FUNCTIONALS DEFINED ON PIECEWISE RIGID FUNCTIONS:
INTEGRAL REPRESENTATION AND Γ-CONVERGENCE

MANUEL FRIEDRICH AND FRANCESCO SOLOMBRINO

ABSTRACT. We analyse integral representation and Γ-convergence properties of functionals defined on piecewise rigid functions, i.e., functions which are piecewise affine on a Caccioppoli partition where the derivative in each component is constant and lies in a set without rank-one connections. Such functionals account for interfacial energies in the variational modeling of materials which locally show a rigid behavior. Our results are based on localization techniques for Γ-convergence and a careful adaption of the global method for relaxation \cite{17, 18} to this new setting, under rather general assumptions. They constitute a first step towards the investigation of lower semicontinuity, relaxation, and homogenization for free-discontinuity problems in spaces of (generalized) functions of bounded deformation.

1. Introduction

Many problems in materials science, physics, computer science, and other fields involve the minimization of surface energies for configurations which represent partitions of the domain into regions of finite perimeter. Among the vast body of literature, we only mention examples in the direction of liquid crystals \cite{41}, phase transition problems in immiscible fluids \cite{13, 53, 54}, fracture mechanics \cite{8}, image segmentation \cite{55}, spin-like lattice systems \cite{1, 2, 21}, or polycrystalline structures \cite{27, 40}, and refer to the references cited therein.

In the framework of the calculus of variations, these phenomena can be formulated by means of integral functionals defined on Caccioppoli partitions or piecewise constant functions on such partitions, see \cite[Section 4.4]{11} or Section 3.1 below for their definition. Problems of this kind have first been studied in the seminal work by ALMGREN \cite{3}. Later, AMBROSIO AND BRAIDES \cite{6, 7} carried out a comprehensive analysis by developing a theory of integral representation, compactness, Γ-convergence, and relaxation. They also addressed the problem of lower semicontinuity which has been further developed over the last years, see, e.g., \cite[Section 5.3]{11} or \cite{27, 28, 29}. Recent advances dealing with density and continuity results \cite{15, 50} witness that the study of this class of functionals is of ongoing interest.

Understanding the properties of Caccioppoli partitions is also a mainstay in the analysis of free-discontinuity problems \cite{11, 59} defined on special functions of bounded variation (SBV) (see \cite[Section 4]{11}). Indeed, in this context, the study of lower semicontinuity conditions \cite{4, 5}, the derivation of integral representation formulas \cite{17, 18, 20, 22}, or compactness properties \cite{49} can often be reduced to corresponding problems on partitions. In a similar fashion, homogenization and Γ-convergence for free-discontinuity problems \cite{29, 25, 26, 51}, their approximation \cite{12, 16, 19, 57}, as well as results on the existence of quasistatic evolutions \cite{45, 51} rely fundamentally on the

decoupling of bulk and surface effects, for which a profound understanding of energies defined on piecewise constant functions is necessary.

In the present paper we are interested in analogous problems for functionals defined on piecewise rigid functions, i.e., functions which are piecewise affine on a Caccioppoli partition where the derivative in each component is constant and lies in a set $L$ without rank-one connections [14]. Our standard examples are the rotations $L = SO(d)$ and the space $L = \mathbb{R}_{\text{skew}}^{d \times d}$ of skew symmetric matrices. In the application of materials science, particularly in fracture mechanics, piecewise rigid functions for $L = SO(d)$ can be interpreted as the configurations which may exhibit cracks along surfaces but do not store nonlinear elastic energy. In fact, in [36], a remarkable piecewise rigidity result has been proved showing that the set of these functions coincides with the (seemingly larger) set of functions $u \in SBV$ with approximate gradient $\nabla u \subset SO(d)$ almost everywhere. An analogous result holds in the geometrically linear setting $L = \mathbb{R}_{\text{skew}}^{d \times d}$ for functions in the space $(G)SBV$ of (generalized) special functions of bounded deformation, introduced in [10] [38]. In the context of fracture mechanics, these results imply that a deformation of a cracked hyperelastic (respectively, linearly elastic) body does not store elastic energy if and only if it is piecewise rigid. Thus, interfacial energies of materials which show locally rigid behavior in different regions of the body can be naturally modeled by functionals defined on piecewise rigid functions.

However, our primary purpose comes from the study of free-discontinuity problems defined on the space $GSBD^p$, see [38], which has obtained steadily increasing attention over the last years, cf., e.g., [30, 31, 32, 33, 34, 35, 46, 47, 48, 50]. We have already mentioned before how the analysis of partition problems has proved to be a relevant tool in the study of free-discontinuity problems on $SBV$. When coming to similar problems on $GSBD^p$, where only a control on the symmetrized gradient of the competitors is available, a larger space than piecewise constant functions must be taken into account in order, e.g., to provide lower semicontinuity conditions for surface integrands, or representation formulas for $\Gamma$-limits, and, in general, to deal with the issues that we mentioned above in the $SBV$ context. In our opinion, it is quite natural to expect that the understanding of energies defined on piecewise rigid functions for $L = \mathbb{R}_{\text{skew}}^{d \times d}$ represents a significant first step (or maybe even the building block) of such a research program.

In this first paper on this topic, we investigate integral representation and $\Gamma$-convergence for functionals defined on piecewise rigid functions. Lower semicontinuity, homogenization, and relaxation will be carried out in a forthcoming paper. We now proceed by describing our setting in more detail.

Let $L \subset \mathbb{R}^{d \times d}$ be a closed set of rigid matrices not satisfying the Hadamard compatibility condition (equivalently, having no rank-one connections between each other, see [14]), for which a locally Bilipschitz parametrization exists, see [22] below for details. The condition of no rank-one connections is needed to ensure that functions exhibit discontinuities along the interface of two components with different constant derivative in $L$. This rules out the formation of laminates. The local Bilipschitz parametrization allows us to treat the matrices $L$ as a subset of a linear space instead of a manifold, cf. the case $L = SO(d)$. For $\Omega \subset \mathbb{R}^d$ open and bounded, we denote by $PR_L(\Omega)$ the set of piecewise rigid functions $u$, i.e.,

$$u(x) = \sum_{j \in \mathbb{N}} (Q_j x + b_j) \chi_{P_j}(x),$$

(1.1)

where $(P_j)_{j \in \mathbb{N}}$ is a Caccioppoli partition of $\Omega$, $Q_j \in L$, and $b_j \in \mathbb{R}^d$ for all $j \in \mathbb{N}$. For open subsets $A \subset \Omega$, we consider functionals $\mathcal{F}(\cdot, A) : PR_L(\Omega) \to [0, \infty)$ of the form

$$\mathcal{F}(u, A) = \int_{J_u \cap A} f(x, [u](x), \nu_u(x)) \, d\mathcal{H}^{d-1}(x),$$

(1.2)
where by $[u]$ and $\nu_n$ we denote the jump height and a normal to the jump (i.e., a normal to the interface), respectively, and $f$ represents an interfacial energy density which may additionally depend on the material point $x$.

We are interested in the problem if, for a sequence of functionals $(F_n)_n$ with densities $(f_n)_n$, an effective limiting problem exists in the sense of variational convergence ($\Gamma$-convergence). Then, it is a natural question if also the $\Gamma$-limit is of the form (1.2). In this context, a standard procedure relies on localization techniques for $\Gamma$-convergence (see [37]), i.e., passing to a $\Gamma$-limit $F(\cdot,A)$ of the sequence $F_n(\cdot,A)$ for every open $A \subset \Omega$. Afterwards, one shows that under certain conditions for $F(\cdot,A)$, including suitable semicontinuity, locality, and measure theoretic properties, there exists an integral representation for $F(\cdot,A)$ in the sense of (1.2).

An approach in this spirit has been performed in [6] for finitely valued piecewise constant functions, i.e., for functions of the form \( u, v \in PR_L(\Omega) \) with $Q_j = 0$ and $b_j \in K$ for a finite set $K \subset \mathbb{R}^d$. $\Gamma$-convergence and integral representation are guaranteed under the natural growth conditions $0 < \alpha \leq f_n(x,\xi,\nu) \leq \beta$ and a uniform continuity condition $x \mapsto f_n(x,\xi,\nu)$ along the sequence of densities $(f_n)_n$, which are maintained in the $\Gamma$-limit. Later, for the problem of integral representation (but not for $\Gamma$-convergence), the continuity assumption in $x$ has been dropped in [17] Theorem 3, and, under a continuity condition $\xi \mapsto f(x,\xi,\nu)$, the result has been generalized to $K = \mathbb{R}^d$ in [20] Theorem 3.2. In the present paper, under similar growth and continuity conditions, we derive analogous results for $PR_L(\Omega)$ in place of piecewise constant functions. As a byproduct, choosing $L = \{0\}$, we also generalize the above mentioned $\Gamma$-convergence results to the case $K = \mathbb{R}^d$.

We now give a more thorough outline of our proof strategy and provide a comparison with [6]. First, concerning integral representation, we follow the global method for relaxation developed in [17] [18], which essentially consists in comparing asymptotic Dirichlet problems on small balls with different boundary data depending on the local properties of $u$. For $\Gamma$-convergence, we apply the localization techniques described above, see e.g. [22] [37].

For both methods, the key ingredient is a construction for joining two functions $u, v \in PR_L(\Omega)$, which is usually called the fundamental estimate. Typically, this is achieved by means of a cut-off construction of the form $w := u\varphi + (1 - \varphi)v$ for some smooth $\varphi$ with $0 \leq \varphi \leq 1$. In the present context, however, a crucial problem has to be faced since in general $w$ is not in $PR_L(\Omega)$. In the case of piecewise constant functions, this issue was solved in [6] by using the coarea formula in $BV$, see [6] Lemma 4.4, which allows to approximate $w$ by a piecewise constant function $\tilde{w}$. Geometrically, the joining of $u$ and $v$ to $\tilde{w}$ consists in modifying the partitions and adding additional interface whose length is controlled by $d(u,v)$, where $d(u,v)$ is a suitable metric on the space. The same strategy cannot be pursued in the present context: e.g., when $L = \mathbb{R}^{d \times d}$ skew, we have $PR_L(\Omega) \subset SBD(\Omega)$, where no analog of the coarea formula is known to hold. (We refer to [48] for more details in that direction.)

Our main trick is the following: we apply the coarea formula twice, once for the functions themselves and once for their derivatives. Roughly speaking, this allows to join two functions $u, v \in PR_L(\Omega)$ by adding additional interface whose length is controlled in terms of $d(u,v)$ and $d_\nabla(\nabla u, \nabla v)$ for suitable metrics $d$ and $d_\nabla$. Unfortunately, the metric $d_\nabla$ is too strong and not compatible with the available compactness results. Therefore, we apply this construction only on components $P_j$ in (1.1) whose volume is ‘not too small’ since on such sets the derivative of an affine mapping can be controlled in terms of the mapping itself by elementary arguments (cf. Lemma 5.24). This in turn allows to control $d_\nabla(\nabla u, \nabla v)$ in terms of $d(u,v)$ on such components. On the other components (i.e., those having small volume), we introduce additional interface by a direct geometrical construction, see Lemma 4.4. This strategy leads to a fundamental estimate in $PR_L(\Omega)$, see Lemma 4.1. Under an additional technical condition, see (4.6), we are able to
provide also a refined version of this result in Lemma 4.5 where boundary values are preserved. This is instrumental for the application to the global method of relaxation.

Apart from the fundamental estimate, we encounter another technical difficulty with respect to other integral representation results \cite{17,18,20,35}. There, at least as an intermediate step, one may consider growth conditions of the form

$$\alpha \mathcal{H}^{d-1}(J_u \cap A) + \alpha' \int_{J_u \cap A} |u| \, d\mathcal{H}^{d-1} \leq F(u, A) \leq \beta \mathcal{H}^{d-1}(J_u \cap A) + \beta' \int_{J_u \cap A} |u| \, d\mathcal{H}^{d-1}$$

for $0 < \alpha \leq \beta$ and $0 < \alpha' \leq \beta'$. The lower bound allows to apply compactness results in $SBV$. In the present context, however, we are forced to work with $\alpha' = \beta' = 0$ since in the construction of the fundamental estimate we control only the length of the added interface but not the modification of the jump heights. Thus, more delicate arguments are necessary to obtain suitable compactness results and, as a consequence, convergence of minima for asymptotic Dirichlet problems, see Lemma 6.3 and Lemma 7.5. The latter is not only of general interest, but in particular instrumental to show that the uniform continuity condition $\xi \mapsto f_n(x, \xi, \nu)$ along the sequence of densities $(f_n)_n$ is maintained in the $\Gamma$-limit, see (6.10). These arguments are based on novel truncation techniques, see Section 7.1, which are inspired by the recent work \cite{49} where compactness results for free-discontinuity problems on $(G)SBV^p$ have been derived in a very general sense.

Finally, let us briefly compare our result for $L = \mathbb{R}^{2 \times 2}$, with the integral representation in $SBD^p$, $p > 1$, in dimension two, proved in \cite{35}. Although in this specific case our functionals are defined on a subspace of $(G)SBD^p$, our result is not merely a simple consequence of \cite{35} since there is in general no obvious way to extend a functional from $PR_L$ to $(G)SBD^p$. Indeed, as explained above, the issue of joining two functions is more delicate in the present context and calls for novel versions of a fundamental estimate.

The paper is organized as follows. In Section 2 we introduce our setting and present our main results about integral representation and $\Gamma$-convergence. Section 3 is devoted to preliminaries about Caccioppoli partitions and (piecewise) rigid functions. In Section 4 we formulate and prove the fundamental estimate. Here, we also present a refinement preserving boundary values and a scaled version on small balls. Section 5 and Section 6 are devoted to the proofs of the integral versions of a fundamental estimate. Finally, Section 7 discusses the examples $L = SO(d)$, $L = \mathbb{R}^{d \times d}_{\text{skew}}$, and introduces a truncation method which is instrumental for the convergence of minima for asymptotic Dirichlet problems.

2. THE SETTING AND MAIN RESULTS

**Notation:** Throughout the paper $\Omega \subset \mathbb{R}^d$ is open, bounded with Lipschitz boundary. Let $\mathcal{A}(\Omega)$ be the family of open subsets of $\Omega$, and $\mathcal{A}_0(\Omega) \subset \mathcal{A}(\Omega)$ be the subset of sets with regular boundary. By $B(\Omega)$ we denote the family of Borel sets contained in $\Omega$. By $\omega_m$ we denote the $m$-dimensional measure of the unit ball in $\mathbb{R}^m$. The symbol $B_R(x)$ will denote a ball of radius $R$ centered at $x$ in an Euclidian space. The notations $\mathcal{L}^d$ and $\mathcal{H}^{d-1}$ are used for the Lebesgue measure, and the $(d - 1)$-dimensional Hausdorff measure in $\mathbb{R}^d$, respectively. For a $\mathcal{L}^d$-measurable set $E \subset \mathbb{R}^d$, the symbol $\chi_E$ denotes its characteristic function. For $A, B \in \mathcal{A}(\Omega)$ with $\overline{B} \subset A$, we write $B \subset A$.

**Jump set:** If $u : \Omega \to \mathbb{R}^d$ is a $\mathcal{L}^d$-measurable function, $u$ is said to have an approximate limit $a \in \mathbb{R}^d$ at a point $x \in \Omega$ if and only if

$$\lim_{\theta \to 0^+} \frac{\mathcal{L}^d \left( \{ |u - a| \geq \varepsilon \} \cap B_{\theta}(x) \right)}{\theta^d} = 0 \quad \text{for every } \varepsilon > 0.$$
In this case, one writes \( \text{ap lim}_{y \to x} u(y) = a \). The \textit{approximate jump set} \( J_u \) is defined as the set of points \( x \in \Omega \) such that there exist \( a \neq b \in \mathbb{R}^d \) and \( \nu \in S^{d-1} := \{ \xi \in \mathbb{R}^d : |\xi| = 1 \} \) with \[
\text{ap lim}_{y \to x} u(y) = a \quad \text{ap lim}_{y \to x} u(y) = b.
\]
The triplet \((a, b, \nu)\) is uniquely determined up to a permutation of \((a, b)\) and a change of sign of \( \nu \), and is denoted by \((u^+(x), u^-(x), \nu_u(x))\). The jump of \( u \) is the function \([u] : J_u \to \mathbb{R}^d \) defined by \([u](x) := u^+(x) - u^-(x)\) for every \( x \in J_u \).

**Set of rigid matrices:** We consider a closed subset \( L \subset \mathbb{R}^{d \times d} \) with the following two properties:

First, each pair of matrices in \( L \) does not satisfy the \textit{Hadamard compatibility condition} (see [14]), i.e., there holds

\[
\text{rank}(Q_1 - Q_2) \geq 2 \quad \text{for all } Q_1, Q_2 \in L, \quad Q_1 \neq Q_2. \tag{2.1}
\]

Moreover, we suppose that, roughly speaking, there exists a locally Bilipschitz parametrization of \( L \). More precisely, we suppose that there exist constants \( d_L \in \mathbb{N}, 0 < c_L < 1, C_L > 0, r_L \in (0, +\infty) \), and a surjective Lipschitz mapping \( \Psi_L : (-r_L, r_L)^{d_L} \to L \) with Lipschitz constant \( C_L \) such that, for each \( Q \in L \), there exists a \textit{right inverse} mapping \( \Xi_L : B_{c_L r_L}(Q) \cap L \rightarrow (-r_L, r_L)^{d_L} \) of \( \Psi_L \) satisfying

\[
|\Xi_L(Q_1) - \Xi_L(Q_2)| \leq C_L |Q_1 - Q_2| \quad \text{for all } Q_1, Q_2 \in B_{c_L r_L}(Q) \cap L. \tag{2.2}
\]

In particular, \( r_L = \infty \) is admissible. In this case, we use the convention \( c_L r_L = \infty \), which means that \( \Psi_L \) has a globally Lipschitz right inverse \( \Xi_L \) defined on all of \( L \). If instead \( r_L < +\infty \) (that is, \( L \) is compact), it suffices that a Lipschitz right inverse is defined on small balls around each point having uniform radius, and that its Lipschitz constant is uniformly bounded by \( C_L \).

It is well-known that property (2.1) is satisfied for \( L = \mathbb{R}^{d \times d}_{\text{skew}} \) as well as for \( L = \text{SO}(d) \). Property (2.2) is immediate in the case \( L = \mathbb{R}^{d \times d}_{\text{skew}} \) since it suffices to define \( \Psi_L \) as the canonical isomorphism between \( \mathbb{R}^{d \times d}_{\text{skew}} \) and \( \mathbb{R}^{d \times d}_{\text{skew}} \), which is bijective and Bilipschitz. Actually, property (2.2) is also satisfied for \( L = \text{SO}(d) \), when \( d = 2 \) or \( d = 3 \).

