximes or oxime ethers in good yield 28-34. The tosyl oximes or oxime ether on treatment with NaH, in dry THF or anhydrous Cs₂CO₃ in dry CH₂Cl₂ heated to reflux for 30 min gave good yield of Beckmann fragmentation products as 1,1,2-trisubstituted cyclopropanes. (Schemes 4). It was observed that the bulk of the ester group suppressed the attack of nucleophilic carbon leads to the lowering of the yield which was observed in the case of compounds 13 and 17 tert-butyl ester and benzyl ester respectively. Hence compound 5 and compound 9 as diethyl or ethyl methyl ester have moderately high and same yield.

Reagents and conditions: (a) anhydrous K₂CO₃, CH₂Cl₂, reflux; (b) NH₂OH.HCl, Et₃N; (c) pTsCl, Et₃N, CH₂Cl₂, rt; (d) i) NaH, dry THF, reflux, 30 min; ii) anhydrous Cs₂CO₃, CH₂Cl₂, reflux.
heated to reflux for 1 hr) in good yield and further oximes were derivatised with p-toluenesulfonyl chloride or 2,4-dinitrofluorobenzene to tosyloximes or oxime ethers in good yield. The tosyl oximes 24 or oxime ether on treatment with NaH, in dry THF or anhydrous CsCO₃ in dry CH₂Cl₂ heated to reflux for 30 min gave various results as ethyl 2-cyano-2-(3-((tosyloxy)imino)cyclohexyl)acetate 24 undergoes Beckmann fragmentation reaction and gave yield 36% of 25 as ethyl 1-cyano-2-(3-cyanopropyl)cyclopropane carboxylate (1,1,2-trisubstituted cyclopropane) whereas the 20 tosyl oxime (ethyl 2-nitro-2-(3-((tosyloxy)imino)cyclohexyl)acetate) on treatment with NaH, in dry THF or anhydrous CsCO₃ in dry CH₂Cl₂ heated to reflux did not undergoes Beckmann fragmentation as well as the Beckmann rearrangement reaction and end up with uncharacterized yellow mass. (Schemes-5 and 6).

Reagents and conditions (c) i) NaH, dry THF, reflux, 30 min; ii) anhydrous CsCO₃, CH₂Cl₂, reflux.

Scheme-4: Synthesis of Substituted Cyclopropane Rings

Reagents and conditions (a) anhydrous K₂CO₃, CH₂Cl₂, reflux; (b) NH₂OH.HCl, Et₃N; (c) pTsCl, Et₃N, CH₂Cl₂, rt; (d) i) NaH, dry THF, reflux, 30 min; ii) anhydrous CsCO₃, CH₂Cl₂, reflux.

Scheme-5: Oxime Derivatives of Niro, Cyano Adducts

Reagents and conditions (c) i) NaH, dry THF, reflux, 30 min; ii) anhydrous CsCO₃, CH₂Cl₂, reflux.

Scheme-6: Cyclopropanation

1,1,2-Trisubstituted Cyclopropane

R. Chandan
CONCLUSION

In summary unexpected results were obtained while the synthesis of planned anti-Bredt’s compounds, when the unknown compounds were characterized and confirmed by NMR and Mass spectroscopy as cyclopropanation through Beckmann Fragmentation as 1,1,2-trisubstituted cyclopropane ring. This methodology was then developed with various substitution patterns as different substituted ester groups and cyano group whereas to incorporate the nitro group using ethyl 2-nitroacetate fails. The methodology developed will be very useful to get quick access to synthesize 1,1,2-trisubstituted cyclopropane ring which is a part of many natural products of high importance.

ACKNOWLEDGEMENT

I am very much thankful to prof. Mark Moloney, Oxford University, UK for kind support. I also extend my gratitude to my Management PES and principal and my family for continuous help in research. Some of the work has been done at the time of Ph.D and it was sponsored by ministry of Social Justice and Empowerment Government of India.
