Abstract

Background: *Rosa damascena* Herrm (*R. damascena*) is a species of the Rosaceae family. The *R. damascena* has been shown to improve depression, anxiety and grief. It also suppresses allergic reactions and migraine headache. In addition, amelioration of learning and memory deficits, delay in onset of seizure attacks, alleviation of pain and improvement of sleep disorders have been attributed to extract and essential oil of *R. damascena*. This review was conducted to integrate the neuropharmacological effects of *R. damascena*.

Methods: Employed scientific databases for collecting information were including PubMed, Web of Science, Scopus and Google Scholar.

Results: The results of animal and clinical trial studies indicate that the extract of *R. damascena* and its essential oil apply useful therapeutic effects on depressant and anxiety-like behaviors, epileptic seizures, learning and memory impairments, sleep disturbances and pain.

Conclusion: Based on scientific findings, the neuroprotective effects of *R. damascena* can be mainly linked to its antioxidant and anti-inflammatory properties.

Keywords: *Rosa damascena* Herrm, Nervous system, Neuropharmacological

1. Introduction

*Rosa damascena* (*R. damascena*) or Damask rose\(^1\) is familiarized as Gole Mohammadi in Iran.\(^2\) This plant is a member of the Rosaceae family.\(^3\) The people believe that Gole Mohammadi reminds them of Prophet Mohammad.\(^4\) This flowering plant is bred in Iran (mainly in Kashan).\(^5\) At the present time, more than 200 species of this plant have been recognized. Regardless of employing as a fancy plant in houses, gardens, and parks, *Rosa damascena* is basically used as a fragrance in industry and is famous due to its perfuming impacts.\(^6\) Additionally, *R. damascena* has been implicated for therapeutic purposes in traditional medicines.\(^7\) There is no review on neuropharmacological impacts of *R. damascena*.\(^8\) This literature review, therefore, was aimed to summarize the neuropharmacological impacts of *R. damascena*.
2. Method
A detailed survey was accomplished in the databases including Medline, PubMed, Science Direct, Scopus, and Google Scholar from beginning of 1950 until the end of 2020 to identify the studies carried out on neuropharmacological effects of *R. damascena*. The keywords were *R. damascena*, neuropharmacological, neurotoxicity, neurodegeneration, memory, learning, epilepsy, pain, anticonvulsant, antianxiety and anti-depressant.

3. Description and History
*R. damascena* is bush plant which grows roughly 1 to 2 meters upper floor and has extensive, ostentatious and beautiful blossoms. This plant is able to grow in different areas of the world. Middle East is known as a main source of Damask rose. The history of breeding of *R. damascena* is long in Iran. It has been defined that the crude refining of rose for oil production was begun from the late seventh century AD, and later it was circumfused in many areas of the world in fourteenth century. Although *R. damascena* is grown in multiple cities of Iran, Kashan is main place to bring up of this flowering plant. Iran was the primary maker of rose oil until the sixteenth century and sent out it to whole of global.³

4. Products
4.1. Rose water
Rose water is one of the most famous products of *R. damascena* which is used mainly in religious ceremonies.⁸ Generated rose water in Kashan has high quality and is employed annually to wash Kaaba (God House) in Mecca. Rose water also has high worthiness in the food industry and some food products are aromatized by it.⁴⁹

4.2. Essential oil
Essential oil is extracted from the flowers of *R. damascena* and is full of linalool, geraniol, citronellol and nerol. The harvest time and temperature are considered as important factors affecting the quality of essential oil of *R. damascena*.¹⁰ The essential oil is pale, yellow and semisolid. Presence of saturated aliphatic hydrocarbons in oil makes it solid in room temperature.⁴¹¹ Essential oil is vended as an expensive product in various countries of the world.¹²

4.3. Dried flowers
Flowers of *R. damascena* are kept in two forms. Dried buds are mostly exported and dried petals are used for alleviation of gastrointestinal system problems including constipation. Dried flowers
of this medicinal plant has been shown to cure asthma, cancer, infection, skin injuries and wounds.\textsuperscript{13} Iranian people consume the flowers of \textit{R. damascena} with yogurt.\textsuperscript{4,13}