**Proposition 2.1.** Let \( d = 2 \), or \( d = 3 \). Then, the set \( L = \text{SO}(d) \) complies with property (2.2).

This fact, although based on standard representation properties of rotation matrices, seems to be nontrivial to us. For the reader’s convenience, we will thus give a proof below in Appendix A.

**Piecewise rigid functions:** We introduce the space of \textit{piecewise rigid functions} by

\[
PR_L(\Omega) := \{ u : \Omega \to \mathbb{R}^d \}^{d\text{-measurable}}: \quad u(x) = \sum_{j \in \mathbb{N}} (Q_j x + b_j) \chi_{P_j}(x),
\]

where \( Q_j \in L, b_j \in \mathbb{R}^d \), and \((P_j)_j\) is a Caccioppoli partition of \( \Omega \). \tag{2.3}

Here and henceforth, we will call an affine mapping of the form \( q_{Q,b}(x) := Qx + b \) with \( Q \in L \) and \( b \in \mathbb{R}^d \) a \textit{rigid motion}. It follows from the properties of Caccioppoli partitions, see Section 3.1, that for each \( u \in PR_L(\Omega) \) we have that \( \mathcal{H}^{d-1}(J_u \setminus \bigcup_j \partial^* P_j) = 0 \) and thus \( \mathcal{H}^{d-1}(J_u) < +\infty \). We equip \( PR_L(\Omega) \) with the topology induced by measure convergence on \( \Omega \).

When \( L = \mathbb{R}^{d \times d}_{\text{skew}} \), one can equivalently characterize \( PR_L(\Omega) \) as the subspace of GSBD functions (see [38]) whose symmetrized approximate gradient \( e(u) \) equals zero \( L^d \)-almost everywhere. For a proof we refer to [36, Theorem A.1] and [18, Remark 2.2(i)]. In a similar fashion, in the case \( L = \text{SO}(d) \), \( PR_L(\Omega) \) coincides with the GSBV functions whose approximate gradient satisfies \( \nabla u(x) \in \text{SO}(d) \) for \( L^d \)-a.e. \( x \in \Omega \), see [36].

**Functionals:** We consider functionals \( F : PR_L(\Omega) \times \mathcal{B}(\Omega) \to [0, \infty) \) with the following general assumptions:
Theorem 2.3 (Integral representation). Let \( \Omega \subset \mathbb{R}^d \) be open, bounded with Lipschitz boundary and \( F : PR_L(\Omega) \times B(\Omega) \to [0, \infty) \) be such that (H1)–(H5) hold. Then

\[
F(u, B) = \int_{J_u \cap B} f(x, [u](x), \nu_u(x)) d\mathcal{H}^{d-1}(x)
\]

for all \( u \in PR_L(\Omega) \), \( B \in \mathcal{B}(\Omega) \), where \( f \) is given by

\[
f(x_0, \xi, \nu) = \lim_{\varepsilon \to 0} \frac{m_F(u_{x_0, \xi, \nu}, B_\varepsilon(x))}{\omega_{d-1} \varepsilon^{d-1}}
\]

for all \( x_0 \in \Omega \), \( \xi \in \mathbb{R}^d \), and \( \nu \in S^{d-1} \).

The second main theorem addresses \( \Gamma \)-convergence of functionals \( F \) satisfying (H1) and (H3)–(H5). For an exhaustive treatment of \( \Gamma \)-convergence we refer to [22] [34].

Theorem 2.3 (\( \Gamma \)-convergence). Let \( \Omega \subset \mathbb{R}^d \) open, bounded with Lipschitz boundary. Let \( F_n : PR_L(\Omega) \times B(\Omega) \to [0, \infty) \) be a sequence of functionals satisfying (H1), (H3)–(H5) for the same \( 0 < \alpha < \beta \) and \( \sigma : [0, +\infty) \to [0, \beta] \). Then there exists \( F : PR_L(\Omega) \times B(\Omega) \to [0, \infty) \) satisfying (H1)–(H4) and a subsequence (not relabeled) such that

\[
F(\cdot, A) = \Gamma- \lim_{n \to \infty} F_n(\cdot, A)
\]

with respect to convergence in measure on \( A \).
for all $A \in A_0(\Omega)$. Moreover, if there holds
\begin{equation}
\limsup_{n \to \infty} m_{F_n}(u, B_\varepsilon(x_0)) \leq \mu(u, B_\varepsilon(x_0)) \leq \liminf_{n \to \infty} m_{F_n}(u, B_\varepsilon(x_0))
\end{equation}
for all $u \in PR_L(\Omega)$ and each ball $B_\varepsilon(x_0) \subset \Omega$, then $\mathcal{F}$ satisfies also $(H_5)$ and admits the representation \((2.6)-(2.7)\).

We note that condition \((2.8)\) can be verified for $L = \mathbb{R}^{d \times d}$ and $L = SO(d)$, $d = 2, 3$, see Section 7. Theorem 2.2 and Theorem 2.3 will be proved in Section 5 and Section 6, respectively. The key ingredient for both results, namely a fundamental estimate in $PR_L(\Omega)$, is addressed in Section 4. From now on we drop the index $L$ and write $PR(\Omega)$ instead of $PR_L(\Omega)$ if now confusion arises.

3. Preliminaries

3.1. Caccioppoli partitions. We say that a partition $P = (P_j)_j$ of an open set $\Omega \subset \mathbb{R}^d$, $d \geq 2$, is a Caccioppoli partition of $\Omega$ if $\sum_j \mathcal{H}^{d-1}(\partial^* P_j) < +\infty$, where $\partial^* P_j$ denotes the essential boundary of $P_j$ (see [11, Definition 3.60]). Moreover, by $(P_j)_j$ we denote the points where $P_j$ has density one (see again [11, Definition 3.60]). By definition, the sets $(P_j)_j$ and $\partial^* P_j$ are Borel measurable. The local structure of Caccioppoli partitions can be characterized as follows (see [11, Theorem 4.17]).

**Theorem 3.1** (Local structure). Let $(P_j)_j$ be a Caccioppoli partition of $\Omega$. Then
$$\bigcup_j (P_j)_j \cup \bigcup_{i \neq j} (\partial^* P_i \cap \partial^* P_j)$$
contains $\mathcal{H}^{d-1}$-almost all of $\Omega$.

Essentially, the theorem states that $\mathcal{H}^{d-1}$-a.e. point of $\Omega$ either belongs to exactly one element of the partition or to the intersection of exactly two sets $\partial^* P_i, \partial^* P_j$. We say that a partition is ordered if $\mathcal{L}^d(P_i) \geq \mathcal{L}^d(P_j)$ for $i \leq j$. Moreover, we say that a set of finite perimeter $P_j$ is indecomposable if it cannot be written as $P_1 \cup P_2$ with $P_1 \cap P_2 = \emptyset$, $\mathcal{L}^d(P_1), \mathcal{L}^d(P_2) > 0$ and $\mathcal{H}^{d-1}(\partial^* P_j) = \mathcal{H}^{d-1}(\partial^* P_1) + \mathcal{H}^{d-1}(\partial^* P_2)$. We state a compactness result for ordered Caccioppoli partitions. (See [11] Theorem 4.19, Remark 4.20 or [50] Theorem 2.8 for the slightly adapted version presented here.)

**Theorem 3.2** (Compactness). Let $\Omega \subset \mathbb{R}^d$ be a bounded Lipschitz domain. Let $P_i = (P_{j,i})_j$, $i \in \mathbb{N}$, be a sequence of ordered Caccioppoli partitions of $\Omega$ with
$$\sup_{i \geq 1} \sum_j \mathcal{H}^{d-1}(\partial^* P_{j,i}) < +\infty.$$
Then there exists a Caccioppoli partition $(P_j)_j$ of $\Omega$ and a subsequence (not relabeled) such that $\sum_j \mathcal{L}^d(P_{j,i} \Delta P_j) \to 0$ as $i \to \infty$, where $P_{j,i} \Delta P_j = (P_{j,i} \setminus P_j) \cup (P_j \setminus P_{j,i})$.

3.2. Properties of rigid and piecewise rigid functions. Recall the function space $PR(\Omega)$ introduced in \((2.3)\), and the fact that each $u \in PR(\Omega)$ can be written as $u = \sum_j q_j \chi_{P_j}$, where $(P_j)_j$ is a Caccioppoli partition of $\Omega$ and $(q_j)_j$ are rigid motions, i.e., $q_j(x) = Q_j x + b_j$ with $Q_j \in L$ and $b_j \in \mathbb{R}^d$. We point out that the representation of $u$ is not unique. In the following, we will use two specific representations of $u$: (a) We say that the representation is pairwise distinct if all affine mappings $(q_j)_j$ are pairwise different. In this case, we observe by \((2.1)\) that
$$\mathcal{H}^{d-1}\left(J_u \Delta \left( \bigcup_{j \in \mathbb{N}} \partial^* P_j \setminus \partial \Omega \right) \right) = 0.$$
(b) We say that the representation is indecomposable if each $P_j$ is a indecomposable set of finite perimeter and we have
\[ \mathcal{H}^{d-1}(\partial^* P_i \cap \partial^* P_j) > 0 \quad \text{for} \quad i \neq j \quad \Rightarrow \quad q_i \neq q_j. \]

Note that for such representations there also holds by (2.1)
\[ \mathcal{H}^{d-1}\left( J_n \Delta \left( \bigcup_{j \in \mathbb{N}} \partial^* P_j \setminus \partial \Omega \right) \right) = 0. \quad (3.2) \]

An indecomposable representation can be deduced from a piecewise distinct representation by splitting each $P_j$ uniquely into its connected components, i.e., into a countable family of pairwise disjoint, indecomposable sets, see [9, Theorem 1]. We start by a compactness result in $PR(\Omega)$.

**Lemma 3.3** (Compactness and lower semicontinuity). Let $\Omega \subset \mathbb{R}^d$ be open, bounded with Lipschitz boundary.

(i) Let $(u_n)_n \subset PR(\Omega)$ be a sequence with $\sup_n \int_\Omega \psi(|u_n|) + \mathcal{H}^{d-1}(J_{u_n}) < +\infty$, where $\psi : [0, \infty) \to [0, \infty)$ is continuous, strictly increasing, and satisfies $\lim_{t \to \infty} \psi(t) = +\infty$. Then there exist $u \in PR(\Omega)$ and a subsequence (not relabeled) such that $u_n \to u$ in measure.

(ii) Given $(u_n)_n \subset PR(\Omega)$ with $u_n \to u$ in measure, there holds $\mathcal{H}^{d-1}(J_u) \leq \liminf_{n \to \infty} \mathcal{H}^{d-1}(J_{u_n})$.

The proof of the above compactness result relies on (2.1), as well as on the following auxiliary result, which will be used several times in the sequel.

**Lemma 3.4.** Let $G \in \mathbb{R}^{d \times d}$, $b \in \mathbb{R}^d$. Let $\delta > 0$, $R > 0$, and let $\psi : \mathbb{R}_+ \to \mathbb{R}_+$ be a continuous, strictly increasing function with $\psi(0) = 0$. Consider a measurable, bounded set $E \subset \mathbb{R}^d$ with $E \subset B_R(0)$ and $L^d(E) \geq \delta$. Then there exists a continuous, strictly increasing function $\tau_\psi : \psi(\mathbb{R}_+) \to \mathbb{R}_+$ with $\tau_\psi(0) = 0$ only depending on $\delta$, $R$, and $\psi$ such that
\[ |G| + |b| \leq \tau_\psi \left( \int_E \psi(|Gx + b|) \, dx \right). \quad (3.3) \]

If $\psi(t) = t^p$, $p \in [1, \infty)$, then $\tau_\psi$ can be chosen as $\tau_\psi(t) = ct^{1/p}$ for $c = c(p, \delta, R) > 0$. Moreover, there exists $c_0 > 0$ only depending on $\delta$ and $R$ such that
\[ \|Gx + b\|_{L^\infty(B_R(0))} \leq (\omega_d R^d)^{-1} c_0 \|Gx + b\|_{L^1(E)} \leq c_0 \|Gx + b\|_{L^\infty(E)}. \quad (3.4) \]

**Proof.** We start by proving an estimate under weaker assumptions than in the statement above. We claim that for each measurable, bounded set $E$ with $\text{diam}(E) \leq 2R$ (not necessarily contained in $B_R(0)$) and $L^d(E) \geq \delta$ there holds
\[ |G| \leq \tilde{\tau}_\psi \left( \int_E \psi(|Gx + b|) \, dx \right) \quad (3.5) \]
for a continuous, strictly increasing function $\tilde{\tau}_\psi$ with $\tilde{\tau}_\psi(0) = 0$. It is not restrictive to consider only the case $b = 0$. Indeed, every $b \in \mathbb{R}^d$ can be decomposed orthogonally as $b = \hat{b} - G y$, with $\hat{b} \in (\text{im}(G))^\perp$ and $y \in \mathbb{R}^d$. Then clearly $|Gx + b| \geq |G(x - y)|$ for all $x \in \mathbb{R}^d$. Since $\psi$ and $\tilde{\tau}_\psi$ are increasing, and $L^d(E)$ and diam($E$) are left unchanged by a translation of $E$, we can then assume $y = \hat{b} = b = 0$.

Since matrix norms are equivalent, we endow $\mathbb{R}^{d \times d}$ with the spectral norm throughout the proof. We fix an eigenvector $v$ with unit norm corresponding to the maximal eigenvalue of the symmetric positive semidefinite matrix $G^TG$, i.e., $G^TGv = |G|^2 v$ by the definition of spectral norm. Let $v^\perp$ be the $(d - 1)$-dimensional hyperplane orthogonal to $v$. Since $|v| = 1$, for each $y \in v^\perp$ there holds
\[ |G(y + s v)| = \left( |Gy|^2 + 2s |G|^2 (y, v) + s^2 |G|^2 |v|^2 \right)^{1/2} \geq |s| |G| \quad (3.6) \]
for all $s \in \mathbb{R}$. For $r > 0$ we define

$$E_r := \{ x = y + s \psi \in E : y \in \psi^{-1}, |s| \geq r \}. \tag{3.7}$$

Using the isodiametric inequality and the fact that $\text{diam}(E) \leq 2R$, we have $\mathcal{L}^d(E \setminus E_r) \leq 2\omega_{d-1}R^{d-1}$. Let $m := \sup_{t \in \mathbb{R}^+} \psi(t) \in \mathbb{R}_+ \cup \{+\infty\}$. Hence, setting for each $t \in [0, m]$ $m_t = \min\{4t, m\}$, $r(t) > 0$ can be chosen, only depending on $\delta$ and $R$, such that

$$\mathcal{L}^d(E \setminus E_{r(t)}) \leq \delta \frac{\sqrt{m_t} - \sqrt{t}}{\sqrt{m_t} + \sqrt{t}}. \tag{3.8}$$

Above the right-hand side is extended by continuity with the value $\frac{1}{4}\delta$ for $t = 0$. Note that $r(t)$ is continuous in $t$. We define the function

$$\hat{\tau}_\psi(t) = r(t)^{-1}\psi^{-1}\left(\sqrt{t}\left(\sqrt{m_t} + \sqrt{t}\right)/2\right), \quad t \in [0, m), \tag{3.9}$$

which is clearly well defined for $t \in [0, m)$, and satisfies $\hat{\tau}_\psi(0) = 0$ since $\psi^{-1}(0) = 0$.

By (3.8) and $\mathcal{L}^d(E) \geq \delta$ we get $\mathcal{L}^d(E_{r(t)}) \geq 2\sqrt{t}\left(\sqrt{m_t} + \sqrt{t}\right)^{-1}\mathcal{L}^d(E)$. Let $t = \int_E \psi(|G x|) \, dx$ for brevity. This along with (3.3) and the fact that $\psi \geq 0$ is monotone increasing yields

$$\psi(r(t)|G|) \leq \frac{1}{\mathcal{L}^d(E_{r(t)})} \int_{E_{r(t)}} \psi(|G x|) \, dx \leq \frac{1}{\mathcal{L}^d(E_{r(t)})} \int_E \psi(|G x|) \, dx \leq \frac{\sqrt{m_t} + \sqrt{t}}{2\sqrt{t}} \int_E \psi(|G x|) \, dx = \sqrt{t}\left(\sqrt{m_t} + \sqrt{t}\right)/2.$$

This implies $|G| \leq r(t)^{-1}\psi^{-1}\left(\sqrt{t}\left(\sqrt{m_t} + \sqrt{t}\right)/2\right) = \hat{\tau}_\psi(t)$ since $\psi^{-1}$ is strictly increasing, too. This concludes the proof of (3.3).

We now show (3.5) for $\tau_\psi := (2R + 1)\hat{\tau}_\psi + 2\psi^{-1}$. Whenever $|b| \leq 2R|G|$, the statement follows directly from (3.5). If instead $|b| > 2R|G|$, since $|Gx| \leq R(G)$ for all $x \in B_R(0), we have $|Gx + b| > \frac{1}{2}|b|$ for all $x \in E \subset B_R(0)$. This implies $\psi(|b|/2) \leq \int_E \psi(|G x + b|) \, dx$ and thus

$$|b| \leq 2\psi^{-1}\left(\int_E \psi(|G x + b|) \, dx\right).$$

This along with (3.3) and the definition $\tau_\psi = (2R + 1)\hat{\tau}_\psi + 2\psi^{-1}$ shows (3.3).

We consider the special situation $\psi(t) = t^p$, $p \in [1, \infty)$. Since $m = \infty$ in this case, in view of (3.3), it is not hard to check that $\hat{\tau}_\psi(t) \leq ct^{1/p}$ and thus $\tau_\psi(t) \leq ct^{1/p}$ for some $c$ sufficiently large depending only on $\delta$, $R$, and $p$. Thus, $\tau_\psi$ can be replaced by the function $t \mapsto ct^{1/p}$.

We finally show (3.4). We apply (3.3) with $\psi(t) = t$. By using that $\tau_\psi(t) \leq ct$ we get $|G| + |b| \leq c \int_E |G x + b| \, dx$. We conclude the proof by recalling that $\mathcal{L}^d(E) \geq \delta$ and noting that $|G x + b| \leq |G| R + |b|$ for all $x \in B_R(0)$. \hfill $\square$

For similar estimates of this kind, we also refer to [30] [48] [50]. We can now prove Lemma 3.3.

