Abstract

Global warming is caused by the retardation of CO₂ assimilation by the elimination of NOx and NP in seven developed countries. Global warming can be protected, if enough amounts of nutrients containing nitrogen and phosphorous are supplied. Most easily available substances containing N and P are NOx and NP in waste water. If developed countries stop the elimination of NOx and NP, CO₂ assaulting is activated and global warming will stop. In addition, production of grain and fish will increase and GDP, national wealth and population will increase. The goal "CO₂ increase zero and growth" described in Paris Agreement could be accomplished sooner than 2050. Promotion of CO₂ assimilation is essential for protection of global warming and for growth.

Keywords: NOx; Promotion of CO₂ assimilation; CO₂ increase zero; Carbon neutral; GWPR; Protection of global warming

1. Introduction

Ehime newspaper at Ehime, Japan reported "Nori (sea weed containing 30% protein) aquaculture: Water purification inhibit growth". To purify air, NOx elimination is carried out. To purify water, NP elimination is carried out. Nori aquaculture is inhibited and CO₂ assimilation and CO₂ fix is inhibited. Nori aquaculture at Seto inland sea stopped completely. Production of Fish at Seto inland sea decreased from half million ton to 50 thousand ton. Fish production of Japan from 12 million (1980) ton top place in the world to 4 million ton (1993). Rice production decreased from 8 million ton (1980) to 4 million ton (1993). Author wrote paper (ref 1) in 1993 asking stop NP elimination and increase CO₂ assimilation to increase food production and to protect global warming. Netherlands population 17400000, second agriculture country, keeping 12 million pig, 4 million cow, 100 million chicken produce much urea and ammonia. Government asking 50% reduction of these nitrogen compounds by 2030. Then 11 thousand house must quiet and 17 thousand house reduce to halt in present 40-50 thousand agriculture house.

Global warming is in progress. When I looked for the reason, I found that environmental measures at developed countries are eliminating nitrogen and phosphorous and CO₂ assimilation is blocked and production of agriculture and fish industry are blocked. GDP of these countries do not increase much. Stop elimination of NP will activate CO₂ assimilation and increase fish, grain production and increase GDP and protect global warming. (ref 1-54)
2. Method to get carbon neutral

Paris agreement asking us: CO₂ emission is equal as carbon fix and progress by 2050. Author define ratio CO₂ em and CO₂ fix as GWPR (Global Warming Protection Ratio)

\[
\text{GWPR} = \frac{\text{CO}_2\text{em}}{\text{CO}_2\text{fix}}
\]

Carbon neutral is CO₂ em = CO₂ fix and GWPR = 1 Present GWPR of the world is 1.3. To lower 1.3 to 1, we can do by lower numerator CO₂ em or increase denominator CO₂ fix. We can consider which is quick method.

Almost all government official and university personal are considering lower numerator CO₂ em. Considering CO₂ as resources, and tried to change various carbon compounds.

And no report as to increase denominator carbon fix. To increase denominator, close waste water clean center and stop injection of ammonia to the exit gas. No money is necessary is this OK? Chemistry and Chemical industry, of Japan Chemical Society offered special issue for the production of compounds starting from CO₂ two times. Many chemist studying to synthesis compounds from CO₂. But industrial production is impossible, because concentration of CO₂ is 0.06 %. The use of 0.06% CO₂ is possible only by plant like tree, plankton. CO₂ assimilation remains as a method to decrease CO₂. To promote CO₂ assimilation, increase of NP is necessary. To increase NP concentration, stop of NP elimination is enough. By just stopping NP elimination, we can increase CO₂ assimilation. We can increase food production. We can increase GDP. We can improve economy. We can stop increase of CO₂. We can get carbon neutral and growth. We can protect global warming. (ref 1-54)

3. Influence of NOx elimination on CO₂ assimilation and GDP

Concentration of CO₂ at billion years ago when earth was born was 90%. Present CO₂ concentration is 0.04 %. Plankton CO₂ assimilation did this reduction. Fossil of plankton is oil. The reaction of CO₂ with water produce carbohydrate and oxygen.

\[
6 \text{CO}_2 + 6 \text{H}_2\text{O} + 6 \times 114 \text{Kcal} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6 \text{O}_2
\]

Biology contain 1/25 nitrogen of carbon, and 1/125 phosphorous of carbon. 1/25 nitrogen of carbon, and 1/125 phosphorous of carbon is necessary for CO₂ assimilation. However, developed 7 countries set up a rule “If NOx elimination by ammonia is not done operation is not possible.”

\[
4\text{NO} + 4 \text{NH}_3 + \text{O}_2 \rightarrow 4 \text{N}_2 + 6 \text{H}_2\text{O}
\]

This reaction is eliminating one fertilizer by one other fertilizer. CO₂ assimilation is inhibited seriously. Production of food is inhibited.

