ABSTRACT

Background: To develop a culturally appropriate lifestyle intervention, involvement of its intended users is needed.

Methods: Members of an African American (AA) breast cancer support group participated in two 4-hour guided discussions, which were audiotaped, transcribed, and analyzed to guide the content.

Results: The support group collaborated with researchers to develop 24 experiential nutrition education sessions using a social cognitive framework and incorporating self-regulation skills (goal-setting, self-monitoring, problem-solving, stimulus control) and social support to enhance self-efficacy for changes in dietary intake.

Conclusions: Community engagement fostered autonomy, built collaboration, and enhanced the capacity of AA breast cancer survivors to participate in developing a lifestyle intervention.

Key words: Community engagement; African Americans; breast cancer survivors; lifestyle intervention; cancer prevention guidelines

doi: 10.21633/jgpha.6.120

INTRODUCTION

African American (AA) women are less likely to be diagnosed but are more likely to die from breast cancer than White women (American Cancer Society (ACS), 2015). Unhealthy eating and post-treatment weight gain are contributors (McCollough et al., 2011). Nevertheless, AA breast cancer survivors (BCSs) rarely collaborate with researchers to develop lifestyle interventions.

Community engagement is the process of working collaboratively with groups of people affiliated by similar situations to address issues affecting their well-being (Centers for Disease Control and Prevention, 1997). This brief report describes the process of engaging AA BCSs in developing a program for experiential nutrition education.

METHODS

Researchers engaged members of the SISTAAH (Survivors Involving Supporters to Take Action in Advancing Health) Talk breast cancer support group to develop a dietary intake intervention to enhance the prognoses for BCSs. The community coalition action theory (Butterfoss & Kegler, 2002) was used to develop a flowchart of the community engagement methods employed in this process (Figure 1). The Institutional Review Board of Augusta University approved this study, and participant consent was obtained prior to enrollment.
Established in 1995, SISTAAH Talk has a purpose of providing a forum for AA women to communicate about and make sense of their breast cancer experience in order to achieve improved physical and mental health outcomes. Membership of the support group includes more than 200 survivors. Founded by a breast cancer researcher, SISTAAH Talk is facilitated by an MPH-level BCS and “coaches” or role models trained to lead lifestyle programs.

The two 4-hour guided discussions were led by a BCS trained in qualitative research methods. Each discussion focused on the content and value of the intervention, including cultural appropriateness, comprehension of health messages, length, planned delivery format, likelihood of attendance, and likelihood of recommending it to others. From BCS feedback, interactive, or experiential nutrition education (e.g., cooking demonstrations, label-reading activities, and grocery store tours) was selected as the intervention approach. A review of similar published interventions (Paxton et al., 2011; Demark-Wahnefried et al., 2008) suggested that 24 weeks was the optimal intervention period. Diet-related cancer prevention guidelines (ACS, 2015; World Cancer Research Foundation/American Institute for Cancer Research, 2007) were used to construct the intervention content.

The discussions were digitally recorded, transcribed verbatim, manually coded, and summarized. NVIVO 10 software (2015) was used to facilitate the coding process. Data were analyzed with Qualitative Content Analysis (Schreier, 2012). Recurring themes were identified and summarized.

RESULTS

For participants (n=60; mean age 45.73 years; SD 7.91; range 35-75 years old), there were two guided discussions, with findings organized into three categories: 1) solving barriers to accessing healthy foods in grocery stores and restaurants; 2) linking behavior change to cultural values; and 3) modifying traditional or favorite dishes to reduce calorie, fat, and sodium content.

BCSs discussed the challenges of locating healthy food in their neighborhoods. One participant stated: “It can be tough. The closest grocery store is 7 miles away. If I don’t stop by the store on the way home, I am stuck with over-priced processed food from the corner store. I try not to eat out because fast-food places are the only restaurants in my neighborhood.”

In considering the effects of culture on healthy eating, one BCS reflected: “Take my collards (greens) away from me, and its over. I switched from (adding) fatback to smoked turkey and now I’ve learned that smoked meats cause cancer. What are we supposed to do?”

The need to transform traditional (e.g., soul food, southern dishes, and Caribbean favorites) recipes into healthier versions was discussed. One participant said: “I am not opposed to eating new foods, but I am never eating kale, even though they call it the new super food. I live in the inner city—and am proud of it. I want to eat the food that I love. I just want to make it healthier.”

The perceptions, strategies, and recommendations of the BCSs guided development of the intervention. Social cognitive theory, incorporating self-regulation skills (goal-setting, self-monitoring, problem-solving, stimulus control) and social support to enhance self-efficacy (Zoellner et al., 2011), undergirded the sessions (Table 1).
Lifestyle behaviors, such as dietary intake, are involved in the development and recurrence of breast cancer and affect the quality of life for survivors. AA women are less likely to participate in traditional lifestyle modification programs. To meet the needs of AA BCSs, interventions must focus on the attitudes, practices, and beliefs of this population (Davis et al., 2005). Few, however, have adopted this approach (Stolley et al., 2009).