**Proof of Lemma 3.3.** We start with (i). We consider the pairwise distinct representation $u_n = \sum_j q_j, n X_P_{\psi, x}$ of each $u_n$ and the associated ordered Caccioppoli partitions $P_n = (P_{j,n})_j$, $n \in \mathbb{N}$. Observe that the assumption $\sup_{n \geq 1} \mathcal{H}^{d-1}(J_{u_n}) < +\infty$ and (3.4) imply that

$$\sup_{n \geq 1} \sum_j \mathcal{H}^{d-1}(\partial^* P_{j,n}) < +\infty.$$

Thus, up to a subsequence (not relabeled), there exists a limiting Caccioppoli partition $(P_j)_j$ in the sense of Theorem 3.2. It is clearly not restrictive to assume that $\mathcal{L}^d(P_j) > 0$ for all $j$, since,
after neglecting all null sets, we still have a Caccioppoli partition of $\Omega$. By lower semicontinuity of the perimeter, by using Theorem 3.1 and by (3.11) we also have

$$
\frac{1}{2} \sum_j \mathcal{H}^{d-1}(\partial^* P_j \setminus \partial \Omega) \leq \liminf_{n \to \infty} \frac{1}{2} \sum_j \mathcal{H}^{d-1}(\partial^* P_{j,n} \setminus \partial \Omega) = \liminf_{n \to \infty} \mathcal{H}^{d-1}(J_{un}).
$$

(3.10)

For a fixed $j \in \mathbb{N}$, Theorem 3.2 implies that there exists $\delta_j$, independently of $n$, with $L^d(P_{j,n}) \geq \delta_j$ for all $n$. Now, by assumption there holds $\int_{P_{j,n}} \psi(|q_{j,n}(x)|) \, dx \leq \frac{M}{\delta_j}$, where $M := \sup_n \int_\Omega \psi(|u_n|)$. Hence, we deduce by Lemma 3.4 and the coerciveness of $\psi$ that there exists a constant $c_{\Omega,M,j}$ such that

$$
\sup_{n \geq 1} \|q_{j,n}\|_{W^{1,\infty}(\Omega)} \leq c_{\Omega,M,j}.
$$

By the Ascoli-Arzelà Theorem, a diagonal argument, and by the fact that $L$ is closed, we deduce that there exist rigid motions $(q_j)_j$ so that, for each $j$, there holds

$$
\lim_{n \to \infty} \|q_{j,n} - q_j\|_{L^\infty(\Omega)} \to 0
$$

(3.11)

along a subsequence independent of $j$, which we do not relabel. We set $u = \sum_j q_j \chi_{P_j}$, and clearly we get $u \in PR(\Omega)$, while (3.11) and Theorem 3.2 give $u_n \to u$ in measure. To see (ii), we note that by construction $J_u \subset \bigcup_j (\partial^* P_j \setminus \partial \Omega)$ up to an $\mathcal{H}^{d-1}$-negligible set. Thus, we deduce the inequality $\mathcal{H}^{d-1}(J_u) \leq \liminf_{n \to \infty} \mathcal{H}^{d-1}(J_{un})$ directly from Theorem 3.1 and (3.10). □

We now collect some crucial properties of piecewise rigid functions in the blow-up at jump points. In particular, we construct suitable modifications with the property that they converge to the function defined in (2.5) in $L^p$, $1 \leq p < +\infty$, see (3.12)(vi). This convergence property will be instrumental for the proof of the integral representation formula in Section 5. We denote the half spaces $\{ \langle x - x_0, \nu \rangle > 0 \}$ and $\{ \langle x - x_0, \nu \rangle < 0 \}$ by $H^+(x_0, \nu)$ and $H^-(x_0, \nu)$, respectively.

Lemma 3.5 (Blow-up at jump points). Let $u = \sum_{j \in \mathbb{N}} q_j \chi_{P_j} \in PR(\Omega)$. Let $\theta \in (0,1)$. For $\mathcal{H}^{d-1}$-a.e. $x_0 \in J_u$ we find $i,j \in \mathbb{N}$ such that $x_0 \in \partial^* P_i \cap \partial^* P_j$, and a sequence $u_\varepsilon \in PR(B\varepsilon(x_0))$ satisfying

(i) $\lim_{\varepsilon \to 0} \frac{1}{\varepsilon^d} \mathcal{L}^d((B\varepsilon(x_0) \cap H^+(x_0,\nu_u)) \setminus P_i) + \lim_{\varepsilon \to 0} \frac{1}{\varepsilon^d} \mathcal{L}^d((B\varepsilon(x_0) \cap H^-(x_0,\nu_u)) \setminus P_j) = 0$,

(ii) $\lim_{\varepsilon \to 0} \frac{1}{\omega_{d-1} \varepsilon^{d-1}} \mathcal{H}^{d-1}(J_u \cap \{ B\varepsilon(x_0) \} = (1 - \varepsilon^{d-1}) \quad \text{for all } t \in (0,1)$,

(iii) $u_\varepsilon = q_i \chi_{P_i} + q_j \chi_{P_j}$ on $B(1-\varepsilon)(x_0)$,

(iv) $u_\varepsilon = u$ in a neighborhood of $\partial B\varepsilon(x_0)$,

(v) $\lim_{\varepsilon \to 0} \frac{1}{\varepsilon^{d-1}} \mathcal{H}^{d-1}(J_{u_\varepsilon} \setminus J_u) + \mathcal{H}^{d-1}(\{ x \in J_{u_\varepsilon} \cap J_u : \langle u_\varepsilon(x) \rangle \neq \langle u(x) \rangle \}) = 0$,

(vi) $\lim_{\varepsilon \to 0} \frac{1}{\varepsilon^d} \int_{B(1-\varepsilon)(x_0)} |u_\varepsilon(x) - (u^+(x_0) + u_{x_0,\langle u\rangle(x_0)}(x_0))|^p \, dx = 0 \quad \forall 1 \leq p < \infty$.

(3.12)

Proof. For $\mathcal{H}^{d-1}$-a.e. $x_0 \in J_u$ there exist two components $P_i$ and $P_j$ such that $x_0 \in \partial^* P_i \cap \partial^* P_j$ and

(i) $\lim_{\varepsilon \to 0} \frac{\mathcal{L}^d((B\varepsilon(x_0) \cap H^+(x_0,\nu_u)) \setminus P_i)}{\varepsilon^d} + \frac{\mathcal{L}^d((B\varepsilon(x_0) \cap H^-(x_0,\nu_u)) \setminus P_j)}{\varepsilon^d} = 0$,

(ii) $\lim_{\varepsilon \to 0} \frac{\mathcal{H}^{d-1}(B\varepsilon(x_0) \cap J_u \cap \partial^* P_i \cap \partial^* P_j)}{\omega_{d-1} \varepsilon^{d-1}} = 1$.

(3.13)
functions. It will be the key tool to prove our integral representation and

We define $u \in u(\Omega)$ such that for every functional $F \in \mathcal{F}(\Omega)$, we may regard every $A \in \mathcal{A}(\Omega)$, $A \subset U$, we may regard every $u \in PR(A)$ as a function on $U$, extended by $u = 0$ on $U \setminus A$.

**Lemma 4.1 (Fundamental estimate).** Let $\eta > 0$ and $A', A, B \in \mathcal{A}_0(\Omega)$ with $A' \subset A$, and let $\psi : \mathbb{R}_+ \to \mathbb{R}_+$ be continuous and strictly increasing with $\psi(0) = 0$. Then there exist a constant $M > 0$ and a lower semicontinuous function $A : PR(A) \times PR(B) \to \mathbb{R}_+ \cup \{+\infty\}$ satisfying

$$A(z_1, z_2) \to 0 \text{ whenever } \int_{(A \setminus A') \cap B} \psi(|z_1 - z_2|) \to 0$$

(4.1)

such that for every functional $F$ satisfying (H$_1$), (H$_3$), (H$_4$), and (H$_5'$) and for all $u \in PR(A)$, $v \in PR(B)$ there exists a function $w \in PR(A' \cup B)$ such that

(i) $F(w, A' \cup B) \leq F(u, A \cap J_w) + F(v, B \cap J_w)$

$$+ \left(\mathcal{H}^{d-1}(\partial A \cup \partial A' \cup \partial B) + F(u, A) + F(v, B)\right)(\eta + M\sigma(A(u, v))),$$

(ii) $\|\min\{|w-u|, |w-v|\}\|_{L^p(A \cup B)} \leq A(u, v)$,

(4.2)

where $\sigma$ is given in (H$_5'$). If $\psi(t) = t^p$, $1 \leq p < \infty$, then $A(z_1, z_2) = M\|z_1 - z_2\|_{L^p(A \setminus A') \cap B}$. 4. Fundamental estimate for $PR(\Omega)$
Remark 4.2 (Topology). We recall that $PR(\Omega)$ is equipped with the topology induced by measure convergence, i.e., a natural choice in Lemma 4.1 is $\psi(t) = \frac{1}{t^\gamma}$. For the applications, however, we are also interested in other topologies, e.g. $\psi(t) = t^\rho$, and therefore we account for different choices in the statement. Note that $\int_{(A \setminus A') \cap B} \psi(|z_1 - z_2|)$ might be infinite. In this case, also $A$ satisfies $A_{(z_1, z_2)} = +\infty$, and $\sigma(A(u, v))$ has to be understood as $\lim_{t \to \infty} \sigma(t)$.

Remark 4.3 ($L^\infty$-estimate). In the case of piecewise constant functions studied by Ambrosio and Braides [6], it is possible to construct $w$ in such a way that $w(x) \in \{u(x), v(x)\}$ for a.e. $x \in A' \cup B$. In our setting, we slightly have to modify rigid motions by the coarea formula, with modifications controlled in terms of $A(u, v)$. This allows us to establish an $L^\infty$-control on $\min\{|w - u|, |w - v|\}$ in (4.2) (ii). (Note that each function $u, v, w$ itself might not lie in $L^\infty$.)

Remark 4.4 (Non-attainment of boundary data). (i) We emphasize that the function $w$ provided above does not necessarily satisfy $w = v$ on $B \setminus A$, as it will be often required in the applications in Section 6 and Section 8. Indeed, consider the following example (for simplicity, in the planar setting $d = 2$ for scalar-valued functions). The extension to the vector case is straightforward:

Let $\rho > 0$ and define the set $A' = B_{1-2}\rho(0)$, $A = B_{1-\rho}(0)$, and $B = B_{1}(0) \setminus B_{1-3\rho}(0)$. For $\varepsilon > 0$, we consider the piecewise constant functions $u \in PR(A)$ and $v_\varepsilon \in PR(B)$ defined by

$$u = 0 \text{ on } A, \quad v_\varepsilon = 0 \text{ on } B \cap \{x_2 > 0\}, \quad v_\varepsilon = \varepsilon \text{ on } B \cap \{x_2 < 0\}.$$  \hfill (4.3)

For each $w \in PR(B_{1}(0))$ with $w = v_\varepsilon$ on $B \setminus A$, one observes that each line parallel to $e_2$ intersects $J_w$. To see this, we choose a piecewise constant function $\bar{w} \in SBV(B_{1}(0); [0, 1])$ with $\bar{w} = w$ on $B \setminus A$ and $\mathcal{H}^1(J_w \setminus J_{\bar{w}}) = 0$, and apply the slicing property [11, Theorem 3.108] of BV functions. This implies $\mathcal{H}^1(J_{\bar{w}}) \geq 2$ and thus $\mathcal{F}(\bar{w}, B_{1}(0)) \geq 2\alpha$ by (H4). On the other hand, we have

$$\mathcal{F}(u, A) + \mathcal{F}(v_\varepsilon, B) + (\mathcal{H}^1(\partial A' \cup \partial A \cup \partial B) + F(u, A) + F(v_\varepsilon, B))(\eta + M\sigma(A(u, v_\varepsilon)))$$

$$\leq 6\rho\beta + (6\pi + 6\rho\beta)(\eta + M\sigma(A(u, v_\varepsilon))).$$

Observe that $\int_{(A \setminus A') \cap B} \psi(|w - v_\varepsilon|) \leq \pi\rho(1 - \frac{4\rho}{\varepsilon})\psi(\varepsilon) \to 0$ as $\varepsilon \to 0$ for fixed $\rho$, and $A(u, v_\varepsilon) \to 0$ by (4.1). In view of $\mathcal{F}(u, B_{1}(0)) \geq 2\alpha$, this contradicts (4.2) (i) when we choose $\eta$ small enough, and let first $\varepsilon \to 0$ and then $\rho \to 0$.

(ii) The example in (i) shows that the issue of non-attainment of boundary data occurs already on the level of piecewise constant functions. The only reason why this problem did not appear in the fundamental estimate for piecewise constant functions by Ambrosio and Braides, see [6, Lemma 4.4], is due to the fact that the functions considered there attain only a finite number of different values. In fact, the delicate point here is the case where the functions $u$ and $v_\varepsilon$ attain very similar values, see (4.3).

For the formulation of a version of the fundamental estimate with boundary data, we need to introduce the following technical definition: for sets $A', U \in \mathcal{A}_0(\Omega)$ with $A' \subseteq U$, a piecewise rigid function $v = \sum_{j \in \mathbb{N}} q_j \chi_{P_j} \in PR(U \setminus \overline{A'})$ in its pairwise distinct representation (see Section 3.2), and a constant $\delta > 0$ we define

$$\Phi(A', U; v, \delta) := \min_{j_1, j_2 \in J, j_1 \neq j_2} \|q_{j_1} - q_{j_2}\|_{L^\infty(U)},$$

where $J \subset \mathbb{N}$ denotes the index set of large components defined by

$$J := \{ j \in \mathbb{N} : \mathcal{L}^d(P_j \cap (U \setminus \overline{A})) \geq \delta \}.$$  \hfill (4.5)

As $J$ contains a finite number of indices, it is clear that $\Phi(A', U; v, \delta) > 0$. If $\#J \leq 1$, then $\Phi(A', U; v, \delta) = +\infty$. We remark that the difference of the affine mappings in (4.3) is compared on $U$ and not on $U \setminus \overline{A'}$ (where $v$ is defined) as in the proof we need to modify functions in the whole
domain $U$ and not only inside $U \setminus \overline{A}$. On the contrary, we emphasize that in the volume of the components inside $U \setminus \overline{A}$ is measured.

**Lemma 4.5** (Fundamental estimate, boundary data). Let $\eta > 0$ and $A', A, B \in \mathcal{A}_0(\Omega)$ with $A' \subset A$. Let $\psi : \mathbb{R}_+ \to \mathbb{R}_+$ be continuous and strictly increasing with $\psi(0) = 0$. Let $\Lambda$ be the function of Lemma 4.1. Then there exist constants $F$ satisfying (H1), (H3), and (H5′) and for all $u \in PR(A)$, $v \in PR(B)$ satisfying the condition

$$M_1 A(u, v) \leq \Phi(A', A' \cup B; v|_{B \setminus \overline{A}}, \delta),$$

there exists a function $w \in PR(A' \cup B)$ such that

(i) $\mathcal{F}(w, A' \cup B) \leq \mathcal{F}(u, A) + \mathcal{F}(v, B)$

$$+ \left(\mathcal{H}^{d-1}(\partial A' \cup \partial A \cup \partial B) + \mathcal{F}(u, A) + \mathcal{F}(v, B)\right) \left(2\eta + M_2 \sigma(\Theta(u, v))\right),$$

(ii) $\|\min\{|w - u|, |w - v|\}|_{L^\infty(A' \cup B)} \leq \Theta(u, v)$,

(iii) $w = v$ on $B \setminus A$.

(4.6)

where $\sigma$ is given in (H5′), and $M_2 > 0$ as well as $\Theta : PR(A) \times PR(B) \to \mathbb{R}_+ \cup \{+\infty\}$ are independent of $u$ and $v$. Here, $\Theta$ is a lower semicontinuous function satisfying

$$\Theta(z_1, z_2) \to 0 \text{ whenever } \int_{(A \setminus A') \cap B} \psi(|z_1 - z_2|) \to 0.$$  

(4.7)

If $\psi(t) = t^p$, $1 \leq p < \infty$, then $\Theta(u, v) = M_2\|u - v\|_{L^p((A \setminus A') \cap B)}$.

The object $\Phi$ measures how similar a function is on different (large) components. Roughly speaking, the technical condition (4.6) ensures that, for the functions $u$ and $v$, the phenomenon described in Remark 4.4 cannot occur. In this context, we remark that, for given $\delta > 0$, the constant $M_1$ will be chosen sufficiently large in the proof, depending on the constant $c_0$ in Lemma 4.4.

In the applications, we will need to use the fundamental estimate on balls of different sizes. To this end, we formulate a scaled version of Lemma 4.5.

**Corollary 4.6** (Scaled version of the fundamental estimate). Let $\eta > 0$ and $\rho > 0$. Suppose that $A', A, B \in \mathcal{A}_0(\Omega)$ with $A' \subset A$ are given such that $\rho A', \rho A, \rho B \subset \Omega$. Let $u_\rho \in PR(\rho A)$ and $v_\rho \in PR(\rho B)$. Under the assumption that

$$\rho^{-d} M_1\|u_\rho - v_\rho\|_{L^1(\rho A \setminus (\rho A' \cap \rho B))} \leq \Phi(\rho A', \rho A' \cup \rho B; v_\rho|_{\rho B \setminus \overline{A}}, \rho \delta)$$

(4.9)

one finds a function $w_\rho \in PR(\rho A' \cup \rho B)$ satisfying

(i) $\mathcal{F}(w_\rho, \rho A' \cup \rho B) \leq \mathcal{F}(u_\rho, \rho A) + \mathcal{F}(v_\rho, \rho B)$

$$+ \left(\rho^{d-1} C_{A', A} + \mathcal{F}(u_\rho, \rho A) + \mathcal{F}(v_\rho, \rho B)\right) \left(2\eta + M_2 \sigma\right)\left(M_2\|u_\rho - v_\rho\|_{L^1(\rho A \setminus (\rho A' \cap \rho B))}\right),$$

(ii) $\|\min\{|w_\rho - u_\rho|, |w_\rho - v_\rho|\}|_{L^\infty(\rho A' \cup \rho B)} \leq M_2\|u_\rho - v_\rho\|_{L^\infty(\rho A \setminus (\rho A' \cap \rho B))},$

(iii) $w_\rho = v_\rho$ on $\rho B \setminus \rho A$.

(4.10)

where $M$ is the constant of Lemma 4.4, $M_1, M_2, \delta$ are the constants of Lemma 4.5 (applied for $\psi(t) = t$), and $C_{A', A} := \mathcal{H}^{d-1}(\partial A' \cup \partial A \cup \partial B)$ for brevity.

The proof of Lemma 4.4 will be addressed in Section 5.2. The proofs of Lemma 4.5 and Corollary 4.6 will be given in Section 4.3. The reader may also skip the following subsections and go directly to the proofs of our main results in Section 5 and Section 6.
4.2. Proof of Lemma 4.7. This section is devoted to the proof of Lemma 4.7. As a preparation, we formulate and prove a lemma about the choice of subsets.