Economical damage and social influence are unmeasurable great. Using 72 million tone methane and generating 198 million tone CO₂ making 227 million tone ammonia and eliminating 400 million tone NOx. 400 million tone NOx can fix 400 million t x25 = 10 billion tone CO₂ and can produce 10 billion tone rice, wheat.

W. Nordhaus (Winner of Nobel Economic Science 2018) proposed theory that global warming is due to increase of CO₂. Carbon emission reduction, decarboxylation is necessary (ref55-58). Increase of CO₂ is reason of Global warming and decrease of CO₂ emission can protect global warming. Japan government considering that decrease of CO₂ emission and decarboxylation can protect global warming. But these ideas are wrong. Many reports that increase of CO₂ is favourable for increase of green area (ref59-79) were published. CO₂ must be reduced by CO₂ assimilation. CO₂ assimilation can be activated by supply of enough nitrogen and phosphorous. Elimination of N, P retard CO₂ fix and food production.

It is wrong measure that hydrogen is a fuel which do not produce CO₂. Japan government is doing policy hydrogen as no CO₂ producing fuel. Hydrogen can be prepared from LNG, petroleum or coal producing CO₂

\[
\text{CH}_4 + 2\text{H}_2\text{O} \rightarrow 4\text{H}_2 + \text{CO}_2
\]

\[
\text{CH}_2 + 2\text{H}_2\text{O} \rightarrow 3\text{H}_2 + \text{CO}_2
\]
Therefor it is wrong to say hydrogen as no CO$_2$ producing fuel.

CO$_2$ produced in Japan is 1250 million tone. In this time, 1250x1/25 = 50 million tone NOx (90 % is NO) is produced. To eliminate this NO, 28.33 million tone NH$_3$ is used.

$$4 \text{ NO (molecular weight} \times 4 = 120) + 4 \text{NH}_3 (68) + \text{O}_2 \longrightarrow 4 \text{ N}_2 + 6 \text{ H}_2\text{O}$$

50 mil t $\quad$ 28.33 mil t

To make 28.33 mil tone ammonia, 5 mil t hydrogen is used.

$$3 \text{H}_2 + \text{N}_2 \longrightarrow 2 \text{ NH}_3$$

5 mil t $\quad$ 28.33 mil t

To make 5 mil t H$_2$, 10 mil t CH$_4$ is used and 27.5 mil t CO$_2$ is produced

$$\text{CH}_4 (16) + 2 \text{ H}_2\text{O} \longrightarrow 4 \text{ H}_2 (8) + \text{ CO}_2 (44)$$

10 mil t $\quad$ 5 mil t $\quad$ 27.5 mil t

Japan eliminated 50 mil t NOx by spending 10 mil t LNG emitting 27.5 mil t CO$_2$. If Japan do not eliminate NOx, Japan can fix 50 mil x 25 = 1.25 billion CO$_2$. If developed countries stop addition of ammonia to the exit gas, Consumption of 8000 million tone CH$_4$ can be saved. And emission of 220 million tone CO$_2$ can be saved. And 400 mil t x 25 = 10 billion t CO$_2$ can be fixed. Accordingly 220 mil t
10.22 billion x 30/44 x 1/3 = 2.32 billion tone grain. 1kg wheat is 1.5 $ 2.32 billion kg wheat is 3.48 billion $. Therefore, if developed country do not eliminate NP, 2.32 billion tone wheat. 3.48 billion $ is produced. GDP will increase. Economy of developed country will become much better. and global warming will not happen.

Yahoo News reported. ICAO accession 193 countries agreed that aviation industry do CO2 increase zero by 2050. Aviation industry is emitting 110 h million tone CO2 2.75 % of total CO2 of the world. Aviation industry need 15 h million dollar investment is necessary for decarbonization. The author is proposing plan to make CO2 increase zero by 2050 without investment. The plan is to stop blow ammonia in to the exit gas. Then 10.2 billion tone CO2 emission will stop and CO2 increase become zero.

