A sixth-order elliptic equation for nanoplates.

Neumann problem and Unique Continuation in the interior

Antonino Morassi, Edi Rosset, Eva Sincich and Sergio Vessella

September 20, 2022

Abstract: In this paper we analyze some properties of a sixth order elliptic operator arising in the framework of the strain gradient linear elasticity theory for nanoplates in flexural deformation. We first rigorously deduce the weak formulation of the underlying Neumann problem as well as its well posedness. Under some suitable smoothness assumptions on the coefficients and on the geometry we derive interior and boundary regularity estimates for the solution of the Neumann problem. Finally, for the case of isotropic materials, we obtain new Strong Unique Continuation results in the interior, in the form of doubling inequality and three spheres inequality, by a Carlemann estimates approach.

1 Introduction

In this work, we begin a line of research aimed at studying some inverse problems for two-dimensional micro and nanomechanical systems, which we will refer to as nanoplates. In particular, here we deal with the formulation and well-posedness of the direct problem describing the static equilibrium of a nanoplate under Neumann boundary conditions, and we derive some unique continuation properties of the solutions to the equation of nanoplates in bending. The latter properties, as is well known, constitute the essential tool for the study of inverse boundary value problems.

Nanoplates are nowadays widespread as mass sensors, biomarkers or gas sensors, as well as actuators for vibration control purposes. The plate typology, although less common than nanobeams, has some inherent mechanical advantages that include robustness, which is a relevant feature for fabrication and functionalisation, and higher stiffness, which results in higher frequencies and small free vibration energy dissipation in both fluid and gaseous environments.
Albeit the detection of added mass is one of the most popular issues in applications, other notable inverse problems for nanoplates involve force or pressure sensing from dynamic data. In addition, there has recently been growing interest in the development of diagnostic techniques for assessing the presence of defects in nanoplates, thus paving the way for the extension of methods hitherto designed for large-scale mechanical systems to the nanodimensional size as well.

The modeling of nanoplates presents specific requirements due to the presence of size effects and, therefore, classical Continuum Mechanics, as a length-scale free theory, loses its predictive capacity in this field. In the last two decades various Generalized Continuum Mechanics theories, such as Couple Stress, Nonlocal or Strain/Stress Gradient, have been proposed to model nanostructures and, specifically, nanoplates within the linear elasticity setting. Among these theories, the Simplified Strain Gradient Elasticity theory (SSGE) developed by Lam et al. has achieved a remarkable diffusion and has been applied to a wide variety of one-dimensional nanostructures, see, among others contributions.

Some recent works address the study of Kirchhoff-Love’s nanoplates using SSGT. Let us begin by recalling the partial differential equation that expresses the static equilibrium of a nanoplate in bending under vanishing body forces and couples. Let \( \Omega \) be the middle surface of a nanoplate having uniform thickness, and let us denote by \((x_1, x_2)\) the Cartesian coordinates of a point of \( \Omega \). It turns out that the transverse displacement \( u = u(x_1, x_2) \) of the nanoplate satisfies the sixth order elliptic equation

\[
\frac{\partial^2}{\partial x_i \partial x_j} \left( -(P_{ijlm} + P_{hijlm}) \frac{\partial^2 u}{\partial x_i \partial x_m} + \frac{\partial}{\partial x_k} \left( Q_{ijklmn} \frac{\partial^3 u}{\partial x_i \partial x_m \partial x_n} \right) \right) = 0 \quad \text{in} \ \Omega, \tag{1.1}
\]

where the summation over repeated indexes \( i, j, k, l, m, n = 1, 2 \) is assumed. Here, \( P_{ijlm} \) are the Cartesian components of the fourth-order tensor describing the material response in classical Kirchhoff-Love theory, whereas \( P_{hijlm} \) and \( Q_{ijklmn} \) are the components of a fourth- and sixth-order tensor, respectively, that account for the three material length scale parameters in the SSGT. We refer to Section 3 for explicit expressions of the above tensors for an isotropic
The mechanical model of the nanoplate is completed by specifying the conditions that apply at the boundary of \( \Omega \). As it occurs in the classical Kirchhoff-Love’s theory of plates [22], one of the subtle issues is the determination of the Neumann boundary conditions [46]. It should be noted that these conditions also play a crucial role in the formulation of inverse boundary value problems, as they determine the correlation between assigned quantities and unknown quantities at the boundary. Neumann boundary conditions on a curved smooth boundary were derived by Papargyri-Beskou [38] for Kirchhoff-Love nanoplates within a simplified version of Mindlin’s theory with a single scale constant [30]. Unfortunately, the transformation from the fixed system of Cartesian coordinates to the local system of coordinates on the boundary used in [38] did not take into account of the possible variation of the local natural basis \((n, \tau)\) in case of curved boundary. Here, the vectors \(n\), \(\tau\) are the unit outer normal and the unit tangent to the boundary, respectively. The oversight was present also in the treatment by Lazopoulos [25], and in [36] only natural conditions on straight portions of the boundary were considered.

In what follows we refer to the mechanical Kirchhoff-Love’s nanoplate model proposed in [21] within the SSGT elasticity, in which the Neumann conditions are correctly derived for smooth boundary (see problem (3.2)–(3.5)). In Section 3 we propose an alternative, although equivalent, determination of these boundary conditions (Lemma 3.2) and we develop the variational formulation of the Neumann problem. We prove existence and uniqueness of the solution (Proposition 3.4), and improved regularity at the interior (Theorem 3.9) and up to the boundary (Theorem 3.5). These properties are derived within the framework of high-order boundary value elliptic problems in variational form, and are instrumental to the second contribution of this paper, namely the quantitative unique continuation results obtained in Section 4 and which we describe below.

First of all, let us recall some basic notions concerning the Unique Continuation Properties. We say that a linear partial differential equation

\[
L(u) = 0 \quad \text{in } B, \quad (1.2)
\]
where $B \subset \mathbb{R}^n$ is an open ball (or, more generally, is a connected open set) enjoys the Weak Unique Continuation Property (WUCP) if the following property holds true: for any open subset $\omega$ of $B$,

$$L(u) = 0 \quad \text{in } B \quad \text{and} \quad u \equiv 0 \quad \text{in } \omega,$$

imply $u \equiv 0$ in $B$.

We say that $L$ enjoys the Strong Unique Continuation Property (SUCP) if the following property holds true: for any point $x_0 \in B$ and for any solution $u$ to (1.2) which satisfies

$$\int_{B_{\rho}(x_0)} u^2 = O(\rho^N), \quad \text{as } \rho \to 0, \forall N \in \mathbb{N},$$

it follows that

$$u \equiv 0, \quad \text{in } B.$$

It is obvious that SUCP implies WUCP.

In the present paper we are interested in quantitative versions of the SUCP. More precisely, we are interested in doubling inequality, which typically takes the form

$$\int_{B_{2\rho}(x_0)} u^2 \leq C \int_{B_{\rho}(x_0)} u^2, \quad (1.3)$$

where $C$ depends on $u$ but not on $\rho$. As shown in [14], a consequence of doubling inequality is the SUCP for solutions to (1.2).

Here, we will prove the doubling inequality for the sixth order equation of nanoplates (1.1) consisting of inhomogeneous isotropic material (see Section 4.1). As recalled above, the doubling inequality implies SUCP. A crucial point to derive the doubling inequality for the nanoplate is to observe that equation (1.1), with the tensors $P_{ijklm}$, $P_{ijklm}^h$ and $Q_{ijklmn}$ given respectively by (3.7), (3.8) and (3.18), can be written in the following form (see Lemma 4.6)

$$\Delta^3 u = a \cdot D\Delta^2 u + L_4(u), \quad (1.4)$$

where $a$ is a bounded vector function and $L_4$ is a forth order operator with bounded coefficients (more specifically, the coefficients of $L_4$ of order less than 3 are zero) or equivalently (see [19 Sect. 8.9])
\[ |\Delta^3 u| \leq M \left( |D\Delta^2 u| + \sum_{k=0}^{4} |D^k u| \right), \quad (1.5) \]

where \( M \) is a positive constant. Now, (1.4) and (1.5) tell us that our task of proving the doubling inequality is certainly included in the more general issue of Unique Continuation Property for equations whose principal part is a power of Laplace operator. The literature on this subject is very extensive, here we only remember some papers:

(a) concerning the WUCP: [16], [27], [37], [39], [41], [47];
(b) concerning the SUCP: [5], [9], [10], [11], [28], [31], [49].

A good part of the interest on the subject of WUCP for equations whose principal part is \( \Delta^m \) arises from the fact that the operator \( \Delta^m \) has multiple complex characteristic for \( m \geq 2 \), \( m \in \mathbb{N} \), hence the general theory of Carleman estimates, conceived by Hörmander, [19], see also [26], does not apply. Here we recall that Carleman estimates were introduced in 1939 in [8] by the homonymous mathematician, to prove the uniqueness for a Cauchy problem for elliptic systems in two variables with nonanalytic coefficients. Carleman estimates are today the most powerful and general tool to study the Unique Continuation Property of PDEs.

As it has been proven in [11], the Unique Continuation Property for solutions to the inequality

\[ |\Delta^m u| \leq M \sum_{k=0}^{h} |D^k u|, \quad (1.6) \]

holds true whenever \( h = \lfloor \frac{3m}{2} \rfloor \) (for every \( p \in \mathbb{R}, \lfloor p \rfloor \) represents the integer part of \( p \)). In particular, in our case we have \( m = 3 \), hence \( h = 4 \). On the other side it was proven, see [50] Ch. 2, Sect. 3] and [16] Sect. 5] and references therein, that there exists an operator of the form

\[ \Delta^3 + L_5, \]

where \( L_5 \) is a fifth-order operator with continuous coefficients (of complex values), for which the unique continuation property fails. At the light of previous considerations, the case (1.4) is, in some sense, an “intermediate case” for which the WUCP and even more, the SUCP is worth to study.
Our proof of doubling inequalities is based on:
(a) a careful iteration of the Carleman estimate with a suitable singular weight
for Laplace operator proved in [33] (in the present paper, Proposition 4.1);
(b) the derivation of a doubling inequality for solutions $u$ to (1.4) in the form
of (1.3), see Corollary 4.10 for precise statement.

By the doubling inequalities we obtain in a standard way some three sphere
inequalities that are, as widely illustrated in [6], a fundamental tool to obtain
estimates of propagation of smallness.

Quantitative estimates in the form of doubling inequalities and of three spheres
inequalities have shown to be extremely useful in the treatment of inverse boundary
value problems associated to the fourth order elliptic equation of the classical
Kirchhoff-Love plate in bending [31]. In a subsequent paper [34] we plan to apply
such estimates to diagnostic problems of non-destructive testing for elastic
nanoplates, which are modeled as inverse boundary value problems of determining,
within a nanoplate $\Omega$, the possible presence of an inclusion made of different
material from boundary measurements of Neumann data and corresponding
work-conjugate quantities. As a matter of fact, the doubling inequalities and
their connection with $A_n$ weight, lead the way to estimates of measure (area) of
very general unknown inclusions. We refer to [3] for the context of second order
elliptic equations and systems and to [5], [11], [32] for the context of fourth
order plate equation.

2 Notation

Let $P = (x_1(P), x_2(P))$ be a point of $\mathbb{R}^2$. We shall denote by $B_r(P)$ the disk in
$\mathbb{R}^2$ of radius $r$ and center $P$ and by $R_{a,b}(P)$ the rectangle of center $P$ and sides
parallel to the coordinate axes, of length $2a$ and $2b$, namely

$$R_{a,b}(P) = \{x = (x_1, x_2) \mid |x_1 - x_1(P)| < a, |x_2 - x_2(P)| < b\}. \quad (2.1)$$

Definition 2.1. ($C^{k, \alpha}$ regularity) Let $\Omega$ be a bounded domain in $\mathbb{R}^2$. Given
$k, \alpha$, with $k \in \mathbb{N}$, $k \geq 1$, $0 < \alpha \leq 1$, we say that a portion $S$ of $\partial \Omega$ is of class $C^{k, \alpha}$
with constants $r_0$, $M_0 > 0$, if, for any $P \in S$, there exists a rigid transformation
of coordinates under which we have \( P = 0 \) and
\[
\Omega \cap R_{r_0,2M_0r_0} = \{ x \in R_{r_0,2M_0r_0} \mid x_2 > g(x_1) \},
\]
where \( g \) is a \( C^{k,\alpha} \) function on \([-r_0,r_0]\) satisfying
\[
g(0) = g'(0) = 0,
\]
\[
\|g\|_{C^{k,\alpha}([-r_0,r_0])} \leq M_0 r_0,
\]
where
\[
\|g\|_{C^{k,\alpha}([-r_0,r_0])} = \sum_{i=0}^{k} r_0^i \sup_{[-r_0,r_0]} |g^{(i)}| + r_0^{k+\alpha} |g|_{k,\alpha},
\]
\[
|g|_{k,\alpha} = \sup_{t,s \in [-r_0,r_0]} \frac{|g^{(k)}(t) - g^{(k)}(s)|}{|t-s|^\alpha}.
\]
We use the convention to normalize all norms in such a way that their terms are dimensionally homogeneous and coincide with the standard definition when the dimensional parameter equals one. For instance, given a function \( u : \Omega \to \mathbb{R} \) we denote
\[
\|u\|_{H^k(\Omega)} = r_0^{-1} \left( \sum_{i=0}^{k} r_0^i \int_{\Omega} |D^k u|^2 \right)^{\frac{1}{2}} \tag{2.2}
\]
where
\[
\int_{\Omega} |D^k u|^2 = \int_{\Omega} \sum_{|\alpha|=k} |D^\alpha u|^2 \tag{2.3}
\]
and so on for boundary and trace norms.

For any \( h > 0 \) we set
\[
\Omega_h = \{ x \in \Omega : \text{dist}(x, \partial \Omega) > h \}.
\]

Given a bounded domain \( \Omega \) in \( \mathbb{R}^2 \) such that \( \partial \Omega \) is of class \( C^{k,\alpha} \), we consider as positive the orientation of the boundary induced by the outer unit normal \( n \) in the following sense. Given a point \( P \in \partial \Omega \), let us denote by \( \tau = \tau(P) \) the unit tangent at the boundary in \( P \) obtained by applying to \( n \) a counterclockwise rotation of angle \( \frac{\pi}{2} \), that is
\[
\tau = e_3 \times n, \tag{2.4}
\]
where $\times$ denotes the vector product in $\mathbb{R}^3$ and $\{e_1, e_2, e_3\}$ is the canonical basis in $\mathbb{R}^3$.

Given any connected component $C$ of $\partial \Omega$ and fixed a point $P_0 \in C$, let us define as positive the orientation of $C$ associated to an arclength parameterization $\psi(s) = (x_1(s), x_2(s))$, $s \in [0, l(C)]$, such that $\psi(0) = P_0$ and $\psi'(s) = \tau(\psi(s))$.

Here $l(C)$ denotes the length of $C$.

Throughout the paper, we denote by $w, \alpha, \alpha = 1, 2, w_s,$ and $w_n$ the derivatives of a function $w$ with respect to the $x_\alpha$ variable, to the arclength $s$ and to the normal direction $n$, respectively, and similarly for higher order derivatives.

We denote by $\mathbb{M}^2, \mathbb{M}^3$ the Banach spaces of second order and the third order tensors and by $\widehat{\mathbb{M}}^2, \widehat{\mathbb{M}}^3$ the corresponding subspaces of tensors having components invariant with respect to permutations of the indexes.

Let $\mathcal{L}(X, Y)$ be the space of bounded linear operators between Banach spaces $X$ and $Y$. Given $K \in \mathcal{L}(\mathbb{M}^2, \mathbb{M}^2)$ and $A, B \in \mathbb{M}^2$, we use the following notation

$$ (KA)_{ij} = \sum_{l, m=1}^{2} K_{ilm} A_{lm}, \quad (2.5) $$

$$ A \cdot B = \sum_{i,j=1}^{2} A_{ij} B_{ij}, \quad (2.6) $$

Similarly, given $K \in \mathcal{L}(\mathbb{M}^3, \mathbb{M}^3)$ and $A, B \in \mathbb{M}^3$, we denote

$$ (KA)_{ijk} = \sum_{l, m, n=1}^{2} K_{ijklmn} A_{lmn}, \quad (2.7) $$

$$ A \cdot B = \sum_{i,j,k=1}^{2} A_{ijk} B_{ijk}, \quad (2.8) $$

Moreover, for any $A \in \mathbb{M}^n$ with $n = 2, 3$ we shall denote

$$ |A| = (A \cdot A)^{\frac{1}{2}}, \quad (2.9) $$

The linear space of the infinitesimal rigid displacements is defined as

$$ \mathcal{R}_2 = \{ r(x) = c + Wx, \ c \in \mathbb{R}^2, \ W \in \mathbb{M}^2, \ W + W^T = 0 \}. \quad (2.10) $$

Throughout the paper, summation over repeated indexes is assumed.
3 The Neumann problem

3.1 Nanoplate mechanical model

Let us consider a nanoplate $\Omega \times (-\frac{t}{2}, \frac{t}{2})$, where the middle surface $\Omega$ is a bounded domain of $\mathbb{R}^2$, and the thickness $t$ is constant and small with respect to $\text{diam}(\Omega)$, i.e. $t << \text{diam}(\Omega)$. We assume that the boundary $\partial \Omega$ of $\Omega$ is of class $C^{2,1}$, with constants $r_0$, $M_0$, and that

$$|\Omega| \leq M_1 r_0^2,$$

(3.1)

where $M_1$ is a positive constant.