**Lemma 4.7** (Choice of subsets). Let $\lambda > 0$. Let $A', A \in \mathcal{A}_0(\Omega)$ with $A' \subset A$. For $0 < t < d_{A',A} := \text{dist}(\partial A', \partial A)$ we define

$$E_t := \{ x \in \mathbb{R}^d : \text{dist}(x, A') < t \}. \quad (4.11)$$

Then for each set of finite perimeter $D \subset \Omega$ there exist $\frac{1}{4} d_{A',A} < T_1 < T_2 < \frac{3}{4} d_{A',A}$ and a function $\varphi \in C^\infty(A)$ with $0 \leq \varphi \leq 1$, $\varphi = 1$ in a neighborhood of $\overline{E_{T_1}}$, and $\text{supp}(\varphi) \subset \subset E_{T_2}$ such that the set of finite perimeter $\overline{F} := D \cap (E_{T_2} \setminus E_{T_1})$ and the function $\varphi$ satisfy

$$\mathcal{H}^{d-1}(\partial^* F) \leq \lambda \mathcal{H}^{d-1}(\partial^* D) + M_\lambda \mathcal{L}^d(D) \quad \text{and} \quad \|\nabla \varphi\|_\infty \leq M_\lambda, \quad (4.12)$$

where $M_\lambda$ only depends on $\lambda$, $A'$, and $A$.

**Proof.** Choose $k \in \mathbb{N}$ such that $k \geq \lambda^{-1}$. Let $t_i = (\frac{1}{4} + \frac{i}{2k}) d_{A,A'}$ for $i = 0, \ldots, k$, and define $A_i = E_{t_i} \setminus E_{t_{i-1}}$ for $i = 1, \ldots, k$. We also define the smaller sets $B_i = E_{t_{i-1}} \setminus E_{t_{i-1}}$, where $t_i^+ = t_i \pm \frac{1}{2k} d_{A,A'}$. For $i = 1, \ldots, k$, let $\varphi_i \in C^\infty(A)$ with $0 \leq \varphi_i \leq 1$, $\varphi_i = 1$ in a neighborhood of $\overline{E_{t_{i-1}^+}}$, and $\text{supp}(\varphi_i) \subset \subset E_{t_{i-1}^+}$, i.e., $\{0 < \varphi_i < 1\} \subset \subset B_i$. Define

$$M_\lambda = \max \{ 16k d_{A,A'}^{-1}, \max_{i=1,\ldots,k} \|\nabla \varphi_i\|_\infty \}.$$

By recalling $k \geq \lambda^{-1}$ we find $i_0 \in \{1, \ldots, k\}$ such that

$$\mathcal{H}^{d-1}(\partial^* D \cap A_{i_0}) \leq \frac{1}{k} \sum_{i=1}^k \mathcal{H}^{d-1}(\partial^* D \cap A_i) \leq \lambda \mathcal{H}^{d-1}(\partial^* D). \quad (4.13)$$

We now claim that one can find $t_{i_0-1} < T_1 < t_{i_0-1}^+$ and $t_{i_0} < T_2 < t_{i_0}$ such that

$$\mathcal{H}^{d-1}(D \cap \partial E_{T_1}) \leq \frac{8k}{d_{A',A}} \mathcal{L}^d(D \cap A_{i_0}), \quad \mathcal{H}^{d-1}(D \cap \partial E_{T_2}) \leq \frac{8k}{d_{A',A}} \mathcal{L}^d(D \cap A_{i_0}). \quad (4.14)$$

We only prove the first inequality above since the other one is similar. To this aim, we observe that

$$\{ x \in \mathbb{R}^d : t_{i_0-1} < \text{dist}(x, A') < t_{i_0-1}^+ \} \subset A_{i_0}.$$

Hence, applying the coarea formula to the Lipschitz function $g(x) := \text{dist}(x, A')$, whose gradient has norm 1 a.e., (see for instance [42, Theorem 3.14]) we get

$$\mathcal{L}^d(D \cap A_{i_0}) \geq \int_{t_{i_0-1}}^{t_{i_0-1}^+} \mathcal{H}^{d-1}(D \cap \{g = t\}) \, dt.$$

Thus, since $t_{i_0-1} - t_{i_0-1} = \frac{d_{A',A}}{8k}$, we can choose $t_{i_0-1} < T_1 < t_{i_0-1}^+$ such that (4.14) holds.

We define $F := D \cap (E_{T_2} \setminus E_{T_1})$. In view of $\{0 < \varphi_{i_0} < 1\} \subset B_{i_0}$, the definition of $T_1$ and $T_2$ implies that $\varphi_{i_0}$ satisfies $\varphi_{i_0} = 1$ in a neighborhood of $\overline{E_{T_1}}$, and $\text{supp}(\varphi_{i_0}) \subset \subset E_{T_2}$. Moreover, by (4.13)–(4.14) we get

$$\mathcal{H}^{d-1}(\partial^* F) \leq \mathcal{H}^{d-1}(\partial^* D \cap A_{i_0}) + \mathcal{H}^{d-1}(D \cap \partial E_{T_1}) + \mathcal{H}^{d-1}(D \cap \partial E_{T_2}) \leq \lambda \mathcal{H}^{d-1}(\partial^* D) + M_\lambda \mathcal{L}^d(D),$$

where we used $M_\lambda \geq 16k d_{A,A'}^{-1}$. This yields the first part of (4.12). The second part of (4.12) follows directly from the definition of $M_\lambda$. \qed

For the proof of Lemma 4.7, we will need another two ingredients. First, we state an elementary property about the covering of points by balls.
Lemma 4.8 (Covering with balls). Let $N \in \mathbb{N}$ and $r_0 > 0$. Then each set of points $\{x_1, \ldots, x_N\} \subset \mathbb{R}^m$ can be covered by finitely many pairwise disjoint balls $\{B_{r_k}(y_k)\}_{k=1}^M$, $M \leq N$, $(y_k)_{k=1}^M \subset \mathbb{R}^m$, satisfying
\[ r_k \in [8^{-N}r_0, r_0], \quad \text{dist}(B_{r_k}(y_i), B_{r_k}(y_j)) > 2 \max_{k=1,\ldots,M} r_k \quad \text{for } 1 \leq i < j \leq M. \]

Proof. From [29] Lemma 3.7 applied for $\gamma = 4$ and $R_0 = r_08^{-N}$ we get pairwise disjoint balls $\{B_{r_k}(y_k)\}_{k=1}^M$ with $r_k \in [8^{-N}r_0, r_0]$ and $|y_i - y_j| > 4 \max_{k=1,\ldots,M} r_k$ for $1 \leq i < j \leq M$. The statement follows with the triangle inequality. \hfill $\square$

We will also need the following result on the approximation of $GSBV$ functions with piecewise constant functions, which can be seen as a piecewise Poincaré inequality and essentially relies on the $BV$ coarea formula. For basic properties of $GSBV$ functions we refer to [11] Section 4.

Theorem 4.9 (Piecewise Poincaré inequality). Let $m \geq 1$ and $z \in (GSBV(\Omega))^m$ with $\|\nabla z\|_{L^1(\Omega)} + \mathcal{H}^{d-1}(J_z) < \infty$. Consider a Borel subset $D \subset \Omega$ with finite perimeter. Fix $\theta > 0$. Then there exists a partition $(P_k)_{k=1}^{\infty}$ of $D$, made of sets of finite perimeter, and a piecewise constant function $z_{\text{pc}} := \sum_{k=1}^{\infty} b_k \chi_{P_k}$ such that
\[
\begin{align*}
\text{(i) } & \sum_{k=1}^{\infty} \mathcal{H}^{d-1}((\partial^* P_k \cap D) \setminus J_z) \leq \theta, \\
\text{(ii) } & \|z - z_{\text{pc}}\|_{L^\infty(D)} \leq c\theta^{-1} \|\nabla z\|_{L^1(D)},
\end{align*}
\]
for a dimensional constant $c = c(m) > 0$, where $D^1$ denotes the set of points with density one. If additionally for some $i = 1, \ldots, m$ the component $z^i$ satisfies $\|z^i\|_{L^\infty(D)} \leq M$, we also have $\|z_{\text{pc}} - z\|_{L^\infty(D)} \leq M$.

For a proof we refer to [48] Theorem 2.3, although the argument can be retrieved in previous literature (see for instance [11], [23]). The additional property that $L^\infty$-caps are preserved by the approximation, which was not stated explicitly there, is a direct consequence of the proof. (The values of the piecewise constant approximation are sampled from intersections of nonempty super-level sets of the $GSBV$ function.) Moreover, we remark that in [48] only sets $D$ with Lipschitz boundary have been considered. The statement is still true in the present situation, provided that the $\mathcal{H}^{d-1}$-measure of $\partial^* D$ does not contribute in estimate (i). To this end, it is essential to intersect with $D^1$.

As a final preparation for the proof of Lemma 4.1, we recall the definition of the Lipschitz mapping $\Psi_L$ before (2.2), and we discuss how piecewise rigid functions can be parametrized by means of the mapping $\Psi_L$. Given a Caccioppoli partition $(P_j)_{j=1}^{\infty}$ of $\Omega$, $(\gamma_j)_{j=1}^{\infty} \subset (-\infty, \infty)^d$, and $(b_j)_{j=1}^{\infty} \subset \mathbb{R}^d$, we can define a piecewise rigid function $z \in PR(\Omega)$ by
\[
z(x) = \sum_{j=1}^{\infty} (\Psi_L(\gamma_j) x + b_j) \chi_{P_j}(x) \quad \text{for } x \in \Omega.
\] (4.15)
We call $z_{\text{par}} = \sum_{j=1}^{\infty} (\gamma_j, b_j) \chi_{P_j} \in GSBV(\Omega; \mathbb{R}^d \times \mathbb{R}^d)$ a parametrization of $z$ and observe that $z_{\text{par}}$ is a piecewise constant function in the sense of [11] Definition 4.21]. Given another piecewise rigid function $\tilde{z} \in PR(\Omega)$ and a corresponding parametrization $\tilde{z}_{\text{par}} = \sum_{j=1}^{\infty} (\tilde{\gamma}_j, \tilde{b}_j) \chi_{P_j}$, we observe that for all $i, j \in \mathbb{N}$
\[
\|z - \tilde{z}\|_{L^\infty(P_i \cap P_j)} \leq \sup x \in \Omega |x| \|\Psi_L(\gamma_i) - \Psi_L(\gamma_j)\| + |b_i - \tilde{b}_j| \leq \sup x \in \Omega |x| C_L |\gamma_i - \gamma_j| + |b_i - \tilde{b}_j|,
\]
where $C_L$ is larger or equal to the Lipschitz constant of $\Psi_L$. This implies
\[
\|z - \tilde{z}\|_{L^\infty(\Omega)} \leq (C_L \sup x \in \Omega |x| + 1) \|z_{\text{par}} - \tilde{z}_{\text{par}}\|_{L^\infty(\Omega)}.
\] (4.16)
We are now ready to prove Lemma 4.1.
Lemma 4.8 for \( r \) some \( Q \) defined. We set

\[
\frac{1}{\delta} \int_{(A \setminus A') \cap B} \psi(|u - v|) \leq \sup_{t \in \mathbb{R}^+} \psi(t).
\]

(4.17)

Indeed, if this does not hold we simply set \( A(u, v) = +\infty \) and \( w = u \chi_A + v \chi_{B \setminus A} \). Then, in view of (H1) and (H3)–(H4), (4.2) is satisfied for \( M = \beta(\lim_{t \to +\infty} \sigma(t))^{-1} \), see also Remark 1.2.

Let \( u \in PR(A), v \in PR(B) \) be given, and let \( u = \sum_{i} q_i^u \chi_{P_i^u} \) and \( v = \sum_{j} q_j^v \chi_{P_j^v} \) be their pairwise distinct representations (see Section 3.2). We first define parametrizations \( u_{\text{par}} \) and \( v_{\text{par}} \) of \( u \) and \( v \) in the sense of (4.13) (Step 1). Then we decompose \( A' \cap B \) into a good set and a bad set (Step 2). Roughly speaking, the bad set consists of the sets \( (P_i^u \cap P_j^v)_{i,j \in \mathbb{N}} \) of measure smaller than \( \delta \). On the good set, we join the parametrizations \( u_{\text{par}} \) and \( v_{\text{par}} \) by means of a cut-off construction to a function \( z_{\text{par}} \) (Step 3). Afterwards, we use Theorem 1.9 to approximate \( z_{\text{par}} \) by a piecewise constant function \( w_{\text{par}} \). In the good set, the desired function \( w \) is then obtained from \( w_{\text{par}} \) via (4.14) and in the bad set we define \( w = u \) (Step 4). Finally, we prove (4.1)–(4.2) for \( w \) (Step 5).

**Step 1 (Parametrization of \( u \) and \( v \)):** We introduce the index sets \( P^u_{\text{large}} = \{ i \in \mathbb{N} : \mathcal{L}^d(P_i^u) \geq \delta \} \) and \( P^v_{\text{large}} = \{ j \in \mathbb{N} : \mathcal{L}^d(P_j^v) \geq \delta \} \). Let \( Q_i^u \) and \( Q_j^v \) be the corresponding matrices in \( L \), and denote by \( b_i^u \) and \( b_j^v \) the translations. We will show that for all \( i \in P^u_{\text{large}} \) and \( j \in P^v_{\text{large}} \), respectively, there exist \( \gamma_i^u \in \Psi_L^{-1}(Q_i^u) \) and \( \gamma_j^v \in \Psi_L^{-1}(Q_j^v) \) such that

\[
|\gamma_i^u - \gamma_j^v| \leq C_\delta |Q_i^u - Q_j^v| \quad \text{for all } i \in P^u_{\text{large}}, j \in P^v_{\text{large}},
\]

(4.18)

for a constant \( C_\delta > 0 \) depending only on \( \delta, A, B, \) and \( L \). Once this is proved, we define the parametrizations \( u_{\text{par}} \in GSBV(A; \mathbb{R}^d \times \mathbb{R}^d) \) and \( v_{\text{par}} \in GSBV(B; \mathbb{R}^d \times \mathbb{R}^d) \) by

\[
\begin{align*}
  u_{\text{par}} &= \sum_{i=1}^{\infty} \gamma_i^u b_i^u \chi_{P_i^u} \quad \text{and} \quad v_{\text{par}} = \sum_{j=1}^{\infty} \gamma_j^v b_j^v \chi_{P_j^v},
\end{align*}
\]

(4.19)

where for \( i \notin P^u_{\text{large}} \) and \( j \notin P^v_{\text{large}} \) we can choose arbitrary \( \gamma_i^u \in \Psi_L^{-1}(Q_i^u) \) and \( \gamma_j^v \in \Psi_L^{-1}(Q_j^v) \), respectively.

We now proceed to show (4.18). First, if \( r_L = +\infty \), then \( \Psi_L \) has a globally Lipschitz right inverse \( \Xi_L \), defined on all of \( L \), and the property follows directly from (2.22) when we choose \( C_\delta \geq C_L \). Otherwise, we proceed as follows: as a preliminary observation, we note that

\[
N := \#P^u_{\text{large}} + \#P^v_{\text{large}} \leq \mathcal{L}^d(A) + \mathcal{L}^d(B).
\]

(4.20)

Indeed, since \( \delta \leq \mathcal{L}^d(P_i^u) \) for \( i \in P^u_{\text{large}} \), we have

\[
\#P^u_{\text{large}} \leq \sum_{i \in P^u_{\text{large}}} \delta^{-1} \mathcal{L}^d(P_i^u) \leq \delta^{-1} \mathcal{L}^d(A).
\]

A similar estimate holds for \( \#P^v_{\text{large}} \) with \( B \) in place of \( A \). This yields (4.20).

Let \( \mathcal{R} = \{ Q_i^u : i \in P^u_{\text{large}} \} \cup \{ Q_j^v : j \in P^v_{\text{large}} \} \). For convenience, we write \( \mathcal{R} = (Q_k)_k \). Using Lemma 1.8 for \( r_0 = c_L r_L \) we find a finite number of pairwise disjoint balls \( B_1, \ldots, B_n \subset \mathbb{R}^d \), \( n \leq N \), with radius smaller than \( c_L r_L \) such that the balls \( (B_i)_i \) cover \( (Q_k)_k \), and one has

\[
Q_{k_1} \subset B_{i_1} \quad \text{and} \quad Q_{k_2} \subset B_{i_2} \quad \text{for} \quad k_1 \neq k_2, i_1 \neq i_2 \quad \Rightarrow \quad |Q_{k_1} - Q_{k_2}| \geq 8^{-N} c_L r_L.
\]

(4.21)

In view of (2.22), on each \( B_i, i = 1, \ldots, n \), a Lipschitz right-inverse mapping \( \Xi_L \) of \( \Psi_L \) is well defined. We set \( \gamma_k = \Xi_L(Q_k) \) for all \( Q_k \in B_i \). We recall that each \( Q_i^u, i \in P^u_{\text{large}} \), coincides with some \( Q_k \in \mathcal{R} \), and we let \( \gamma_i^u = \gamma_k^u \). For each \( Q_i^v \) we proceed in a similar fashion. In view of this
Let \( \gamma = \max\{C_L, 2\sqrt{d_L}N/c_L\} \). Indeed, if \( Q_{k_1}, Q_{k_2} \) are contained in the same ball \( B_i \), the property follows from \( (2.2) \). Otherwise, \( (4.21) \) and the fact that \( \gamma_{k_1}, \gamma_{k_2} \in (r_L, r_L)^d \) imply
\[
|\gamma_{k_1} - \gamma_{k_2}| \leq 2\sqrt{d_L}r_L \leq 2\sqrt{d_L}N/c_L|Q_{k_1} - Q_{k_2}|.
\]
We note that \( C_\delta > 0 \) depends only on \( \delta, A, B, \) and \( L \), see \( (4.20) \).