It is difficult to reduce CO2. But it is easy to reduce GWPR by increase of CO2 fix. To increase CO2 fix, by increase of NP. To increase NP, just stop the elimination of NP. To increase N and P, stop the elimination of NP. Developing countries like China, India and Indonesia are using NOx and NP as fertilizer. CO2 assimilation is promoted rapidly and production of agriculture and fish industry increased rapidly and GDP increase rate are high. On the contrary, at developed country, CO2 assimilation is inhibited and production of agriculture and fish industry is inhibited. Economic and social influence are immeasurable. We can compare developed country who doing NOx, NP elimination and developing countries who use NOx, NP as fertilizer.

CO2em (CO2 emission), NOx (NOx production), NOxcon (NOx concentration at exit gas), W. dump (Wastewater dumping), GWPR (global warming protection ratio), GDP (GDP ratio 2021/1991) of 13 countries are shown in Table 1

| Country    | CO2em | NOx | NOxcon | Dump | Fixable CO2 | GWPR | GDP |
|------------|-------|-----|--------|------|-------------|------|-----|
| World      | 510   | 16.5|        |      |             |      |     |

Developing countries like China, India and Indonesia do not eliminate NOx and do not dump waste water and use NOx and NP as fertilizer. They can accelerate CO2 assimilation. They can fix CO2 produced at their countries. Therefore, GWPR.
Developed countries eliminate NOx and waste water NP. Then GDP ratio 2021/1991 is low USA 3.7, Japan 1.1, Germany 4.3, UK 3.3. Japan started NOx, NP elimination then CO2 assimilation is blocked. Fish industry and agriculture are blocked and national wealth decreased much.

Developed countries are eliminating 30 h million tone NOx spending 12 h million tone LNG and emitting 33 h million tone CO2. If no elimination NOx, 30 million tone NOx can fix 30x25= 750 million tone CO2. 750 million tone CO2 can become 30/44 x750 million tone plant like rice, wheat corn. Plant produce 1/3 grain. 2/3 of plant is straw. 750 million tone CO2 afford 750x30/44x750 x1/3= 170.4 million tone grain. Suppose 1 kg grain is 1 $, 174.4 million$ x1000 = 174.4 billion $.

Developed countries can get 174.4 billion $, by stopping NP elimination and can get high GDP and GDP ratio 2021/ 1991 will increase as China.

Not only Elimination of NOx and NP are promoting global warming, but also retarding development of countries and industry.

Japan government consider that ammonia as a substance that do not produce CO2 and using ammonia to eliminate NOx CO2 produced in Japan is 1.25 billion tone. NOx produced in Japan is 1/25 of 1.25 billion tone, 50 million tone. Japan is eliminating 20 times of synthetic fertilizer 2.5 million tone. Japan official are trying to make zero generations of CO2. And trying to reduce CO2 by many method.

Studies at Japan is decarbonization, decrease of CO2, carbon neutral, carbon recycle (consider CO2 as resources and separation of, recovery of CO2, and reuse for various carbon compounds) But industrialization is impossible. Because CO2 concentration is too low 0.06%.

Only plant can absorb such dilute CO2. CO2 assimilation by plant is only method to reduce carbon increase.

Activation of CO2 assimilation and increase of CO2 fix is easy method to make carbon neutral

But government policy do not change. I phoned and send mails more than ten times. to Ministry of the Environment, Ministry of Agriculture, Forestry and Fisheries. But they did not response. Official of ministry of fisheries say that we are glad to see such paper. Minister of Environment has stronger power to continue the elimination of NP suppressing the opinion of Ministry of agriculture and Fisheries. And continue the elimination of NOx and NP.

Elimination of NOx, NP suppress CO2 assimilation and suppress the production of agriculture and fishery product and depress the economy and depress the increase of GDP. As shown In Table1,

GDP ratio of Japan 2021/1991 is 1.1 The GDP ratio of China who do not eliminate NOx, NP is 2021/1991 is 51.1 Therefore, we should stop elimination of NOx, NP and increase CO2fix and become carbon neutral and develop.

Japan should change to the policy to increase CO2 fix and increase food production. Japan should decrees the import of LNG (now Japan is top importer of LNG) by stopping the production of hydrogen. Also Japan should stop the investment to use hydrogen as new energy. And carry hydrogen from Australia. These investment do not contribute for the decrease of GWPR, protection of global warming. We can stop NOx, NP elimination by just stop ammonia addition and stop waste water purification center without investment. And we can change CO2 to fish and grain. We can increase food production ratio from 37% to 70 -100 %. Contribution to the economy is so great. We can protect depression of country. We can accomplish the goal Increase of CO2 is zero and develop before 2050.