4.4. Other products
Besides products listed above, ethanolic, aqueous and chloroformic extracts are prepared from flowers, petals, and hips of \textit{R. damascena}. These extracts are employed for research works.\textsuperscript{14}

5. Chemical compounds
Presence of glycosides, terpenes, flavonoids and anthocyanin has been confirmed in extract of \textit{R. damascena}.\textsuperscript{15,16} Carboxylic acid, myrcene, vitamin C, quercetin and kaempferol also were extracted from \textit{R. damascena}.\textsuperscript{17} Rose hips contain vitamins such as vitamine C, minerals, fatty acids, carotenoids and polyphenoles. Phenolic compounds of \textit{R. damascena} possess antioxidant, anticancer, anti-inflammatory, antimutagenic, and antidepressant properties.\textsuperscript{7,18} The essential oil of \textit{R. damascena} contains a lot of non-terpenoid hydrocarbons. The essential oil also is rich of compounds such as linalool, geraniol, n-tricosane, 1-nonadecene, n-pentacosane, nerol and n-hexatriacontane.\textsuperscript{19}

6. Traditional remedies
In traditional medicine, rose water extracted from petals of \textit{R. damascena} is used for preparation of food. The rose water has been suggested to have antimicrobial, antiseptic, antioxidant, anti-inflammatory, anti-aging and lenient effects. Dried flowers of \textit{R. damascena} have been found to remedy digestive problems, to alleviate the pain in abdominal and chest, to reinforce heart and to reduce menstrual bleeding. People believe that rose hips purify blood, therefore they are used with bread.\textsuperscript{20} Rose oil is prepared from petals of flower and can be used orally. The oil of \textit{R. damascena} is used against anxiety, depression and grief. Reduction of thirst and amelioration of wound and skin injuries have been attributed to oil of \textit{R. damascena}. Vapor therapy of rose oil has been also suggested to be helpful in treatment of some allergies and headaches including migraine headache.\textsuperscript{13}

7. Neuropharmacological effects
Multiple pharmacological researches have been done on \textit{R. damascena} to evaluate its impacts on the central nervous system (CNS). Beneficial effect of \textit{R. damascena} on depression, anxiety, learning and memory, seizure, sleep and pain has been documented. Therefore, this review goes on address these issues.

7.1. Effect on depression and anxiety
Depression and anxiety are disorders with similar features such as nervousness, irritability, and problems in sleeping and concentrating. Elevated plus maze and open field are experimental tests widely employed for evaluating the effects of compounds and drugs on anxiety. Hole cross test also is used to monitor the spontaneous activity of animals. The results obtained from forced swimming test (FST) are used to assess the effect of antidepressant drugs. Using the mentioned tools, *R. damascena* has been reported to possess anxiolytic and anti-depression effects. The results of open field and hole cross tests indicated that oral administration of 250 and 500 mg/kg of the ethanolic extract of *R. damascena* led to a significant reduction in locomotion of animals. Unlike these findings in an animal study on male rats, intraperitoneal infusion of 60 and 90 mg/kg of ethanolic extract of *R. damascena* increased immobility, decreased swimming times in FST whereas 15 mg/kg was not effective. The antidepresant effect of *R. damascena* extract was attributed to flavonoides and kaempferol presented in extract. Researchers reported that 15 mg/kg of aqueous extract significantly enhanced swimming time and mitigated immobility time in rats. This antidepressant effect of *R. damascena* was comparable with imipramine. Regarding this subject, suppression of reuptake of monoamine neurotransmitters in the brain has been considered as a undelying mechanism for antidepressant effect of *R. damascena* extract. It was documented that administration of 0.15 ml/kg rose oil as a vapor for 15 min every day for 28 days improved sucrose preference and attenuated depression like behavior induced by chronic mild stress in rats. In this study, antioxidant effect of the oil of *R. damascena* is mentioned as a basic factor in reduction of sickness behaviors in rats. Researchers showed that 100–1600 mg/kg of *R. damascena* oil dissolved in olive oil palliated the avoidance rate in the discrete shuttle-type conditioned avoidance task in mice. In a clinical trial, 10 and 15 mg capsules of *R. damascena* extract improved depression and behavioral obstacles in old dementia patients. It has been suggested that these effects may be due to the inhibition of serotonic reuptake. The Anti-anxiety and anti-depressive effects of *R. damascena* were shown in Table 1.
Table 1: Anti-anxiety and anti-depressive effects of *R. damascena*

