OSTROWSKI TYPE INEQUALITIES VIA \( h \)-CONVEX FUNCTIONS WITH APPLICATIONS FOR SPECIAL MEANS

MEVLÜT TUNÇ

Abstract. In this paper, we establish some new Ostrowski type inequalities for absolutely continuous mappings whose first derivatives absolute value are \( h \)-convex (resp. \( h \)-concave) which are super-multiplicative or super-additive. Some applications for special means are given.

1. Introduction

Let \( f : I \subset [0, \infty) \to \mathbb{R} \) be a differentiable mapping on \( I^o \), the interior of the interval \( I \), such that \( f' \in L[a,b] \), where \( a, b \in I \) with \( a < b \). If \( |f'(x)| \leq M \), then the following inequality:

\[
|f(x) - \frac{1}{b-a} \int_a^b f(u) \, du| \leq \frac{M}{b-a} \left[ \frac{(x-a)^2 + (b-x)^2}{2} \right]
\]

holds. This result is known in the literature as the Ostrowski inequality. For recent results and generalizations concerning Ostrowski’s inequality, see [1, 2, 3, 8, 5, 11] and the references therein.

Definition 1. [12] We say that \( f : I \to \mathbb{R} \) is Godunova-Levin function or that \( f \) belongs to the class \( Q(I) \) if \( f \) is non-negative and for all \( x, y \in I \) and \( t \in (0,1) \) we have

\[
f(tx + (1-t)y) \leq t f(x) + (1-t) f(y)
\]

Definition 2. [9] We say that \( f : I \subseteq \mathbb{R} \to \mathbb{R} \) is a \( P \)-function or that \( f \) belongs to the class \( P(I) \) if \( f \) is nonnegative and for all \( x, y \in I \) and \( t \in [0,1] \), we have

\[
f(tx + (1-t)y) \leq f(x) + f(y)
\]

Definition 3. [13] Let \( s \in (0,1] \). A function \( f : [0, \infty) \to [0, \infty) \) is said to be \( s \)-convex in the second sense if

\[
f(tx + (1-t)y) \leq t^s f(x) + (1-t)^s f(y),
\]

for all \( x, y \in [0,\infty) \) and \( t \in [0,1] \). This class of \( s \)-convex functions is usually denoted by \( K^s_2 \).

Definition 4. [16] Let \( h : J \to \mathbb{R} \) be a nonnegative function, \( h \neq 0 \). We say that \( f : I \subseteq \mathbb{R} \to \mathbb{R} \) is \( h \)-convex function, or that \( f \) belongs to the class \( SX(h, I) \), if \( f \) is nonnegative and for all \( x, y \in I \) and \( t \in [0,1] \) we have

\[
f(tx + (1-t)y) \leq h(t) f(x) + h(1-t) f(y).
\]

2000 Mathematics Subject Classification. 26D10, 26A15, 26A16, 26A51.

Key words and phrases. Ostrowski’s inequality, \( h \)-convex, super-multiplicative, super-additive.
If inequality (1.3) is reversed, then $f$ is said to be $h$-concave, i.e. $f \in SV (h, I)$. Obviously, if $h (t) = t$, then all nonnegative convex functions belong to $SX (h, I)$ and all nonnegative concave functions belong to $SV (h, I)$; if $h (t) = \frac{t}{t+1}$, then $SX (h, I) = Q (I)$; if $h (t) = 1$, then $SX (h, I) \supseteq P (I)$; and if $h (t) = t^\alpha$, where $s \in (0, 1)$, then $SX (h, I) \supseteq K^2_s$.

Remark 1. [10] Let $h$ be a non-negative function such that

\begin{equation}
(1.6)
\end{equation}

for all $\alpha \in (0, 1)$. For example, the function $h_k(x) = x^k$ where $k \leq 1$ and $x > 0$ has that property. If $f$ is a non-negative convex function on $I$, then for $x, y \in I$, $\alpha \in (0, 1)$ we have

\begin{equation}
(1.7)
\end{equation}

\[
f (ax + (1 - \alpha)y) \leq \alpha f(x) + (1 - \alpha)f(y) \leq h(\alpha)f(x) + h(1 - \alpha)f(y).
\]

So, $f \in SX (h, I)$. Similarly, if the function $h$ has the property: $h(\alpha) \leq \alpha$ for all $\alpha \in (0, 1)$, then any non-negative concave function $f$ belongs to the class $SV (h, I)$.