The material of the nanoplate is assumed to be linearly elastic, inhomogeneous, center-symmetric and isotropic, according to the simplified version of Toupin [43], [44] and Mindlin and Eshel [30] theories proposed by Lam et al. in [24].

Under the kinematic framework of the Kirchhoff-Love theory, and for infinitesimal deformation, the statical equilibrium problem of the nanoplate loaded at the boundary and under vanishing body forces is described by the following Neumann boundary value problem [21]:

$$(M_{\alpha\beta} + M^h_{\alpha\beta\gamma\gamma})_{,\alpha\beta} = 0 \text{ in } \Omega,$$

(3.2)

$$(M_{\alpha\beta} + M^h_{\alpha\beta\gamma\gamma})_{,\alpha} n_{\beta} + ((M_{\alpha\beta} + M^h_{\alpha\beta\gamma\gamma}) n_{\alpha} \tau_{\beta} )_{,s} + (M^h_{\alpha\beta\gamma\gamma} n_{\alpha} \tau_{\beta} )_{,ss} - (M^h_{\alpha\beta\gamma\gamma} n_{\alpha} \tau_{\beta} )_{,s} = -\hat{V} \text{ on } \partial \Omega,$$

(3.3)

$$(M_{\alpha\beta} + M^h_{\alpha\beta\gamma\gamma}) n_{\alpha} n_{\beta} + (M^h_{\alpha\beta\gamma\gamma} n_{\alpha} n_{\gamma} (\tau_{\alpha} n_{\beta} + \tau_{\beta} n_{\alpha} ))_{,s} - (M^h_{\alpha\beta\gamma\gamma} n_{\alpha} n_{\gamma} n_{\beta} )_{,s} n_{s} = -\hat{M} n \text{ on } \partial \Omega,$$

(3.4)

$$M^h_{\alpha\beta\gamma\gamma} n_{\alpha} n_{\beta} n_{\gamma} = -\hat{M}^h n \text{ on } \partial \Omega.$$

(3.5)

The functions $M_{\alpha\beta} = M_{\alpha\beta}(u)$, $M^h_{\alpha\beta\gamma\gamma} = M^h_{\alpha\beta\gamma\gamma}(u)$, $\alpha, \beta, \gamma = 1, 2$, in the above equations are the cartesian components of the couple tensor $M = (M_{\alpha\beta})$ and the high-order couple tensor $M^h = (M^h_{\alpha\beta\gamma\gamma})$, respectively, corresponding to the transverse displacement $u(x_1, x_2)$, $u : \Omega \rightarrow \mathbb{R}$, of the point $(x_1, x_2) = x$ belonging to the middle surface of the nanoplate. To simplify the notation, the
dependence of these quantities on \( u \) is not explicitly indicated in (3.2)–(3.5) and in what follows.

As shown in [21], the functions \( M_{\alpha\beta} \) are given by

\[
M_{\alpha\beta} = -(P_{\alpha\beta\gamma\delta} + P^h_{\alpha\beta\gamma\delta})u_{\gamma\delta}, \tag{3.6}
\]

where the fourth order tensors \( P = P(x) \in L^\infty(\Omega, L(\tilde{\mathcal{M}}^2, \tilde{\mathcal{M}}^2)), P^h = P^h(x) \in L^\infty(\Omega, L(\tilde{\mathcal{M}}^2, \tilde{\mathcal{M}}^2)) \) have Cartesian components \( P_{\alpha\beta\gamma\delta}, P^h_{\alpha\beta\gamma\delta} \) given by

\[
P_{\alpha\beta\gamma\delta} = B((1 - \nu)\delta_{\alpha\gamma}\delta_{\beta\delta} + \nu\delta_{\alpha\beta}\delta_{\gamma\delta}), \tag{3.7}
\]

\[
P^h_{\alpha\beta\gamma\delta} = (2a_2 + 5a_1)\delta_{\alpha\gamma}\delta_{\beta\delta} + (-a_1 - a_2 + a_0)\delta_{\alpha\beta}\delta_{\gamma\delta}. \tag{3.8}
\]

It is easy to verify that, for every \( A, B \in \tilde{\mathcal{M}}^2, \)

\[
P A \cdot B = P B \cdot A, \quad \text{a.e. in } \Omega, \tag{3.9}
\]

\[
P^h A \cdot B = P^h B \cdot A, \quad \text{a.e. in } \Omega. \tag{3.10}
\]

The bending stiffness (per unit length) \( B = B(x) \) is given by the function

\[
B(x) = \frac{E(x)\mu^3}{12(1-\nu^2(x))}, \tag{3.11}
\]

where the Young’s modulus \( E \) and the Poisson’s coefficient \( \nu \) of the material can be written in terms of the Lamé moduli \( \mu \) and \( \lambda \) as follows

\[
E(x) = \frac{\mu(x)(2\mu(x) + 3\lambda(x))}{\mu(x) + \lambda(x)}, \quad \nu(x) = \frac{\lambda(x)}{2(\mu(x) + \lambda(x))). \tag{3.12}
\]

On \( \mu \) and \( \lambda \) we assume the following ellipticity conditions:

\[
\mu(x) \geq \alpha_0 > 0, \quad 2\mu(x) + 3\lambda(x) \geq \gamma_0 > 0 \quad \text{a.e. in } \Omega, \tag{3.13}
\]

where \( \alpha_0, \gamma_0 \) are positive constants.

The coefficients \( a_i(x), i = 0, 1, 2, \) are given by (see [21])

\[
a_0(x) = 2\mu(x)\ell_0^2, \quad a_1(x) = \frac{2}{15}\mu(x)\ell_0^2, \quad a_2(x) = \mu(x)\ell_2^2, \tag{3.14}
\]

where the material length scale parameters \( \ell_i \) are assumed to be positive constants.

Denoting
\[ l = \min\{l_0, l_1, l_2\}, \quad (3.15) \]

by (3.13)-(3.15), we have

\[ a_i(x) \geq tl^2\alpha_0^h > 0, \quad i = 0, 1, 2, \quad \text{a.e. in } \Omega, \quad (3.16) \]

where \( \alpha_0^h = \frac{2}{l^2}\alpha_0 \).

The functions \( \overline{M}_{ijk} \) \( (i, j, k = 1, 2) \) are given by

\[ \overline{M}_{ijk} = Q_{ijklmn}u_{lmn}, \quad (3.17) \]

where the sixth order tensor \( Q = Q(x) \in L^{\infty}(\Omega, \mathcal{L}(\hat{M}^3, \hat{M}^3)) \) can be expressed as follows \((i, j, k, l, m, n = 1, 2)\)

\[ Q_{ijklmn} = \frac{1}{3}(b_0 - 3b_1)(\delta_{ij}\delta_{km} + \delta_{ik}\delta_{mn} + \delta_{jk}\delta_{lm}) + \frac{5}{6}b_1 \delta_{jn}(\delta_{kl}\delta_{km} + \delta_{km}\delta_{kl}) + \delta_{in}(\delta_{jl}\delta_{km} + \delta_{jm}\delta_{kl}) + \delta_{in}(\delta_{jl}\delta_{km} + \delta_{jm}\delta_{kl}), \quad (3.18) \]

where \( 2(Q_8 + 2Q_9) = 5b_1 \) \( (3.19) \)

and

\[ b_0(x) = 2\mu(x)\frac{l_0^3}{12}, \quad b_1(x) = \frac{2}{5}\mu(x)\frac{l_0^3}{12} \quad \text{a.e. in } \Omega. \quad (3.20) \]

Note that, by (3.13)–(3.19), the constitutive equations (3.17) become

\[ \overline{M}_{ijk} = \frac{1}{3}(b_0 - 3b_1)(\delta_{ij}u_{mmk} + \delta_{ik}u_{mmj} + \delta_{jk}u_{mni}) + 5b_1u_{ijk}, \quad (3.21) \]

It is easy to verify that, for every \( A, B \in \hat{M}^3 \),

\[ QA \cdot B = QB \cdot A, \quad \text{a.e. in } \Omega. \quad (3.22) \]

The functions \( \hat{V} \) (shear force), \( \hat{M}_n \) (bending moment) and \( \hat{M}_h^b \) (high-order bending moment) appearing in the boundary equilibrium equations (3.3)–(3.5) are the work conjugate actions to the deflection \( u \), to the normal derivative \( \frac{\partial u}{\partial n} \) and to the second normal derivative \( \frac{\partial^2 u}{\partial n^2} \) at the boundary \( \partial \Omega \), respectively. On these quantities we require the following regularity conditions

\[ \hat{V} \in H^{-5/2}(\partial \Omega), \quad \hat{M}_n \in H^{-3/2}(\partial \Omega), \quad \hat{M}_h^b \in H^{-1/2}(\partial \Omega). \quad (3.23) \]
In the paper several constants depending on the a priori data will appear. In order to simplify our notation, we will denote them by $C, C_1, C_2, ...$, avoiding in most cases to point out their specific dependence on the a priori data which may vary from case to case.

### 3.2 Variational formulation and well-posedness of the Neumann problem

In view of the variational formulation of the equilibrium problem (3.2)–(3.5), we recall the following ellipticity result.

**Lemma 3.1** (Strong convexity of the strain energy density; [21]). Let the tensors $\mathbb{P}, \mathbb{P}^h \in L^\infty(\Omega, \mathcal{L}(\hat{\mathbb{M}}^2, \hat{\mathbb{M}}^2))$ and $\mathbb{Q} \in L^\infty(\Omega, \mathcal{L}(\hat{\mathbb{M}}^3, \hat{\mathbb{M}}^3))$ be given by (3.7), (3.8) and (3.18)–(3.20) respectively, with Lamé moduli $\lambda, \mu$ satisfying (3.13). For every $w \in H^3(\Omega)$, we have

$$ (\mathbb{P} + \mathbb{P}^h)D^2w \cdot D^2w \geq t(t^2 + l^2)\xi_P|D^2w|^2 \quad \text{a.e. in } \Omega, \tag{3.24} $$

$$ \mathbb{Q}D^3w \cdot D^3w \geq t^3l^2\xi_Q|D^3w|^2 \quad \text{a.e. in } \Omega, \tag{3.25} $$

where $\xi_P, \xi_Q$ are positive constants only depending on $\alpha_0$ and $\gamma_0$ and $l$ has been defined in (3.15).

In order to introduce the variational formulation of the Neumann problem (3.2)–(3.5), we need to derive an expression of the derivatives with respect to the cartesian variables at boundary points in terms of the derivatives with respect to local variables. The following lemma holds.

**Lemma 3.2.** Let $\Omega$ be a bounded domain in $\mathbb{R}^2$ of $C^2$ class and let $w \in H^3(\Omega)$. At any point of the boundary of $\Omega$, the following change of variables formulas hold:

$$ w_{,\alpha} = w_{,\alpha} n_\beta + w_{,s} \tau_\beta \quad \text{a.e. on } \partial\Omega, \tag{3.26} $$

$$ w_{,\alpha\beta} = w_{,ss} \tau_\alpha \tau_\beta + w_{,m} n_\alpha n_\beta + w_{,sn} (\tau_\alpha n_\beta + \tau_\beta n_\alpha) + w_{,sa} (\tau_\alpha \tau_\beta - n_\alpha n_\beta) + w_{,m} \tau_\alpha n_{\beta, s} \quad \text{a.e. on } \partial\Omega, \tag{3.27} $$
\[w,_{\alpha\beta} = w,_{ss} \tau_\alpha \tau_\beta + w,_{nn} n_\alpha n_\beta + w,_{sn} (\tau_\alpha n_\beta + \tau_\beta n_\alpha) +
\]
\[+ w,_{s} (\tau_\beta n_\alpha, s - n_\beta n_\alpha, s) + w,_{n} \tau_\beta n_\alpha, s \quad \text{a.e. on } \partial \Omega. \quad (3.28)\]

**Proof.** Formula (3.26) is standard. By a density argument it is not restrictive to assume \(w \in C^2(\Omega)\). Let \(s\) be an arclength defined on \(\partial \Omega\). Locally \(\partial \Omega\) is represented either as \((\xi_1, g(\xi_1))\), or as \((g(\xi_2), \xi_2)\), with \(g \in C^2[a,b]\). In view of the formulas (3.27), (3.28), it follows that the formulas are symmetric with respect to the cartesian coordinates, so that it is non restrictive to prove the result when \(\partial \Omega\) is locally represented as \((\xi_1, g(\xi_1))\). The arclength \(s\), up to an additive constant, is given by
\[
s(\xi_1) = \pm \int_a^{\xi_1} \sqrt{1 + (g'(t))^2} dt,
\]
the sign depending on the fact that the domain \(\Omega\) is described locally either as \(\{x(x_1, x_2) \mid x_2 > g(x_1)\}\) or as \(\{x(x_1, x_2) \mid x_2 < g(x_1)\}\) respectively.

To fix ideas, let us consider the first situation, so that we have
\[
s'(\xi_1) = \sqrt{1 + (g'(\xi_1))^2}.
\]
(3.29)

For the inverse function \(\xi_1(s)\), we have
\[
\xi_1'(s) = \frac{1}{\sqrt{1 + (g'(\xi_1(s)))^2}}
\]
(3.30)

The unit tangent and outer normal vector at \((\xi_1, g(\xi_1))\) are given by
\[
\tau = \left( \frac{1}{\sqrt{1 + (g'(\xi_1))^2}}, \frac{g'(\xi_1)}{\sqrt{1 + (g'(\xi_1))^2}} \right),
\]
(3.31)
\[
n = \left( \frac{g'(\xi_1)}{\sqrt{1 + (g'(\xi_1))^2}}, \frac{-1}{\sqrt{1 + (g'(\xi_1))^2}} \right).
\]
(3.32)

It is useful to notice that \(n_1 = \tau_2\), \(n_2 = -\tau_1\).

We have
\[
\tau_{1,s} = -n_{2,s} = \frac{-g'g''}{(1 + (g')^2)^2}|_{\xi_1(s)},
\]
(3.33)
\[
\tau_{2,s} = n_{1,s} = \frac{g''}{(1 + (g')^2)^2}|_{\xi_1(s)}.
\]
(3.34)

Recalling that the curvature \(K\) is given by
\[
K = \frac{g''}{(1 + (g')^2)^{3/2}}|_{\xi_1(s)},
\]
(3.35)
we can rewrite the above formulas in the following form

\begin{align*}
  n_{\alpha,s} &= K \tau_{\alpha}, \\
  \tau_{\alpha,s} &= -K n_{\alpha}.
\end{align*}

Let us introduce a local coordinate system \((y_1, y_2) = (s, z)\), where \(s\) is the arclength parameter and \(z\) is the shift along the direction of the outer unit normal \(n\). Let us consider the following map

\[ x = \varphi(y), \quad (x_1, x_2) = \varphi(y_1, y_2) = \varphi(s, z) \quad s \in I, z \in (-\delta, \delta), \]

\[ \varphi(s, z) = (\xi_1(s), g(\xi_1(s))) + zn = \left( \xi_1(s) + z \frac{g'(\xi_1(s))}{\sqrt{1 + (g'(\xi_1(s))^2)}} \right), \]

where \(I\) is an open interval and \(\delta\) is a positive constant.

The Jacobian matrix of \(\varphi\) is

\[ J\varphi(s, z) = \begin{pmatrix}
  \frac{1}{\sqrt{1 + (g')^2}} + \frac{z g''}{(1 + (g')^2)^{3/2}} & \frac{g'}{\sqrt{1 + (g')^2}} \\
  g' \left( \frac{1}{\sqrt{1 + (g')^2}} + \frac{z g''}{(1 + (g')^2)^{3/2}} \right) & \frac{-1}{\sqrt{1 + (g')^2}}
\end{pmatrix}, \]

where \(g'\) and \(g''\) have to be computed in \(\xi_1(s)\).

The determinant of the above matrix is given by

\[ \det(J\varphi) = -1 - \frac{z g''}{(1 + (g')^2)^{3/2}}. \]

Notice that \(\det(J\varphi) \neq 0\) in a suitable neighborhood of \(I \times \{0\}\), whose image through the map \(\varphi\) is a neighborhood of a portion of \(\partial \Omega\).

Therefore \(\varphi\) is locally invertible, and let \(f\) its inverse:

\[ y = f(x), \quad (s, z) = (y_1, y_2) = f(x_1, x_2) = (f_1(x_1, x_2), f_2(x_1, x_2)). \]

The Jacobian matrix of \(f\) is
Recalling (3.33)–(3.34), we can compute at boundary points \((z, w, x)\) that \((\tau \beta, s)\) and \((\tau \alpha, s)\) have to be computed in \(f_2(x_1, x_2)\).

Let us recall the following formula (see for instance [40, p. 458, formula (7.101)])

\[
J f(x_1, x_2) = \begin{pmatrix}
\begin{pmatrix} \sqrt{1 + (g')^2 + \frac{g''}{1 + (g')^2}} \end{pmatrix}^{-1} g' \begin{pmatrix} \sqrt{1 + (g')^2 + \frac{g''}{1 + (g')^2}} \end{pmatrix}^{-1} \\
\frac{g'}{\sqrt{1 + (g')^2}} & \frac{-1}{\sqrt{1 + (g')^2}}
\end{pmatrix},
\]

(3.39)

where \(g'\) and \(g''\) have to be computed in \(\xi_1(f_1(x_1, x_2))\) and \(z\) has to be computed in \(f_2(x_1, x_2)\).