Step 2 (Identification of good and bad sets): Let \( (P_{k_{i_{u,v}}}^n)_k \) be the partition of \( (A \setminus A') \cap B \) consisting of the nonempty sets \( P_i^u \cap P_j^v \cap ((A \setminus A') \cap B), i, j \in \mathbb{N} \). Clearly, by Theorem 3.1 and (H4) we have
\[
\sum_{k=1}^{\infty} \mathcal{H}^{d-1}(\partial^* P_{k_{i_{u,v}}}^n) \leq \mathcal{H}^{d-1}(\partial A \cup \partial A' \cup \partial B) + 2\mathcal{H}^{d-1}(J_u) + 2\mathcal{H}^{d-1}(J_v) \\
\leq 2\alpha^{-1} (\mathcal{F}(u, A) + \mathcal{F}(v, B) + \mathcal{H}^{d-1}(\partial A \cup \partial A' \cup \partial B)). \tag{4.22}
\]
Let \( P_{n_{u,v}}^{\text{large}} = \{ k : L^d(P_{k_{i_{u,v}}}^n) \geq \delta \} \) and \( P_{n_{u,v}}^{\text{small}} = \mathbb{N} \setminus P_{n_{u,v}}^{\text{large}} \). We also define
\[
D_{\text{large}} = \bigcup_{k \in P_{n_{u,v}}^{\text{large}}} P_{k_{i_{u,v}}}^n, \quad D_{\text{small}} = ((A \setminus A') \cap B) \setminus D_{\text{large}}. \tag{4.23}
\]
We observe by \( (4.22) \) and the isoperimetric inequality that
\[
L^d(D_{\text{small}}) = \sum_{k \in P_{n_{u,v}}^{\text{small}}} L^d(P_{k_{i_{u,v}}}^n) \leq \delta^{1/d} \sum_{k \in P_{n_{u,v}}^{\text{small}}} (L^d(P_{k_{i_{u,v}}}^n))^{(d-1)/d} \leq c_{\tau,d}\delta^{1/d} \sum_{k \in P_{n_{u,v}}^{\text{small}}} \mathcal{H}^{d-1}(\partial^* P_{k_{i_{u,v}}}^n) \\
\leq 2c_{\tau,d}\delta^{1/d} \alpha^{-1} (\mathcal{F}(u, A) + \mathcal{F}(v, B) + \mathcal{H}^{d-1}(\partial A \cup \partial A' \cup \partial B)). \tag{4.24}
\]

We apply Lemma 4.7 on \( D_{\text{small}} \) for \( \lambda = \eta\alpha/(8\beta) \) to obtain \( 1/4 d_{A', A} < T_1 < T_2 < 3/4 d_{A', A} \) and a function \( \varphi \in C^\infty(A) \) with \( \varphi = 1 \) in a neighborhood of \( E_{T_1} \) and \( \text{supp}(\varphi) \subset E_{T_2} \) satisfying \( (1.12) \). We define the sets
\[
D_{\text{bad}} = (D_{\text{small}} \cap (E_{T_2} \setminus E_{T_1}))^1, \quad D_{\text{good}} = ((A' \cup B) \setminus D_{\text{bad}})^1, \tag{4.25}
\]
where \( (\cdot)^1 \) denotes the set of points with density one. For an illustration of the sets we refer to Figure 1. Lemma 4.7 and \( (4.22) \)–\( (4.24) \) imply
\[
\mathcal{H}^{d-1}(\partial^* D_{\text{bad}}) \leq \lambda \mathcal{H}^{d-1}(\partial^* D_{\text{small}}) + M_\lambda L^d(D_{\text{small}}) \\
\leq \frac{\eta}{2\beta} (\mathcal{F}(u, A) + \mathcal{F}(v, B) + \mathcal{H}^{d-1}(\partial A \cup \partial A' \cup \partial B)), \tag{4.26}
\]
where we used \( \lambda = \eta\alpha/(8\beta) \) and \( \delta = (a\eta/(8\beta c_{\tau,d}M_\lambda))^{1/d} \).

\begin{figure}[h]
\centering
\includegraphics[width=0.5\textwidth]{figure1}
\caption{Left: The sets \( A', A, \) and \( B, \) and \( \partial E_{T_1}, \partial E_{T_2} \) (dashed). (For illustration purposes, we replaced \( \text{dist}(x, A') \) in \( (4.11) \) by \( \text{dist}_\infty(x, A') \) in the picture.) Middle: \( D_{\text{large}} \) (blue) and \( D_{\text{small}} \) (gray). Right: \( D_{\text{good}} \) (blue) and \( D_{\text{bad}} \) (gray).}
\end{figure}
Step 3 (Joining $u_{\text{par}}$ and $v_{\text{par}}$ on $D_{\text{good}}$): Choose $R$ sufficiently large depending on $A$ and $B$ such that $A' \cup B \subset B_R(0)$. Recall the function $\psi$ given in the statement of the lemma. Consider $P_{k}^{u,v}$, $k \in \mathcal{P}_{\text{large}}$, and choose $i \in \mathcal{P}_{i}^{u}$, $j \in \mathcal{P}_{j}^{v}$ such that $P_{k}^{u,v} = P_{i}^{u} \cap P_{j}^{v} \subset ((A \setminus A') \cup B)$. By Lemma 4.34 there exists a continuous, strictly increasing function $\tau_0 : \psi(\mathbb{R}_+) \to \mathbb{R}_+$ with $\tau_0(0) = 0$ only depending on $\delta$, $R$, and $\psi$ such that by (4.13)

$$|\gamma_i^u - \gamma_j^v| + |b_i^u - b_j^v| \leq C_3 |Q_i^u - Q_j^v| + |b_i^u - b_j^v| \leq C_3 \int_{P_k^{u,v}} \psi((Q_i^u - Q_j^v) x + (b_i^u - b_j^v))) \, dx.$$ 

Recall that $\mathcal{L}^d(P_{k}^{u,v}) \geq \delta$. For each $z_1 \in PR(A)$, $z_2 \in PR(B)$, we let

$$A_*(z_1, z_2) := C_3 \int_{(A \setminus A') \cap B} \psi(|z_1 - z_2|) \, dx$$

(4.27)

if $\delta^{-1} \int_{(A \setminus A') \cap B} \psi(|z_1 - z_2|) \, dx < \sup \psi(\mathbb{R}_+) \psi(t)$, and $A_*(z_1, z_2) = +\infty$ else. (Note that this is consistent with the definition below (4.17).) Recalling (4.19) we thus find that

$$||u_{\text{par}} - v_{\text{par}}||_{L^\infty(D_{\text{large}})} \leq A_*(u, v) \leq +\infty,$$

(4.28)

where $D_{\text{large}}$ is defined in (4.23).

Let $\varphi \in C^\infty(A \cup B)$ be the function provided by Lemma 4.7 which satisfies $0 \leq \varphi \leq 1$, $\varphi = 1$ in a neighborhood of $\overline{E_{T_1}}$, and supp $\varphi \subset E_{T_1}$. We define

$$z_{\text{par}} = \varphi u_{\text{par}} + (1 - \varphi)v_{\text{par}} \in GSBV(A' \cup B; \mathbb{R}^d \times \mathbb{R}^d).$$

As $u_{\text{par}}$ and $v_{\text{par}}$ are piecewise constant, we get $\nabla z_{\text{par}} = 0$ on $(A' \cup B) \setminus \{0 < \varphi < 1\}$ and $\nabla z_{\text{par}} = \nabla \varphi \otimes (u_{\text{par}} - v_{\text{par}})$ on $\{0 < \varphi < 1\}$. By recalling the definition of $D_{\text{large}}$ and $D_{\text{good}}$ in (4.23) and (4.25), respectively, we observe $D_{\text{good}} \cap \{0 < \varphi < 1\} \subset D_{\text{good}} \cap (E_{T_2} \setminus E_{T_1}) \subset D_{\text{large}}$ up to an $\mathcal{L}^d$-negligible set, see Figure 1. Therefore, we obtain by (4.28)

(i) $\parallel \nabla z_{\text{par}} \parallel_{L^1(D_{\text{good}})} \leq \parallel \nabla \varphi \parallel_{L^\infty(D_{\text{large}})} \leq A_*(u, v),$

(ii) $\parallel \nabla z_{\text{par}} \parallel_{L^1(D_{\text{good}})} \leq \parallel \nabla \varphi \parallel_{L^\infty(D_{\text{large}})} \leq L^d(A' \cup B) \parallel \nabla \varphi \parallel_{L^\infty(A') \cup B} A_*(u, v).$ 

(4.29)

Moreover, since $J_u, J_{u_{\text{par}}}$ and $J_v, J_{v_{\text{par}}}$ coincide up to $H^{d-1}$-negligible sets, we have

$$J_{z_{\text{par}}} \cap D_{\text{good}} \subset ((J_u \setminus E_{T_2}) \cup (J_v \setminus E_{T_1})) \cap D_{\text{good}}$$

(4.30)

up to an $H^{d-1}$-negligible set.

Step 4 (Definition of the piecewise rigid function $w$ using $z_{\text{par}}$): We apply Theorem 4.9 for $z = z_{\text{par}}$, $D = D_{\text{good}}$, and for $\theta = \eta(2\beta)^{-1} \mathcal{H}^{-1}(\partial A \cup \partial A' \cup \partial B)$ to find a partition $(P_k)_{k=1}^\infty$ of $D_{\text{good}}$ and corresponding constants $(\gamma_k, b_k)_{k=1}^\infty \subset (r_{L}, r_L)^{dL} \times \mathbb{R}^d$ such that

(i) $\sum_{k=1}^\infty \mathcal{H}^{d-1}(\partial P_k \cap D_{\text{good}}) \leq \sum_{k=1}^\infty \mathcal{H}^{d-1}(\partial A \cup \partial A' \cup \partial B)$,

(ii) $\parallel z_{\text{par}} - (\gamma_k, b_k) \parallel_{L^\infty(D_{\text{good}})} \leq C_\eta \parallel \nabla z_{\text{par}} \parallel_{L^1(D_{\text{good}})}$ for all $k \in \mathbb{N}$,

(4.31)

where $C_\eta > 0$ depends on $\eta, \beta, A, A'$, and $B$. We define $w_{\text{par}} = \sum_{k=1}^\infty (\gamma_k, b_k) \chi_{P_k}$ on $D_{\text{good}}$. By

(4.12),(4.22) (i), and (4.31) (ii) we obtain

$$\parallel w_{\text{par}} - z_{\text{par}} \parallel_{L^\infty(D_{\text{good}})} \leq C_\eta L^d(A' \cup B) \parallel \nabla \varphi \parallel_{L^\infty(A') \cup B} A_*(u, v) \leq C_\eta M_A A_*(u, v),$$

where in the last step we passed to a larger constant $C_\eta$. We observe that $D_{\text{good}}$ coincides with $((A' \cup B) \cap E_{T_1}) \cup (B \setminus E_{T_1}) \cup D_{\text{large}}$ up to set of negligible $\mathcal{L}^d$-measure, see (4.25) and Figure 1. By

(4.20) (i) and the fact that $z_{\text{par}} = v_{\text{par}}$ on $(A' \cup B) \cap E_{T_1}$, $z_{\text{par}} = v_{\text{par}}$ on $B \setminus E_{T_2}$, we get

(i) $\parallel w_{\text{par}} - u_{\text{par}} \parallel_{L^\infty((A' \cup B) \cap E_{T_1})} \leq C_\eta M_A A_*(u, v)$,

(ii) $\parallel w_{\text{par}} - v_{\text{par}} \parallel_{L^\infty(B \setminus E_{T_2})} \leq C_\eta M_A A_*(u, v)$,

(iii) $\parallel w_{\text{par}} - u_{\text{par}} \parallel_{L^\infty(B \setminus E_{T_2})} \leq (1 + C_\eta M_A) A_*(u, v).$
Define \( w^{\text{good}} \in PR(D_{\text{good}}) \) by \( w^{\text{good}}(x) = \sum_{k=1}^{\infty} (\Psi_{L}(\gamma_k) x + b_k) \chi_{T_k}(x) \). Recalling \( A' \cup B \subset B_R(0) \) by the choice of \( R \), we get by (4.16)

\[
\begin{align*}
\text{(i) } \|w^{\text{good}} - u\|_{L^\infty(A' \cup B \cap E_{T_1}^{\text{good}})} & \leq \frac{1}{2} A(u, v), \\
\text{(ii) } \|w^{\text{good}} - v\|_{L^\infty(B \setminus E_{T_1}^{\text{good}})} & \leq \frac{1}{2} A(u, v), \\
\end{align*}
\]

where \( A \) is defined by

\[
A(z_1, z_2) := 2(1 + C_L R)(1 + C_\eta M \Lambda) A_s(z_1, z_2) \quad \text{for } z_1 \in PR(A), \; z_2 \in PR(B). 
\]

We now define the piecewise rigid function \( w \in PR(A' \cup B) \) by

\[
w = \begin{cases} 
  w^{\text{good}} & \text{on } D_{\text{good}}, \\
  u & \text{on } D_{\text{bad}}.
\end{cases}
\]

In particular, this definition implies

\[
\|w - u\|_{L^\infty(D_{\text{good}} \cap E_{T_1}^{\text{good}})} \leq \frac{1}{2} A(u, v), \quad \|w - v\|_{L^\infty(D_{\text{bad}} \setminus E_{T_1}^{\text{good}})} \leq \frac{1}{2} A(u, v).
\]

In fact, this follows from (4.32) and the fact that \( (E_{T_2}^{\text{good}} \setminus E_{T_1}^{\text{good}}) \cap D_{\text{good}} \subset D_{\text{large}} \), see (4.28) and (4.29). We close this step of the proof by noticing that

\[
\mathcal{H}^{d-1}(J_w \cap D_{\text{good}}^{-1}) \setminus J_{\tau_{\text{par}}} \leq \frac{\eta}{23} \mathcal{H}^{d-1}(\partial A \cup \partial A' \cup \partial B)
\]

which follows from the definition of \( w^{\text{good}} \) and (4.31)(i).

**Step 5 (Proof of (4.1)–(4.2)):** Having defined \( w \), it remains to confirm (4.1)–(4.2). Recall the definition of \( \Lambda \) in (4.33). In view of (1227), (1233), and the fact that \( \tau_u(0) = 0 \), property (4.31) holds. By Fatou’s lemma it is elementary to check that \( \Lambda \) is lower semicontinuous. In particular, if \( \psi(t) = t^p, 1 \leq p < \infty \), then \( \Lambda(z_1, z_2) = M\|z_1 - z_2\|_{L^p((A \cup A') \cap B)} \) for some \( M > 0 \) sufficiently large since in this case \( \tau_\psi(t) = ct^{1/p} \), see Lemma 3.3.

Let us now show (4.2). We first observe that (4.2)(ii) follows from (3.33)–(3.35). Thus, it remains to prove (4.2)(i). Recall the definition of \( D_{\text{good}} \) and \( D_{\text{bad}} \) in (4.29). By (H1), (H3), (H4), and the definition of \( w \) we obtain

\[
\mathcal{F}(w, A' \cup B) = \mathcal{F}(w, D_{\text{good}}) + \mathcal{F}(w, \partial^* D_{\text{bad}}) + \mathcal{F}(w, D_{\text{bad}})
\]

\[
= \mathcal{F}(w, D_{\text{good}}) + \mathcal{F}(w, \partial^* D_{\text{bad}}) + \mathcal{F}(w, J_w \cap D_{\text{bad}}). 
\]

It now suffices to show that there holds

\[
\begin{align*}
\text{(i) } \mathcal{F}(w, D_{\text{good}}) & \leq \mathcal{F}(u, D_{\text{good}} \cap A \cap J_w) + \mathcal{F}(v, D_{\text{good}} \cap B \cap J_w) + \Delta, \\
\text{(ii) } \mathcal{F}(w, \partial^* D_{\text{bad}}) & \leq \Delta,
\end{align*}
\]

where for brevity we set

\[
\Delta = \left( \mathcal{H}^{d-1}(\partial A \cup \partial A' \cup \partial B) + \mathcal{F}(u, A) + \mathcal{F}(v, B) \right) \left( \eta/2 + \alpha^{-1} \sigma(A(u, v)) \right).
\]

In fact, once this is shown, (4.2)(i) follows from (4.37) for \( M \geq 2\alpha^{-1} \).

**Proof of (4.38)(i).** In view of (H1), (H4), and (4.30), we find

\[
\mathcal{F}(w, D_{\text{good}}) \leq \sum_{j=1}^{3} \mathcal{F}(w, \Gamma_j), 
\]

where we define

\[
\begin{align*}
\Gamma_1 & := (J_w \cap D_{\text{good}}) \cap (J_u \cap E_{T_1}^{\text{good}}), \\
\Gamma_2 & := (J_w \cap D_{\text{good}}) \cap (J_v \setminus E_{T_1}^{\text{good}}), \\
\Gamma_3 & := (J_w \cap D_{\text{good}}) \setminus J_{\tau_{\text{par}}}.
\end{align*}
\]
We estimate each $F(w, I_j)$ separately.

(1) For $H^{d-1}$-a.e. $x \in I_1 = J_w \cap J_u \cap E_T \cap D_{good}$, the one-sided approximate limits $w^+(x), w^-(x)$ of $w$ satisfy $|w^+(x) - u^+(x)|, |w^-(x) - u^-(x)| \leq \frac{1}{4} \Lambda(u, v)$ by (4.35), where we choose $\nu_w = \nu_u$ on $J_w \cap J_u$. This implies $|w^+(x) - u^+(x)| + |w^-(x) - u^-(x)| \leq \Lambda(u, v)$ for $H^{d-1}$-a.e. $x \in I_1$. Thus, by (H4) this yields

$$\int_{I_1} \sigma(|w^+ - u^+| + |w^- - u^-|) dH^{d-1} \leq H^{d-1}(J_u) \sigma(\Lambda(u, v)) \leq \alpha^{-1} F(u, A) \sigma(\Lambda(u, v)),$$

where $\sigma$ is the modulus of continuity from (H5'). This implies by (H5')

$$F(u, I_1) \leq F(u, I_1) + \int_{I_1} \sigma(|w^+ - u^+| + |w^- - u^-|) dH^{d-1} \leq F(u, I_1) + \alpha^{-1} F(u, A) \sigma(\Lambda(u, v)). \quad (4.40)$$

(2) In a similar fashion, for $H^{d-1}$-a.e. $x \in I_2$, we have $|w^+(x) - u^+(x)| + |w^-(x) - u^-(x)| \leq 2\frac{1}{4} \Lambda(u, v) = \Lambda(u, v)$ by (4.35). Therefore, we have by (H4) and (H5')

$$F(u, I_2) \leq F(v, I_2) + \int_{I_2} \sigma(|w^+ - u^+| + |w^- - u^-|) dH^{d-1} \leq F(v, I_2) + \alpha^{-1} F(v, B) \sigma(\Lambda(u, v)). \quad (4.41)$$

(3) Finally, (4.36) and (H4) imply

$$F(u, I_3) \leq \beta H^{d-1}((J_w \cap D_{good}) \setminus J_{par}) \leq \eta \frac{\eta}{2} H^{d-1}(\partial A \cup \partial A' \cup \partial B). \quad (4.42)$$

By combining (4.39)–(4.42) we obtain (4.38)(i).

Proof of (4.38)(ii). We use (H4) and (4.26) to find

$$F(u, \partial^* D_{bad}) \leq \beta H^{d-1}(\partial^* D_{bad}) \leq \eta \left( F(u, A) + F(v, B) + H^{d-1}(\partial A \cup \partial A' \cup \partial B) \right) \leq \Delta. \quad (4.43)$$

This concludes the proof.

Remark 4.10. For later purposes in the proof of Lemma 4.3, we observe that by the estimate on $I_3$ and $\partial^* D_{bad}$, see (4.26)–(4.43), we have that

$$H^{d-1}(J_w) \leq H^{d-1}(J_u \cup J_v) + \eta (F(u, A) + F(v, B) + \eta H^{d-1}(\partial A' \cup \partial A \cup \partial B)).$$

By (H4) this yields

$$H^{d-1}(J_w) \leq (1 + \eta) \alpha^{-1} (F(u, A) + F(v, B) + \eta H^{d-1}(\partial A' \cup \partial A \cup \partial B)).$$

Moreover, (4.35) implies that with $K := \{ x \in \mathbb{R}^d : \text{dist}(x, A') \geq \frac{3}{4} d_{A'}, A \}$ we get

$$\|w - v\|_{L^\infty(B \cap K)} \leq \frac{1}{2} \Lambda(u, v)$$

since $K \cap E_{T_2} = \emptyset$ and thus $B \cap K \subset D_{good} \setminus E_{T_2}$, see (4.26).
4.3. Proofs of Lemma [4.5] and Corollary [4.6] In this section we prove the fundamental estimate for piecewise rigid functions with boundary data and present a scaled version as corollary. We start with the proof of Lemma 4.5.