Definition 5. [10] A function $h : J \to \mathbb{R}$ is said to be a super-multiplicative function if

\begin{equation}
(1.8)
\end{equation}

for all $x, y \in J$, when $xy \in J$.

If inequality (1.3) is reversed, then $h$ is said to be a sub-multiplicative function. If equality is held in (1.8), then $h$ is said to be a multiplicative function.

Definition 6. [1] A function $h : J \to \mathbb{R}$ is said to be a super-additive function if

\begin{equation}
(1.9)
\end{equation}

for all $x, y \in J$, when $x + y \in J$.

In [15], M.Z. Sarıkaya, A. Sağlam and H. Yıldırım established the following Hadamard type inequality for $h$-convex functions:

Theorem 1. [15] Let $f \in SX (h, I)$, $a, b \in I$ and $f \in L^1 ([a, b])$, then

\begin{equation}
(1.10)
\end{equation}

\[
\frac{1}{2h(\frac{b}{2})} f \left( \frac{a + b}{2} \right) \leq \frac{1}{b - a} \int_a^b f (x) dx \leq [f (a) + f (b)] \int_0^1 h (t) dt.
\]

For recent results related $h$-convex functions see [6, 7, 14, 15, 16].

The aim of this study is to establish some Ostrowski type inequalities for the class of functions whose derivatives in absolute value are $h$-convex and $h$-concave functions.

2. Ostrowski type inequalities for $h$-convex functions

In order to achieve our objective, we need the following lemma [8]:

Lemma 1. [8] Let $f : I \subseteq \mathbb{R} \to \mathbb{R}$ be a differentiable mapping on $I^o$ where $a, b \in I$ with $a < b$. If $f' \in L[a, b]$, then the following equality holds:

\[
f(x) - \frac{1}{b - a} \int_a^b f (u) \, du = \frac{(x - a)^2}{b - a} \int_0^1 tf' (tx + (1 - t) a) \, dt - \frac{(b - x)^2}{b - a} \int_0^1 tf' (tx + (1 - t) b) \, dt
\]

for each $x \in [a, b]$.
Theorem 2. Let \( h : J \subseteq \mathbb{R} \to \mathbb{R} \) be a nonnegative and super-multiplicative function, \( f : I \subseteq \mathbb{R} \to \mathbb{R} \) be a differentiable mapping on \( I \) such that \( f' \in L[a, b] \), where \( a, b \in I \) with \( a < b \), and \( h(\alpha) \geq \alpha \). If \( |f'| \) is \( h \)-convex function on \( I \) and \( |f'(x)| \leq M, x \in [a, b] \), then we have:

\[
|f(x) - \frac{1}{b-a} \int_a^b f(u) \, du| \leq \frac{M[(x-a)^2 + (b-x)^2]}{b-a} \int_0^1 [h(t^2) + h(t - t^2)] \, dt.
\]

for each \( x \in [a, b] \).

Proof. By Lemma 1 and since \( |f'| \) is \( h \)-convex, then we can write:

\[
|f(x) - \frac{1}{b-a} \int_a^b f(u) \, du| \leq \frac{(x-a)^2}{b-a} \int_0^1 t |f'(tx + (1-t)a)| \, dt + \frac{(b-x)^2}{b-a} \int_0^1 t |f'(tx + (1-t)b)| \, dt
\]

\[
\leq \frac{(x-a)^2}{b-a} \int_0^1 t [h(t)|f'(x)| + h(1-t)|f'(a)|] \, dt + \frac{(b-x)^2}{b-a} \int_0^1 t [h(t)|f'(x)| + h(1-t)|f'(b)|] \, dt
\]

\[
\leq \frac{M(x-a)^2}{b-a} \int_0^1 [h^2(t) + h(t)h(1-t)] \, dt + \frac{M(b-x)^2}{b-a} \int_0^1 [h^2(t) + h(t)h(1-t)] \, dt
\]

\[
\leq \frac{M[(x-a)^2 + (b-x)^2]}{b-a} \int_0^1 [h(t^2) + h(t - t^2)] \, dt.
\]

The proof is completed. \( \Box \)

Remark 2. In (2.1), if we choose \( h(t) = t \), inequality (2.1) reduces to (1.1).

