Fault Predictions in Object Oriented Software

Bremananth R and Thushara R

Abstract—The dynamic software development organizations optimize the usage of resources to deliver the products in the specified time with the fulfilled requirements. This requires prevention or repairing of the faults as quick as possible. In this paper an approach for predicting the run-time errors in java is introduced. The paper is concerned with faults due to inheritance and violation of java constraints. The proposed fault prediction model is designed to separate the faulty classes in the field of software testing. Separated faulty classes are classified according to the fault occurring in the specific class. The results are papered by clustering the faults in the class. This model can be used for predicting software reliability.

Keywords— Clustering faults, Inconsistent Type Usage (ITU), Illicit file usage, Spaghetti.

I. INTRODUCTION

The programs written using object-oriented languages may have data flow anomalies and faults. Occasionally one of these faults manifests a failure, and corrective measures are then usually taken to eliminate the fault. The traditional testing techniques that are available primarily focus on the syntactic and semantic error constructs. The other constructs which lead to an incorrect output is due to the fault that occurs during run-time. Our paper takes these types of errors into consideration and errors are predicted during the compilation time, reducing the errors during the run-time.

The errors are taken as metrics to predict fault classes.

The metrics considered are:
1. Spaghetti Error
2. Inconsistent Type Usage error
3. Lvalue required
4. Undefined loop Exception
5. Illicit File Usage Exception
6. Incorrect inheritance

A. Proposed System

The preliminary work done by us is to develop a new compiler which is used to test the classes for the above specified metrics and the faulty classes are displayed along with their metrics. The faults are clustered with the common type of errors occurring in it and the output is displayed according to the cluster of the errors that have occurred in the tested classes.

II METHODOLOGY

The experiment has been carried out using 20 Java classes from different sources and all the classes are measured with 6 metrics. For this, a compiler is generated for the above specified metrics. The compiler compiles the source code and separates the faulty classes containing the errors along with the class name [1].

A Spaghetti Error

The error has derived its name from catering science representing a cup of noodles. A cup of noodles remain in an attached format, such that each one is extended with the other. Similarly in multilevel inheritance the derived class is inherited from the base class. Multilevel inheritance is not an error in java but when the inheritance level reaches six or more than six, it leads to a run time anomaly. Figure1 is an example of multilevel inheritance, where A.Java is the super class of the inheritance level for which B.java is a descendant class which in turn is inherited by the class C.java class.

```java
public class MLI 1
public class ML_A
{
 ML_A()
{
 System.out.print("Welcome to ML_A");
}}
// MLI 2, MLI 3, MLI 4, MLI 5.....
class ML_G extends ML_F
{
 ML_G()
{
 System.out.print("Welcome to ML_G");
}
public static void main(String arg[])
{
 ML_G mlf = new ML_G();
}
```

Fig. 1 Illustration of spaghetti error

C.java is base class for the class D.java which serves as the base class of E.java. E.java class is inherited by the class F.java. When the class G.java extends F.java class it leads to an anomaly in the inherited level (as the inheritance level reaches six). Result of spaghetti error is illustrated in figure2.
B Inconsistent Type Usage error (ITU)

For this fault type [2], a descendant class does not override any inherited method. Thus, there can be no polymorphic behavior. Every instance of a descendant class that is used where an instance of base class is expected can only behave exactly like an instance of base class. That is, only methods of base class can be used. Any additional methods specified in base class are hidden since the instance of derived class is being used as if it is an instance of base class. However, anomalous behavior is still possible. If an instance of descendant class is used in multiple contexts anomalous behavior can occur if derived class has extension methods. In this case, one or more of the extension methods can call a method of base class or directly define a state variable inherited from base class. Anomalous behavior will occur if either of these actions results in an inconsistent inherited state. Figure 3 is an example illustrating the error Inconsistent Type Usage (ITU). In this program stack is a derived class of vector. g() is a function which expects vector as its argument type. But in the above example stack object s is passed where the vector instance v is required. This is syntactically correct because an instance of stack is also an instance of vector. The problem begins at line 21 where the last element of s is removed. The fault is manifested when control returns and reaches the first call to stack::pop() at line 14. Here, the element removed from the stack is not the last element that was added, thus the stack integrity constraint will be violated. Hence the result of the software class will be affected. Result of ITU error is illustrated in figure 4.