Proof of Lemma 4.5. Let \( A', A, B \in \mathcal{A}_0(\Omega) \) with \( A' \subset A \) and \( \eta > 0 \) be given. It is not restrictive to suppose that \( 0 < \eta < 1 \). Set \( U = A' \cup B \) for brevity. We define \( d_{A',A} = \text{dist}(\partial A', \partial A) \) and 
\[
\delta = (d_{A',A} \alpha \eta / (24 \beta c_{\pi,d}))^d,
\]
where \( c_{\pi,d} \) denotes the isoperimetric constant in dimension \( d \), and \( \alpha, \beta \) are the constants from (H4). Choose \( R > 0 \) such that \( U \subset B_R(0) \). Let \( c_0 \geq 1 \) be the constant in (5.3), depending on \( R \) and \( \delta \). Define \( M_1 = 2c_0 \).

Let \( u \in PR(A), v \in PR(B) \) be given and let \( u = \sum_j q_j^x \chi_{P_j^x} \) and \( v = \sum_j q_j^y \chi_{P_j^y} \) be their pairwise distinct representations. Suppose that (4.6) holds, where \( \Lambda \) are the constants from (H4). Then we consider the other components and show, by means of condition (4.6), that for \( \Omega \neq \Phi \) such that the difference of the affine mappings \( q_j^x \) and \( q_j^y \) can be controlled suitably (Step 2). Starting from \( z \), we then define \( w \) where the main idea in the definition is to replace \( z \) on each \( P_j^x \) by \( v \) near \( B \setminus A \) and by \( q_j^y \) otherwise (Step 3). This allows to show that the correct boundary values are attained. Moreover, the control on the difference of the affine mappings yields that the energy increases only slightly by passing from \( z \) to \( w \) (Step 4).

Step 1 (Small components): Let \( (P_k^{u,z})_k \) be the partition of \( B \) consisting of the nonempty sets \( P_i^x \cap P_j^y, i, j \in \mathbb{N} \). Let \( J_{\text{small}}^{u,z} = \{ k \in \mathbb{N} : \mathcal{L}^d(P_k^{u,z} \cap K) < \delta \} \) and \( J_{\text{large}}^{u,z} = \mathbb{N} \setminus J_{\text{small}}^{u,z} \). We define \( F_{\text{small}} = \bigcup_{k \in J_{\text{small}}^{u,z}} P_k^{u,z} \) and observe by (3.1) that 
\[
\mathcal{H}^{d-1}((\partial^* F_{\text{small}} \cap B) \setminus (J_v \cup J_z)) = 0.
\]

By using the isoperimetric inequality we get 
\[
\mathcal{L}^d(F_{\text{small}} \cap K) = \sum_{k \in J_{\text{small}}^{u,z}} \mathcal{L}^d(P_k^{u,z} \cap K) \leq \delta^{1/d} \sum_{k \in J_{\text{small}}^{u,z}} (\mathcal{L}^d(P_k^{u,z}))^{(d-1)/d}
\leq \delta^{1/d} c_{\pi,d} \sum_{k \in J_{\text{small}}^{u,z}} \mathcal{H}^{d-1}(\partial^* P_k^{u,z})
\leq 2\delta^{1/d} c_{\pi,d} (\mathcal{H}^{d-1}(J_v) \mathcal{H}^{d-1}(J_z) + \mathcal{H}^{d-1}(\partial B)),
\]
where the last step follows from (3.1) and Theorem 5.1. Similar to the proof of Lemma 4.7 we cut small components. For \( t > 0 \) define 
\[
E_t := \{ x \in \mathbb{R}^d : \text{dist}(x, A') < t \}
and observe that \( E_t \cap (U \setminus A) = \emptyset \) for all \( t \in (0, d_{A', A}) \). By repeating the argument leading to (4.14), we find \( T \in (\frac{d}{2} d_{A', A}, d_{A', A}) \) such that
\[
\mathcal{H}^{d-1}(F_{\text{small}} \cap \partial E T) = \mathcal{H}^{d-1}((F_{\text{small}} \cap K) \cap \partial E T) \leq 4d_{A', A}^{-1} \mathcal{L}^d(F_{\text{small}} \cap K) \\
\leq 8s^{1/d_{A', A}} \mathcal{C}_{T,d} (\mathcal{H}^{d-1}(J_v) + \mathcal{H}^{d-1}(J_z) + \mathcal{H}^{d-1}(\partial B)). \tag{4.46}
\]

**Step 2 (Large components):** For each \( i \in \mathbb{N} \), we define
\[
J_i = \left\{ j \in \mathbb{N} : \exists k \in J_{v,z}^{\text{large}} \text{ such that } P_k^{v,z} = P_i \cap P_j^{v} \right\}, \tag{4.47}
\]
and observe that for each \( i \in \mathbb{N} \)
\[
\bigcup_{j \in J_i} (P_k^{v,z} \cap P_j^{v}) = P_i \cap \bigcup_{k \in J_{v,z}^{\text{large}}} P_k^{v,z} = P_i \cap (B \setminus F_{\text{small}}), \tag{4.48}
\]
where in the last step we used the definition of \( F_{\text{small}} \) before (4.45). We point out that \( J_i = \emptyset \) is possible. In this case, (4.48) still holds because both sides of the equality are empty.

We now provide some properties of the sets \( J_i \). For each \( i \in \mathbb{N} \) and each \( j \in J_i \), we choose \( k \in J_{v,z}^{\text{large}} \) such that \( P_k^{v,z} = P_i \cap P_j^{v} \). Since \( U \subset B_R(0) \) and \( \mathcal{L}^d(P_{v}^{v,z} \cap K) \geq \delta \), by (4.4) we have
\[
\|q_j^v - q_j^v\|_{L^\infty(U)} \leq c_0 \|q_j^v - q_{j'}^v\|_{L^\infty(P_{v,z}^{v,z} \cap K)}. \tag{4.49}
\]
We now show that
\[
\#J_i \leq 1 \quad \text{for all } i \in \mathbb{N}. \tag{4.50}
\]
In fact, assume by contradiction that for some \( i \) there exist two different \( j, j' \in J_i \). Then (4.49) together with the triangle inequality yields
\[
\|q_j^v - q_{j'}^v\|_{L^\infty(U)} \leq \frac{1}{2} M_1 A(u,v). \tag{4.51}
\]
Moreover, by (4.47) and the definition of \( J_{v,z}^{\text{large}} \) we have \( \mathcal{L}^d(P_{j}^{v}) \geq \delta \) and \( \mathcal{L}^d(P_{j'}^{v}) \geq \delta \). In view of (4.44) and the fact that \( j \neq j' \), this yields \( 0 < \Phi(A', U; v|_{B \setminus K}, \delta) \leq \frac{1}{2} M_1 A(u,v) \). This, however, contradicts (4.6). In the following, the unique index in \( J_i \), if existent, will be denoted by \( j_i \).

**Step 3 (Definition of \( w \)):** We now introduce the piecewise rigid function \( w \). We define \( w : U \to \mathbb{R}^d \) on each \( P_i \) separately by distinguishing the two cases \( \#J_i = 1 \) and \( \#J_i = 0 \), see (4.50). Recall \( E_T \) defined before (4.47) and the fact that \( \mathbb{R}^d \setminus E_T \subset K \). We let
\[
\begin{align*}
  w &= q_{j_i}^v \text{ on } P_i^v \cap E_T, \quad w = v \text{ on } P_i^v \setminus E_T \quad \text{if } \#J_i = 1 \\
  w &= z \text{ on } P_i^z \cap E_T, \quad w = v \text{ on } P_i^z \setminus E_T \quad \text{if } \#J_i = 0,
\end{align*} \tag{4.51}
\]
where \( j_i \in J_i \) is the index corresponding to \( i \in \mathbb{N} \). Clearly, \( w \in PR(U) \) is well defined and piecewise rigid since \( v \in PR(B) \) and \( U \setminus E_T \subset K \cap B \). For later purposes, we observe that up to sets of negligible \( \mathcal{H}^{d-1} \)-measure there holds
\[
\begin{align*}
  (i) \quad &J_w \cap (J_w \setminus J_z) \subset K \cap B, \\
  (ii) \quad &J_w \setminus (J_z \cup J_w) \subset F_{\text{small}} \cap \partial E T,
\end{align*} \tag{4.52}
\]
where \( F_{\text{small}} \subset B \) was defined before (4.45). Indeed, property (i) follows from (4.51) and the fact that \( U \setminus E_T \subset K \cap B \). To see (ii), we first observe that Theorem 3.1, (3.1), and (4.51) imply (up to sets of negligible \( \mathcal{H}^{d-1} \)-measure)
\[
J_w \setminus (J_z \cup J_w) \subset J_w \cap \partial E T \cap \bigcup_{i \in \mathbb{N}} (P_i^z)^{-1} \subset (\partial E T \cap F_{\text{small}}) \cup \bigcup_{i \in \mathbb{N}} (J_w \cap (P_i^z)^{-1} \cap (\partial E T \setminus F_{\text{small}})).
\]
By using (4.48) we have $P_i^\ast \cap (B \setminus F_{\text{small}}) = \emptyset$ if $\# J_i = 0$ and $P_i^\ast \cap (B \setminus F_{\text{small}}) = P_i^\ast \cap P_j^\ast$ for $\# J_i = 1$. In view of (4.51), we also observe that $w$ does not jump on $P_i^\ast \cap P_j^\ast \cap \partial E_T$ for $\# J_i = 1$. In both cases, we thus have $\mathcal{H}^{d-1}(J_w \cap (P_i^\ast)^- \cap (\partial E_T \setminus F_{\text{small}})) = 0$. This yields (4.52) (ii).

**Step 4 (Proof of (4.7)):** We define

$$\Theta(z_1, z_2) = \left( \frac{1}{2} M_1 + 1 \right) A(z_1, z_2) \quad \text{for} \quad z_1 \in PR(A), z_2 \in PR(B),$$

where $A$ is given in (4.41). Then, if $\psi(t) = t^p$, $1 \leq p < \infty$, $\Theta$ has the form $\Theta(u, v) = M_2 \| u - v \|_{L^p(A \cap A') \cap B}$ for some $M_2$ sufficiently large.

We now establish (4.7). First, (4.7)(iii) follows directly from (4.51) and the fact that $B \setminus A = U \setminus A \subset U \setminus E_T$. As a preparation for (4.7)(ii), we observe that

$$\| w - z \|_{L^\infty(U)} \leq \frac{1}{4} M_1 A(u, v).$$

In fact, on $U \setminus E_T \subset B \cap K$ we have $w = v$ by (4.51), hence the inequality holds by (4.44) (ii) and the fact that $M_1 \geq 2$. On the other hand, on each $P_i^\ast \cap E_T$, we either have $w = z$, if $\# J_i = 0$, or we can apply (4.49) for $j = j_i$, if $\# J_i = 1$. In both cases, (4.54) follows. This along with (4.2) (ii) (applied for $z$ in place of $w$) and (4.53) yields (4.7)(ii).

Finally, we prove (4.7)(i). In view of (H1) and (H3), we have

$$F(w, U) \leq \sum_{j=1}^3 F(w, \Gamma_j),$$

where we define

$$\Gamma_1 := J_w \cap J_z, \quad \Gamma_2 := J_w \cap (J_v \setminus J_z), \quad \Gamma_3 := J_w \setminus (J_z \cup J_v).$$

We estimate each $F(w, \Gamma_j)$ separately.

1. For $\mathcal{H}^{d-1}$-a.e. $x \in \Gamma_1$, the one-sided approximate limits $w^+(x), w^-(x)$ of $w$ satisfy $|w^+(x) - z^+(x)|, |w^-(x) - z^-(x)| \leq \frac{1}{4} M_1 A(u, v)$ by (4.51), where we choose $\nu_w = \nu_z$ on $J_w \cap J_z$. This implies

$$|w^+(x) - z^+(x)| + |w^-(x) - z^-(x)| \leq \frac{1}{2} M_1 A(u, v) \leq \Theta(u, v) \quad \text{for} \quad \mathcal{H}^{d-1}$-a.e. $x \in \Gamma_1$, where we used (4.53). Thus, by (H5) this yields

$$F(w, \Gamma_1) \leq F(z, \Gamma_1) + \int_{\Gamma_1} \sigma(|w^+ - z^+| + |w^- - z^-|) \, d\mathcal{H}^{d-1} \leq F(z, U) + \mathcal{H}^{d-1}(J_z) \sigma(\Theta(u, v)),$$

where $\sigma$ is the modulus of continuity from (H5'). Then by (4.2) (i) (applied for $F(z, U)$) and (4.44) (i) we get

$$F(w, \Gamma_1) \leq F(u, A \cap J_z) + F(v, B \cap J_z)$$

$$+ (\mathcal{H}^{d-1}(\partial A \cup \partial A' \cup \partial B) + F(u, A) + F(v, B)) \left( \eta + M \sigma(A(u, v)) + 2 \alpha^{-1} \sigma(\Theta(u, v)) \right).$$

2. In a similar fashion, for $\mathcal{H}^{d-1}$-a.e. $x \in \Gamma_2$, we have $|w^+(x) - v^+(x)|, |w^-(x) - v^-(x)| \leq \frac{1}{4} (M_1 + 2) A(u, v)$ by (4.41), (4.54), and the fact that $\Gamma_2 \subset K \cap B$, see (4.52) (i). Thus, we get

$$|w^+(x) - v^+(x)| + |w^-(x) - v^-(x)| \leq \frac{1}{2} (M_1 + 1) A(u, v) = \Theta(u, v) \quad \text{by (4.53). Therefore, we obtain by (H4) and (H5)}$$

$$F(w, \Gamma_2) \leq F(v, \Gamma_2) + \int_{\Gamma_2} \sigma(|w^+ - z^+| + |w^- - z^-|) \, d\mathcal{H}^{d-1}$$

$$\leq F(v, \Gamma_2) + \mathcal{H}^{d-1}(J_v) \sigma(\Theta(u, v)) \leq F(v, B \setminus J_z) + \alpha^{-1} F(v, B) \sigma(\Theta(u, v)).$$

(4.57)
(3) Finally, (4.44) (i), (4.46), (4.52) (ii), and (H₄) imply
\[ \mathcal{F}(w, \Gamma_3) \leq \beta \mathcal{H}^{d-1}(F_{\text{small}} \cap \partial E_T) \leq 8\beta^{1/d} d_{A',A}^{1/d} \mathcal{H}^d(J_u) + \mathcal{H}^d(\partial T) \]
\[ \leq 8\beta^{1/d} d_{A',A}^{1/d} \mathcal{H}^d(\partial T) \]
\[ \leq \eta(\mathcal{F}(u, A) + \mathcal{F}(v, B) + \mathcal{H}^d(\partial A' \cup \partial A \cup \partial B)), \]
where in the last step we used the definition \( \delta = (d_{A',A} \alpha)/(24 \beta c_{\varepsilon,d}) \). Define \( M_2 = M + 3 \alpha^{-1} \) and recall \( \Theta(u, v) \geq \Lambda(u, v) \) by (4.53), as well as that \( \sigma \) is increasing. By combining (4.55)–(4.58) and using (H₁) we obtain (4.7) (i). This concludes the proof. □

We now close this section with the proof of Corollary 4.6.

**Proof of Corollary 4.6.** We suppose that \( A', A, B \in \mathcal{A}_0(\Omega) \) with \( A' \subset A \) are given such that \( \rho A', \rho A, \rho B \subset \Omega \). Let \( U = A' \cup B \). Let \( M \) be the constant of Lemma 4.1 and \( M_1, M_2, \delta \) be the constants of Lemma 4.3 (applied for \( \psi(t) = t \)). For brevity, set \( C_{A',A,B} = \mathcal{H}^d(\partial A' \cup \partial A \cup \partial B) \).

Given \( \mathcal{F} : PR(\Omega) \times B(\Omega) \to [0, \infty) \) satisfying (H₁), (H₃)–(H₄) and (H₄'), we define \( \mathcal{F}^\rho : PR(\rho^{-1} \Omega) \times B(\rho^{-1} \Omega) \to [0, \infty) \) by
\[ \mathcal{F}^\rho(z, B) = \rho^{-(d-1)} \mathcal{F}(z, \rho B) \] (4.59)
for all \( z \in PR(\rho^{-1} \Omega) \) and \( B \in B(\rho^{-1} \Omega) \), where \( z_\rho(x) := z(x/\rho) \). Then it is elementary to check that also \( \mathcal{F}^\rho \) satisfies (H₁), (H₃)–(H₄) and (H₄').

Let \( u_\rho \in PR(\rho A) \) and \( v_\rho \in PR(\rho B) \). We define \( u \in PR(A) \) by \( u(x) = u_\rho(\rho x) \) and \( v \in PR(B) \) by \( v(x) = v_\rho(\rho x) \). Note that a scaling argument yields
\[ \rho^{-d}\|u_\rho - v_\rho\|_{L^1(\rho A \setminus \rho A')} < \|u - v\|_{L^1((A \setminus A') \cap B)} \] (4.60)

Assumption 4.9 and (4.60) imply
\[ MM_1\|u - v\|_{L^1((A \setminus A') \cap B)} = \rho^{-d} MM_1\|u_\rho - v_\rho\|_{L^1(\rho (A \setminus A') \cap \rho B)} \]
\[ \leq \Phi(\rho A', \rho A' \cup B; v_\rho|_{\rho B \setminus \rho A' \cup B}, \rho^d \delta) = \Phi(A', A' \cup B; v|_{B \setminus \partial A' \cup \partial B}). \]

We apply Lemma 4.3 on \( u \) and \( v \) for \( \psi(t) = t \) and \( \mathcal{F}^\rho \), where we note that in this case \( \Lambda(z_1, z_2) = M\|z_1 - z_2\|_{L^1((A \setminus A') \cap B)} \), see Lemma 4.1. We obtain \( w \in PR(A' \cup B) \) such that
\[ (i) \quad \mathcal{F}^\rho(w, A' \cup B) \leq \mathcal{F}^\rho(u, A) + \mathcal{F}^\rho(v, B) \]
\[ + \left( C_{A', A, B} + \mathcal{F}^\rho(u, A) + \mathcal{F}^\rho(v, B) \right) \left( 2\eta + M_2 \sigma \left( M_2\|u - v\|_{L^1((A \setminus A') \cap B)} \right) \right), \]
\[ (ii) \quad \min\{|w - u|, |w - v|\} \leq M_2\|u - v\|_{L^1((A \setminus A') \cap B)}, \]
\[ (iii) \quad w = v \text{ on } B \setminus A. \]

Define \( w_\rho \in PR(\rho A' \cup \rho B) \) by \( w_\rho(x) = w(x/\rho) \). Then (4.10) follows from the estimates on \( w \) along with (4.59)–(4.60). □

5. Integral representation in \( PR(\Omega) \)

This section is devoted to the proof of Theorem 2.2. In Section 5.1 we show how Theorem 2.2 can be deduced from two auxiliary lemmas whose proofs are given in Section 5.2. In Section 5.3 we also present a generalization which will be instrumental in Section 6.
5.1. **Proof of Theorem 2.2** Let \( F : PR(\Omega) \times A(\Omega) \rightarrow [0, \infty) \) and \( u \in PR(\Omega) \). We first state that \( F \) is equivalent to \( m_F \) (see (2.4)) in the sense that the two quantities have the same Radon-Nykodym derivative with respect to \( \mathcal{H}^{d-1}|_{J_u \cap \Omega} \).