In the next corollary, we will also make use of the Beta function of Euler type, which is for \( x, y > 0 \) defined as

\[
\beta(x, y) = \int_0^1 t^{x-1} (1-t)^{y-1} \, dt = \frac{\Gamma(x)\Gamma(y)}{\Gamma(x+y)}.
\]
Corollary 1. In (2.7), if we choose \( h(t) = t^s \), then we have
\[
\left| f(x) - \frac{1}{b-a} \int_a^b f(u) \, du \right| \leq \frac{M \left[(x-a)^2 + (b-x)^2 \right]}{b-a} \int_0^1 \left[t^{2s} + (t-t^s)^s \right] \, dt \]
\[
= \frac{M \left[(x-a)^2 + (b-x)^2 \right]}{b-a} \int_0^1 \left[t^{2s} + t^s (1-t)^s \right] \, dt 
\]
\[
= \frac{M \left[(x-a)^2 + (b-x)^2 \right]}{b-a} \left[ \frac{1}{2s+1} + \frac{\Gamma(s+1)\Gamma(s+1)}{\Gamma(2s+2)} \right] \]
\[
= \frac{M \left[(x-a)^2 + (b-x)^2 \right]}{b-a} \left[ \frac{\Gamma(2s+1) + s^2 (\Gamma(s))^2}{(2s+1)\Gamma(2s+1)} \right] 
\]

One of the important result is given in the following theorem.

Theorem 3. Let \( h: J \subseteq \mathbb{R} \to \mathbb{R} \) be a nonnegative and superadditive functions, \( f: I \subseteq \mathbb{R} \to \mathbb{R} \) be a differentiable mapping on \( I^o \) such that \( f' \in L[a,b] \), where \( a, b \in I \) with \( a < b \). If \( |f'|^q \) is \( h \)-convex function on \([a,b]\), \( p,q > 1 \), \( \frac{1}{p} + \frac{1}{q} = 1 \), \( h(t) \geq t \) and \( |f'(x)| \leq M \), \( x \in [a,b] \), then
\[
(2.2) \quad \left| f(x) - \frac{1}{b-a} \int_a^b f(u) \, du \right| \leq \frac{Mh^\frac{1}{q} (1)}{b-a} \left( \int_0^1 (h(t)^p) \, dt \right)^\frac{1}{p} \left( (x-a)^2 + (b-x)^2 \right) 
\]
for each \( x \in [a,b] \).

Proof. Suppose that \( p > 1 \). From Lemma 1 and using the Hölder’s inequality, we can write
\[
\left| f(x) - \frac{1}{b-a} \int_a^b f(u) \, du \right|
\leq \frac{(x-a)^2}{b-a} \int_0^1 t |f'(tx + (1-t)a)| \, dt + \frac{(b-x)^2}{b-a} \int_0^1 t |f'(tx + (1-t)b)| \, dt
\]
\[
\leq \frac{(x-a)^2}{b-a} \left( \int_0^1 t^p dt \right)^\frac{1}{p} \left( \int_0^1 |f'(tx + (1-t)a)|^q dt \right)^\frac{1}{q}
\]
\[
+ \frac{(b-x)^2}{b-a} \left( \int_0^1 t^p dt \right)^\frac{1}{p} \left( \int_0^1 |f'(tx + (1-t)b)|^q dt \right)^\frac{1}{q}. 
\]
Since \( |f'|^q \) is \( h \)-convex and by using properties of \( h \)-convexity in the assumptions,
\[
\int_0^1 |f'(tx + (1-t)a)|^q dt \leq \int_0^1 \left[ h(t) |f'(x)|^q + h(1-t) |f'(a)|^q \right] dt
\]
\[
\leq M^q \int_0^1 \left[ h(t) + h(1-t) \right] dt
\]
\[
\leq M^q \int_0^1 h(1) dt = M^q h(1).
\]
Similarly, we can show that
\[
\int_{0}^{1} |f'(tx + (1 - t)b)|^q \, dt \leq \int_{0}^{1} [h(t) |f'(x)|^q + h(1 - t) |f'(b)|^q] \, dt \leq M^q h(1),
\]
and
\[
\int_{0}^{1} t^p \, dt \leq \int_{0}^{1} h(t^p) \, dt.
\]
Therefore, we obtain
\[
\left| f(x) - \frac{1}{b-a} \int_{a}^{b} f(u) \, du \right| \leq M h^{\frac{q}{p}} (1) \left( \frac{x-a}{b-a} \right)^2 \left( \int_{0}^{1} h(t^p) \, dt \right)^{\frac{1}{p}} + M h^{\frac{q}{p}} (1) \left( \frac{b-x}{b-a} \right)^2 \left( \int_{0}^{1} h(t^p) \, dt \right)^{\frac{1}{p}}
\]
\[
= \frac{M h^{\frac{q}{p}} (1)}{b-a} \left( \int_{0}^{1} h(t^p) \, dt \right)^{\frac{1}{p}} \left( (x-a)^2 + (b-x)^2 \right)
\]
The proof is completed. \( \square \)