| Preparation      | Dose/concentration | Type of study | Mechanism/ Results                                                                 |
|------------------|--------------------|---------------|-----------------------------------------------------------------------------------|
| Ethanolic extract| 250 and 500 mg/kg  | In vivo (mice) | Decrease of locomotion and reduction of depressant actions<sup>27</sup>             |
|                  | (oral)             |               |                                                                                   |
| Ethanolic extract| 60 and 90 mg/kg    | In vivo (rat) | Increase of immobility and decrease of swimming times in FST<sup>28</sup>           |
|                  | (i.p)              |               |                                                                                   |
| Aqueous extract  | 15 mg/kg (i.p)     | In vivo (rat) | Enhancement of swimming time and reduction of immobility time in FST<sup>29</sup>  |
| Rose oil         | 0.15 ml/kg (i.p)   | In vivo (rat) | Improvement of sucrose preference and attenuation of depression like behavior induced by chronic mild stress<sup>30</sup> |
| Essential oil    | 100–1600 mg/kg     | In vivo (mice) | Decrease of avoidance rate without affecting the response rate<sup>31</sup>        |
|                  | (subcutaneous)     |               |                                                                                   |
| Capsules         | 10 and 15 mg       | Clinical trial| Amelioration of depression and behavioral obstacles<sup>32</sup>                   |
|                  | capsules (oral)    |               |                                                                                   |

7.2. Effect on learning and memory
Oral administration of methanolic extract of *R. damascena* (300, 600, 1200 mg/kg/day for 1 month) improved amyloid β-related memory abnormalities in rats when they were examined by Morris water maze (MWM) and passive avoidance tests. Based on high performance liquid chromatography (HPLC) analysis, these effects may be resulted from antioxidant compounds presented in extract of *R. damascena* such as flavonoids and polyphenols.\textsuperscript{33} Treatment with 50 and 250 mg/kg of hydroalcoholic extract of *R. damascena* for 2 weeks prevented scopolamine-induced memory deficits. In this research extract improved brain oxidative damage via decreasing malondialdehyde (MDA) and increasing thiol concentration.\textsuperscript{34} Oral use of 1 g/kg of hydroalcoholic extract of *R. damascena* has been indicated to have positive impact on high-fat diet-induced learning and memory dysfunction in rats. It was hypothesized that antioxidant properties of *R. damascena* extract contribute in results of this study.\textsuperscript{35} Inhibition of acetylcholinesterase has been documented to prevent memory deficits. In an in vitro study, 1000 µg/ml of essential oil of *R. damascena* showed inhibitory impact on acetylcholinesterase and butyrylcholinesterase. Based on these findings, *R. damascena* can amplify memory abilities via the suppression of acetylcholinesterase and butyrylcholinesterase activity.\textsuperscript{36} Improving impacts of *R. damascena* on learning and memory impairments have been concluded in Table 2.

**Table 2: Effects of *R. damascena* on learning and memory**

| Preparation | Dose/concentration | Type of study | Mechanism/ Results |
|-------------|---------------------|---------------|--------------------|
| Methanolic extract | 300, 600, 1200 mg/kg/day (oral) | In vivo (rat) | Improvement of spatial memory and passive avoidance learning\textsuperscript{33} |
| Hydroalcoholic extract | 50 and 250 mg/kg (i.p) | In vivo (rat) | Amelioration of spatial memory, decrease of MDA and increase of thiol concentration\textsuperscript{34} |
| Hydroalcoholic extract | 1 g/kg (oral) | In vivo (rat) | Improvement of high-fat diet – induced learning and memory dysfunction\textsuperscript{35} |
| Essential oil | 1000 µg/ml | In vitro | Inhibition of acetylcholinesterase and butyrylcholinesterase activity\textsuperscript{36} |
7.3. Effect on seizure