**Lemma 5.1.** Suppose that \( F \) satisfies (H1)–(H4). Let \( u \in PR(\Omega) \) and \( \mu = \mathcal{H}^{d-1}|_{J_u \cap \Omega} \). Then for \( \mu \)-a.e. \( x_0 \in \Omega \) we have

\[
\lim_{\varepsilon \to 0} \frac{F(u, B_\varepsilon(x_0))}{\mu(B_\varepsilon(x_0))} = \lim_{\varepsilon \to 0} \frac{m_F(u, B_\varepsilon(x_0))}{\mu(B_\varepsilon(x_0))}.
\]

We defer the proof of Lemma 5.1 to Section 5.2. The second ingredient is that, asymptotically as \( \varepsilon \to 0 \), the minimization problems \( m_F(u, B_\varepsilon(x_0)) \) and \( \overline{m}_F(u, B_\varepsilon(x_0)) \) coincide for \( \mathcal{H}^{d-1}\)-a.e. \( x_0 \in J_u \), where we write \( \overline{u}_{x_0} := u_{x_0, u(x_0)} \) for brevity, see (2.5).

**Lemma 5.2.** Suppose that \( F \) satisfies (H1) and (H3)–(H5). Then for \( \mathcal{H}^{d-1}\)-a.e. \( x_0 \in J_u \) we have

\[
\lim_{\varepsilon \to 0} \frac{m_F(u, B_\varepsilon(x_0))}{\omega_{d-1}\varepsilon^{d-1}} = \sup_{\varepsilon \to 0} \frac{m_F(\overline{u}_{x_0}, B_\varepsilon(x_0))}{\omega_{d-1}\varepsilon^{d-1}}. \tag{5.1}
\]

We defer the proof of Lemma 5.2 also to Section 5.2 and now proceed to prove Theorem 2.2.

**Proof of Theorem 2.2.** We need to show that for \( \mathcal{H}^{d-1}\)-a.e. \( x_0 \in J_u \) one has

\[
\frac{dF(u, \cdot)}{d\mathcal{H}^{d-1}|_{J_u}}(x_0) = f(x_0, [u](x_0), \nu_u(x_0)),
\]

where \( f \) was defined in (2.7). By Lemma 5.1 and the fact that \( \lim_{\varepsilon \to 0}(\omega_{d-1}\varepsilon^{d-1})^{-1}\mu(B_\varepsilon(x_0)) = 1 \) for \( \mathcal{H}^{d-1}\)-a.e. \( x_0 \in J_u \) we deduce

\[
\frac{dF(u, \cdot)}{d\mathcal{H}^{d-1}|_{J_u}}(x_0) = \lim_{\varepsilon \to 0} \frac{F(u, B_\varepsilon(x_0))}{\mu(B_\varepsilon(x_0))} = \lim_{\varepsilon \to 0} \frac{m_F(u, B_\varepsilon(x_0))}{\mu(B_\varepsilon(x_0))} = \lim_{\varepsilon \to 0} \frac{m_F(u, B_\varepsilon(x_0))}{\omega_{d-1}\varepsilon^{d-1}} < \infty
\]

for \( \mathcal{H}^{d-1}\)-a.e. \( x_0 \in J_u \). The statement now follows from (2.7) and Lemma 5.2. \( \square \)

5.2. **Proof of Lemmata 5.1 and 5.2.** For the proof of Lemma 5.1 we basically follow the lines of [17, 18, 35], with the difference that the required compactness results are more delicate due to the weaker growth condition from below (see (H4)) compared to [17, 18, 35]. We start with some notation. We set \( c_d \) as the dimensional constant

\[
c_d := \frac{1}{2} \frac{\omega_{d-1}}{d\omega_d}.
\]

For \( \delta > 0 \) and \( A \in \mathcal{A}(\Omega) \) we define

\[
m_F^\delta(u, A) = \inf \left\{ \sum_{i=1}^{\infty} m_F(u, B_i) : B_i \subset A \text{ pairwise disjoint balls, diam}(B_i) \leq \delta, \quad \mathcal{H}^{d-1}(B_i \cap J_u) \geq c_d \mathcal{H}^{d-1}(\partial B_i), \quad \mathcal{H}^{d-1}\left( J_u \cap \left( A \setminus \bigcup_{i=1}^{\infty} B_i \right) \right) = 0 \right\} \tag{5.2}
\]

and, as \( m_F^\delta(u, A) \) is decreasing in \( \delta \), we can also introduce

\[
m_F^*(u, A) = \lim_{\delta \to 0} m_F^\delta(u, A). \tag{5.3}
\]

Notice that the existence of coverings as in (5.2) follows from the Morse covering theorem (see, e.g., [14, Theorem 1.147]), provided one observes that at \( \mathcal{H}^{d-1}\)-a.e. \( x \in J_u \), there holds by rectifiability

\[
\lim_{\delta \to 0} \frac{\mathcal{H}^{d-1}(J_u \cap B_\delta(x))}{\mathcal{H}^{d-1}(\partial B_\delta(x))} = 2c_d.
\]
Lemma 5.3. Suppose that $F$ satisfies $(H_1), (H_3)-(H_4)$. Let $u \in PR(\Omega)$ and $\mu = \mathcal{H}^{d-1}|_{J_u \cap \Omega}$. If $F(u, A) = m_F^\delta(u, A)$ for all $A \in \mathcal{A}(\Omega)$, then for $\mu$-a.e. $x_0 \in \Omega$ we have

$$\lim_{\varepsilon \to 0} \frac{F(u, B_\varepsilon(x_0))}{\mu(B_\varepsilon(x_0))} = \lim_{\varepsilon \to 0} \frac{m_F^\delta(u, B_\varepsilon(x_0))}{\mu(B_\varepsilon(x_0))}. $$

Proof. The statement follows by repeating exactly the arguments in [35] Proofs of Lemma 4.2 and Lemma 5.3. Note that the assumption $F(u, A) = m_F^\delta(u, A)$ enters the proof at the very end of [35] Proof of Lemma 4.3 and replaces the application of [35] Lemma 4.1. \hfill $\square$

In view of Lemma 5.3 in order to see that $F$ and $m_F$ have the same Radon-Nykodym derivative with respect to $\mathcal{H}^{d-1}|_{J_u \cap \Omega}$, it remains to show the following.

Lemma 5.4. Suppose that $F$ satisfies $(H_1)-(H_4)$. Then for all $u \in PR(\Omega)$ and all $A \in \mathcal{A}(\Omega)$ there holds $F(u, A) = m_F^\delta(u, A)$.

Proof. We follow the proof of [35] Lemma 4.1 and only indicate the necessary changes. For each ball $B \subset A$ we have $m_F(u, B) \leq F(u, B)$ by definition. By $(H_1)$ we get $m_F^\delta(u, A) \leq F(u, A)$ for all $\delta > 0$. This shows $m_F^\delta(u, A) \leq F(u, A)$, see (5.3).

We now address the reverse inequality. We fix $A \in \mathcal{A}(\Omega)$ and $\delta > 0$. Let $(B_1^\delta)_i$, be balls as in the definition of $m_F^\delta(u, A)$ such that

$$\sum_{i=1}^\infty m_F(u, B_1^\delta) \leq m_F^\delta(u, A) + \delta. \quad (5.4)$$

By the definition of $m_F$, we find $v_i^\delta \in PR(B_1^\delta_i)$ such that $v_i^\delta = u$ in a neighborhood of $\partial B_1^\delta$ and

$$F(v_i^\delta, B_1^\delta) \leq m_F(u, B_1^\delta) + \delta \mathcal{L}^d(B_1^\delta). \quad (5.5)$$

We define

$$v^\delta = \sum_{i=1}^\infty v_i^\delta \chi_{B_1^\delta} + u \chi_{N_0^\delta},$$

where $N_0^\delta := \Omega \setminus \bigcup_{i=1}^\infty B_1^\delta_i$. By (5.4)–(5.5) and $(H_4)$ we get $\mathcal{H}^{d-1}(J_u^\delta) < +\infty$. Thus, by construction, we obtain $v^\delta \in PR(\Omega)$. Moreover, by $(H_1)$, $(H_3)$, and (5.4)–(5.5) we have

$$F(v^\delta, A) = \sum_{i=1}^\infty F(v_i^\delta, B_i^\delta) + F(u, N_0^\delta \cap A) \leq \sum_{i=1}^\infty (m_F(u, B_i^\delta) + \delta \mathcal{L}^d(B_i^\delta)) \leq m_F^\delta(u, A) + \delta(1 + \mathcal{L}^d(A)), \quad (5.6)$$

where we also used the fact that $\mathcal{H}^{d-1}(J_u^\delta \cap N_0^\delta \cap A) = F(u, N_0^\delta \cap A) = 0$ by the definition of $(B_1^\delta)_i$, and $(H_4)$. We now claim that $v^\delta \to u$ in measure. To prove this, it suffices to show that

$$\sum_{i=1}^\infty \mathcal{L}^d(B_1^\delta) \to 0$$
as $\delta \to 0$. The above limit ensues from the definition of the covering $(B_1^\delta)_i$, the isoperimetric inequality, and (5.2), which yield

$$\sum_{i=1}^\infty \mathcal{L}^d(B_1^\delta) \leq \sum_{i=1}^\infty \mathcal{L}^d(B_1^\delta) \frac{1}{\varepsilon} \mathcal{L}^d(B_\varepsilon(x_0)) \frac{d}{d-1} \leq c_{\pi, d} \delta \sum_{i=1}^\infty \mathcal{H}^{d-1}(\partial B_i^\delta) \leq c_{\pi, d} \frac{\delta}{c_d} \sum_{i=1}^\infty \mathcal{H}^{d-1}(J_u) \to 0,$$

where $c_{\pi, d}$ denotes the isoperimetric constant. With this, using $(H_2)$, (5.3), and (5.6) we get the required inequality $m_F^\delta(u, A) \geq F(u, A)$ in the limit as $\delta \to 0$. This concludes the proof. \hfill $\square$

Proof of Lemma 5.4. The combination of Lemma 5.3 and Lemma 5.4 yields the result. \hfill $\square$
We now turn our attention to Lemma 5.2. Our goal is to show that, asymptotically as \( \varepsilon \to 0 \), the minimization problems \( m_F(u, B_\varepsilon(x_0)) \) and \( m_F(\bar{u}_{x_0}, B_\varepsilon(x_0)) \) coincide for \( \mathcal{H}^{d-1} \)-a.e. \( x_0 \in J_u \). Essentially, the argument relies on Lemma 4.1, which allows us to join two piecewise rigid functions, and some properties of piecewise rigid functions, see Lemma 3.5.

**Proof of Lemma 5.2.** It suffices to prove (5.1) for points \( x_0 \in J_u \) where the statement of Lemma 3.5 holds.

*Step 1 (Inequality “≤” in (5.1)).* We fix \( \eta > 0 \) and \( \theta > 0 \). Choose \( \varepsilon \in PR(B_{(1-\theta)\varepsilon}(x_0)) \) with \( \varepsilon = \tilde{u}_{x_0} \) in a neighborhood of \( \partial B_{(1-\theta)\varepsilon}(x_0) \) and

\[
F(\varepsilon, B_{(1-\theta)\varepsilon}(x_0)) \leq m_F(\bar{u}_{x_0}, B_{(1-\theta)\varepsilon}(x_0)) + \varepsilon^d. \tag{5.7}
\]

We extend \( \varepsilon \) to a function in \( PR(B_\varepsilon(x_0)) \) by setting \( \varepsilon = \tilde{u}_{x_0} \) outside \( B_{(1-\theta)\varepsilon}(x_0) \). Let \( (u_\varepsilon)_\varepsilon \) be the sequence given by Lemma 3.5. We now want to apply Corollary 4.6 on \( \varepsilon \) (in place of \( u_\rho \)) and \( u_\varepsilon \) (in place of \( v_\rho \)) for \( \eta, \rho = \varepsilon, A' = B_{1-\theta}(x_0), A = B_{1-\theta}(x_0), \) and \( B = B_{1}(x_0) \setminus B_{1-\theta}(x_0) \).

To be in a position for applying Corollary 4.6 we must first check that in fact (4.9) holds for \( \varepsilon \) sufficiently small. Let \( \delta \) be the constant provided by Lemma 4.6. Now, for the given \( x_0 \in J_u \), consider the components \( P_i \) and \( P_j \) provided by Lemma 3.5 satisfying \( x_0 \in \partial^* P_i \cap \partial^* P_j \). Note that \( u_\varepsilon = q_1 \chi_{P_i} + q_2 \chi_{P_j} \) on \( \varepsilon A \), see (3.12) (iii). Notice that \( P_i \cup P_j \) might not form a Caccioppoli partition of \( \varepsilon A' \cup \varepsilon B \). However, the remaining components contained in \( (\varepsilon A' \cup \varepsilon B) \setminus (P_i \cup P_j) \), if nonempty, do not belong to the index set \( J \) in (4.5) (with \( \varepsilon^d \delta \) in place of \( \delta \), cf. (4.9)) for small values of \( \varepsilon \). Indeed, (3.12) (i) implies

\[
\lim_{\varepsilon \to 0} \frac{\varepsilon^d}{\varepsilon^d} \left( (\varepsilon A' \cup \varepsilon B) \setminus (P_i \cup P_j) \right) = 0.
\]

Hence, \( J \) contains at most the indices \( i \) and \( j \). Now, on the one hand, we find \( ||q_i - q_j||_{L^\infty(\varepsilon A' \cup \varepsilon B)} \geq ||u(x_0)||/2 \) for \( \varepsilon \) sufficiently small. By (4.4) and (4.5) this yields

\[
\Phi(\varepsilon A', \varepsilon A' \cup \varepsilon B; u_\varepsilon|_{\varepsilon B \setminus \varepsilon A}, \varepsilon \delta) \geq ||u(x_0)||/2
\]

for \( \varepsilon \) sufficiently small. On the other hand, (3.12) (vi) and the fact that \( \varepsilon = \tilde{u}_{x_0} \) on \( \varepsilon (A \setminus A') \) imply

\[
\lim_{\varepsilon \to 0} \frac{1}{\varepsilon^d} \int_{\varepsilon (A \setminus A')} |\varepsilon - u_\varepsilon| \, dx = 0. \tag{5.8}
\]

This shows that (4.9) holds with \( \varepsilon = \tilde{u}_{x_0} \) in place of \( u_\rho \) and \( u_\varepsilon \) in place of \( v_\rho \), for \( \varepsilon \) sufficiently small.

By (4.10) there exist functions \( w_\varepsilon \in PR(B_\varepsilon(x_0)) \) such that \( w_\varepsilon = u_\varepsilon \) on \( B_\varepsilon(x_0) \setminus B_{(1-\theta)\varepsilon}(x_0) \) and

\[
F(w_\varepsilon, B_\varepsilon(x_0)) \leq F(\varepsilon, B_{(1-\theta)\varepsilon}(x_0)) + F(u_\varepsilon, \varepsilon B)
+ (F(\varepsilon, \varepsilon A) + F(u_\varepsilon, \varepsilon B) + 3d\omega_d \varepsilon^{d-1}) \cdot (2\eta + M_2 \varepsilon^{-d} M_2 \varepsilon \varepsilon - u_\varepsilon\|L^1(\varepsilon A')) \)),
\]

where \( M_2 \) is the constant of Lemma 3.5. In particular, \( w_\varepsilon = u \) in a neighborhood of \( \partial B_\varepsilon(x_0) \) by (3.12) (iv). Using (5.8) and the fact that \( \lim_{t \to 0} \sigma(t) = 0 \) we find a sequence \( (\rho_\varepsilon) \) with \( \rho_\varepsilon \to 0 \) such that

\[
F(w_\varepsilon, B_\varepsilon(x_0)) \leq (1 + 2\eta + \rho_\varepsilon)(F(\varepsilon, \varepsilon A) + F(u_\varepsilon, \varepsilon B) + 3d\omega_d \varepsilon^{d-1}(2\eta + \rho_\varepsilon)). \tag{5.9}
\]
Using that \( z_\varepsilon = \bar{u}_{x_0} \) on \( B_\varepsilon(x_0) \setminus B_{(1-3\theta)\varepsilon}(x_0) \subset \varepsilon B \), \((H_1), (H_4), (5.9)\), and \((5.7)\) we compute

\[
\limsup_{\varepsilon \to 0} \frac{\mathcal{F}(z_\varepsilon, \varepsilon A)}{\varepsilon^{d-1}} \leq \limsup_{\varepsilon \to 0} \frac{\mathcal{F}(z_\varepsilon, B_{(1-3\theta)\varepsilon}(x_0))}{\varepsilon^{d-1}} + \limsup_{\varepsilon \to 0} \frac{\mathcal{F}(\bar{u}_{x_0}, \varepsilon B)}{\varepsilon^{d-1}}
\]

\[
\leq \limsup_{\varepsilon \to 0} \frac{m_{\mathcal{F}}(\bar{u}_{x_0}, B_{(1-3\theta)\varepsilon}(x_0))}{\varepsilon^{d-1}} + \omega_{d-1} \left[ 1 - (1 - 4\theta)^{d-1} \right] \beta
\]

\[
\leq (1 - 3\theta)^{d-1} \limsup_{\varepsilon \to 0} \frac{m_{\mathcal{F}}(\bar{u}_{x_0}, B_\varepsilon(x_0))}{(\varepsilon')^{d-1}} + \omega_{d-1} \left[ 1 - (1 - 4\theta)^{d-1} \right] \beta, \quad (5.10)
\]

where in the step we substituted \((1 - 3\theta)\varepsilon \) by \( \varepsilon' \). By \((5.12)\) (ii), \((v)\), and \( B = B_1(x_0) \setminus B_{1-4\theta}(x_0) \) we also find

\[
\limsup_{\varepsilon \to 0} \frac{\mathcal{F}(u_\varepsilon, \varepsilon B)}{\varepsilon^{d-1}} \leq \limsup_{\varepsilon \to 0} \frac{\mathcal{F}(u_\varepsilon, \varepsilon B)}{\varepsilon^{d-1}} \leq \omega_{d-1} \left[ 1 - (1 - 4\theta)^{d-1} \right] \beta. \quad (5.11)
\]

Recall that \( w_\varepsilon = u \) in a neighborhood of \( \partial B_\varepsilon(x_0) \). This together with \((5.9), (5.11)\) and \( \rho_\varepsilon \to 0 \) yields

\[
\lim_{\varepsilon \to 0} \frac{m_{\mathcal{F}}(u_\varepsilon, B_\varepsilon(x_0))}{\omega_{d-1}\varepsilon^{d-1}} \leq \limsup_{\varepsilon \to 0} \frac{\mathcal{F}(w_\varepsilon, B_\varepsilon(x_0))}{\omega_{d-1}\varepsilon^{d-1}}
\]

\[
\leq (1 + 2\eta) \left( (1 - 3\theta)^{d-1} \limsup_{\varepsilon \to 0} \frac{m_{\mathcal{F}}(\bar{u}_{x_0}, B_\varepsilon(x_0))}{\omega_{d-1}\varepsilon^{d-1}} \right) + 2(1 + 2\eta) \left[ 1 - (1 - 4\theta)^{d-1} \right] \beta + 6d \frac{\omega_d}{\omega_{d-1}} \eta. \quad (5.12)
\]

Passing to \( \eta, \theta \to 0 \) we obtain inequality “\( \leq \)” in \((5.11)\).