For example, \( h(t) = t^2 \) is a superadditive function for nonnegative real numbers because the square of \((u + v)\) is always greater than or equal to the square of \(u\) plus the square of \(v\), for \(u, v \in [0, \infty)\).

**Corollary 2.** In (2.2), if we choose \( h(t) = t^n \) with \( n \in \mathbb{N} \), \( n \geq 2 \), then we have
\[
(2.3) \quad \left| f(x) - \frac{1}{b-a} \int_{a}^{b} f(u) \, du \right| \leq \frac{M}{b-a} \left( \frac{1}{np+1} \right)^{\frac{1}{p}} \left( (x-a)^2 + (b-x)^2 \right).
\]

**Remark 3.** Since \( \left( \frac{1}{np+1} \right)^{\frac{1}{p}} < \frac{1}{2} \), for any \( 4 \geq n > p > 1 \), \( n \in \mathbb{N} \), then we behold that the inequality (2.3) is better than the inequality (1.1). Better approaches can be obtained even it is irregular for bigger \( n \) and \( p \) numbers.

As we know, \( h\)-convex functions include all nonnegative convex, \( s\)-convex in the second sense, \( Q(I)\)-convex and \( P\)-convex function classes. In this respect, it is normal to obtain weaker results once compared with inequalities in referenced studies. Because, the inequalities written herein were considered to be more general than above-mentioned classes and it was taken into account to be super-multiplicative or super-additive material. In this case, right side of inequality may be greater.

A new approach for \( h\)-convex function is given in the following result.

**Theorem 4.** Let \( h : I \subseteq \mathbb{R} \rightarrow \mathbb{R} \) be a nonnegative and supermultiplicative functions, \( f : I \subseteq \mathbb{R} \rightarrow \mathbb{R} \) be a differentiable mapping on \( I^o \) such that \( f' \in L[a,b] \), where \( a, b \in I \) with \( a < b \). If \( |f'|^q \) is \( h\)-convex function on \([a, b] \), \( q \geq 1 \), \( h(\alpha) \geq \alpha \) and \( |f'(x)| \leq M \), \( x \in [a, b] \), then
\[
(2.4) \quad \left| f(x) - \frac{1}{b-a} \int_{a}^{b} f(u) \, du \right| \leq \frac{\sqrt{2}M}{2(b-a)} \left( (x-a)^2 + (b-x)^2 \right) \left( \int_{0}^{1} \left( h(t^2) + h(t-t^2) \right) dt \right)^{\frac{1}{p}}
\]
for each $x \in [a, b]$.