Replacing \(y_1\) and \(y_2\) with \(s\) and \(z\) respectively and noticing that \((\cdot)_{zn} = (\cdot)_{z}^{n}\) at boundary points, we have that

\[
I = w_{\alpha\beta} (x) = \sum_{i,j=1}^{2} w_{i,y_i,y_j} (y) f_{i,x_\alpha} (x) f_{j,x_\beta} (x) + \sum_{i,j=1}^{2} w_{i,y_i} (y) f_{j,x_\alpha} (x) f_{i,x_\beta} (y) = I + II
\]

(3.40)

where \(y = f(x)\). Recalling \(3.33\)–\(3.34\), we can compute at boundary points \((z = 0)\)

\[
(f_{1,x_1})_{z} = \frac{-g'g''}{(1 + (g')^2)^2} |_{\xi_1(s)} = \tau_{1,s} = -n_{2,s},
\]

(3.43)

\[
(f_{1,x_2})_{z} = \frac{-g''}{(1 + (g')^2)^2} |_{\xi_1(s)} = \tau_{2,s} = -n_{1,s},
\]

(3.44)

\[
(f_{2,x_1})_{z} = \frac{-g''}{(1 + (g')^2)^2} |_{\xi_1(s)} = \tau_{1,s} = -n_{2,s},
\]

(3.45)

\[
(f_{2,x_2})_{z} = \frac{-g'g''}{(1 + (g')^2)^2} |_{\xi_1(s)} = \tau_{2,s} = n_{1,s},
\]

(3.46)

\[
(f_{2,x_1})_{z} = \frac{-g''}{(1 + (g')^2)^2} |_{\xi_1(s)} = \tau_{2,s} = n_{1,s},
\]

(3.47)

\[
(f_{2,x_2})_{z} = \frac{g'}{1 + (g')^2} |_{\xi_1(s)} = \tau_{1,s} = n_{2,s},
\]

(3.48)

\[
(f_{2,x_1})_{z} = 0,
\]

(3.49)

\[
(f_{2,x_2})_{z} = 0.
\]

(3.50)
Recalling (3.36)–(3.37), we can summarize these results in the following compact form

\[
(f_1, x_β) = \tau_β s = -K n_β, \tag{3.51}
\]

\[
(f_1, x_β)_z = -n_β s = -K \tau_β, \tag{3.52}
\]

\[
(f_2, x_β)_s = n_β s = K \tau_β, \tag{3.53}
\]

\[
(f_2, x_β)_z = 0. \tag{3.54}
\]

Therefore we have

\[
II = w_s (\tau_α \tau_β s - n_α n_β s) + w_m \tau_α n_β s =
\]

\[
w_s (-K \tau_α n_β - K n_α \tau_β) + w_m K \tau_α \tau_β =
\]

\[
w_s (\tau_β \tau_α s - n_β n_α s) + w_m \tau_β n_α s \tag{3.55}
\]

and the thesis follows from (3.41) and the above formula. □

We are now in position to deduce the weak formulation of the problem (3.2)–(3.5).

By multiplying equation (3.2) by a test function \(w \in H^3(Ω)\) and integrating by parts three times we get

\[
\int_Ω -\mathcal{M}_{αβ}(u) w_{αβ} + \overline{\mathcal{M}}_{αβγ}(u) w_{αβγ} = \int_{∂Ω} (\mathcal{M}_{αβ}(u) + \overline{\mathcal{M}}_{αβγ}(u)) w_{αβ} \tag{3.56}
\]

By using formulas (3.26) and (3.28) in the second and third boundary integral on the right hand side of (3.56) respectively we end up with

\[
\int_Ω -\mathcal{M}_{αβ}(u) w_{αβ} + \overline{\mathcal{M}}_{αβγ}(u) w_{αβγ} =
\]

\[
\int_{∂Ω} (\mathcal{M}_{αβ}(u) + \overline{\mathcal{M}}_{αβγ}(u)) w_{αβ} +
\]

\[
\int_{∂Ω} (\mathcal{M}_{αβ}(u) + \overline{\mathcal{M}}_{αβγ}(u)) n_α n_β + (\overline{\mathcal{M}}_{αβγ}(u) n_γ n_α n_β) w +
\]

\[
\int_{∂Ω} (-\mathcal{M}_{αβ}(u) + \overline{\mathcal{M}}_{αβγ}(u)) n_α n_β + \overline{\mathcal{M}}_{αβγ}(u) n_γ n_α n_β =
\]

\[
\int_{∂Ω} \overline{\mathcal{M}}_{αβγ}(u) n_α n_β n_γ w_{αn}.
\]
Hence taking into account the boundary conditions (3.3) - (3.5), the latter implies that
\[ \int_{\Omega} -M_{\alpha\beta}(u)w_{\alpha\beta} + M_{\alpha\beta\gamma}^h(u)w_{\alpha\beta\gamma} = - \int_{\partial\Omega} \tilde{V}w + \tilde{M}_n w_{,n} + \tilde{M}_n^h w_{,nn} . \] (3.57)
By expressing the derivative \( w_{,n} \) and \( w_{,nn} \) at the boundary with respect to cartesian coordinates we can rewrite (3.57) as follows
\[ \int_{\Omega} -M_{\alpha\beta}(u)w_{\alpha\beta} + M_{\alpha\beta\gamma}^h(u)w_{\alpha\beta\gamma} = - \int_{\partial\Omega} \tilde{V}w + \tilde{M}_n n_\alpha w_{,\alpha} + \tilde{M}_n^h n_\alpha n_\beta w_{,\alpha\beta} . \] (3.58)
Choosing test function \( w = 1, w = x_1, w = x_2 \) in (3.58), we obtain the following three compatibility conditions
\[ \int_{\partial\Omega} \tilde{V} = 0, \int_{\partial\Omega} \tilde{V} x_1 + \tilde{M}_n n_1 = 0, \int_{\partial\Omega} \tilde{V} x_2 + \tilde{M}_n n_2 = 0. \] (3.59)
Let us denote
\[ a(u, w) = \int_{\Omega} -M_{\alpha\beta}(u)w_{\alpha\beta} + M_{\alpha\beta\gamma}^h(u)w_{\alpha\beta\gamma} , \] (3.60)
\[ L(w) = - \int_{\partial\Omega} \tilde{V}w + \tilde{M}_n w_{,n} + \tilde{M}_n^h w_{,nn} , \] (3.61)
\[ \tilde{L}(w) = - \int_{\partial\Omega} \tilde{V}w + \tilde{M}_n n_\alpha w_{,\alpha} + \tilde{M}_n^h n_\alpha n_\beta w_{,\alpha\beta} . \] (3.62)
The variational formulation of the Neumann problem (3.2) - (3.5) is as follows.

**Definition 3.3.** (Weak formulation of the Neumann problem)
A function \( w \in H^3(\Omega) \) satisfying
\[ a(u, w) = L(w) , \text{ for every } w \in H^3(\Omega) , \] (3.63)
is called a weak solution to the Neumann problem (3.2) - (3.5).

From this definition it is evident that, given a weak solution \( u \), also \( u + l \) is a solution, for every affine function \( l \).

Therefore, in order to uniquely identify the solution, we assume the following normalization conditions
\[ \int_{\Omega} u = 0, \int_{\Omega} u_{,\alpha} = 0, \alpha = 1, 2. \] (3.64)
We consider the continuous bilinear form
\[(3.59)\]
the compatibility conditions
\[(3.60)\]
where
\[C > 0\]
(see for instance \[31, Proposition 3.3\]) we have that
\[a = \|\cdot\|_H^2(\Omega)\]
\[l\]
is an affine function.
Proof. We introduce the subspace \(H(\Omega)\) of \(H^3(\Omega)\) defined by
\[H(\Omega) = \{v \in H^3(\Omega) : \int_\Omega v = 0, \int_\Omega v_{\alpha} = 0, \quad \alpha = 1, 2\},\]
endowed with the usual \(\|\cdot\|_{H^3(\Omega)}\) norm. By the second order Poincaré inequality (see for instance \[31, Proposition 3.3\]) we have that
\[r_0^2 \int_\Omega |D^2 v|^2 + r_0^4 \int_\Omega |D^3 v|^2 \leq \|v\|_{H^3(\Omega)}^2 \leq C \left( r_0^2 \int_\Omega |D^2 v|^2 + r_0^4 \int_\Omega |D^3 v|^2 \right)\]
(3.67)
where \(C > 0\) is a constant only depending on \(M_0, M_1\).

We consider the continuous bilinear form
\[a : H(\Omega) \times H(\Omega) \to \mathbb{R}\]
(3.68)
where \(a\) is defined in \(3.69\).

By Lemma \(3.1\) and \(3.67\) we have that, for every \(w \in H(\Omega)\),
\[a(w, w) \geq C \left( r_0^2 \int_\Omega |D^2 w|^2 + r_0^4 \int_\Omega |D^3 w|^2 \right) \geq C r_0 \|w\|_{H^3(\Omega)}^2,\]
(3.69)
with \(C > 0\) only depending on \(\frac{1}{r_0}, \frac{1}{r_0}, \xi_\rho, \xi_\zeta, M_0, M_1\). Hence, we may infer that the bilinear form \(a\) is coercive. By standard trace inequalities we have that for any \(w \in H(\Omega)\)
\[|L(w)| \leq C r_0 \left( \|\tilde{\nabla}\|_{H^{-\frac{1}{2}}(\partial\Omega)} + r_0^{-1} \|\tilde{M}_n\|_{H^{-\frac{1}{2}}(\partial\Omega)} + r_0^{-2} \|\tilde{M}_n^h\|_{H^{-\frac{1}{2}}(\partial\Omega)} \right) \|w\|_{H^3(\Omega)},\]
(3.70)
with $C$ only depending on $M_0$, $M_1$. From the latter we deduce that $\tilde{L}$ is a continuous functional on $H(\Omega)$.

By the Lax-Milgram Theorem, we can infer that there exists a unique $u \in H(\Omega)$ such that

$$a(u, w) = \tilde{L}(w), \quad \text{for any } w \in H(\Omega).$$

(3.71)

Given any $g \in H^3(\Omega)$, there exists $w \in H(\Omega)$ and an affine function $l(x_1, x_2) = a + bx_1 + cx_2$ such that

$$g(x_1, x_2) = w(x_1, x_2) + a + bx_1 + cx_2.$$  

(3.72)

By using the compatibility conditions (3.59), (3.71) extends to every test function $g \in H^3(\Omega)$, that is $u$ is the desired weak solution to problem (3.2) - (3.5).

By using the weak solution $u$ as test function in (3.71) and combining (3.69), (3.70) we get

$$\|u\|_{H^3(\Omega)}^2 \leq Cr_0^{-1}a(u, u) = Cr_0^{-1}\tilde{L}(u) \leq C \left(\|\tilde{V}\|_{H^{-5/2}(\partial\Omega)} + r_0^{-1}\|\tilde{M}_n\|_{H^{-3/2}(\partial\Omega)} + r_0^{-2}\|\tilde{M}_{n}^2\|_{H^{-3/2}(\partial\Omega)}\right)\|u\|_{H^3(\Omega)},$$

(3.73)

obtaining (3.65). Finally, let us assume that $v \in H^3(\Omega)$ is a weak solution to (3.2) - (3.5). Hence

$$a(u - v, w) = 0, \quad \text{for any } w \in H^3(\Omega).$$

(3.74)

In particular, choosing as test function $w = u - v$ we have that

$$a(u - v, u - v) = 0.$$  

(3.75)

By Lemma 3.1 we deduce that $\|D^2(u - v)\|_{L^2(\Omega)} = 0$ meaning that $u - v$ is an affine function a.e. in $\Omega$.

\[\square\]

### 3.3 Advanced regularity

We conclude this section with a global regularity result.

**Theorem 3.5** (Global $H^4$-regularity). Let $\Omega$ be a bounded domain in $\mathbb{R}^2$ with boundary $\partial\Omega$ of class $C^{5,1}$ with constants $r_0$, $M_0$, and satisfying (3.1). Let
$u \in H^3(\Omega)$ be the weak solution of the Neumann problem \[(3.2) \text{ - (3.5)}\] satisfying \[(3.54), \text{ where } \hat{V} \in H^{-3/2}(\partial \Omega), \: \hat{M}_n \in H^{-1/2}(\partial \Omega), \: \hat{M}^h_n \in H^{1/2}(\partial \Omega) \text{ are such that the compatibility conditions } \[(3.55)\text{ are satisfied. Assume that } P, \: P^h \text{ defined in } \[(3.7)\text{, respectively. Theorem 3.6 (Interior regularity). Let } B_\sigma \text{ be an open ball in } \mathbb{R}^2 \text{ centered at the origin and with radius } \sigma. \text{ Let } u \in H^3(B_\sigma) \text{ be such that}\]

\[a(u, \varphi) = 0, \quad \text{for every } \varphi \in H^3_0(B_\sigma), \quad (3.77)\]

where

\[a(u, \varphi) = \int_{B_\sigma} (P + P^h)D^2 u \cdot D^2 \varphi + Q D^3 u \cdot D^3 \varphi. \quad (3.78)\]

The tensors $P, P^h \in C^{0,1}(\overline{B_\sigma}), Q \in C^{0,1}(\overline{B_\sigma})$ defined in \[(3.7), \text{ (3.8), (3.13)}\] satisfy the strong convexity condition \[(3.24), \text{ (3.25)}\], respectively.

Then, $u \in H^4(B_{\sigma/2})$ and we have

\[\|u\|_{H^4(B_{\sigma/2})} \leq C \|u\|_{H^3(B_\sigma)}, \quad (3.79)\]

where $C > 0$ only depends on $\frac{1}{\tau_0}, \frac{1}{r_0}, \xi_Q, \xi_P, \|P\|_{C^{0,1}(\overline{B_\sigma})}, \|P^h\|_{C^{0,1}(\overline{B_\sigma})}, \|Q\|_{C^{0,1}(\overline{B_\sigma})}$.

Theorem 3.7 (Boundary regularity). Let us denote by $B^+_\sigma$ the hemidisk $\{(x_1, x_2) \in \mathbb{R}^2 \mid x_1^2 + x_2^2 < \sigma^2, \: x_2 > 0\}$ and let $\Gamma_\sigma = \{(x_1, x_2) \in \mathbb{R}^2 \mid -\sigma < x_1 < \sigma, \: x_2 = 0\}, \Gamma^+_\sigma = \partial B^+_\sigma \setminus \Gamma_\sigma$. Let $u \in H^3(B^+_\sigma)$ be such that

\[a_+(u, \varphi) = l_+(\varphi), \quad \text{for every } \varphi \in H^3_{l_+}(B^+_\sigma), \quad (3.80)\]
Then \( B \) is a convexity conditions \( \Omega = \Omega_0 \) (3.9) symmetry conditions \( K_1 \) that here we have used the notation introduced in Theorem 3.7 for \( \Gamma \)

Proof of Proposition 3.5. Without loss of generality we can assume \( g = 0, \frac{\partial g}{\partial n} = 0, \frac{\partial^2 g}{\partial n^2} = 0 \) on \( \Gamma^+ \),

\[
a_+(u, \varphi) = a_+^E(u, \varphi) + a_+^K(u, \varphi),
\]

(3.81)

\[
a_+^E(u, \varphi) = \int_{B^+} \sum_{i,j=1}^2 \|E^{(i,j)}D^iu \cdot D^j\varphi,
\]

(3.82)

\[
a_+^K(u, \varphi) = \int_{B^+} \sum_{i,j=1}^3 \|K^{(i,j)}D^iu \cdot D^j\varphi,
\]

(3.83)

and \( l_+(\cdot) \) is a continuous functional on \( H^3_{\Gamma^+}(B^+_\sigma) \) such that

\[
|l_+(\varphi)| \leq G\|\varphi\|_{H^2(B^+_\sigma)} \quad \text{for every } \varphi \in H^3_{\Gamma^+}(B^+_\sigma),
\]

(3.84)

where \( G \) is a positive constant and \( E^{(i,j)} \in \mathcal{L}(M^1, M^j), i, j = 1, 2, (M^1 \equiv \mathbb{R}^2), K^{(i,j)} \in \mathcal{L}(M^1, M^j), i, j = 1, 2, 3, f \in L^2(B^+_\sigma) \). Let the tensor fields \( E^{(i,j)}, K^{(i,j)} \) be of \( C^{0,1} \) class in \( B^+_\sigma \) satisfying

\[
\sum_{i,j=1}^2 \sigma^{4-2(i+j)}\|E^{(i,j)}\|_{C^{0,1}(B^+_\sigma)} \leq E,
\]

(3.85)

\[
\sum_{i,j=1}^3 \sigma^{6-2(i+j)}\|K^{(i,j)}\|_{C^{0,1}(B^+_\sigma)} \leq K,
\]

(3.86)

for some positive constants \( E, K \). Moreover, let \( E^{(2,2)} \) and \( K^{(3,3)} \) satisfy the symmetry conditions (3.10)-(3.11) and (3.22), respectively, and the strong convexity conditions \( E^{(2,2)}D^2w \cdot D^2w \geq \xi_E|D^2w|^2, K^{(3,3)}D^3w \cdot D^3w \geq \xi_K|D^3w|^2 \) in \( B^+_\sigma \), for every \( w \in H^3(B^+_\sigma) \), where \( \xi_E, \xi_K \) are positive constants.

Then \( u \in H^1(B^+_\sigma) \) and we have

\[
\|u\|_{H^1(B^+_\sigma)} \leq C \left( G + \|u\|_{H^3(B^+_\sigma)} \right),
\]

(3.87)

where the constant \( C > 0 \) only depends on \( \xi_E, \xi_K, E, K \).

Proof of Proposition 3.5. Without loss of generality we can assume \( r_0 = 1 \).