C Lvalue required

Comparing of two strings in java can be done by using the .(dot) equals operation. But this condition is violated when the operator == is used to check whether the strings are equal. This is never specified as a fault in java, even though the constraint is violated. Hence our module deals with this constraint specifying that the use of == operator to equal two strings is illegal. An example program for Lvalue required, given in figure 5 has two string variables d and e. The use of == operator in the line 8, is against the rules and hence the error message is displayed as Lvalue required.

```java
1  class A
2  {
3      int a, b, c, x;
4      String d="WEL";
5      String e="WEL";
6      public void A_a()
7          {
8              if(d==e)
9                  {
10                   }
11                  System.out.println("Class A called");
12              }
```

Fig. 5 Occurrence of Lvalue required error

Result for Lvalue required is illustrated in figure 6.
As the name specifies this error is nothing but a dummy loop. If we use any undefined loop java compiler does not consider this as an error. Our module will consider this as an error while at compilation time. In figure 7, there is a dummy do while loop which is of no use. Just the loop goes on and on. Hence this is specified as an error by our compiler.

```
1 class A
2 {
3     int a, b, c, x;
4     public void A_a()
5     {
6         if (a > 4)
7             a--;
8     }
9     do
10    { while (a > 10);
11 }
12 }
```

Result of undefined loop exception is illustrated in figure 8.

```
1 class loopa
2 {
3     loopa();
4     {
5         int a = 0;
6         int i = 0;
7         try
8             {
9                 FileOutputStream file_output = new FileOutputStream(file);
10                DataOutputStream data_out = new DataOutputStream(file_output);
11                for (i = 0; i < 10; i++)
12                    {
13                        data_out.writeInt(i);
14                        data_out.writeDouble(i);
15                    }
16                file_output.close();
17             }
18         catch (IOException e)
19             {
20                System.out.println("IO exception: " + e);
21         }
22 }
```

The unclosed file leads to a dynamic error during execution when the file is tried to open again. The result of illicit file usage exception is displayed as in figure 10.

```
1    class A
2   {
3      int a, b, c, x;
4      public void A_a()
5       {
6          if (a > 4)
7         {
8            a--;
9          }
10        do
11        {
12         } while (a > 10);
13      }
```
**F Incorrect Inheritance**

The name itself specifies that the inheritance is not right. The type of inheritance that is incorrect in java is the multiple inheritance, which is replaced with the interfaces. Though java does not support multiple inheritance it does not show a bug that the fault occurring is due to the usage of the incorrect inheritance (i.e.) multiple inheritance. It just gives a syntax error as “{expected”. But our module exactly specifies that the error is due to the usage of the incorrect inheritance. Figure 11 is an example in which C.Java inherits two classes B.java and A.java. Since a single class inherits two classes, it leads to incorrect inheritance.

![Diagram of Incorrect Inheritance](image)

```java
class C extends A,B {
    MP_A()
    System.out.println("WELCOME TO MP_A");
}
```

Fig. 11: Illustration of Incorrect Inheritance error

Result of incorrect inheritance error is illustrated in figure 12.

![Fig. 12 Output of incorrect inheritance](image)

**IV IMPLEMENTATION AND RESULT ANALYSIS**

Our module allows the user to input a folder which contains the classes to be tested. On loading the folder the selected classes to be tested present inside the folder are fed to the source code one by one which monitors for the occurrence of error. The errors are monitored based on the six metrics specified earlier. If an error is detected then the error number is stored in the error list of that particular class in the database. After monitoring all the classes with source code the results are stored in database as in table I.

| class name | errlst |
|------------|--------|
| A.java     | 1,6,   |
| ML_G.java  | 3,     |
| ML_H.java  | 3,4,   |
| MP_A.java  | 2,5,   |
| loopa.java | 1,6,5, |
| sample.java| 1,4,   |