4. NOx is good fertilizer and best compound to reduce CO2 (ref 7)

NOx is hated as pollution gas causing illness. Many governments mis understand the usefulness of NOx and set up very strict law to eliminate NOx in burned gas and forced to eliminate NOx using ammonia This caused global warming

I wish to insist that NOx elimination should be stopped. Because toxicity of NOx is not so serious compared with significant merit of NOx. NOx is essential for plant to grow and produce food. NOx is essential for the promotion of CO2
assimilation and essential for the production of foods (ref 26,27,41-54) and for the promotion of health and long life ((ref 80-87)

Thunder produce NOx from N2 and O2. (ref 7,88-91). About 4 million thunder in one day and about 30 x 106 t NOx is produced by thunder in one year and about 20-80% of NOx is produced by thunder in the world.

The year of many thunder give good harvest. This fact is written at Kojiki, 1300 year old Japan history book. Thunder by Japanese character Kaminari rain top on ta (field) bottom. Lightning japanese character Inazuma Ine (rice) and Tsuma (wife). Both is precious as life. Heavy snow(2-3 m) fall at Hokuriku district Japan.many snow fall and produce many thunder This produce much NOx. The concentration of nitrogen in the snow melted river is high. Toyama bay produce plankton, fish, crab, shrimp Ishikawa prefecture produce rice and Niigata prefecture produce delicious rice koshihikari. I buy fish and rice at Niigata prefecture. Meat from Ishikawa Prefecture. Rice straw afford meat by reasonable price.

5. Heat balance of earth. Heat absorption by CO2 assimilation (Ref 29)

On earth 140 billion tone fossil fuel is burned and CO2 3.6 x1015 t was produced. And 7.4 x 1015 kcal is produced. When we consider the heat produced by animal respiration, 7.4 x 1015 kcal x 4.6/3.6 = 9.45 x 1015 kcal is produced.

The earth is also warmed by the heat of atomic energy. Uranium produce 2 x 1015 kcal heat. Electricity generation capacity of the world is 16868 Tetra watt h. Electricity generation by atomic energy is 2086 Tetra watt h. Therefore, 7.4 x 1015 x 2986/ 10868 = 2.02x1015 kcal evolved by atomic energy.

The earth is also warmed by the heat evolved by animal. Human being eat 1000 kcal food every day and release heat 1000 kcal every day. Population of the world is 7.6 billion. Therefore, human being is releasing 1000 x 365x76x109 = 2.8x1016 kcal in one year. Animal other than human being, caw, bird, whales, seal are producing heat. We can estimate as same as human being 2.8x1016 kcal. Therefore, total heat is fossil burning produce 7.4 x 1016 kcal, atomic energy produce 2.02x1015 kcal. Human being produce 2.8x1016 kcal. Other animal produce 2.8x1016 kcal

Total heat produced is (7.4+0.202 + 2.8+ 2.8) x1016= 13.002 x1016 kcal. We must absorb 13.002x1016 kcal by CO2 assimilation. CO2 1 mole 44g and water 18 g absorb 114 kcal sun's heat to carbohydrate and 32 g oxygen. If 51 billion t, 5.1x1016 g CO2 do CO2 assimilation, 114x 5.1x1016 /44= 13.136x1016 kcal can be absorbed. Heat production 13.002 x1016kcal is almost same as heat absorption 13.136x1016 kcal.

CO2 assimilation must be promoted by stopping of NOx elimination and by stopping waste water purification. By stopping NOx elimination. 1.44 billion tone NOx can fix 14.4x25= 36.0 billion tone CO2. Amount of N,P in drainage is around 0.5 billion tone. By using this 0.5 billion tone N,P, we can fix 0.5x25= 12.5 billion tone CO2. By adding 36.0 + 12.5= 48.5 billion tone CO2 can be fixed. And we can absorb 13.1 x 1016 kcal. And earth can keep comfortable temperature. Heat absorption by CO2 assimilation is essential to lower earth temperature.