By the regularity of \( \partial \Omega \), we can construct a finite collection of open sets \( \Omega_0, \widetilde{\Omega}_1, \ldots, \widetilde{\Omega}_N \) and, for every \( j, j = 1, \ldots, N \), a homeomorphism \( T_{(j)} \) of \( C^{3,1} \) class which maps \( \Omega_j = \widetilde{\Omega}_j \cap \Omega \) into \( B^+_1 \), \( \partial T_{(j)} \cap \partial \Omega \) into \( \Gamma_1 \) and \( \partial T_{(j)} \cap \Omega \) into \( \Gamma^+_1 \), such that \( \Omega = \Omega_0 \cup \left( \bigcup_{j=1}^N T_{(j)}(B^+_1) \right), \Omega_0 \subset \Omega_0, \) where \( \delta_0 > 0 \) only depends on \( M_0 \). Note that here we have used the notation introduced in Theorem 3.7 for \( \Gamma_1 \) and \( \Gamma^+_1 \).
By the regularity of $\partial \Omega$ and (3.1), the number $N$ is controlled by a constant only depending on $M_0$ and $M_1$.

The set $\Omega_0$ can be covered by a finite number of balls contained in $\Omega$. Therefore, using the local interior regularity result of Theorem 3.6, we have that $u \in H^4(\Omega_0)$ and

$$\|u\|_{H^4(\Omega_0)} \leq C\|u\|_{H^2(\Omega)},$$

(3.88)

where the constant $C > 0$ only depends on $t$, $l$, $M_1$, $\xi_\Omega$, $\|P\|_{C^{0,1}(\Omega)}$, $\|P^h\|_{C^{0,1}(\Omega)}$, $\|Q\|_{C^{0,1}(\Omega)}$.

We now fix $j$, $1 \leq j \leq N$, and we determine an estimate analogous to (3.88) in $\Omega_j$.

Let us define $H^3_{\partial \Omega_j \cap \Omega}(\Omega_j) = \{ f \in H^3(\Omega_j) | h = h, n = h, nn = 0 \text{ on } \partial \Omega_j \cap \Omega \}$. (3.89)

The function $u \in H^3(\Omega)$, solution of (3.2)–(3.5), satisfies

$$\int_{\Omega_j} (P + P^h)D^2u \cdot D^2\varphi + Q D^3u \cdot D^3\varphi = L_+(\varphi) \quad \text{for every } \varphi \in H^3_{\partial \Omega_j \cap \Omega}(\Omega_j),$$

(3.90)

where

$$L_+(\varphi) = -\int_{\Omega_j \cap \partial \Omega} \hat{V}\varphi + \hat{M}_n\varphi, n + \hat{M}_u\varphi, nn.$$

(3.91)

Hereinafter, to simplify the notation, we denote $T_{(j)}$ by $T$, and we define

$$y = T(x), \quad y \in B_1^+, \quad (3.92)$$

$$x = T^{-1}(y), \quad x \in \Omega_j, \quad (3.93)$$

$$v(y) = u(T^{-1}(y)), \quad (3.94)$$

$$\psi(y) = \varphi(T^{-1}(y)), \quad \psi \in H^3_{1+}(B_1^+). \quad (3.95)$$

By changing the variables in (3.90) according to (3.92), the function $v$ belongs to $H^3(B_1^+)$ and satisfies

$$\int_{B_1^+} \sum_{i,j=1}^{2} E^{(i,j)} D^i v \cdot D^j \psi + \sum_{i,j=1}^{3} E^{(i,j)} D^i v \cdot D^j \psi = L_+(\psi)$$

for every $\psi \in H^3_{1+}(B_1^+)$. (3.96)

23
where

\[ \mathcal{L}_+(\psi) = - \int_{\Gamma_1} \left( \hat{V}_\psi + \hat{M}_n S^T D \psi \cdot S^T \nu |S^{-T} n| + \hat{M}_h^h (RD \psi + S^T D^2 \psi S) S^T \nu \cdot S^T \nu |S^{-T} n|^2 \right) |S\tau|^{-1}, \]

(3.97)

with

\[ \hat{V}(y) = \hat{V}(\mathcal{T}^{-1}(y)), \]

(3.98)

\[ \hat{M}_n = \hat{M}_n(\mathcal{T}^{-1}(y)), \]

(3.99)

\[ \hat{M}_h^h = \hat{M}_h^h(\mathcal{T}^{-1}(y)), \]

(3.100)

and

\[ S_{kr} = \frac{\partial T_k}{\partial x_r}, \quad R_{ksr} = \frac{\partial^2 T_k}{\partial x_s \partial x_r}. \]

(3.101)

Here, \( \nu \) is the outer unit normal to \( B^+_1 \). As shown in [31] (Proposition 8.2), the expressions of the tensors \( E^{(i,j)} \in \mathcal{L}(\mathcal{M}_i, \mathcal{M}_j) \), \( i, j = 1, 2 \), \( (\mathcal{M}^1 \equiv \mathbb{R}^2) \) can be deduced passing to Cartesian coordinates, namely

\[ \sum_{i,j=1}^{2} E^{(i,j)} D^i \nu \cdot D^j \psi = (P_{ijsr} + P_{ijsr}^h)(S_{kr} S_{ls} v_{,kl} + R_{ksr} v_{,k})(S_{mi} S_{nj} \psi_{,mn} + R_{mij} \psi_{,n}) |\det S|^{-1}. \]

(3.102)

By the regularity assumptions on \( \mathcal{P} \), \( \mathcal{P}^h \) and the regularity of the boundary \( \partial \Omega \), the tensors \( E^{(i,j)} \) belong to \( C^{0,1}(\overline{B}^+_1) \), \( i, j = 1, 2 \). Moreover, by the properties of \( \mathcal{P} \) and \( \mathcal{P}^h \), the fourth order tensor \( E^{(2,2)} \) satisfies the symmetry conditions

\[ E^{(2,2)}_{mnlk} = E^{(2,2)}_{klmn} = E^{(2,2)}_{klmn}, \quad m, n, k, l = 1, 2, \text{ in } B^+_1 \]

(3.103)

and the strong convexity condition

\[ E^{(2,2)} A \cdot A \geq \xi^\circ_E |A|^2 \text{ in } \overline{B}^+_1, \]

(3.104)

for every \( 2 \times 2 \) symmetric matrix \( A \), where \( \xi^\circ_E > 0 \) is a constant only depending on \( t, l, M_0 \) and \( \xi_E \).
The term in (3.96) involving the tensors $K^{(i,j)} \in \mathcal{L}(M^i, M^j)$ can be analysed similarly. We have

$$
\sum_{i,j=1}^{3} K^{(i,j)} D^i \psi \cdot D^j \psi =
$$

$$
= Q_{ijklmn} (S_{al} S_{\beta m} S_{\gamma n} v_{,\alpha \beta \gamma} + T_{lmna} v_{,\alpha \beta} + Z_{lmna} v_{,\alpha} ) \cdot
(S_{\delta l} S_{\epsilon j} S_{\tau k} v_{,\delta \epsilon \tau} + T_{ijkl} v_{,\tau \chi} + Z_{ijkl} v_{,\tau} ) |\det S|^{-1},
$$

(3.105)

where

$$
T_{lmna} = R_{aln} S_{\beta m} + R_{\beta mn} S_{al} + R_{aml} S_{\beta n},
$$

(3.106)

$$
Z_{lmna} = \frac{\partial^3 T}{\partial x_l \partial x_m \partial x_n}.
$$

(3.107)

By the regularity assumptions on $Q$ and on the boundary $\partial \Omega$, the tensors $K^{(i,j)}$ belong to $C^{0,1}$, $i,j = 1,3$.

The sixth order tensor $K^{(3,3)}$ satisfies the symmetry conditions and the strong convexity condition

$$(\text{Claim A}) \quad K^{(3,3)} A \cdot A \geq \xi^* |A|^2 \quad \text{in} \quad B^*_1,
$$

(3.108)

for every $A \in \mathcal{M}^3$, where $\xi^* > 0$ is a constant only depending on $t$, $l$, $M_0$ and $\xi_Q$. A proof of Claim A is presented at the end of this proof.

By the regularity of the Neumann data, by the Poincaré inequality and by trace inequalities, we have

$$
|\mathcal{L}_1(\psi)| \leq C \left( \| \tilde{V} \|_{H^{-3/2}(\Gamma_1)} \| \psi \|_{H^{3/2}(\Gamma_1)} + \| \tilde{M}_n \|_{H^{-1/2}(\Gamma_1)} \| D\psi \|_{H^{1/2}(\Gamma_1)} + 
\| \tilde{M}_h \|_{H^{-1/2}(\Gamma_1)} \| D^2 \psi \|_{H^{-1/2}(\Gamma_1)} \right) \leq
$$

$$
\leq C \left( \| \tilde{V} \|_{H^{-3/2}(\Gamma_1)} + \| \tilde{M}_n \|_{H^{-1/2}(\Gamma_1)} + \| \tilde{M}_h \|_{H^{1/2}(\Gamma_1)} \right) \| \psi \|_{H^4(B^*_1)},
$$

(3.109)

for every $\psi \in H^3_{\Gamma_1} (B^*_1)$, where the constant $C > 0$ only depends on $M_0$.

Finally, by the regularity result up to the boundary, see Theorem 3.7, we have that $v \in H^4(B^*_1)$ and

$$
\| v \|_{H^4(B^*_1)} \leq C \left( \| \tilde{V} \|_{H^{-3/2}(\Gamma_1)} + \| \tilde{M}_n \|_{H^{-1/2}(\Gamma_1)} + \| \tilde{M}_h \|_{H^{1/2}(\Gamma_1)} + \| v \|_{H^4(B^*_1)} \right),
$$

(3.110)
and, by applying the homeomorphism $T$, we have

\begin{align}
\|u\|_{H^4(\Omega_j)} & \leq C \left( \|\tilde{V}\|_{H^{-3/2}(\overline{\Omega}_j \cup \partial \Omega)} + \|\tilde{M}_n\|_{H^{-1/2}(\overline{\Omega}_j \cup \partial \Omega)} + \|\tilde{M}_h\|_{H^{1/2}(\overline{\Omega}_j \cup \partial \Omega)} + \|u\|_{H^3(\Omega_j)} \right), \\
(3.111)
\end{align}

where $\Omega_j = \mathcal{T}^{-1}(B_{\frac{\rho}{2}})$ and the constant $C > 0$ only depends on $t$, $l$, $M_0$, $M_1$, $\xi_Q$, $\|P\|_{C^0(\overline{\Omega})}$, $\|P^h\|_{C^0(\overline{\Omega})}$, $\|Q\|_{C^0(\overline{\Omega})}$. Then, estimate (3.76) follows by (3.88), (3.111) and (3.65).

**Proof of Claim A.** Let us notice that, for every $A \in \hat{\mathbb{M}}^3$, the matrix $A$ given by

\begin{equation}
A_{lmn} = S_{\alpha l}S_{\beta m}S_{\gamma n}A_{\alpha \beta \gamma}
\end{equation}

belongs to $\hat{\mathbb{M}}^3$. Therefore, by the strong convexity of $Q$, we have

\begin{equation}
\mathbb{R}^{(3,3)} A \cdot A = QA \cdot A |\det S|^{-1} \geq \xi_Q^* |A|^2 \quad \text{in } B_{\frac{\rho}{4}},
\end{equation}

for every $A \in \hat{\mathbb{M}}^3$, where $\xi_Q^* > 0$ is a constant only depending on $t$, $l$, $M_0$ and $\xi_Q$. To conclude it is enough to prove that there exists a constant $C > 0$ such that

\begin{equation}
|A|^2 \geq C |A|^2 \quad \text{in } B_{\frac{\rho}{4}},
\end{equation}

for every $A \in \hat{\mathbb{M}}^3$. Noting that $A_{ijk} = \delta_{ia}\delta_{j\beta}\delta_{k\gamma}A_{i\beta\gamma}$ and $\delta_{ia} = ((ST)^{-1})_{ia}S_{i\alpha}$, we have

\begin{equation}
|A|^2 = A_{ijk}A_{ijk} = \Theta_{ij}\Theta_{\alpha \beta}\Theta_{\alpha \beta}A_{lmn}A_{pqr},
\end{equation}

where $\Theta = S^{-1}S^{-T}$. By applying Cauchy-Schwarz’s inequality iteratively and observing that $|\Theta| \leq C$ in $B_{\frac{\rho}{4}}$, it is found that $|A|^2 \leq c|A|^2$, where the constant $c > 0$ only depends on $M_0$, which implies (3.114).

**Proof of Theorem 3.6.** Without loss of regularity we can assume $\sigma = 1$. Let $\vartheta \in C^\infty_0(\mathbb{R}^2)$ be a function such that $0 \leq \vartheta(x) \leq 1$ in $\mathbb{R}^2$, with $\vartheta \equiv 1$ in $B_{\rho}$, $\vartheta \equiv 0$ in $\mathbb{R}^2 \setminus B_{\sigma_0}$ and $|D^k\vartheta| \leq C$, $k = 1, \ldots, 4$, where $\sigma_0 = \frac{1}{4}(\rho + 1) = \frac{3}{4}$, $\rho = \frac{1}{2}$ and $C > 0$ is an absolute constant.

Let $s \in \mathbb{R} \setminus \{0\}$ and let us introduce the difference operator in the $\alpha$th direction as

\begin{equation}
(\tau_{\alpha,s}v)(x) = \frac{v(x + se\alpha) - v(x)}{s}, \quad \alpha = 1, 2,
\end{equation}

(3.116)
for any function \( v \). In what follows we shall assume that \( |s| \leq \frac{1}{16} \).

For every function \( \varphi \in H^3(B_1) \), let us still denote by \( \varphi \in H^3(\mathbb{R}^2) \) its extension to the plane \( \mathbb{R}^2 \) obtained by assuming \( \varphi \equiv 0 \) in \( \mathbb{R}^2 \setminus B_1 \). Let us notice that, for every smooth function \( \psi \) and \( \alpha = 1, 2 \), we have

\[
D^\beta \tau_{\alpha,s}(\psi) = \tau_{\alpha,s}(D^\beta \psi),
\]

where

\[
D^\beta = D_{\beta_1}^\beta_1 D_{\beta_2}^\beta_2 = \frac{\partial^{\beta_1}}{\partial x_1^{\beta_1}} \frac{\partial^{\beta_2}}{\partial x_2^{\beta_2}}, \beta = (\beta_1, \beta_2).
\]

Let us start by elaborating the term in \( a(u, \varphi) \) containing the third order derivatives, with \( u \) replaced by \( \tau_{\alpha,s}(\vartheta u) \).

We have

\[
(\vartheta u)_{,\alpha \beta \gamma} = \vartheta u_{,\alpha \beta \gamma} + (\vartheta_{,\alpha} u_{,\beta \gamma} + \vartheta_{,\beta} u_{,\alpha \gamma} + \vartheta_{,\gamma} u_{,\alpha \beta}) + \\
+ (\vartheta_{,\alpha \beta} u_{,\gamma} + \vartheta_{,\alpha \gamma} u_{,\beta} + \vartheta_{,\beta \gamma} u_{,\alpha}) + \vartheta_{,\alpha \beta \gamma} u
\]

or, equivalently, in compact notation

\[
D^3(\vartheta u) = \partial D^3 u + D \partial \otimes D^2 u + D^2 \vartheta \otimes Du + u D^3 \vartheta.
\]

Therefore, we have

\[
\int_{B_1} Q D^3(\tau_{\alpha,s}(\vartheta u)) \cdot D^3 \varphi = \int_{B_1} Q(\tau_{\alpha,s}(\vartheta D^3 u)) \cdot D^3 \varphi + \\
+ \int_{B_1} Q(\tau_{\alpha,s}(D \vartheta \otimes D^2 u + D^2 \vartheta \otimes Du)) \cdot D^3 \varphi + \\
+ \int_{B_1} Q(\tau_{\alpha,s}(u D^3 \vartheta)) \cdot D^3 \varphi \equiv I_1 + I_2 + I_3.
\]

Let us estimate \( I_2 \). By the definition of \( \tau_{\alpha,s} \), we have

\[
\tau_{\alpha,s}(D \vartheta \otimes D^2 u + D^2 \vartheta \otimes Du) = D \vartheta(x + se_\alpha) \otimes \tau_{\alpha,s}(D^2 u) + \tau_{\alpha,s}(D \vartheta) \otimes D^2 u + \\
+ D^2 \vartheta(x + se_\alpha) \otimes \tau_{\alpha,s}(Du) + \tau_{\alpha,s}(D^2 \vartheta) \otimes Du
\]

and then

\[
|I_2| \leq C \|u\|_{H^3(B_1)} \|D^3 \varphi\|_{L^2(B_1)},
\]

where the constant \( C > 0 \) only depends on \( \|Q\|_{L^\infty(B_1)} \). Similarly, we have

\[
|I_3| \leq C \|u\|_{H^1(B_1)} \|D^3 \varphi\|_{L^2(B_1)},
\]

(3.120)
where the constant $C > 0$ only depends on $\|Q\|_{L^\infty(\overline{B_1})}$.