Proof. Suppose that $q \geq 1$. From Lemma 1 and using the power mean inequality, we have

$$\left| f(x) - \frac{1}{b-a} \int_a^b f(u) \, du \right| \leq \frac{(x-a)^2}{b-a} \int_0^1 t |f'(tx + (1-t)a)| \, dt + \frac{(b-x)^2}{b-a} \int_0^1 t |f'(tx + (1-t)b)| \, dt$$

$$\leq \frac{(x-a)^2}{b-a} \left( \int_0^1 t \, dt \right)^{1-\frac{1}{q}} \left( \int_0^1 t |f'(tx + (1-t)a)|^q \, dt \right)^{\frac{1}{q}}$$

$$+ \frac{(b-x)^2}{b-a} \left( \int_0^1 t \, dt \right)^{1-\frac{1}{q}} \left( \int_0^1 t |f'(tx + (1-t)b)|^q \, dt \right)^{\frac{1}{q}}$$

Since $|f'|^q$ is $h$-convex, we have

$$\int_0^1 t |f'(tx + (1-t)a)|^q \, dt \leq \int_0^1 \left[t h(t) |f'(x)|^q + th(1-t) |f'(a)|^q \right] \, dt$$

$$\leq |f'(x)|^q \int_0^1 h(t) h(t) \, dt + |f'(a)|^q \int_0^1 h(t) h(1-t) \, dt$$

$$\leq M^q \left[ \int_0^1 h(t^2) \, dt + \int_0^1 h(t-t^2) \, dt \right].$$

Similarly, we can observe that

$$\int_0^1 t |f'(tx + (1-t)b)|^q \, dt \leq |f'(x)|^q \int_0^1 h(t) h(t) \, dt + |f'(b)|^q \int_0^1 h(t) h(1-t) \, dt$$

$$\leq M^q \left[ \int_0^1 h(t^2) \, dt + \int_0^1 h(t-t^2) \, dt \right].$$

Therefore, we deduce

$$\left| f(x) - \frac{1}{b-a} \int_a^b f(u) \, du \right| \leq M \left( \frac{1}{2} \right)^{1-\frac{1}{q}} \left( \int_0^1 \left(h(t^2) + h(t-t^2) \right) \, dt \right)^{\frac{1}{q}} \left( \frac{(x-a)^2 + (b-x)^2}{b-a} \right)$$

and the proof is completed. \hfill \Box

Remark 4. i) In the above inequalities, one can establish several midpoint type inequalities by letting $x = \frac{a+b}{2}$. 
ii) In Theorem 5, if we choose
(a) \( x = \frac{a+b}{2} \), then we obtain
\[
\left| f\left( \frac{a+b}{2}\right) - \frac{1}{b-a} \int_a^b f(u) \, du \right| \leq \frac{\sqrt[2]{M} \sqrt{2}}{b-a} \left( \int_0^1 \left( f\left( t^2 \right) + h(t-t^2) \right) \, dt \right)^{\frac{1}{2}}
\]
(b) \( x = a \), then we obtain
\[
\left| f(a) - \frac{1}{b-a} \int_a^b f(u) \, du \right| \leq \frac{\sqrt[2]{M} \sqrt{2}}{b-a} \left( \int_0^1 \left( f\left( t^2 \right) + h(t-t^2) \right) \, dt \right)^{\frac{1}{2}}
\]
(c) \( x = b \), then we obtain
\[
\left| f(b) - \frac{1}{b-a} \int_a^b f(u) \, du \right| \leq \frac{\sqrt[2]{M} \sqrt{2}}{b-a} \left( \int_0^1 \left( f\left( t^2 \right) + h(t-t^2) \right) \, dt \right)^{\frac{1}{2}}
\]

The following result holds for \( h \)-concave functions.

**Theorem 5.** Let \( h : J \subseteq \mathbb{R} \to \mathbb{R} \) be a non-negative and superadditive functions, \( f : I \subseteq \mathbb{R} \to \mathbb{R} \) be a differentiable mapping on \( I^c \) such that \( f' \in L[a,b] \), where \( a,b \in I \) with \( a < b \). If \( |f'|^q \) is \( h \)-concave function on \([a,b]\), \( p,q > 1 \), \( \frac{1}{p} + \frac{1}{q} = 1 \), \( h(t) \geq t \), then
\[
\left| f(x) - \frac{1}{b-a} \int_a^b f(u) \, du \right| \leq \frac{1}{\sqrt[2]{(p+1)^2} h^\frac{1}{2} (\frac{1}{2})} \left[ \frac{(x-a)^2}{b-a} |f'\left( \frac{x+a}{2} \right)| + \frac{(b-x)^2}{b-a} |f'\left( \frac{x+b}{2} \right)| \right]
\]
for each \( x \in [a,b] \).