6. Method to improve Economy

- Best method to improve economy is activation of production of food. Activation of CO2 activation will produce much food and economy will progress. Provide nitrogen and phosphorous is necessary. Like China, Indian and Indonesia and Japan (before 1980) No addition of ammonia to exit gas, no waste water treatment are good. If developed countries stop environmental measures, If developed countries stop NOx elimination. Consumption of 80 million tone LNG cane saved.220 million tone CO2 emission can saved. 40000x25 = 10 billion tone CO2 can be fixed. Accordingly 220 Millie + 10 billion tone = 10.22 billion tone can be fixed. CO2 emission is 10 billion tone. CO2 increase become zero (minus0.2 billion tone. Paris agreement is asking development. Activation of CO2 assimilation will increase food production. Economy will develop

- Use of geothermal (heat of earth)
In the middle of earth, there are magnitude magma, huge energy. Japan and Hungary have volcanic mountain. Generation of electricity should be done at more large scale. Use of heat of earth is not done at enlarge scale by the resist of hot spring supplier. Reuse of hot water as hot spring or as room warmer after electricity generation can be useful. By more deep digging to 1000 or 2000 m might produce very high temperature water as new energy source.
7. Control of climate

7.1. Control of temperature.

Temperature can be controlled by CO₂ assimilation. CO₂ assimilation is heat absorbing reaction. 114 kcal is absorbed / mol. Global warming will not happen if developed countries do not do NOₓ, NP elimination. The earth will be cooled by the absorption of heat by the activation of CO₂ assimilation as shown at heat balance part.

7.2. Control of rain fall.

When rain fall is desired, burning of wood is dune as rainfall pray at Japan. Hot air produced by burning of tree go up to heaven and low pressure is produced new air containing water blow in and rain fall. In Europe, drought is now at Spain, France, Italy and Germany. Stopping of coal electricity generation at Germany. Generation of weak west wind does not blow in to Spain France and Germany. And rainfall was very small. But now electricity generation by coal restarted at Germany. Then rain might start to fall next year.

Drought might be caused by the elimination of NOₓ, NP. Shortage of nitrogen and phosphorous retard the growth of tree. Land become no tree like desert. Desert give no evaporation of water and no rain.

8. Electricity generation should be done by coal (Ref 29)

IPCC asking electricity generation by oil and natural gas than coal, because coal generate more CO₂ than oil. But I think coal is better for the generation of electricity to save the consumption of oil. The difference of CO₂ generation by both fuels is not so much different. CO₂ increase can be saved by the decrease of CO₂ emission by stopping NOₓ elimination procedure. When we compare buried amount, coal (132 years) is 3 times as much as oil (42 years) and natural gas (60 years). We can manufacture many kind of chemical and plastic from oil. Oil is more convenient as transportation fuels. Therefore, oil and natural gas are 3 times more precious than coal. Price of coal is 1/3 of oil. Therefore we can generate electricity by coal at low price. The price of electricity is very important for the competition of productive industry. The year of oil scare is coming in 50 years. Then we must do liquefaction of coal to get liquid fuel for transportation. In this process, about half energy of coal is lost. We can enjoy our civilized life longer by saving the consumption of oil and natural gas. Gasoline car is shifting to electric car. This is shift from oil to coal (electricity produced from coal).

9. Electricity generation by solar system should be done at no green land

Construction of solar mega system by the sacrifice of wood is not clever way. 1 hectare, 1000 m² wood can absorb heart 3.8×106 kcal and can fix 13.7 tone CO₂. Heart absorption efficiency of solar system cell is 1/3 of green leaf of tree. Solar system cell cannot fix CO₂. For the preparation of solar cell material, much fossil fuel is necessary generating almost
same amount of CO₂ in compared with the generation of CO₂ and electricity by burning of fossil fuel. Therefore, construction of solar mega system by the sacrifice of wood is promoting global warming.

1000 m² cell can generate 114000 kWh and can save 7.5 t CO₂ and can absorb 1.3 x 10⁶ kcal. For the production of 1000 m² cell 5 tone CO₂ is produced. Electricity generation should be done at no green land like Arabian Peninsula. China constructed big solar electricity plant at high altitude no green Xinjiang.

10. Future Prediction (ref 51)

10.1. We must protect burn out of fossil

Since industrial revolution, mankind has been using a large amount of fossil fuel for manufacturing of food, iron, aluminium, plastic, and fertilizer. Global warming comes from over burning of fossil. Fossil fuel is a fossil of plants made by CO₂ assimilation from CO₂ and water in 5 billion years. Mankind has been using this fossil fuel in 500 years. Yearly use of fossil fuel is estimated to be reduced 25% by COVID-19. Thus, the term of years when oil, natural gas, and coal can be used is extended from 42 to 56 years, from 60 to 81 years, from 121 to 162 years, respectively as shown at Table 2.