Let us rewrite the term $I_1$ as follows

$$I_1 = \int_{B_1} \tau_{\alpha,s}(\varphi D^3 u) \cdot D^3 \varphi =$$

$$= \int_{B_1} \tau_{\alpha,s}(\varphi D^3 u) \cdot D^3 \varphi - \int_{B_1} \int \tau_{\alpha,s} Q(x) (\varphi D^3 u) (x + se_\alpha) \cdot D^3 \varphi \equiv I'_1 + I''_1,$$  

(3.122)

where

$$|I''_1| \leq C \|D^3 u\|_{L^2(B_1)} \|D^3 \varphi\|_{L^2(B_1)},$$

(3.123)

with a constant $C > 0$ only depending on $\|Q\|_{C^{0,1}((B_1))}$. By integrating by parts, and recalling that $\varphi \in H^3_0(B_1)$, we have

$$I'_1 = \int_{B_1} \tau_{\alpha,s}(\varphi D^3 u) \cdot D^3 \varphi = -\int_{B_1} \varphi D^3 u \cdot (\tau_{\alpha,-s} D^3 \varphi) =$$

$$= -\int_{B_1} \varphi D^3 u \cdot (\tau_{\alpha,-s} D^3 \varphi) - \int_{B_1} \tau_{\alpha,s} Q(x) (\varphi D^3 u) (x + se_\alpha) \cdot D^3 \varphi +$$

$$+ \int_{B_1} \varphi D^3 u \cdot (D^3 \varphi (\varphi_{\alpha,-s} \tau_{\alpha,s}) + D\varphi \otimes D^2 (\varphi_{\alpha,-s} \tau_{\alpha,s}) + D^2 \varphi \otimes D (\varphi_{\alpha,-s} \tau_{\alpha,s})) =$$

$$= -\int_{B_1} \varphi D^3 u \cdot (D^3 \varphi (\varphi_{\alpha,-s} \tau_{\alpha,s}) + \tilde{I}'_1).$$

(3.124)

By Poincaré’s inequality in $H^3_0(B_1)$, we have

$$|\tilde{I}'_1| \leq C \|D^3 u\|_{L^2(B_1)} \|D^3 \varphi\|_{L^2(B_1)},$$

(3.125)

where the constant $C > 0$ only depends on $\|Q\|_{L^\infty(\overline{B_1})}$.

By using (3.120), (3.121), (3.124), (3.125) in (3.119), we have, for every $\varphi \in H^3_0(B_1)$,

$$\int_{B_1} \varphi D^3 (\varphi_{\alpha,s} (\varphi)) \cdot D^3 \varphi = -\int_{B_1} \varphi D^3 u \cdot D^3 (\varphi_{\alpha,-s} \varphi) + r_Q,$$  

(3.126)

with

$$|r_Q| \leq C \|u\|_{H^3(B_1)} \|D^3 \varphi\|_{L^2(B_1)},$$

(3.127)

where the constant $C > 0$ only depends on $\|Q\|_{C^{0,1}((B_1))}$.

By proceeding similarly with the term in $a(u, \varphi)$ containing the second order derivatives (with $u$ replaced by $\tau_{\alpha,s}(\varphi)$), for every $\varphi \in H^3_0(B_1)$ we have

$$\int_{B_1} (P + \varphi^h) D^2 (\tau_{\alpha,s}(\varphi)) \cdot D^2 \varphi = -\int_{B_1} (P + \varphi^h) D^2 u \cdot D^2 (\varphi_{\alpha,-s} \tau_{\alpha,s}) + r_P,$$  

(3.128)

28
with
\[ |x| \leq C \|u\|_{H^2(B_1)} \|D^2 \varphi\|_{L^2(B_1)}, \]
(3.129)
where the constant \( C > 0 \) only depends on \( \|P\|_{C^{0,1}(\overline{\Omega})}, \|P^h\|_{C^{0,1}(\overline{\Omega})} \).

By (3.126)–(3.129), for every \( \varphi \in H^3_0(B_1) \) we have
\[ a(\tau_{\alpha,s}(\vartheta u), \varphi) = -a(u, \vartheta \tau_{\alpha,-s} \varphi) + r, \]
(3.130)
where, by Poincaré's inequality,
\[ |r| \leq C \|u\|_{H^3(B_1)} \|D^2 \varphi\|_{L^2(B_1)} \]
and the constant \( C > 0 \) only depends on \( \|P\|_{C^{0,1}(\overline{\Omega})}, \|P^h\|_{C^{0,1}(\overline{\Omega})}, \|Q\|_{C^{0,1}(\overline{\Omega})} \).

The function \( \vartheta \tau_{\alpha,-s} \varphi \in H^3_0(B_1) \) is a test function and then, by the weak formulation of the problem (3.77), for every \( \varphi \in H^3_0(B_1) \) we have
\[ a(\tau_{\alpha,s}(\vartheta u), \varphi) \leq C \|D^3 \varphi\|_{L^2(B_1)} \|u\|_{H^3(B_1)}, \]
(3.132)
where the constant \( C > 0 \) only depends on \( \|P\|_{C^{0,1}(\overline{\Omega})}, \|P^h\|_{C^{0,1}(\overline{\Omega})}, \|Q\|_{C^{0,1}(\overline{\Omega})} \).

Let us take \( \varphi = \tau_{\alpha,s}(\vartheta u) \). By the strong convexity of the strain energy (see Lemma 3.1), for every \( s \) such that \( |s| \leq \frac{1}{16} \) we have
\[ \|D^3 \tau_{\alpha,s}(\vartheta u)\|_{L^2(B_1)} \leq C \|u\|_{H^3(B_1)} \]
(3.133)
and, therefore,
\[ \|D^4 u\|_{L^2(B_1)} \leq C \|u\|_{H^3(B_1)}, \]
(3.134)
where the constant \( C > 0 \) only depends on \( t, \xi, \|P\|_{C^{0,1}(\overline{\Omega})}, \|P^h\|_{C^{0,1}(\overline{\Omega})}, \|Q\|_{C^{0,1}(\overline{\Omega})} \). \qed

**Proof of Theorem 3.7.** Let us assume for simplicity \( \sigma = 1 \). Let us denote by \( \vartheta \in C_0^\infty(\mathbb{R}^2) \) a function such that \( 0 \leq \vartheta(x) \leq 1 \) for every \( x \in \mathbb{R}^2 \), \( \vartheta \equiv 1 \) in \( B_\rho \), \( \vartheta \equiv 0 \) in \( \mathbb{R}^2 \setminus B_{\rho_0} \), \( |D^k \vartheta| \leq C \), \( k = 1, \ldots, 4 \), where \( \rho = \frac{1}{2} \rho_0 = \frac{1}{2}(\rho + 1) + \frac{1}{4} \), and \( C \) is an absolute constant.

For every function \( \varphi \in H^2_0(B_1^+) \), we still denote by \( \varphi \in H^2(\mathbb{R}^2_+) \) its extension to \( \mathbb{R}^2_+ \) obtained by assuming \( \varphi \equiv 0 \) in \( \mathbb{R}^2 \setminus B_1^+ \). Let \( s \in \mathbb{R} \setminus \{0\} \), with \( |s| \leq \frac{1}{16} \). Let us notice that if \( u \in H^2(B_1^+) \), then \( \tau_{1,s}(\vartheta u) \in H^2_0(B_1^+) \).

29
We shall firstly derive an estimate of the tangential derivative $\frac{\partial}{\partial x_1} D^3 u$.

By using arguments analogous to those adopted to prove (3.130), (3.131) in the study of the interior regularity, for every $\varphi \in H^3_{\Gamma_1^+}(B_1^+)$, we have

$$a_+ (\tau_{1,s}(\vartheta u), \varphi) = - a_+ (u, \vartheta \tau_{1,-s} \varphi) + r_+,$$  \hspace{1cm} (3.135)

where, by Poincaré’s inequality applied on $H^3_{\Gamma_1^+}(B_1^+)$,

$$|r_+| \leq C \|u\|_{H^3(B_1^+)} \|D^3 \varphi\|_{L^2(B_1^+)} ,$$  \hspace{1cm} (3.136)

with a constant $C > 0$ only depending on $E$ and $K$. The function $\vartheta \tau_{1,-s} \varphi \in H^3_{\Gamma_1^+}(B_1^+)$ is a test function and then, by (3.135), (3.136), by the weak formulation of the problem (3.80) and by Poincaré’s inequality in $H^3_{\Gamma_1^+}(B_1^+)$, for every $\varphi \in H^3_{\Gamma_1^+}(B_1^+)$ we have

$$|a_+ (\tau_{1,s}(\vartheta u), \varphi)| \leq C \left( G + \|u\|_{H^3(B_1^+)} \right) \|D^3 \varphi\|_{L^2(B_1^+)} ,$$  \hspace{1cm} (3.137)

where the constant $C > 0$ only depends on $E$ and $K$.

We now estimate from below $a_+(\psi, \psi)$ for every $\psi \in H^3_{\Gamma_1^+}(B_1^+)$. We write

$$a_+(\psi, \psi) = \int_{B_1^+} K^{(3,3)} D^3 \psi \cdot D^3 \psi + \mathcal{R}(\psi, \psi) ,$$  \hspace{1cm} (3.138)

where

$$\mathcal{R}(\psi, \psi) = a_+^{\#}(\psi, \psi) + \int_{B_1^+} \sum_{i,j=1, i+j<6} K^{(i,j)} D^i \psi \cdot D^j \psi .$$  \hspace{1cm} (3.139)

By Poincaré’s inequality in $H^3_{\Gamma_1^+}(B_1^+)$ and by the standard inequality $2ab \leq \epsilon a^2 + \epsilon^{-1} b^2$ for every $a, b \in \mathbb{R}$ and $\epsilon > 0$, the remainder $\mathcal{R}(\psi, \psi)$ can be estimated as follows

$$|\mathcal{R}(\psi, \psi)| \leq C \left( \epsilon \|D^3 \psi\|_{L^2(B_1^+)}^2 + \left( 1 + \frac{1}{\epsilon} \right) \|D^2 \psi\|_{L^2(B_1^+)}^2 \right)$$  \hspace{1cm} (3.140)

for every $\psi \in H^3_{\Gamma_1^+}(B_1^+)$, where $C > 0$ only depends on $E$ and $K$. Taking $\psi = \tau_{1,s}(\vartheta u)$, by the strong convexity of $K^{(3,3)}$ and choosing $\epsilon$ small enough in (3.140), we have

$$a_+ (\tau_{1,s}(\vartheta u), \tau_{1,s}(\vartheta u)) \geq C_2 \|D^3 (\tau_{1,s}(\vartheta u))\|_{L^2(B_1^+)}^2 - C_3 \|D^2 (\tau_{1,s}(\vartheta u))\|_{L^2(B_1^+)}^2$$  \hspace{1cm} (3.141)
where $C_2 > 0$, $C_3 > 0$ only depend on $\xi, E, K$. By (3.137) (with $\varphi = \tau_1, s(\vartheta u)$) and (3.141), for every $s$ such that $|s| \leq 1/16$, we have

$$\|D^3(\tau_1, s(\vartheta u))\|_{L^2(B_1^+)}^2 \leq C\|D^3(\tau_1, s(\vartheta u))\|_{L^2(B_1^+)}(G + \|u\|_{H^3(B_1^+)}) + C\|u\|_{H^3(B_1^+)}^2, \tag{3.142}$$

which implies

$$\left\| \frac{\partial}{\partial x_1} D^3 u \right\|_{L^2(B_1^+)} \leq C \left( G + \|u\|_{H^3(B_1^+)} \right), \tag{3.143}$$

where the constant $C > 0$ only depends on $\xi, E, K$.

To obtain an analogous estimate for the normal derivative $\frac{\partial}{\partial x_2} D^3 u$, we use the following lemma.

**Lemma 3.8.** ([Lemma 9.3]) Assume that the function $v \in L^2(B_\rho^+)$ has weak tangential derivative $\frac{\partial v}{\partial x_1} \in L^2(B_\sigma^+)$ and that there exist a constant $K > 0$ such that

$$\left| \int_{B_\rho^+} \frac{\partial^3 v}{\partial x_1^3} \right| \leq K\|\varphi\|_{H^2(B_\rho^+)}, \quad \text{for every } \varphi \in C^\infty_0 (B_\sigma^+). \tag{3.144}$$

Then, for every $\rho < \sigma$, $v \in H^1(B_\rho^+)$ and

$$\|v\|_{H^1(B_\rho^+)} \leq C \left( K + \|v\|_{L^2(B_\rho^+)} + \sigma \left\| \frac{\partial v}{\partial x_1} \right\|_{L^2(B_\rho^+)} \right), \tag{3.145}$$

where $C > 0$ only depends on $\xi, \sigma$.

In what follows we shall consider test functions $\varphi \in C^\infty_0 (B_{\sigma_0}^+)$, where $\sigma_0 = 3/4$ (and $\sigma = 1$). From the expression (3.81) of $a_+(u, \varphi)$ we have

$$\int_{B_{\sigma_0}^+} \sum_{i,j,k} K_{i,j,k,l,m,n}^{(3,3)} u_l \varphi_{mn} \varphi_{222} = a_+(u, \varphi) - \sum_{B_{\sigma_0}^+} K_{i,j,k,l,m,n}^{(3,3)} u_i \varphi_{j,k} - \int_{B_{\sigma_0}^+} \sum_{i,j} E^{(i,j)} D^i u \cdot D^j \varphi - \int_{B_{\sigma_0}^+} \sum_{i,j} \mathbb{E}^{(i,j)} D^i u \cdot D^j \varphi. \tag{3.146}$$

Let us estimate the terms on the right-hand side of (3.146). By the weak formulation (3.80), we have

$$|a_+(u, \varphi)| \leq G\|\varphi\|_{H^2(B_{\sigma_0}^+)}. \tag{3.147}$$
Let us consider the second term on the right hand side of (3.146). Since $(i, j, k) \neq (2, 2, 2)$, without loss of generality we can assume $k = 1$. Integrating by parts with respect to $x_1$, for every $\varphi \in C_{0}^{\infty}(B_{\sigma_0}^{+})$ we have

$$
\int_{B_{\sigma_0}^{+}} K_{ijlmn}^{(3,3)} u_{lmn} \varphi_{,ij} = - \int_{B_{\sigma_0}^{+}} (K_{ijlmn}^{(3,3)} u_{lmn})_{,i} \varphi_{,ij} = - \int_{B_{\sigma_0}^{+}} K_{ijlmn,1}^{(3,3)} u_{lmn} \varphi_{,ij} - K_{ijlmn}^{(3,3)} u_{lmn} \varphi_{,ij},
$$

(3.148)

and therefore, by (3.143) and Hölder’s inequality, we have

$$
\left| \int_{B_{\sigma_0}^{+}} K_{ijlmn}^{(3,3)} u_{lmn} \varphi_{,ij} \right| \leq C (G + \|u\|_{H^1(B_{\sigma_0}^{+})}) \|D^2 \varphi\|_{L^2(B_{\sigma_0}^{+})},
$$

(3.149)

where $C > 0$ only depends on $\xi_{\sigma}, E, K$.

By using Poincaré’s inequality in $C_{0}^{\infty}(B_{\sigma_0}^{+})$, the terms involving $K^{(i,j)}$ in (3.140) can be estimated as follows

$$
\left| \int_{B_{\sigma_0}^{+}} \sum_{i,j=1}^{2} K^{(i,j)} D^i u \cdot D^j \varphi \right| \leq C \|u\|_{H^2(B_{\sigma_0}^{+})} \|D^2 \varphi\|_{L^2(B_{\sigma_0}^{+})},
$$

(3.150)

where $C > 0$ only depends on $E$. The estimate of the terms in (3.146) involving $K^{(i,j)}$ is easy, with the exception of those terms which involve $D^3 \varphi$ (that is $j = 3$). These integrals can be estimated by integrating by parts and discharging one derivative from $\varphi$ to $u$. Let us consider the term with $K^{(2,3)}$, the analysis of the term with $K^{(1,3)}$ being similar. Passing to Cartesian coordinates and integrating by parts, for every $\varphi \in C_{0}^{\infty}(B_{\sigma_0}^{+})$ we have

$$
\left| \int_{B_{\sigma_0}^{+}} K^{(2,3)} D^2 u \cdot D^3 \varphi \right| = \int_{B_{\sigma_0}^{+}} K^{(2,3)}_{ijklm} u_{lm} \varphi_{,ijk} = \int_{B_{\sigma_0}^{+}} (K^{(2,3)}_{ijklm} u_{lm})_{,k} \varphi_{,ij} \leq C \|u\|_{H^2(B_{\sigma_0}^{+})} \|D^2 \varphi\|_{L^2(B_{\sigma_0}^{+})},
$$

(3.151)

where $C > 0$ only depends on $K$. Therefore, by using (3.147), (3.149), (3.151) in (3.146), for every $\varphi \in C_{0}^{\infty}(B_{\sigma_0}^{+})$ we obtain

$$
\left| \int_{B_{\sigma_0}^{+}} K^{(3,3)} u_{lmn} \varphi_{,2222} \right| \leq C (G + \|u\|_{H^2(B_{\sigma_0}^{+})}) \|\varphi\|_{H^2(B_{\sigma_0}^{+})},
$$

(3.152)

where $C > 0$ only depends on $\xi_{\sigma}, E, K$. 

32
Let us define
\[ v = \sum_{l,m,n=1}^{2} K^{(3,3)}_{222lmn} u_{lmn}. \]  
(3.153)

By Lemma 3.8, for every \( \rho < \sigma_0 \), the function \( v \) belongs to \( H^1(B^+_\rho) \) and, by (3.143),
\[ \|v\|_{H^1(B^+_\rho)} \leq C \left( G + \|u\|_{H^3(B^+_1)} \right), \]  
(3.154)
where the constant \( C > 0 \) only depends on \( \xi_K, E, K \). By the ellipticity of the tensor \( K^{(3,3)} \), \( K^{(3,3)}_{222222} > 0 \) and then
\[ u,_{222} = (K^{(3,3)}_{222222})^{-1} \left( v - \sum_{(l,m,n) \neq (2,2,2)} K^{(3,3)}_{222lmn} u_{lmn} \right). \]  
(3.155)

By (3.143), we deduce that \( u,_{222} \in H^1(B^+_\rho) \), with
\[ \|u,_{222}\|_{L^2(B^+_\rho)} \leq C \left( G + \|u\|_{H^3(B^+_1)} \right), \]  
(3.156)
where the constant \( C > 0 \) only depends on \( \xi_K, E, K \). Finally, by (3.143) and (3.156) we obtain the wished inequality
\[ \|u\|_{H^4(B^+_\rho)} \leq C \left( G + \|u\|_{H^3(B^+_1)} \right), \]  
(3.157)
where the constant \( C > 0 \) only depends on \( \xi_K, E, K \).