**Proof.** Suppose that \( p > 1 \). From Lemma 4 and using the Hölder’s inequality, we can write
\[
\left| f(x) - \frac{1}{b-a} \int_a^b f(u) \, du \right| \leq \frac{(x-a)^2}{b-a} \int_0^1 t |f'\left( tx + (1-t) a \right)| \, dt + \frac{(b-x)^2}{b-a} \int_0^1 t |f'\left( tx + (1-t) b \right)| \, dt
\]
\[
\leq \frac{(x-a)^2}{b-a} \left( \int_0^1 t^p \, dt \right)^{\frac{1}{2}} \cdot \left( \int_0^1 |f'\left( tx + (1-t) a \right)|^q \, dt \right)^{\frac{1}{2}}
\]
\[
+ \frac{(b-x)^2}{b-a} \left( \int_0^1 t^p \, dt \right)^{\frac{1}{2}} \cdot \left( \int_0^1 |f'\left( tx + (1-t) b \right)|^q \, dt \right)^{\frac{1}{2}}.
\]
But since \( |f'|^q \) is \( h \)-concave, using the inequality (1.10), we have
\[
\left( \int_0^1 |f'\left( tx + (1-t) a \right)|^q \, dt \right) \leq \frac{1}{2h\left( \frac{1}{2} \right)} \left| f'\left( \frac{x+a}{2} \right) \right|^q
\]
and
\[
\left( \int_0^1 |f'\left( tx + (1-t) b \right)|^q \, dt \right) \leq \frac{1}{2h\left( \frac{1}{2} \right)} \left| f'\left( \frac{x+b}{2} \right) \right|^q.
\]
By combining the above numbered inequalities, we obtain
\[
\left| f(x) - \frac{1}{b-a} \int_a^b f(u) \, du \right|
\leq \frac{(x-a)^2}{b-a} \frac{1}{(p+1)^{\frac{1}{p}}} \left( \frac{1}{2h \left( \frac{1}{2} \right)} \right)^{\frac{1}{p}} \left| f' \left( \frac{x+a}{2} \right) \right|
\]
\[
+ \frac{(b-x)^2}{b-a} \frac{1}{(p+1)^{\frac{1}{p}}} \left( \frac{1}{2h \left( \frac{1}{2} \right)} \right)^{\frac{1}{p}} \left| f' \left( \frac{x+b}{2} \right) \right|
\]
\[
= \frac{1}{\sqrt{2} (p+1)^{\frac{1}{p}} h^{\frac{1}{p}} \left( \frac{1}{2} \right)^{\frac{1}{p}}} \left[ \frac{(x-a)^2}{b-a} \left| f' \left( \frac{x+a}{2} \right) \right| + \frac{(b-x)^2}{b-a} \left| f' \left( \frac{x+b}{2} \right) \right| \right]
\]

The proof is completed. □

A midpoint type inequality for functions whose derivatives in absolute value are $h$-concave may be established from the above result as follows:

**Corollary 3.** In (2.5), if we choose $x = \frac{a+b}{2}$, then we get
\[
(2.9) \quad \left| f \left( \frac{a+b}{2} \right) - \frac{1}{b-a} \int_a^b f(u) \, du \right|
\leq \frac{b-a}{\sqrt{2} (p+1)^{\frac{1}{p}} h^{\frac{1}{p}} \left( \frac{1}{2} \right)^{\frac{1}{p}}} \left[ \left| f' \left( \frac{3a+b}{4} \right) \right| + \left| f' \left( \frac{a+3b}{4} \right) \right| \right].
\]

For instance, if $h(t) = t$, then we obtain
\[
(2.10) \quad \left| f \left( \frac{a+b}{2} \right) - \frac{1}{b-a} \int_a^b f(u) \, du \right|
\leq \frac{b-a}{4 (p+1)^{\frac{1}{p}}} \left[ \left| f' \left( \frac{3a+b}{4} \right) \right| + \left| f' \left( \frac{a+3b}{4} \right) \right| \right].
\]

where $|f'|^q$ is $h$-concave function on $[a,b]$, $p, q > 1$.