**DISCUSSION/CONCLUSIONS**

Table 1. Theory-Based Content of the Experiential Nutrition Education Sessions

| Session | Title | Content | Theoretical Component |
|---------|-------|---------|-----------------------|
| 1       | What’s in it for me? | Program requirements; diet-related cancer prevention guidelines | Outcome expectancy; self-efficacy; self-monitoring |
| 2       | Be SMART | Setting Specific, Measurable, Achievable, Realistic and Timely (SMART) goals | Goal setting; self-efficacy; self-worth; feedback |
| 3       | The proof is in the pudding | Reading labels; grocery shopping tour; guided discussion | Social support; feedback |
| 4       | In living color | Fruits; cooking demonstration; guided discussion | Social support; self-monitoring |
| 5       | Know your risk | Diet, body weight, and breast cancer recurrence | Social support, feedback, self-monitoring |
| 6       | What goes in … | Introduction to plate method; portion size | Self-monitoring; goal setting |
| 7       | Keeping score | Meal planning; eating during holidays and special occasions | Methods for self-monitoring, behavioral cues, identifying and overcoming barriers |
| 8       | How sweet it is | Looking for hidden sugar; cooking demonstration; guided discussion | Self-monitoring; problem solving; stimulus control |
| 9       | Lifestyle and breast cancer | Dietary intake, physical activity, tobacco and alcohol use, stress management | Self-efficacy; social support |
| 10      | What’s love got to do with it? | Promoting self-care | Self-efficacy; self-esteem; social support |
| 11      | Eat more for less | Portion control, energy-dense foods; grocery shopping tour; guided discussion | Self-efficacy; social support |
| 12      | Woman in the mirror | Red and processed meats; portion control; cooking demonstration | Self evaluation and assessment of progress toward SMART goal |
| 13      | Food for the soul | Transforming traditional dishes into healthier options | Problem solving |
| 14      | Taking charge of what’s around you | Controlling the environment; understanding your triggers and cues to action | Self-monitoring; problem solving; stimulus control |
| 15      | Eating on the run | Finding budget-friendly healthy foods in your area; grocery shopping tour; guided discussion | Self-efficacy; self-monitoring; social support |
| 16      | Stay in the game | Whole grains; cooking demonstration; guided discussion | Self-efficacy; self-monitoring; social support |
| 17      | Mind over matter | Stress management | Outcome expectancy; problem solving |
| 18      | Slim down | Weight control | Self-monitoring; outcome expectancy; problem solving |
| 19      | Restoration | Sleep, meditation, rest; grocery shopping tour; guided discussion | Self-efficacy; self-monitoring; social support |
| 20      | Fresh feast | Vegetables; cooking demonstration; guided discussion | Self-efficacy; self-monitoring; social support |
| 21      | It all works together | Whole foods and the holism of lifestyle change | Goal setting; problem solving; outcome expectancy |
| 22      | Get moving to better health | Physical activity benefits for breast cancer survivors | Self-monitoring; stimulus control |
| 23      | Nutrition and breast cancer | Super foods; grocery shopping tour; guided discussion | Self-efficacy; self-monitoring; social support |
| 24      | Looking back and moving forward | Celebration and strategies for maintenance; cooking demonstration; guided discussion | Outcome expectancy; self-efficacy; self-monitoring; social support |
This report described a process of engaging AA BCSs in developing an experiential nutrition education program. The outcomes of two 4-hour guided discussions were categorized as: solving barriers to accessing healthy foods in grocery stores and restaurants; linking behavior change to cultural values; and modifying traditional dishes to reduce calorie, fat, and sodium. Strategies for overcoming these barriers, including enhancing self-efficacy, promoting self-monitoring, and providing social support, were identified.

A similar approach of engaging AAs was utilized in Moving Forward (Stolley et al., 2009). A weight loss program designed for AA BCSs, its success was due, in part, to involvement of AA BCSs in the development of the intervention. Results, including high participant retention (87%), significant weight loss (mean=5.6 lbs [SD=6.5 lbs]), improved diet (a reduction in consumption of sweet and fatty foods and an increase in vegetable consumption by1.6 servings per day) and increased physical activity (median time spent in vigorous activity increased from 0 to 24 minutes per day), demonstrated the feasibility of recruiting, enrolling, and maintaining engagement of AA BCSs.

To enhance enrollment of AA BCSs in nutrition education programs aimed at reducing breast cancer recurrence, researchers should engage them in all stages of program development. Engagement of BCSs at the levels of program conceptualization and implementation may improve the effectiveness of the program.