We conclude this section with an improved interior regularity result, which will be useful in dealing with the unique continuation property in Section 4.1.

**Theorem 3.9 (Improved interior regularity).** Let \( B_\sigma \) be an open ball in \( \mathbb{R}^2 \) centered at the origin and with radius \( \sigma \). Let \( u \in H^3(B_\sigma) \) be such that
\[ a(u, \varphi) = 0 \quad \text{for every } \varphi \in H^3_0(B_\sigma), \]  
(3.158)
with
\[ a(u, \varphi) = \int_{B_\sigma} (P + P^h) D^2 u \cdot D^2 \varphi + Q D^3 u \cdot D^3 \varphi, \]  
(3.159)
where the tensors \( P, P^h \in C^{1,1}(\overline{B_\sigma}, \mathcal{L}(\hat{M}^2, \hat{M}^2)) \), \( Q \in C^{2,1}(\overline{B_\sigma}, \mathcal{L}(\widehat{\mathcal{M}}^3, \widehat{\mathcal{M}}^3)) \) defined in (3.7), (3.8), (3.13) satisfy the strong convexity condition (3.24), (3.25), respectively.
Then, $u \in H^6(B_{\frac{1}{2}})$ and we have
\[
\|u\|_{H^6(B_{\frac{1}{2}})} \leq C\|u\|_{H^3(B_{\frac{1}{2}})},
\] (3.160)
where $C > 0$ only depends on $\frac{1}{r_0}$, $\frac{1}{r_0}$, $\xi_Q$, $\xi_P$, $\|P\|_{C^{1,1}(\overline{B_{1}})}$, $\|P^h\|_{C^{1,1}(\overline{B_{1}})}$, $\|Q\|_{C^{2,1}(\overline{B_{1}})}$.

**Proof.** We can assume, without loss of generality, $\sigma = 1$. By Theorem 3.6 we know that $u \in H^4(B_{\frac{1}{2}})$. Therefore, differentiating (3.2) with respect to $x_p$, $p = 1, 2$, and integrating by parts, we obtain
\[
a(u_p, \varphi) = l_p(\varphi) \quad \text{for every } \varphi \in H^3_0(B_{\frac{1}{2}}),
\] (3.161)
where $a(\cdot, \cdot)$ is defined in (3.159) and
\[
l_p(\varphi) = \int_{B_{\frac{1}{2}}} (P_{ijlm} + P^h_{ijlm}) u_{,p} \varphi_{,ij} - (Q_{ijklmm,p} u_{,lmn}, \varphi_{,jk}).
\] (3.162)
By the regularity assumptions on the coefficients and (3.79), we have
\[
|l_p(\varphi)| \leq C\|u\|_{H^3(B_{1})} \|D^2\varphi\|_{L^2(B_{\frac{1}{2}})},
\] (3.163)
where $C > 0$ is a constant only depending on $t, l, \xi_Q$, $\xi_P$, $\|P\|_{C^{0,1}(\overline{B_{1}})}$, $\|P^h\|_{C^{0,1}(\overline{B_{1}})}$, $\|Q\|_{C^{1,1}(\overline{B_{1}})}$.

At this point, by (3.161) and (3.163), we can use arguments analogous to those adopted in the proof of (3.130) (with $u$ replaced by $u_p$) to obtain
\[
\|D^5u\|_{L^2(B_{\frac{1}{2}})} \leq C\|u\|_{H^3(B_{1})}.
\] (3.164)
Finally, estimate (3.160) follows by iterating once more the above procedure.

**Remark 3.10.** Let us notice that, as it is evident from the proofs, Proposition 3.4, Theorem 3.5, and Theorem 3.9 extend to the anisotropic case, for $P, P^h, Q$ satisfying the symmetry conditions (3.9), (3.10), (3.22), and the strong convexity conditions (3.24), (3.25).

### 4 Doubling and Three spheres inequalities

In this section we derive unique continuation results in the form of three-spheres and doubling inequalities for solutions to the differential inequality
\[
|\Delta^3 u| \leq M(|D\Delta^2 u| + \sum_{k=0}^{4} |D^k u|) \quad \text{in } B_{1}
\] (4.1)
where $M$ is a positive constant. Let us notice that the solutions to \((3.2)\), with $P, P_h$ and $Q$ given by \((3.7)\), \((3.8)\), and \((3.18)\) respectively, satisfy \((4.1)\); see Lemma 4.6 for a precise statement. Our method is based on Carleman estimates.

4.1 Carleman estimates

We shall need the following results, see [33], Proposition 5.1 and inequality (5.46) in the proof of Proposition 3.5, respectively.

Proposition 4.1 (Carleman estimate for $\Delta$). Let $\epsilon \in (0, \frac{1}{2}]$. Let us define

$$\rho(x) = \phi_\epsilon(|x|), \text{ for } x \in B_1 \setminus \{0\},$$

where

$$\phi_\epsilon(s) = \frac{s}{(1 + s^2)^{1/\epsilon}}.$$ (4.3)

Then there exist $\tau_0 > 1$, $C > 1$, only depending on $\epsilon$, such that for every $\tau \geq \tau_0$ and for every $u \in C_0^\infty(B_1 \setminus \{0\})$

$$C \int \rho^{4-2\tau}|\Delta u|^2 dx \geq \sum_{k=0}^1 \tau^{3-2k} \int \rho^{2k+\epsilon-2\tau}|D^k u|^2 dx.$$ (4.4)

Furthermore we have

$$C \int \rho^{4-2\tau}|\Delta u|^2 dx \geq \tau^2 \int \rho^{2k} |D^2 u|^2 dx + \sum_{k=0}^1 \tau^{3-2k} \int \rho^{2k+\epsilon-2\tau}|D^k u|^2 dx$$ (4.5)

for every $\tau \geq \tau_0$, for every $r \in (0, 1)$ and for every $u \in C_0^\infty(B_1 \setminus \overline{B}_r/4)$.

Remark 4.2. Let us notice that

$$\frac{s}{2^{1/\epsilon}} \leq \phi_\epsilon \leq s, \quad \forall s, 0 \leq s \leq 1,$$

$$\frac{|x|}{2^{1/\epsilon}} \leq \rho(x) \leq |x|, \quad \forall x \in B_1.$$ (4.6)

Proposition 4.3 (Carleman estimate for $\Delta^2$). Let $\epsilon \in (0, \frac{1}{2})$. Let $\rho$ and $\phi_\epsilon$ the same functions defined in Proposition 4.1. Then there exist absolute constants $\tau > 1$, $C > 1$ depending on $\epsilon$ only, such that
\[
\sum_{k=0}^{3} \tau^{6-2k} \int \rho^{2k+2\tau-2\tau} |D^k U|^2 \, dx \leq C \int \rho^{8-2\tau} (\Delta^2 U)^2 \, dx,
\]  
(4.7)
for every \( \tau \geq \tau \) and for every \( U \in C_0^\infty(B_1 \setminus \{0\}) \).

**Lemma 4.4.** Given \( \zeta \in C^2(B_1 \setminus \{0\}) \) and \( u \in C_0^\infty(B_1 \setminus \{0\}) \), the following identities hold true:

\[
\int \zeta \Delta u = -\int (\zeta (Du)^2 + (Du \cdot D\zeta)u),
\]  
(4.8a)
\[
\int \zeta \sum_{i,j,k=1}^{2} |\partial_{ijk} u|^2 = \int (-D^2 \zeta Du + \Delta \zeta |Du|^2 + \zeta (\Delta u)^2),
\]  
(4.8b)
\[
\int \zeta \sum_{i,j,k=1}^{2} |\partial_{ijk} u|^2 = -\int \zeta \Delta u \Delta^2 u + \int (-\text{tr}(D^2 u D^2 \zeta D^2 u) + \Delta \zeta |D^2 u|^2 + \frac{1}{2} \Delta \zeta (\Delta u)^2).
\]  
(4.8c)

For a proof of the above identities see [31, pp. 2351–2352].

**Proposition 4.5 (Carleman estimate for \( \Delta^3 \)).** Let \( \epsilon \in (0, \frac{1}{5}] \). Let \( \rho \) and \( \phi_\epsilon \) the same functions defined in Proposition 4.3.

Then there exist constants \( \tau > 1 \), \( C > 1 \) and \( R_1 \in (0,1] \) only depending on \( \epsilon \) such that

\[
C \int \rho^{4-2\tau} |\Delta^3 u|^2 \, dx \geq \tau \int \rho^{2+\epsilon-2\tau} |D \Delta^2 u|^2 \, dx + \sum_{k=0}^{4} \tau^{9-2k} \int \rho^{2k+5\epsilon-8-2\tau} |D^k u|^2 \, dx,
\]  
(4.9)
for every \( \tau \geq \tau \) and for every \( u \in C_0^\infty(B_{R_1} \setminus \{0\}) \).

Furthermore we have

\[
C \int \rho^{4-2\tau} |\Delta^3 u|^2 \, dx \geq \tau \int \rho^{2+\epsilon-2\tau} |D \Delta^2 u|^2 \, dx + \sum_{k=0}^{4} \tau^{9-2k} \int \rho^{2k+5\epsilon-8-2\tau} |D^k u|^2 \, dx + \tau^{6} \int \rho^{-11-2\tau} u^2 \, dx,
\]  
(4.10)
for every \( \tau \geq \tau \), for every \( \tau \in (0,R_1) \) and for every \( u \in C_0^\infty(B_{R_1} \setminus B_{r/4}) \).
Proof. Let us apply estimate (4.4) to $\Delta^3 u = \Delta (\Delta^2 u)$ to obtain (for brevity we omit $dx$ in the integrals)

$$C \int \rho^{4-2\tau} |\Delta^3 u|^2 \geq \tau \int \rho^{2+\epsilon-2\tau} |D (\Delta^2 u)|^2 +$$

$$+ \tau^3 \int \rho^{-2\tau} |\Delta^2 u|^2,$$  \hspace{1cm} (4.11)

for every $\tau \geq \tau_0$ and for every $u \in C^\infty_0 (B_1 \setminus \{0\})$, where $C$ depends on $\epsilon$ only. Now, in order to estimate from below the second term at right hand side of (4.11), we apply estimate (4.7). To do this, we change $\tau$ in $4 - \frac{\epsilon}{2} + \tau$ in (4.7).

We have

$$C \int \rho^{-2\tau} |\Delta^2 u|^2 \geq \sum_{k=0}^3 \tau^{6-2k} \int \rho^{2k+3\epsilon-8-2\tau} |D^k u|^2,$$  \hspace{1cm} (4.12)

for every $\tau \geq \tau$ and for every $u \in C^\infty_0 (B_1 \setminus \{0\})$. By (4.11) and (4.12) we get

$$C \int \rho^{4-2\tau} |\Delta^3 u|^2 \geq \tau \int \rho^{2+\epsilon-2\tau} |D (\Delta^2 u)|^2 +$$

$$+ \frac{\tau^3}{2} \int \rho^{-2\tau} |\Delta^2 u|^2 +$$

$$+ \frac{1}{2} \sum_{k=0}^3 \tau^{9-2k} \int \rho^{2k+3\epsilon-8-2\tau} |D^k u|^2.$$  \hspace{1cm} (4.13)

Now we need to estimate from below the second term on the righthand side of (4.13). By (4.8b) (just writing $\Delta u$ instead of $u$) we have

$$\int \zeta (\Delta^2 u)^2 = \int \zeta |D^2 \Delta u|^2 -$$

$$- \int (\Delta \zeta |D \Delta u|^2 - D^2 \zeta D \Delta u \cdot D \Delta u).$$  \hspace{1cm} (4.14)

Furthermore let $\sigma \geq \epsilon$ be a number that we will choose later. Since $\rho \leq 1$ we have trivially

$$\int \rho^{-2\tau} |\Delta^2 u|^2 \geq \int \rho^{\sigma-2\tau} |\Delta^2 u|^2.$$  \hspace{1cm} (4.15)

Now, let us choose

$$\zeta = \rho^{\sigma-2\tau},$$

we have for $\tau \geq 1$
where $C > 0$ only depends on $\epsilon$.

Hence, by (4.14) and (4.15) we have

$$
\int \rho^{\sigma - 2} |\Delta^2 u|^2 \geq \int \rho^{2+\sigma - 2} |\Delta^2 u|^2 - C\tau^2 \int \rho^{2+\sigma - 2} |D^2 u|^2,
$$

(4.16)

where $C_\ast$ only depends on $\epsilon$. By (4.16) we have trivially

$$
\tau^3 \int \rho^{\sigma - 2} |\Delta^2 u|^2 \geq \tau \int \rho^{2+\sigma - 2} |\Delta^2 u|^2 - C\tau^2 \int \rho^{2+\sigma - 2} |D^2 u|^2.
$$

(4.17)

Now, by (4.13) and (4.17) we have

$$
C \int \rho^{2+\rho - 2} |D^3 u|^2 \geq \tau \int \rho^{2+\rho - 2} |\Delta^2 u|^2 + \tau \int \rho^{2+\rho - 2} |D^2 u|^2 + \text{J}
$$

$$
+ \sum_{k=0}^2 \tau^{9-2k} \int \rho^{2k+3\rho - 8} |D^k u|^2 dx,
$$

(4.18)

for every $\tau \geq \tau$ and for every $u \in C^\infty_0(B_1 \setminus \{0\})$. Now, let us choose

$$
\sigma = 4\epsilon,
$$

denote

$$
R_0 = (1/2C_\ast)^{1/\epsilon}.
$$

Taking into account (4.10), we have, for every $u \in C^\infty_0(B_{R_0} \setminus \{0\})$,

$$
J = \tau^3 \int (\rho^\sigma - 1) \rho^{2+3\epsilon - 2\sigma} |D^3 u|^2 \geq \frac{\tau^3}{2} \int \rho^{2+3\epsilon - 2\sigma} |D^3 u|^2.
$$

(4.19)
By (4.18) and (4.19) we get

\[ C \int \rho^{4-2\tau} |\Delta^3 u|^2 \geq \tau \int \rho^{2+\epsilon-2\tau} |D\Delta^2 u|^2 + \tau \int \rho^{4\epsilon-2\tau} |D^2 \Delta u|^2 + \]
\[ + \sum_{k=0}^{3} \tau^{9-2k} \int \rho^{2k+3\epsilon-8-2\tau} |D^k u|^2, \]  \hspace{1cm} (4.20)

for every \( \tau \geq \tau \) and for every \( u \in C^\infty_0(B_{R_0} \setminus \{0\}) \).

In order to obtain the term with \( |D^4 u|^2 \) we use again (4.8b) in the following form (just writing \( \partial^2 hk u \), \( h,k = 1,2 \) instead of \( u \))

\[ \int \zeta(\Delta \partial^2hk u)^2 = \int \zeta |D^2 \partial^2hk u|^2 - \int (\Delta \zeta |D \partial^2hk u|^2 - D^2 \zeta D \partial^2hk u \cdot D \partial^2hk u) \]  \hspace{1cm} (4.21)

for \( h,k = 1,2 \). Let us choose \( \zeta = \rho^{5\epsilon-2\tau} \) we have

\[ |D^2 \zeta| \leq C \tau^2 \rho^{-2+5\epsilon-2\tau}, \]

where \( C \) only depends on \( \epsilon \). Hence, by (4.21) we have

\[ \tau \int \rho^{4\epsilon-2\tau} |D^2 \Delta u|^2 \geq \tau \int \rho^{5\epsilon-2\tau} |D^2 \Delta u|^2 \geq \]
\[ \geq \tau \int \rho^{5\epsilon-2\tau} |D^4 u|^2 - \tilde{C} \tau^3 \int \rho^{-2+5\epsilon-2\tau} |D^3 u|^2 \]  \hspace{1cm} (4.22)

By (4.20) and (4.22) we have that

\[ C \int \rho^{4-2\tau} |\Delta^3 u|^2 \geq \tau \int \rho^{2+\epsilon-2\tau} |D\Delta^2 u|^2 + \tau \int \rho^{4\epsilon-2\tau} |D^2 \Delta u|^2 + \]
\[ + \tau^3 \int (-\tilde{C} \rho^{2\epsilon} + 1) \rho^{-2+3\epsilon-2\tau} |D^3 u|^2 + \]
\[ + \sum_{k=0}^{2} \tau^{9-2k} \int \rho^{2k+3\epsilon-8-2\tau} |D^k u|^2. \]  \hspace{1cm} (4.23)

Let

\[ R_1 = \min \left\{ R_0, \left(\frac{1}{2\tilde{C}}\right)^{1/2\epsilon} \right\}. \]

Taking into account (4.6), we have, for every \( u \in C^\infty_0(B_{R_1} \setminus \{0\}) \),
\[ \tilde{J} = \tau^3 \int \left( -\tilde{C} \rho^{2\tau} + 1 \right) \rho^{-2+3\tau-2\tau} |D^3 u|^2 \geq \frac{\tau^3}{2} \int \rho^{-2+3\tau-2\tau} |D^3 u|^2. \quad (4.24) \]

By (4.23) and (4.24) we get

\[ C \int \rho^{4-2\tau} |\Delta^3 u|^2 \geq \tau \int \rho^{2+\tau-2\tau} |D \Delta^2 u|^2 + \sum_{k=0}^{4} \tau^{9-2k} \int \rho^{2k+5\tau-8-2\tau} |D^k u|^2, \quad (4.25) \]

for every \( \tau \geq \tau \) and for every \( u \in C^\infty_0(B_R \setminus \{0\}) \). Hence (4.9) is proved.