### 3. Applications to special means

We consider the means for arbitrary positive numbers $a, b$ $(a \neq b)$ as follows;

The arithmetic mean:
\[
A(a,b) = \frac{a+b}{2}
\]

The generalized log-mean :
\[
L_p(a,b) = \left[ \frac{b^{p+1} - a^{p+1}}{(p+1)(b-a)} \right]^{\frac{1}{p}}, \quad p \in \mathbb{R} \setminus \{-1,0\}.
\]

The identric mean:
\[
I(a,b) = \frac{1}{e} \left( \frac{b^b}{a^a} \right)^{\frac{1}{b-a}}
\]

Now, using the result of Section 2, we give some applications to special means of real numbers.

In [16], the following example is given:
Example 1. Let \( h \) be a function defined by \( h(x) = (c + x)^{p-1}, \ x \geq 0 \). If \( c = 0 \), then the function \( h \) is multiplicative. If \( c \geq 1 \), then for \( p \in (0,1) \) the function \( h \) is super-multiplicative and for \( p > 1 \) the function \( h \) is sub-multiplicative.

Hence, for \( c = 1, \ p \in (0,1) \), we have \( h(t) = (1 + t)^{p-1}, \ t \geq 0 \) is supermultiplicative. Let \( f(x) = x^n, \ x > 0, |n| \geq 2 \) is \( h \)-convex functions.

**Proposition 1.** Let \( 0 < a < b, \ p \in (0,1) \) and \( |n| \geq 2 \). Then

\[
|A^n(a,b) - L^n_0(a,b)| \leq \frac{M(b-a)}{4} \left[ \int_0^1 (1 + t^2)^{p-1} dt + \int_0^1 (1 + t - t^2)^{p-1} dt \right]
\]

**Proof.** The inequality is derived from (2.3) with \( x = \frac{a+b}{2} \) applied to the \( h \)-convex functions \( f: \mathbb{R} \rightarrow \mathbb{R}, \ f(x) = x^n, |n| \geq 2 \) and \( h: \mathbb{R} \rightarrow \mathbb{R}, \ h(t) = (1 + t)^{p-1}, \ p \in (0,1) \). The details are disregarded. \( \square \)

**Proposition 2.** Let \( 0 < a < b, \ p \in (0,1), \ q > 1 \) and \( |n| \geq 2 \). Then

\[
|A^n(a,b) - L^n_0(a,b)| \leq \frac{\sqrt{2M(b-a)}}{8} \left[ \int_0^1 (1 + t^2)^{p-1} dt + \int_0^1 (1 + t - t^2)^{p-1} dt \right]^{\frac{1}{2q}}
\]

**Proof.** The inequality is derived from (2.3) with \( x = \frac{a+b}{2} \) applied to the \( h \)-convex functions \( f: \mathbb{R} \rightarrow \mathbb{R}, \ f(x) = x^n, |n| \geq 2 \) and \( h: \mathbb{R} \rightarrow \mathbb{R}, \ h(t) = (1 + t)^{p-1}, \ p \in (0,1) \). The details are disregarded. \( \square \)

**Proposition 3.** Let \( 0 < a < b \) and \( p, q > 1 \). Then we have

\[
\left| \ln(A(a,b) + 1) - (b-a) \ln I(a+1, b+1) \right| \leq \frac{b-a}{4(p+1)^\frac{1}{2}} \left[ \frac{1}{3a+b+4} + \frac{1}{a+3b+4} \right].
\]

**Proof.** The inequality is derived from (2.10) applied to the concave function \( f: [a,b] \rightarrow \mathbb{R}, \ f(x) = \ln(x+1) \). The details are disregarded. \( \square \)

**Competing interests**
The author declares that they have no competing interests.

**Acknowledgement 1.** The author gives his warm thanks to the Editor and the Authors for their precious papers in the reference list.