Infusion of 750 mg/kg of essential oil of *R. damascena* before pentylenetetrazol (PTZ) increased the latency time in beginning of seizures in rats. These anticonvulsant properties were linked to the effects of flavonoids of *R. damascena* on gamma aminobutyric acid (GABA)A receptors.\(^{37}\) It has been shown that 100, 500 and 1000 mg/kg of aqueous and ethanolic extracts of *R. damascena* could attenuate the severity of minimal clonic seizures (MCS) and generalized tonic-clonic seizures (GTCS) in mice kindled by PTZ.\(^{38}\) Electrocorticography (ECoG) recording also showed that administration of 50, 100 and 200 mg/kg of hydroalcoholic extract of *R. damascena* attenuated severity of seizures induced by PTZ in rats. One of the possible proposed mechanisms in results of this study is free radicals scavenging properties by the extract of this plant.\(^{39}\) Injection of 750 and 1000 mg/kg of essential oil of *R. damascena* 30 min before PTZ administration in rats retarded the development of seizure stages and prevented kindling acquisition. The role of flavonoids of essential oil in the reduction of seizure severity via activating GABA\(_A\) receptors has been suggested in this research.\(^{40}\) It has been revealed that seizures followed by PTZ administration can result in neuronal apoptosis in CA\(_1\), CA\(_3\) and dentate gyrus (DG) areas of hippocampus. Researchers reported that hydroalcoholic extract of *R. damascena* (50, 100 and 200 mg/kg) stopped neuronal death caused by PTZ in hippocampus of rats.\(^{41}\) In a clinical trial, sixteen children with refractory epilepsy received essential oil (5 mg/kg) of *R. damascena* for 3-6 weeks. Based on results, mean frequency of seizures significantly was lowered compared to the control. It was proposed that probably flavonoid compounds of *R. damascena* involve in these results via affecting benzodiazepine receptors.\(^{42}\) The anticonvulsant effects of *R. damascena* have been demonstrated in Table 3.
Table 3: Effects of *R. damascena* on seizure and epilepsy

| Preparation          | Dose/concentration | Type of study | Mechanism/Results                                      |
|----------------------|--------------------|---------------|--------------------------------------------------------|
| Essential oil        | 750 mg/ kg (i.p)   | In vivo (rat) | Postponement in onset seizure via affecting GABA<sub>A</sub> receptors<sup>37</sup> |
| Aqueous extract      | 100 and 500 mg/kg (i.p) | In vivo (mice) | Retardation in beginning minimal clonic seizures and generalized tonic-clonic seizures<sup>38</sup> |
| Ethanol extract      | 1000 mg/kg (i.p)   | In vivo (rat) |                                                        |
| Hydroalcoholic extract | 50, 100 and 200 mg/ kg (i.p) | In vivo (rat) | Attenuation of severity of seizures induced by PTZ<sup>39</sup> |
| Essential oil        | 750 and 1000 mg/ kg (i.p) | In vivo (rat) | Prevention of seizure attacks and delay in induction of kindling<sup>40</sup> |
| Hydroalcoholic extract | 50, 100 and 200 mg/kg (i.p) | In vivo (rat) | Cessation of neuronal death caused by PTZ<sup>41</sup> |
| Essential oil        | 5 mg/kg (oral)     | Clinical trial | Improvement of refractory seizures<sup>42</sup> |

7.4. Effect on sleep

Hypnotic effects of *R. damascena* were investigated in several studies. Aqueous and ethanolic extracts (500 and 1000 mg/kg) significantly elevated sleep time caused by pentobarbital which was similar to the effects of diazepam. These effects may be mediated via influencing GABA<sub>A</sub> receptors.<sup>43</sup> In another study, hypnotic impact of the ethanol extract of *R. damascena* and its fractions was evaluated in mice. Results showed that 250 and 500 mg/kg of ethanol extract of *R. damascena* and its ethylacetate fraction exerted hypnotic effects in mice. These effects were
attributed to enhanced level of GABAA receptors activity.\textsuperscript{44} In a clinical trial, the effect of \textit{R. damascena} on sleep was examined. \textit{R. damascena} was used for three subsequent nights and sleep quality was tested using the Pittsburgh Sleep Quality Index. \textit{R. damascena} aromatherapy significantly improved the sleep quality.\textsuperscript{45} The effects of \textit{R. damascena} on sleep disorders have been presented in Table 4.