The metrics we have used are stored with the error code and error name as in table II.

| errcode | ername                  |
|---------|-------------------------|
| 1       | Lvalue required          |
| 2       | Incorrect inheritance error |
| 3       | Spaghetti error          |
| 4       | Inconsistent Type Usage error |
| 5       | Illicit file usage exception |
| 6       | Undefined loop exception |

When the compiler has identified the faulty classes the result will be displayed in a format as that of figure 13. The user can view the errors of a particular class by selecting the class required and on clicking the “error view” button the errors of that class will be listed at the right side by retrieving its error names from the database with the help of “errcode “listed in errlst.
On clicking the “ok” button all the errors with their specific classes are displayed as in figure 14.

Listing 1 specifies source code which creates a panel with error view, ok and load buttons. The load button loads the path of the folder where the classes to be tested are placed. The code for compiling the java classes and displaying the errors is called in turn and the classes with the errors are displayed as in figure 13.

```java
public resultwin() {
    super(new BorderLayout());
    fileName = new JTextField(10);
    errlst = new Vector();
    List load = new JList(errlst);
    toppanel = new JPanel();
toppanel.add(load);
toppanel.add(fileName);
    //adding List control details
    load.addActionListener(new LoadListener());
    listModel = new DefaultListModel();
    listModel1 = new DefaultListModel();
    //Create the list and put it in a scroll pane.
    list = new JList(listModel);
    list1 = new JList(listModel1);
    list.setSelectionMode(ListSelectionModel.SINGLE_SELECTION);
    list.setSelectedIndex(0);
    list.setVisibleRowCount(5);
    JScrollPane listScrollPane = new JScrollPane(list); //scrollpane set to list control
    list1.setVisibleRowCount(5);
    JScrollPane listScrollPane1 = new JScrollPane(list1);
    fireButton.setActionCommand(fireString);
    fireButton.addActionListener(new FireListener());
    fireButton = new JButton(fireString);
    fireButton.addActionListener(new FireListener());
    //Create a panel that uses BoxLayout.
    JPanel buttonPane = new JPanel();
    JPanel listpanel = new JPanel();
    listpanel.add(listScrollPane);
    listpanel.add(listScrollPane1);
    buttonPane.setLayout(new BoxLayout(buttonPane, BoxLayout.LINE_AXIS));
    buttonPane.add(fireButton);
    buttonPanel.add(new JSeparator(SwingConstants.VERTICAL));
    buttonPanel.add(Box.createHorizontalStrut(5));
    buttonPanel.setBorder(BorderFactory.createEmptyBorder(5,5,5,5));
    add(toppanel, BorderLayout.NORTH);
    add(listpanel, BorderLayout.CENTER);
    add(buttonPane, BorderLayout.PAGE_END);
}
```

```java
class OKListener implements ActionListener {
    public void actionPerformed(ActionEvent e) {
        //adding selected fields to the vector
        Vector v = new Vector();
        v.addElement(list1.getModel().getElementAt(i));
        dispwin.createAndShowGUI(); //next screen with vector as input
    }
}
```

```java
class LoadListener implements ActionListener {
    public void actionPerformed(ActionEvent e) {
        JFileChooser jfc = new JFileChooser();
        jfc.setFileSelectionMode(JFileChooser.DIRECTORIES_ONLY);
        //scrollpane set to list control
    }
}
```
if (e.getSource() == Load) {
    int rVal = jfc.showOpenDialog(new resultwin());
    if (rVal == JFileChooser.APPROVE_OPTION) {
        file = jfc.getSelectedFile();
        String fname1 = file.getAbsolutePath();
        fileName.setText(fname1);
        mainfile.disp(fname1);
    }
    try {
        Class.forName("sun.jdbc.odbc.JdbcOdbcDriver");
        con = DriverManager.getConnection("jdbc:odbc:stst");
        st = con.createStatement();
        r = st.executeQuery("select * from clserr");
        while (r.next()) {
            listModel.addElement(r.getString("class_name"));
            errlst.addElement(r.getString("errlst"));
        }
    } catch (Exception eee) {
    }
}