Now we prove (4.10). Let us apply (4.5) in the following form

\[ \tau^2 r \int \rho^{-1-2\tau} v^2 dx \leq C \int \rho^{4-2\tau} |\Delta v|^2, \quad (4.26) \]

for every \( v \in C^\infty_0(B_R \setminus \overline{B}_{r/4}) \).

If \( v = \Delta^2 u \) then (4.26) gives

\[ \int \rho^{4-2\tau} |\Delta^3 u|^2 dx \geq C^{-1} r^2 \int \rho^{4-2\tau} |\Delta^2 u|^2. \quad (4.27) \]

If \( v = \Delta u \) then (4.26) gives

\[ \int \rho^{-1-2\tau} |\Delta^3 u|^2 = \int \rho^{4-2(\tau+2\tau)} |\Delta^2 u|^2 \geq \]

\[ \geq C^{-1} r^2 \int \rho^{-6-2\tau} |\Delta u|^2 = \]

\[ = C^{-1} r^2 \int \rho^{1-2(5+\tau)} |\Delta u|^2 \geq \]

\[ \geq C^{-2} r^4 r^2 \int \rho^{-11-2\tau} u^2. \quad (4.28) \]

Hence, by (4.27) and (4.28) we get

\[ \int \rho^{4-2\tau} |\Delta^3 u|^2 \geq C^{-3} r^6 r^3 \int \rho^{-11-2\tau} u^2 dx, \quad (4.29) \]

for every \( u \in C^\infty_0(B_R \setminus \overline{B}_{r/4}) \) and \( \tau \geq \tau \).

Finally by (4.25) and (4.29) we obtain (4.10).
4.2 Doubling and Three Sphere Inequalities

Lemma 4.6. Let $P, P^h \in C^{1,1}(\overline{B_1}, \mathcal{L}(\tilde{M}^2, \tilde{M}^2)), Q \in C^{2,1}(\overline{B_1}, \mathcal{L}(\tilde{M}^3, \tilde{M}^3))$ be given by (3.47), (3.34), (3.18) and satisfying the strong convexity conditions (3.24), respectively.

Let $u \in H^6(B_1)$ be a weak solution to (3.2). Then, there exists a constant $M > 0$ depending on $M_2, a_0, t, l$ only, such that

$$|\Delta^3 u| \leq M(|D \Delta^2 u| + \sum_{k=0}^1 |D^h u|) \quad \text{in } B_1,$$

where $M_2 = \|P\|_{C^{1,1}(\overline{B_1})} + \|P^h\|_{C^{1,1}(\overline{B_1})} + \|Q\|_{C^{2,1}(\overline{B_1})}$.

Lemma 4.7 (Caccioppoli-type inequality). Let $K$ be a positive number and let us assume that $u \in H^6(B_1)$ satisfies the inequality

$$|\Delta^3 u| \leq K \sum_{k=0}^5 |D^k u|.$$

Then, for every $r, 0 < r < 1$, we have

$$\|D^h u\|_{L^2(B_{\frac{r}{2}})} \leq \frac{C}{r^k} \|u\|_{L^2(B_r)}, \quad \forall h = 1, \ldots, 6,$$

where $C$ is a constant only depending on $K$.

Proof. We apply [20] Th. 17.1.3] to the sixth order elliptic operator $\Delta^3$ obtaining that, for any $r \in (0, 1)$ and $k = 0, 1, \ldots, 6$, we have

$$\|d^k(x)D^h u\|_{L^2(B_{\frac{r}{2}})} \leq C \left( \|d^6(x)\Delta^3 u\|_{L^2(B_r)} + \|u\|_{L^2(B_r)} \right)^{\frac{k}{6}} \|u\|_{L^2(B_r)}^{1 - \frac{k}{6}},$$

where

$$d(x) = \text{dist} (x, \partial B_r) = r - |x|, \quad x \in B_r$$

and $C$ is an absolute constant.

By applying Young inequality

$$a^\beta b^{1-\beta} \leq \beta a + (1-\beta)\varepsilon \frac{a}{a+b},$$

for every $a, b \geq 0, \beta \in [0, 1], \varepsilon > 0$, and by using (4.31) and (4.33) we get
\[
\sum_{k=0}^{5} \int_{B_r} d^{2k}(x) |D^{k}u|^2 \, dx \leq C \varepsilon^2 \int_{B_{r/2}} d^{12}(x)|\Delta^3 u|^2 \, dx + C_\varepsilon \|u\|^2_{L^2(B_r)} \leq \nonumber
\]
\[
\leq CK^2 \varepsilon^2 \sum_{k=0}^{5} \int_{B_r} d^{12}(x) |D^{k}u|^2 \, dx + C_\varepsilon \|u\|^2_{L^2(B_r)},
\]
where \(C\) is an absolute constant and \(C_\varepsilon\) depends on \(\varepsilon\) only. Hence we have
\[
\sum_{k=0}^{5} \int_{B_r} (1 - CK^2 \varepsilon^2 d^{12-2k}(x)) \, d^{2k}(x) |D^{k}u|^2 \leq C_\varepsilon \|u\|^2_{L^2(B_r)}. \] (4.35)

Now, if \(\varepsilon = \left(\frac{1}{2CK^2}\right)^{1/2}\) then
\[
1 - CK^2 \varepsilon^2 d^{12-2k}(x) \geq 1 - CK^2 \varepsilon^2 \geq \frac{1}{2}, \quad k = 0, 1, \ldots, 5.
\]
Hence we have
\[
\sum_{k=0}^{5} \left(\frac{r}{2}\right)^{2k} \int_{B_{r/2}} |D^{k}u|^2 \, dx \leq \sum_{k=0}^{5} \int_{B_r} d^{2k}(x) |D^{k}u|^2 \, dx \leq C \|u\|^2_{L^2(B_r)}, \] (4.36)
Furthermore, by (4.33) for \(k = 6\), (4.36) and (4.31) we get
\[
\int_{B_r} d^{12}(x) |D^6u|^2 \, dx \leq C \int_{B_{r/2}} d^{12}(x)|\Delta^4 u|^2 \, dx + C \|u\|^2_{L^2(B_r)} \leq \nonumber
\]
\[
\leq C \sum_{k=0}^{5} \int_{B_r} d^{12}(x) |D^{k}u|^2 \, dx + C \|u\|^2_{L^2(B_r)} \leq \nonumber
\]
\[
\leq C \|u\|^2_{L^2(B_r)},
\]
where \(C\) depends on \(K\) only.
Now by (4.36) and (4.37) we have
\[
\sum_{k=0}^{6} \left(\frac{r}{2}\right)^{2k} \int_{B_{r/2}} |D^{k}u|^2 \, dx \leq \sum_{k=0}^{6} \int_{B_r} d^{2k}(x) |D^{k}u|^2 \, dx \leq C \|u\|^2_{L^2(B_r)} \] (4.38)
and (4.32) follows.

**Theorem 4.8 (Doubling inequality).** Let \(M\) be a positive number and \(R_1\) the number introduced in Proposition 4.5. Assume that \(U \in H^6(B_1)\) satisfy
\[
|\Delta^3 U| \leq M \left( |D\Delta^2 U| + \sum_{k=0}^{4} |D^{k}U| \right),
\] (4.39)
then there exists $C > 1$, only depending on $M$, such that, for every $r < \frac{R}{2}$ we have
\[
\int_{B_{2r}} U^2 \leq CN^k \int_{B_r} U^2,
\] (4.40)
where
\[
N = \frac{\int_{B_{R_1}} U^2}{\int_{B_{R_1/2^7}} U^2}
\] (4.41)
(with $k = 8$).

Lemma 4.9. Let $U \in H^6(B_1)$ satisfy (4.39). Then there exists an absolute constant $R_1 \in (0,1]$ such that for every $R$ and for every $r$ such that $0 < 2r < R < \frac{R_1}{2}$, we have
\[
R(2r)^{-2\tau} \int_{B_{2r}} U^2 + R^{1-2\tau} \int_{B_R} U^2 \leq CM^2 \left[ \left( \frac{r}{2^7} \right)^{-2\tau} \int_{B_r} U^2 + \left( \frac{R_1}{2^6} \right)^{-2\tau} \int_{B_{R_1}} U^2 \right],
\] (4.42)
for every $\tau \geq \tilde{\tau}$, with $\tilde{\tau}$ depending on $M$ only and $C$ a positive absolute constant.

Proof. Let $r, R$ satisfy
\[
0 < 2r < R < \frac{R_1}{2}.
\] (4.43)
Let $\eta \in C_0^\infty((0, R_1))$ such that
\[
0 \leq \eta \leq 1
\] (4.44)
\[
\eta = 0, \quad \text{in} \quad \left(0, \frac{r}{4}\right) \cup \left(\frac{2}{3}R_1, 1\right), \quad \eta = 1, \quad \text{in} \quad \left[\frac{r}{2}, 1\right],
\] (4.45)
\[
\left| \frac{d^k \eta}{dt^k}(t) \right| \leq Cr^{-k}, \quad \text{in} \quad \left[\frac{r}{4}, \frac{r}{2}\right], \quad \text{for} \quad 0 \leq k \leq 6,
\] (4.46)
\[
\left| \frac{d^k \eta}{dt^k}(t) \right| \leq CR_1^{-k}, \quad \text{in} \quad \left[\frac{R_1}{2}, \frac{2R_1}{3}\right], \quad \text{for} \quad 0 \leq k \leq 6.
\] (4.47)
Let us define
\[
\xi(x) = \eta(|x|).
\] (4.48)
Let us fix $\epsilon = \frac{1}{5}$ and let us shift $\tau$ in $\tau - 4$ in estimate (4.10), by adjusting the exponent of such an estimate, we have
\[ \tau^6 r^3 \int_{B_{R_1}} \rho^{-3-2\tau} u^2 dx + \tau \int_{B_{R_1}} \rho^{11-2\tau} |D\Delta^2 u|^2 + \sum_{k=0}^{4} \tau^{9-2k} \int_{B_{R_1}} \rho^{2k+1-2\tau} |D^k u|^2 \leq \]
\[ \leq C \int_{B_{R_1}} \rho^{12-2\tau} |\Delta^3 u|^2, \] (4.49)

for every \( \tau \geq \tau \), for every \( r \in (0, R_1) \) and for every \( u \in C_0^\infty(\overline{B_{R_1} \setminus B_{r/4}}) \), where \( R_1 \) has been introduced in Proposition 4.5 and is an absolute constant since here we have chosen \( \epsilon = \frac{1}{5} \).

By a density argument, we may apply the Carleman estimate (4.49) to \( u = \xi U \), obtaining
\[ \tau^6 r^3 \int_{B_{R_1}} \rho^{-3-2\tau} \xi^2 u^2 dx + \tau \int_{B_{R_1}} \rho^{11-2\tau} |D\Delta^2 (\xi U)|^2 \]
\[ + \sum_{k=0}^{4} \tau^{9-2k} \int_{B_{R_1}} \rho^{2k+1-2\tau} |D^k (\xi U)|^2 \leq C \int_{B_{R_1}} \rho^{12-2\tau} |\Delta^3 (\xi U)|^2, \] (4.50)

for \( \tau \geq \tau \) and \( C \) an absolute constant. Since we have
\[ |\Delta^3 (\xi U)|^2 \leq 2\xi^2 |\Delta^3 U|^2 + C \sum_{k=0}^{5} |D^k U|^2 |D^{6-k} \xi|^2, \] (4.51)
denoting
\[ J_0 = \int_{B_{r/2} \setminus B_{r/4}} \rho^{12-2\tau} \sum_{k=0}^{5} (r^{-k-6} |D^k U|)^2, \] (4.52)
\[ J_1 = \int_{B_{2R_1} \setminus B_{R_1}/2} \rho^{12-2\tau} \sum_{k=0}^{5} (R_1^{-k-6} |D^k U|)^2, \] (4.53)

we have
\[ \tau^6 r^3 \int_{B_{R_1}} \rho^{-3-2\tau} \xi^2 u^2 dx + \tau \int_{B_{R_1}} \rho^{11-2\tau} |D\Delta^2 (\xi U)|^2 + \]
\[ + \sum_{k=0}^{4} \tau^{9-2k} \int_{B_{R_1}} \rho^{2k+1-2\tau} |D^k (\xi U)|^2 \leq C \int_{B_{R_1}} \rho^{12-2\tau} |\Delta^3 U|^2 + C J_0 + C J_1, \] (4.54)

for \( \tau \geq \tau \), with \( C \) an absolute constant.

Now, by using (4.43)–(4.48), (4.51), performing a trivial estimate from below of the left hand side of (4.54) and a trivial estimate from above of the right hand side of (4.54), we get
\[ \tau^6 r^3 \int_{B_{R_1}} \rho^{-3-2\tau} |\xi U|^2 + \tau \int_{B_{R_1/2} \setminus B_{r/2}} \rho^{11-2\tau} |D\Delta^2 U|^2 + + \sum_{k=0}^{4} \tau^{8-2k} \int_{B_{R_1/2} \setminus B_{r/2}} \rho^{2k+1-2\tau} |D^k U|^2 \leq CM^2 \int_{B_{R_1/2} \setminus B_{r/2}} \rho^{12-2\tau} |D\Delta^2 U|^2 + + CM^2 \int_{B_{R_1/2} \setminus B_{r/2}} \sum_{k=0}^{4} \tau^{8-2k} \int_{B_{R_1/2} \setminus B_{r/2}} \rho^{3} \cdot \rho^{2k+1-2\tau} |D^k U|^2 + \leq CM^2 (J_0 + J_1), \]  

for \( \tau \geq \tilde{\tau} \), with \( C \) an absolute constant and \( \tilde{M} = \sqrt{M^2 + 1} \).

Let us move on the left of (4.55) the first and the second term on the right of (4.55) and we obtain

\[ \tau^6 r^3 \int_{B_{R_1}} \rho^{-3-2\tau} |\xi U|^2 + \int_{B_{R_1/2} \setminus B_{r/2}} (\tau - CM^2 \rho) \rho^{11-2\tau} |D\Delta^2 U|^2 + + \sum_{k=0}^{4} \int_{B_{R_1/2} \setminus B_{r/2}} \tau^{8-2k} (\tau - CM^2 \rho^3) \rho^{2k+1-2\tau} |D^k U|^2 \leq \leq CM^2 (J_0 + J_1), \]  

for \( \tau \geq \tilde{\tau} \), where \( C \) is the same constant that appears in (4.55).

Now, taking into account that \( \rho \leq 1 \) in \( B_{R_1} \), by (4.56) we obtain

\[ \tau^6 r^3 \int_{B_{R_1}} \rho^{-3-2\tau} |\xi U|^2 + \int_{B_{R_1/2} \setminus B_{r/2}} (\tau - CM^2 \rho) \rho^{11-2\tau} |D\Delta^2 U|^2 + + \frac{1}{2} \sum_{k=0}^{4} \tau^{9-2k} \int_{B_{R_1/2} \setminus B_{r/2}} \rho^{2k+1-2\tau} |D^k U|^2 \leq CM^2 (J_0 + J_1), \]  

for \( \tau \geq \tilde{\tau} \), where (recall that \( \tilde{\tau} \geq 1 \))

\[ \tilde{\tau} = \max \left\{ 2CM^2, \tau \right\}. \]

Let us estimate \( J_0 \) and \( J_1 \).

We start by observing that by (4.5) for any \( x \in B_{r/2} \setminus B_{r/4} \) we have that

\[ \frac{r}{2^7} \leq \rho(x) \leq \frac{r}{2}. \]  

(4.58)
From (4.32), (4.52) and (4.58), we have
\begin{align}
J_0 & = \int_{B_{r/2} \setminus B_{r/4}} \rho^{12 - 2\tau} \sum_{k=0}^{5} (r^{k-6}|D^k U|)^2 \leq \\
& \leq C \left( \frac{r}{2^7} \right)^{-2\tau} \sum_{k=0}^{5} \int_{B_{r/2}} (r^{k}|D^k U|)^2 \leq \quad (4.59) \\
& \leq C \left( \frac{r}{2^7} \right)^{-2\tau} \int_{B_r} U^2,
\end{align}
where $C$ depends on $M$.

Similarly, we observe that by (4.6) for any $x \in B_{2R_1/3} \setminus B_{R_1/2}$ we have that
\begin{equation}
R_1^{2/6} \leq \rho(x) \leq \frac{2}{3} R_1. \quad (4.60)
\end{equation}

Again from (4.32), (4.53) and (4.60), we have
\begin{equation}
J_1 \leq C \left( \frac{R_1}{2^6} \right)^{-2\tau} \int_{B_{R_1}} U^2. \quad (4.61)
\end{equation}

By (4.57), (4.59), (4.61) we have
\begin{align}
\tau^6 r^3 \int_{B_{R_1}} \rho^{-3-2\tau}|\xi U|^2 + \tau^9 \int_{B_{R_1/2} \setminus B_{r/2}} \rho^{1-2\tau} U^2 & \leq \quad (4.62) \\
& \leq CM^2 \left( \left( \frac{r}{2^7} \right)^{-2\tau} \int_{B_r} U^2 + \left( \frac{R_1}{2^6} \right)^{-2\tau} \int_{B_{R_1}} U^2 \right),
\end{align}
for every $\tau \geq \bar{\tau}$.