**Table 4: Effects of \textit{R. damascena} on sleep**

| Preparation               | Dose/concentration | Type of study | Mechanism/Results                   |
|---------------------------|--------------------|---------------|-------------------------------------|
| Ethanolic extract         | 500 and 1000 mg/kg (i.p) | In vivo (mice) | Elevation of sleeping time induced by pentobarbital\textsuperscript{43} |
| aqueous extract           |                    |               |                                     |
| Ethanollic extract        | 250 and 500 mg/kg (i.p) | In vivo (mice) | Prolongation of sleep time\textsuperscript{44} |
| Ethylacetate fraction     | 500 mg/kg (i.p)    |               |                                     |

| Drop                      | Aromatherapy       | Clinical trial | Improvement of sleep quality\textsuperscript{45} |
|---------------------------|--------------------|----------------|---------------------------------------------------|

**7.5. Analgesic effects**

The effects of hydroalcoholic extract (250, 500 and 1000 mg/kg) of \textit{R. damascena} and its oil (100, 200 and 400 μL/kg) on pain alleviation were examined in rats. The hydroalcoholic extract (500 and 1000 mg/kg) significantly alleviated abdominal twitches. In formalin test, the oil of the plant was not effective but hydroalcoholic extract lowered paw licking time of both phases of formalin test dose-dependently. It is probable that analgesic effects of hydroalcoholic extract of \textit{R. damascena} were carried out via the inhibition of C fibers.\textsuperscript{46}

In clinical trial, 88 patients with migraine headache received a combination of \textit{Viola odorata L.} and \textit{R. damascena} flowers and \textit{Coriandrum sativum L.} fruits in 500 mg capsules three times a day and propranolol tablet (20 mg) twice a day. According to the results, the capsules alleviated
headache in patients with migraine. In another clinical trial, ethanolic extract (400 mg capsules) of R. damascena had analgesic and anti-inflammatory effects and reduced postoperative pain. The effects of R. damascena on pain relief have been presented in Table 5.

Table 5: Analgesic effects of R. damascena

| Preparation          | Dose/concentration | Type of study | Mechanism/Results                                      |
|----------------------|--------------------|---------------|--------------------------------------------------------|
| Hydroalcoholic extract | 500 and 1000 mg/kg (oral) | In vivo (rat) | Inhibition of abdominal twitches and reduction of carrageenan-induced paw edema |
| Capsule              | 500 mg capsules three times a day (oral) | clinical trial | Improvement of headaches in patients with migraine |
| Ethanolic extract    | 400 mg capsules    | clinical trial | Relief of postoperative pain and amelioration of inflammation |

8. Toxic effects
There are not enough reports about toxic effects of R. damascena. In a study on dogs, researchers evaluated the nephrotoxic and hepatotoxic effects of this plant in doses of 90-1440 mg/kg during 10 days. The results indicated a slight increase in bilirubin concentration and alanine aminotransferase (ALT) in group treated with R. damascena with respect to control group. There was no remarkable difference in blood concentration of creatinine, urea and alkaline phosphatase (ALP) in dogs treated with R. damascena compared to those of control group.

9. Conclusion
Based on the present review, R. damascena extracts and products obtained from it in particular rose oil prevent the death of brain neurons and exert beneficial therapeutic effects on anxiety, depression, learning and memory impairments, seizure, sleep disorders and pain.
neuroprotective effect of *R. damascena* can be linked to its antioxidant and anti-inflammatory properties. In addition, presented ingredients in *R. damascena* extract can improve behavioral disorders resulted from brain neuronal damages via amplifying the effect of neurotransmitters such as GABA and inhibiting acetylcholinesterase and butyrylcholinesterase activity.

Effects of *Rosa damascena* on nervous system

- Treatment of anxiety and depressive–like behaviors
- Improvement of learning and memory deficits
- Reduction of epileptic seizure severity
- Positive effects on sleep disorders and pain relief