class FireListener implements ActionListener {
    public void actionPerformed(ActionEvent e) {
        //This method can be called only if there's a valid //selection so go ahead and remove whatever's //selected.
        int index = list.getSelectedIndex();
        String s = (String)errlst.elementAt(index);
        String res[] = p.split(s);
        listModel1.clear();
        try {
            Class.forName("sun.jdbc.odbc.JdbcOdbcDriver");
            Connection con1 = DriverManager.getConnection("jdbc:odbc:stst");
            Statement st1 = con.createStatement();
            ResultSet r1;
            for (int rr = 0; rr < res.length; rr++) {
                System.out.println(res[rr].trim());
                r1 = st1.executeQuery("select errname from errtab where errcode =" + res[rr].trim() + ";
                if (r1.next()) {
                    listModel1.addElement(r1.getString("errname"));
                }
            }
        }
        catch (Exception eee) {
            System.out.print(eee);
        }
    }
}

int size = listModel.getSize();
    if (size == 0) { //Nobody's left, disable firing.
        fireButton.setEnabled(false);
    } else { //Select an index.
        if (index == listModel.getSize()) {
            //removed item in last position
            index--;
        }
        list.setSelectedIndex(index);
        list.ensureIndexIsVisible(index);
    }
}

//This listener is shared by the text field and the hire button.
class HireListener implements ActionListener, DocumentListener {
    private boolean alreadyEnabled = false;
    private JButton button;
    public HireListener(JButton button) {
        this.button = button;
    }
    //Required by ActionListener.
    public void actionPerformed(ActionEvent e) {
        int index = list1.getSelectedIndex(); //get selected index
        String s = (list1.getSelectedValue()).toString();
        listModel1.remove(index);
        listModel.addElement(s);
        if (index == -1) { //no selection, so insert at beginning
            index = 0;
        } else { //add after the selected item
            index++;
        }
        list1.setSelectedIndex(index);
        list1.ensureIndexIsVisible(index);
    }
    //Required by DocumentListener.
    public void insertUpdate(DocumentEvent e) {
        enableButton();
    }
    //Required by DocumentListener.
    public void removeUpdate(DocumentEvent e) {
        handleEmptyTextField(e);
    }
    //Required by DocumentListener.
    public void changedUpdate(DocumentEvent e) {
        if (!handleEmptyTextField(e)) {
            enableButton();
        }
    }
    private void enableButton() {
        if (!alreadyEnabled) {
            button.setEnabled(true);
        }
    }
}
The source code compiles the classes to be tested and specifies the faults that occur in a single combination is clustered and the classes that possess those clustered faults are displayed along with the clustered faults (Listing 2).

```java
private boolean handleEmptyTextField(DocumentEvent e) {
    if (e.getDocument().getLength() <= 0) {
        button.setEnabled(false);
        alreadyEnabled = false;
        return true;
    }
    return false;
}

// This method is required by ListSelectionListener.
public void valueChanged(ListSelectionEvent e) {
    if (e.getValueIsAdjusting() == false) {
        if (list.getSelectedIndex() == -1) {
            // No selection, disable fire button.
            fireButton.setEnabled(false);
        } else {
            // Selection, enable the fire button.
            fireButton.setEnabled(true);
        }
    }
}

/**
 * Create the GUI and show it. For thread safety,
 * this method should be invoked from the
 * event-dispatching thread.
 */
private static void createAndShowGUI() {
    // Create and set up the window.
    JFrame frame = new JFrame("Java Compiler");
    frame.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);
    // Create and set up the content pane.
    JComponent newContentPane = new resultwin();
    newContentPane.setOpaque(true);
    frame.setContentPane(newContentPane);
    // Display the window.
    frame.pack();
    frame.setVisible(true);
}

public static void main(String[] args) {
    // Schedule a job for the event-dispatching thread:
    // creating and showing this application's GUI.
    javax.swing.SwingUtilities.invokeLater(new Runnable() {
        public void run() {
            createAndShowGUI();
        }
    });
}