Now, recalling that $2r < R < \frac{R_1}{2}$, by (4.31), (4.32), we have trivially
\begin{equation}
\tau^6 r^3 \int_{B_{R_1}} \rho^{-3-2\tau}|\xi U|^2 \geq \frac{1}{8} (2r)^{-2\tau} \int_{B_{2r} \setminus B_{r/2}} U^2, \quad (4.63)
\end{equation}

and
\begin{equation}
\tau^9 \int_{B_{R_1/2} \setminus B_{r/2}} \rho^{1-2\tau} U^2 \geq (R)^{-1-2\tau} \int_{B_R \setminus B_{r/2}} U^2. \quad (4.64)
\end{equation}

By (4.62), (4.63) and (4.64) we have
\begin{align}
(2r)^{-2\tau} \int_{B_{2r} \setminus B_{r/2}} U^2 + (R)^{-1-2\tau} \int_{B_R \setminus B_{r/2}} U^2 & \leq \quad (4.65) \\
& \leq CM^2 \left[ \left( \frac{r}{2^7} \right)^{-2\tau} \int_{B_r} U^2 + \left( \frac{R_1}{2^6} \right)^{-2\tau} \int_{B_{R_1}} U^2 \right],
\end{align}
for every $\tau \geq \tilde{\tau}$. Now, adding $2R(2r)^{-2\tau} \int_{B_{r/2}} U^2$ to both sides of (4.65) we get the wished estimate (4.42) for $r < R/2$ and $R < R_1/2$.

Proof of Theorem 4.8 Let us fix $R = \frac{R_1}{27}$ in (4.12) obtaining

$$\frac{R_1}{27}(2r)^{-2\tau} \int_{B_{2r}} U^2 + \left( \frac{R_1}{27} \right)^{1-2\tau} \int_{B_{R_1/27}} U^2 \leq CM^2 \left[ \left( \frac{r}{27} \right)^{-2\tau} \int_{B_r} U^2 + \left( \frac{R_1}{27} \right)^{-2\tau} \int_{B_{R_1}} U^2 \right],$$

(4.66)

for every $\tau \geq \tilde{\tau}$, where $\tilde{\tau}$ depends on $M$ only and $C$ is an absolute constants.

Now, choosing $\tau = \tau_0$, where

$$\tau_0 = \tilde{\tau} + \log_4 \frac{27CM^2 N}{R_1},$$

(4.67)

and

$$N = \frac{\int_{B_{R_1}} U^2}{\int_{B_{R_1/27}} U^2},$$

(4.68)

we have

$$\left( \frac{R_1}{27} \right)^{1-2\tau} \int_{B_{R_1/27}} U^2 \geq CM^2 \left( \frac{R_1}{27} \right)^{-2\tau} \int_{B_{R_1}} U^2.$$\(1\)

Hence, by (4.66), we obtain

$$\frac{R_1}{27}(2r)^{-2\tau_0} \int_{B_{2r}} U^2 \leq CM^2 \left( \frac{r}{27} \right)^{-2\tau_0} \int_{B_r} U^2,$$

(4.69)

where $C$ is an absolute constant. Using (4.67) and (4.69), we have

$$\int_{B_{2r}} U^2 \leq CN^{k} \int_{B_r} U^2,$$

(4.70)

where $C$ depends on $M$ only and $k = 8$.

The proof is complete.
Corollary 4.10 (Doubling inequality and three sphere inequality). Assume that $U \in H^6(B_1)$ satisfies inequality (4.39).

Then there exists an absolute constant $R_1 \in (0, 1]$ such that for every $r \leq s \leq \frac{R_1}{2r}$, we have

$$\int_{B_r} U^2 \leq CN^k \left( \frac{s}{r} \right)^{\log_2(CN^k)} \int_{B_r} U^2,$$

(4.71)

where $N$ is given by (4.41).

In addition, if $2r \leq s \leq \frac{R_1}{2r}$ then we have

$$\int_{B_s} U^2 \leq \left( C \int_{B_{R_1}} U^2 \right)^{1-\tilde{\theta}(s,r)} \left( \int_{B_r} U^2 \right) \tilde{\theta}(s,r),$$

(4.72)

where

$$\tilde{\theta}(s,r) = \frac{1}{1 + 2^k \log_2 \frac{s}{r}}.$$

Proof. Let us prove (4.71). Let $r < s \leq \frac{R_1}{2r}$. Denote

$$j = \left[ \log_2 \left( \frac{sr^{-1}}{s} \right) \right],$$

(whre, for every $a \in \mathbb{R}^+$, $[a]$ denotes the integer part of $a$). We have

$$2^j r \leq s < 2^{j+1} r.$$

By iteration, (4.40) gives

$$\int_{B_s} U^2 \leq \int_{B_{2^{j+1}r}} U^2 \leq \left( CN^k \right)^{j+1} \int_{B_r} U^2 \leq CN^k \left( \frac{8}{r} \right)^{\log_2(CN^k)} \int_{B_r} U^2$$

and (4.71) follows.

Now let us prove (4.72). By elementary properties of logarithm function and by (4.71) we have, for $2r \leq s \leq \frac{R_1}{2r}$,

$$\int_{B_s} U^2 \leq \left( CN^k \right)^{2 \log_2 \frac{s}{r}} \int_{B_r} U^2,$$

(4.73)

Now, by (4.41) we have trivially

$$N = \frac{\int_{B_{R_1}} U^2}{\int_{B_{2r}} U^2} \leq \frac{\int_{B_{R_1}} U^2}{\int_{B_r} U^2}.$$
By the last inequality and by (4.73) we have

\[
\left( \int_{B_s} U^2 \right)^{1+2\log_2 s} \leq \left( C \int_{B_{R_1}} U^2 \right)^{2\log_2 \frac{s}{r}} \int_{B_r} U^2
\]

which implies (4.72).

\[\square\]

5 Appendix

Proof of Lemma 4.6. The main task will be to clarify that the sixth order derivates and the fifth order ones may be set in the form as they appear in (4.30). For that reason we only elaborated the function

\[h(u) = (M^h_{\alpha\beta\gamma}(u))_{\alpha\beta\gamma}\]  

(5.1)

associated with the sixth order tensor. To simplify the notation, we write \(M^h_{\alpha\beta\gamma} = M^h_{\alpha\beta\gamma}(u)\).

By (3.21) we easily deduce that the high order couple tensor satisfy the following symmetric properties

\[
M^h_{112} = M^h_{121} = M^h_{211},
\]

(5.2)

\[
M^h_{122} = M^h_{212} = M^h_{221}.
\]

(5.3)

We find convenient to introduce the following slightly modified definition of the tensors above

\[
M^h_{111} = M^h_{111}, \quad M^h_{222} = M^h_{222},
\]

(5.4)

\[
M^h_{112} = 3M^h_{112}, \quad M^h_{221} = 3M^h_{221}.
\]

(5.5)

We observe that
\[ h(u) = M_{\alpha\beta\gamma,\alpha\beta\gamma}^h = M_{\alpha\beta1,\alpha\beta1}^h + M_{\alpha\beta2,\alpha\beta2}^h = \]
\[ [M_{\alpha11,\alpha11}^h + M_{\alpha21,\alpha21}^h] + [M_{\alpha12,\alpha12}^h + M_{\alpha22,\alpha22}^h] = \]
\[ [M_{111,111}^h + M_{211,211}^h] + [M_{121,121}^h + M_{221,221}^h] + \]
\[ [M_{112,112}^h + M_{212,212}^h] + [M_{122,122}^h + M_{222,222}^h] = \]
\[ M_{111,111}^h + (M_{121}^h + M_{112}^h)_{112} + \]
\[ (M_{211}^h + M_{212}^h + M_{122}^h)_{122} + M_{222,222}^h = \]
\[ M_{111,111}^h + M_{222,222}^h + M_{112,112}^h + M_{221,221}^h. \] (5.6)

From (5.21) we obtain the extended formulas for the constitutive equation for higher order moments

\[ M_{111}^h = u_{111}(b_0 + 2b_1) + u_{122}(b_0 - 3b_1), \] (5.7)

\[ M_{222}^h = u_{112}(b_0 - 3b_1) + u_{222}(b_0 + 2b_1), \] (5.8)

\[ M_{112}^h = u_{112}(b_0 + 12b_1) + u_{222}(b_0 - 3b_1), \] (5.9)

\[ M_{221}^h = u_{111}(b_0 - 3b_1) + u_{221}(b_0 + 12b_1). \] (5.10)

By adding and subtracting the term \(2b_1u_{122}\) on the right hand side of (5.7) the first constitutive equation for higher order moments becomes

\[ M_{111}^h = (b_0 + 2b_1)(\Delta u),_1 - 5b_1u_{122}. \] (5.11)

Dealing analogously for (5.8)-(5.10) we obtain

\[ M_{222}^h = (b_0 + 2b_1)(\Delta u),_2 - 5b_1u_{112}, \] (5.12)

\[ M_{112}^h = (b_0 + 12b_1)(\Delta u),_2 - 15b_1u_{222}, \] (5.13)

\[ M_{221}^h = (b_0 + 12b_1)(\Delta u),_1 - 15b_1u_{111}. \] (5.14)
In view of the next computations, it is worthy to recall the following formal
third order product rules

\[(fg)_{111} = f_{,111}g + 3f_{,11}g_{,1} + 3f_{,1}g_{,11} + fg_{,111}, \quad (5.15)\]

\[(fg)_{112} = f_{,112}g + fg_{,112} + f_{,11}g_{,2} + 2f_{,12}g_{,1} + 2f_{,1}g_{,12}, \quad (5.16)\]

\[(fg)_{122} = f_{,221}g + fg_{,221} + f_{,1}g_{,22} + 2f_{,21}g_{,2} + 2f_{,2}g_{,21}, \quad (5.17)\]

\[(fg)_{222} = f_{,222}g + 3f_{,22}g_{,2} + 3f_{,2}g_{,22} + fg_{,222}. \quad (5.18)\]

By (5.11) and a double application of the formula (5.15) we have that

\[M_{111,111} = (b_0 + 2b_1)_{,111}(\Delta u)_{,11} + 3(b_0 + 2b_1)_{,11}(\Delta u)_{,111} + 3(b_0 + 2b_1)(\Delta u)_{,1111} +
-5(b_{1,111}u_{,112} + 3b_{1,11}u_{1122} + 3b_{1,1}u_{12211} + b_{1,122111}) \quad (5.19)\]

By (5.12) and a double application of the formula (5.18) we have that

\[M_{222,222} = (b_0 + 2b_1)_{,222}(\Delta u)_{,22} + 3(b_0 + 2b_1)_{,22}(\Delta u)_{,222} + 3(b_0 + 2b_1)(\Delta u)_{,2222} +
-5(b_{1,222}u_{,112} + 3b_{1,22}u_{1122} + 3b_{1,2}u_{11222} + b_{1,12222}) \quad (5.20)\]

By (5.13) and a double application of the formula (5.16) we have that

\[M_{112,112} = (b_0 + 12b_1)_{,112}(\Delta u)_{,21} + (b_0 + 12b_1)(\Delta u)_{,2112} +
(b_0 + 12b_1)_{,11}(\Delta u)_{,22} + (b_0 + 12b_1)_{,2}(\Delta u)_{,211} +
2(b_0 + 12b_1)_{,12}(\Delta u)_{,21} + 2(b_0 + 12b_1)_{,1}(\Delta u)_{,212} +
-15(b_{1,112}u_{,22} + b_{1,122}u_{,2112} + b_{1,11}u_{222} +
+b_{1,12}u_{,1221} + 2b_{1,12}u_{221} + 2b_{1,1}u_{221}) \quad (5.21)\]
By (5.14) and a double application of the formula (5.17) we have that

\[
M^{b}_{221,122} = (b_0 + 12b_1),_{221}(\Delta u),_{111} + (b_0 + 12b_1)(\Delta u),_{1221} + \\
(b_0 + 12b_1),_{22}(\Delta u),_{11} + (b_0 + 12b_1),_{1}(\Delta u),_{122} + \\
2(b_0 + 12b_1),_{21}(\Delta u),_{12} + 2(b_0 + 12b_1),_{2}(\Delta u),_{121} + \\
-15(b_{1,221}u,_{111} + b_{1,111221} + b_{1,221u,_{1111} + \\
+ b_{1,1u,_{11122} + 2b_{1,211u,_{1112} + 2b_{1,2u,_{11121}) (5.22)}
\]

We now isolate and sum up the terms in (5.19)-(5.21) containing fifth order derivatives of \( u \), namely

\[
3(b_0 + 2b_1),_{1}(\Delta u),_{111} - 15b_{1,1u,_{11122} + 3(b_0 + 2b_1),_{2}(\Delta u),_{222} \\
-15b_{1,2u,_{11122} + (b_0 + 12b_1),_{2}(\Delta u),_{211} + 2(b_0 + 12b_1),_{1}(\Delta u),_{212} \\
-15b_{1,2u,_{22111} - 30b_{1,1u,_{22121} + (b_0 + 12b_1),_{1}(\Delta u),_{122} \\
+2(b_0 + 12b_1),_{2}(\Delta u),_{112} - 15b_{1,1u,_{11122} - 30b_{1,2u,_{11121}) (5.23)}
\]

We separately analyze the terms in (5.23) associated to \( b_0 \) and the ones associated to \( b_1 \).

Namely the contribute due to \( b_0 \) is given by

\[
3b_{0,1}(\Delta u),_{111} + 3b_{0,2}(\Delta u),_{222} + b_{0,2}(\Delta u),_{211} + \\
2b_{0,1}(\Delta u),_{212} + b_{0,1}(\Delta u),_{122} + 2b_{0,2}(\Delta u),_{112} = \\
3b_{0,1}(\Delta u),_{111} + (\Delta u),_{122} + 3b_{0,2}(\Delta u),_{222} + (\Delta u),_{122} \\
3b_{0,1}(\Delta u),_{111} + (\Delta u),_{22} + 3b_{0,2}(\Delta u),_{22} + (\Delta u),_{11} \\
3b_{0,1}(\Delta^2 u),_{1} + 3b_{0,2}(\Delta^2 u),_{2} (5.24)
\]
The contribute due to \( b_1 \) is given by

\[
6b_{1,1}(\Delta u),_{111} - 15b_{1,1}u,_{11122} + 6b_{1,2}(\Delta u),_{222} \\
- 15b_{1,2}u,_{11222} + 12b_{1,2}(\Delta u),_{211} + 24b_{1,1}(\Delta u),_{212} \\
- 15b_{1,2}u,_{22211} - 30b_{1,1}u,_{22212} + 12b_{1,1}(\Delta u),_{122} \\
+ 24b_{1,2}(\Delta u),_{112} - 15b_{1,1}u,_{11122} - 30b_{1,2}u,_{11121} = \\
b_{1,1}\{6(\Delta u),_{111} - 30u,_{11122} + 36(\Delta u),_{122} - 30u,_{22212}\} \\
+ b_{1,2}\{6(\Delta u),_{222} - 30u,_{22211} + 36(\Delta u),_{211} - 30u,_{11121}\} = \\
6b_{1,1}\{(\Delta u),_{11} + (\Delta u),_{22},1 + 5[(\Delta u),_{122} - u,_{11122} - u,_{22212}]\} \\
+ 6b_{1,2}\{(\Delta u),_{22} + (\Delta u),_{11},2 + 5[(\Delta u),_{211} - u,_{22211} - u,_{11121}]\} = \\
6b_{1,1}\{(\Delta u),_{11} + (\Delta u),_{22},1 + 5[(\Delta u),_{122} - (\Delta u),_{122}]\} \\
+ 6b_{1,2}\{(\Delta u),_{22} + (\Delta u),_{11},2 + 5[(\Delta u),_{211} - (\Delta u),_{112}]\} = \\
6b_{1,1}(\Delta^2 u),_1 + 6b_{1,2}(\Delta^2 u),_2 \tag{5.25}
\]

Gathering (5.24) and (5.23) we have that the terms in (5.23) are equal to

\[
(3b_{0,1} + 6b_{1,1})(\Delta^2 u),_1 + (3b_{0,2} + 6b_{1,2})(\Delta^2 u),_2, \tag{5.26}
\]

hence the fifth-order term is of the form \( a \cdot D\Delta^2 u \) and therefore can be bounded from above by \( C|D\Delta^2 u| \).

We now isolate and sum up the terms in (5.19)-(5.21) containing sixth order derivatives of \( u \), namely

\[
(b_0 + 2b_1)(\Delta u),_{1111} - 5b_1u,_{11122} + (b_0 + 2b_1)(\Delta u),_{2222} - 5b_1u,_{11222} \\
+(b_0 + 12b_1)(\Delta u),_{1122} - 15b_1u,_{12222} + (b_0 + 12b_1)(\Delta u),_{1122} - 15b_1u,_{11122} = \\
b_0\Delta^3 u + b_1\{2(\Delta u),_{1111} + 2(\Delta u),_{2222} + 24(\Delta u),_{1122} - 20u,_{11122} - 20u,_{11222}\} = \\
b_0\Delta^3 u + b_1\{2(\Delta u),_{1111} + 2(\Delta u),_{2222} + 4(\Delta u),_{1122} + 4(\Delta u),_{1122}\} = \\
(b_0 + 2b_1)\Delta^3 u \tag{5.27}
\]

The norm of the term above might be indeed bounded from below by \( C|\Delta^3 u| \).