Table 2 Estimated amount of buried fossil

| Fossil      | buried amount billion ton | yearly use billion ton | Number of Years capable of use of fossil billion ton |
|-------------|---------------------------|------------------------|------------------------------------------------------|
| Natural gas | 276.9                     | 4.6 → 3.4              | 60 → 81                                              |
| Oil         | 173                       | 4.1 → 3.1              | 42 → 56                                              |
| Coal        | 909                       | 7.5 → 5.6              | 121 → 162                                            |
| Uranium     |                           |                        | 124                                                  |

Until now, our human being has used 1360 billion tons of fossil which is corresponding to around a half of the total reserves of fossil buried in the earth. The remaining fossil is estimated as 1360 billion tons.

When fossil is burned out, we need not worry about global warming. We must worry how we can live civilized life. How can we drive car, airplane, and agriculture machine? How can we generate electricity? We must save the consumption of fossil. We should not spend precious fossil for the elimination of NOx and NP. We must protect burn out of fossil fuel as long as possible.

10.2. Prediction of fossil fuel and life at 2222 (200 years after now)

Human being is using now much fossil as exemplified in the use of 3.4 billion tons of natural gas, 3.1 billion tons of oil, and 5.6 billion tons of coal. About the same amount of remaining fossil as that used so far could be used in the future. However, the remaining fossil is limited. The amount of fossil used every year will become smaller than now. In 2222, a 1/4 amount of remaining fossil will be still available. We must limit the use of fossil to get food like agriculture machine and fishing boat. The number of sailing boats will increase. The number of cars and airplanes will become much fewer. Leisure trip must be limited. The use of fossil for air conditioning must be limited. We must depend on woods. There is 80 billion tons of wood in the world and increasing 1-2% annually. Tree grows quickly if sufficient N and P are provided. We must provide enough NP for the promotion of plant growth.

11. Discussion

Main discussion point at PC 27 2022 at Egypt was how much money should pay from developed country to developing country.

Correct answer is: Pay is unnecessary. Developed country must stop global warming by next PC 28. Global warming can be stopped by stopping of put in ammonia to the exit gas. Then CO₂ assimilation is accelerated and 10 billion tone CO₂ is fixed and 13.1 x 10¹⁶ kcal is absorbed. And earth will cool down. Global warming will stop as written at heat balance part. Then payment of developed counties become unnecessary. And much food is produced.
Japan is proposing to pay some money to developing countries. But I think it is better to stop paying Japan can stop global warming by preparing NP fertilizer with some money and spread this fertilizer at sea and activate CO₂ assimilation and fix CO₂ and absorb heat and cool down the earth and protect global warming and get fish. Activation of CO₂ assimilation is essential to protect global warming.

11.1. G20 summit Electricity generation by coal

10 countries including US, Japan are planning to pay 20 billion dollars to Indonesia to change from coal electricity generation to LPG electricity generation. But I think electricity generation should be done by coal. Buried amount, coal (132 years) is 2 times as much as natural gas (60 years). LNG is more convenient as transportation fuels. Therefore, oil and natural gas are 3 times more precious than coal. Price of coal is 1/3 of LNG. The price of LNG is rising. Therefore, we can generate electricity by coal at low price. The price of electricity is very important for the competition of productive industry. Then we should not pay 20 billion dollars to change from coal to LNG.

11.2. Stopping of war at Ukraïne

War at Ukraïne is consuming much fossil and increasing much CO₂. Ukraïne reported at PC27. War is producing greenhouse gas hundred million tone, and it make difficult to fit Paris treatment. War at Ukraïne should be stopped.

12. Conclusion

Promotion of CO₂ assimilation is best method to protect global warming and progress. Elimination of NOx and NP should be stopped.

Compliance with ethical standards

Acknowledgments

I wish to acknowledge Dr. Ryoichi Itou Head Editor of Rikuryou Science for Calculation of CO₂, NOx, fish, grain production. I acknowledge Late Dr. Okazaki Minoru (Head of Research Laboratory, Kurita Industry). He was my most intimate friend since 1947. He developed the methods to make clean water and clean air. He gave me precious informations to write papers. I also acknowledge the editors of New Food Industry [ref 1, 17, 35, 46], Eur J Exp Biol [ref 7], International J of Waste Resources [ref 16, 19], International J of Earth Sciences and Biology [ref 29] who advised me to write papers without asking any publication fees.