**Step 2 (Inequality “\( \geq \)” in \((5.11)\)):** Let \( (u_\varepsilon)_\varepsilon \) be again the sequence from Lemma 3.3. Since \( u_\varepsilon = u \) in a neighborhood of \( \partial B_\varepsilon(x_0) \) by \((5.12)\) (iv), we get

\[
m_{\mathcal{F}}(u_\varepsilon, B_\varepsilon(x_0)) = m_{\mathcal{F}}(u, B_\varepsilon(x_0)) \quad (5.13)
\]

for all \( \varepsilon > 0 \). With \((5.13)\) at hand, the proof is now very similar to Step 1, and we only indicate the main changes. Fix \( \eta > 0, \theta > 0 \), and choose \( z_\varepsilon \in PR(B_{(1-3\theta)\varepsilon}(x_0)) \) with \( z_\varepsilon = u_\varepsilon \) in a neighborhood of \( \partial B_{(1-3\theta)\varepsilon}(x_0) \) such that

\[
\mathcal{F}(z_\varepsilon, B_{(1-3\theta)\varepsilon}(x_0)) \leq m_{\mathcal{F}}(u_\varepsilon, B_{(1-3\theta)\varepsilon}(x_0)) + \varepsilon^d. \quad (5.14)
\]

We extend \( z_\varepsilon \) to a function in \( PR(B_\varepsilon(x_0)) \) by setting \( z_\varepsilon = u_\varepsilon \) outside \( B_{(1-3\theta)\varepsilon}(x_0) \). We apply Corollary 4.4 on \( z_\varepsilon \) (in place of \( u_\varepsilon \)) and \( \bar{u}_{x_0} \) (in place of \( v_\varepsilon \)) for the same sets as in Step 1. We observe \( \Phi(\varepsilon A', \varepsilon A' \cup \varepsilon B; \bar{u}_{x_0}|_{\varepsilon B \setminus \varepsilon A'}, \varepsilon^d\delta) = ||u(x_0)|| \) and, as \( z_\varepsilon = u_\varepsilon \) on \( \varepsilon(A \setminus A') \), \((5.12)\) (vi) yields

\[
\lim_{\varepsilon \to 0} \frac{1}{\varepsilon^d} \int_{\varepsilon(A \setminus A')} |z_\varepsilon - \bar{u}_{x_0}| \, dx = 0. \quad (5.15)
\]

Thus, \((4.9)\) holds for \( \varepsilon \) sufficiently small. By \((4.10)\) there exist functions \( w_\varepsilon \in PR(B_\varepsilon(x_0)) \) such that \( w_\varepsilon = \bar{u}_{x_0} \) on \( B_\varepsilon(x_0) \setminus B_{(1-\theta)\varepsilon}(x_0) \) and

\[
\mathcal{F}(w_\varepsilon, B_\varepsilon(x_0)) \leq \mathcal{F}(z_\varepsilon, \varepsilon A) + \mathcal{F}(\bar{u}_{x_0}, \varepsilon B)
\]

\[
+ (\mathcal{F}(z_\varepsilon, \varepsilon A) + \mathcal{F}(\bar{u}_{x_0}, \varepsilon B) + 3dw_\varepsilon \omega_{d-1} \beta) \cdot (2\eta + M_2 \sigma(\varepsilon^{-d}M_2||z_\varepsilon - \bar{u}_{x_0}||_{L^1(\varepsilon(A \setminus A'))})).
\]

Similar to Step 1, cf. \((5.9)\), using \((5.15)\) we find a sequence \( (\rho_\varepsilon)_\varepsilon \) with \( \rho_\varepsilon \to 0 \) such that

\[
\mathcal{F}(w_\varepsilon, B_\varepsilon(x_0)) \leq (1 + 2\eta + \rho_\varepsilon)(\mathcal{F}(z_\varepsilon, \varepsilon A) + \mathcal{F}(\bar{u}_{x_0}, \varepsilon B)) + 3dw_\varepsilon \omega_{d-1}(2\eta + \rho_\varepsilon). \quad (5.16)
\]
Repeating the arguments in (5.10)–(5.11), in particular using that \(z_\varepsilon = u_\varepsilon\) on \(B_\varepsilon(x_0) \setminus B_{(1-3\theta)}(x_0)\), and using (5.14) we derive
\[
\limsup_{\varepsilon \to 0} \frac{\mathcal{F}(z_\varepsilon, \varepsilon A)}{\varepsilon^{d-1}} \leq (1 - 3\theta)^{d-1} \limsup_{\varepsilon \to 0} \frac{\mathfrak{m}(u_\varepsilon, B_\varepsilon(x_0))}{\varepsilon^{d-1}} + \omega_{d-1} \left[ 1 - (1 - 4\theta)^{d-1} \right] \beta.
\]
(5.17)

Estimating \(\mathcal{F}(\bar{u}_{x_0}, \varepsilon B)\) as in (5.10), with (5.16)–(5.17) and \(\rho_\varepsilon \to 0\) we then obtain
\[
\limsup_{\varepsilon \to 0} \frac{\mathcal{F}(\bar{u}_{x_0}, B_\varepsilon(x_0))}{\omega_{d-1} \varepsilon^{d-1}} \leq (1 + 2\eta) \left( (1 - 3\theta)^{d-1} \limsup_{\varepsilon \to 0} \frac{\mathfrak{m}(u_\varepsilon, B_\varepsilon(x_0))}{\omega_{d-1} \varepsilon^{d-1}} \right) + 2(1 + 2\eta) \left[ 1 - (1 - 4\theta)^{d-1} \right] \beta + 6d \omega_{d-1} \eta.
\]

Passing to \(\eta, \theta \to 0\) and recalling that \(w_\varepsilon = \bar{u}_{x_0}\) in a neighborhood of \(\partial B_\varepsilon(x_0)\) we derive
\[
\limsup_{\varepsilon \to 0} \frac{\mathfrak{m}(\bar{u}_{x_0}, B_\varepsilon(x_0))}{\omega_{d-1} \varepsilon^{d-1}} \leq \limsup_{\varepsilon \to 0} \frac{\mathfrak{m}(u_\varepsilon, B_\varepsilon(x_0))}{\omega_{d-1} \varepsilon^{d-1}}.
\]

This along with (5.10) shows inequality “\(\geq\)” in (5.1).

\[\square\]

5.3. A useful generalization. We now formulate a generalization of Theorem 2.2 which will be instrumental in Section 6 below. Suppose that we have a sequence of functionals \(\mathcal{F}_n : PR(\Omega) \times B(\Omega) \to [0, \infty)\) satisfying \((H_1)\), \((H_3)-(H_5)\) uniformly, i.e., for the same \(0 < \alpha < \beta\) and \(\sigma : [0, +\infty) \to [0, \beta]\).

Let \(\mathcal{F} : PR(\Omega) \times B(\Omega) \to [0, \infty)\) be a functional satisfying \((H_1)-(H_4)\). Later, we will show that these conditions will be guaranteed when \(\mathcal{F}\) is the \(\Gamma\)-limit of the sequence \((\mathcal{F}_n)_n\). If we additionally assume (2.8), we have the following generalization of Theorem 2.2.

Corollary 5.5. Consider a sequence \((\mathcal{F}_n)_n\) satisfying \((H_1)\), \((H_3)-(H_5)\) uniformly and \(\mathcal{F}\) satisfying \((H_1)-(H_4)\). Assume that (2.8) holds. Then \(\mathcal{F}\) admits the representation
\[
\mathcal{F}(u, B) = \int_{J_u \cap B} f(x, [u](x), \nu_u(x)) d\mathcal{H}^{d-1}(x)
\]
for all \(u \in PR(\Omega)\) and \(B \in B(\Omega)\), with \(f(x, \xi, \nu)\) given by (2.7).

We emphasize that we cannot apply directly Theorem 2.2 on \(\mathcal{F}\), since we do not assume \((H_5)\). The idea is to prove equality in Lemma 5.2 for \(\mathcal{F}\) by using the corresponding properties for \(\mathcal{F}_n\). To prove Corollary 5.5 we need the following preliminary result, which is itself a corollary of Lemma 5.2. In the statement, we write again \(\bar{u}_{x_0} := u_{x_0, [u](x_0), \nu_{u}(x_0)}\) for brevity, see (2.8).

Corollary 5.6. Consider a sequence \((\mathcal{F}_n)_n\) satisfying \((H_1)\), \((H_3)-(H_5)\) uniformly. Assume that (2.8) holds. Let \(u \in PR(\Omega)\). Then for \(\mathcal{H}^{d-1}\) a.e. \(x_0 \in J_u\) we have
\[
\lim_{\varepsilon \to 0} \frac{\mathfrak{m}(u, B_\varepsilon(x_0))}{\omega_{d-1} \varepsilon^{d-1}} = \limsup_{\varepsilon \to 0} \frac{\mathfrak{m}(\bar{u}_{x_0}, B_\varepsilon(x_0))}{\omega_{d-1} \varepsilon^{d-1}}.
\]

Proof. The proof is analogous to the one of Lemma 5.2. We therefore only highlight the adaptions for one inequality, see Step 1 above. Fix \(\eta, \theta > 0\). First, by using (2.8), for each \(\varepsilon\) we can choose first \(\varepsilon'(\varepsilon) < \varepsilon\) and then \(n(\varepsilon) \in \mathbb{N}\), both depending on \(\varepsilon\), such that
\[
\begin{align*}
(i) \quad & \mathfrak{m}(u, B_\varepsilon(x_0)) \leq \mathfrak{m}_{n(\varepsilon)}(u, B_{\varepsilon'}(x_0)) + \varepsilon^d, \\
(ii) \quad & \mathfrak{m}_{n(\varepsilon)}(\bar{u}_{x_0}, B_{(1-3\theta)}(x_0)) \leq \mathfrak{m}(\bar{u}_{x_0}, B_{(1-3\theta)}(x_0)) + \varepsilon^d. \quad (5.18)
\end{align*}
\]
In fact, first choose \( \varepsilon'(\varepsilon) < \varepsilon \) such that \( \mathbf{m}_F(u, B_{\varepsilon}(x_0)) \leq \liminf_{n \to \infty} \mathbf{m}_{F_n}(u, B_{\varepsilon}(x_0)) + \varepsilon^3/2 \). Then, choose \( n(\varepsilon) \) depending on \( \varepsilon' \) (and thus on \( \varepsilon \)) such that (5.18) holds. Choose \( z_{\varepsilon'} \in PR(B_{(1-\theta)\varepsilon}(x_0)) \) with \( z_{\varepsilon'} = \bar{u}_{x_0} \) in a neighborhood of \( \partial B_{(1-\theta)\varepsilon}(x_0) \) and

\[
F_{n(\varepsilon)}(z_{\varepsilon'}, B_{(1-\theta)\varepsilon}(x_0)) \leq \mathbf{m}_{F_{n(\varepsilon)}}(\bar{u}_{x_0}, B_{(1-\theta)\varepsilon}(x_0)) + \varepsilon^3.
\]

We proceed as in the proof of Lemma 5.2 we apply Corollary 4.6 to obtain \( w_{\varepsilon'} \in PR(B_{\varepsilon}(x_0)) \) with \( w_{\varepsilon'} = u_{\varepsilon'} \) on \( B_{\varepsilon}(x_0) \setminus B_{(1-\theta)\varepsilon}(x_0) \) which satisfies (cf. (5.9))

\[
F_{n(\varepsilon)}(w_{\varepsilon'}, B_{\varepsilon}(x_0)) \leq (1 + 2\eta + \rho_{\varepsilon})(F_{n(\varepsilon)}(z_{\varepsilon'}, \varepsilon' A) + F_{n(\varepsilon)}(u_{\varepsilon'}, \varepsilon' B)) + 3d\omega d^2\varepsilon^3(2\eta + \rho_{\varepsilon})\quad (5.19)
\]

for a sequence \( \rho_{\varepsilon} \) converging to zero, where we use that \( (F_n)_n \) satisfy (H4) and (H5) uniformly.

Applying (5.18)(ii) and following the lines of (5.10) we get

\[
\limsup_{\varepsilon \to 0} \frac{F_{n(\varepsilon)}(z_{\varepsilon'}, \varepsilon' A)}{(\varepsilon')^{d-1}} \leq \limsup_{\varepsilon \to 0} \frac{m_{F_{n(\varepsilon)}}(\bar{u}_{x_0}, B_{(1-\theta)\varepsilon}(x_0))}{(\varepsilon')^{d-1}} + \omega d-1 \big(1 - (1 - 4\theta)d^{-1}\big) \beta
\]
\[
\leq (1 - 3\theta)d^{-1}\limsup_{\varepsilon \to 0} \frac{m_{F}(\bar{u}_{x_0}, B_{\varepsilon}(x_0))}{(\varepsilon')^{d-1}} + \omega d-1 \big(1 - (1 - 4\theta)d^{-1}\big) \beta,
\]

where we set \( \varepsilon'' = (1 - 3\theta)\varepsilon' \), and recall that \( \varepsilon'' = \varepsilon''(\varepsilon) \) depends on \( \varepsilon \). Admitting arbitrary sequence \( \varepsilon'' \to 0 \), we do not decrease the right hand side. Therefore,

\[
\limsup_{\varepsilon \to 0} \frac{F_{n(\varepsilon)}(z_{\varepsilon'}, \varepsilon' A)}{(\varepsilon')^{d-1}} \leq (1 - 3\theta)d^{-1}\limsup_{\varepsilon'' \to 0} \frac{m_{F}(\bar{u}_{x_0}, B_{\varepsilon''}(x_0))}{(\varepsilon'')^{d-1}} + \omega d-1 \big(1 - (1 - 4\theta)d^{-1}\big) \beta. \quad (5.20)
\]

We also get \( \limsup_{\varepsilon \to 0}(\varepsilon'')^{-(d-1)}F_{n(\varepsilon)}(w_{\varepsilon'}, \varepsilon' B) \leq \omega d-1 \big(1 - (1 - 4\theta)d^{-1}\big) \beta \) by (5.22)(ii),(v) and the fact that (H4) holds uniformly, cf. (5.11). This together with (5.18)(i), (5.19), (5.20), \( \varepsilon' < \varepsilon \), and \( u_{\varepsilon'} = u_{\varepsilon''} = u \) in a neighborhood of \( \partial B_{\varepsilon''}(x_0) \) now shows (cf. (5.12))

\[
\lim_{\varepsilon \to 0} \frac{m_{F}(u, B_{\varepsilon}(x_0))}{\omega d-1 d^{-1}} \leq \limsup_{\varepsilon \to 0} \frac{m_{F_{n(\varepsilon)}}(u, B_{\varepsilon}(x_0))}{\omega d-1 (\varepsilon'')^{d-1}} \leq \limsup_{\varepsilon \to 0} \frac{F_{n(\varepsilon)}(w_{\varepsilon'}, B_{\varepsilon}(x_0))}{\omega d-1 (\varepsilon')^{d-1}} \leq (1 + 2\eta)(1 - 3\theta)d^{-1}\limsup_{\varepsilon \to 0} \frac{m_{F}(\bar{u}_{x_0}, B_{\varepsilon}(x_0))}{\omega d-1 \varepsilon^{d-1}} + 2(1 + 2\eta) \big(1 - (1 - \theta)d^{-1}\big) \beta + 6d\omega d^2\eta.
\]

Passing to \( \eta, \theta \to 0 \) we obtain one inequality. To see the reverse one, we follow the lines of Step 2 of the proof of Lemma 5.2 and carry out similar adaption.

We close this section by noting that Corollary 5.5 follows from Corollary 5.6 arguing exactly as in the proof of Theorem 2.2. (Note that Lemma 5.11 is applicable since \( F \) satisfies (H1)–(H4).)

6. \( \Gamma \)-convergence results for functionals on \( PR(\Omega) \)

This section is devoted to the proof of Theorem 2.2. Consider a sequence of functionals \( (F_n)_n \) satisfying (H1) and (H3)–(H5) uniformly, i.e., for the same \( 0 < \alpha < \beta \) and \( \sigma : [0, +\infty) \to [0, \beta] \). We will first identify a \( \Gamma \)-limit \( F \) with respect to the convergence in measure on \( \Omega \). Then, our goal is to obtain an integral representation of \( F \). To this aim, we apply the localization method for \( \Gamma \)-convergence together with the fundamental estimate in Lemma 4.1 to deduce that properties (H1)–(H4) are satisfied. As mentioned before, we cannot prove directly that \( F \) satisfies (H5) and therefore the results of Subsections 5.1 [5.2 cannot be used. To circumvent this problem, we will use Corollary 5.5 to get the representation result. We will also eventually prove that (H5) is satisfied by showing that the integrand \( f \) satisfies an equivalent property.
Consider a sequence of functionals \((\mathcal{F}_n)_n\) defined on \(PR(\Omega)\). As a first step, we analyze fundamental properties of the \(\Gamma\)-limitinf and \(\Gamma\)-limsup with respect to the topology of the convergence in measure. To this end, we define

\[
\mathcal{F}'(u, A) := \Gamma - \liminf_{n \to \infty} \mathcal{F}_n(u, A) = \inf \left\{ \liminf_{n \to \infty} \mathcal{F}_n(u_n, A) : \ u_n \to u \text{ in measure on } A \right\},
\]

\[
\mathcal{F}''(u, A) := \Gamma - \limsup_{n \to \infty} \mathcal{F}_n(u, A) = \inf \left\{ \limsup_{n \to \infty} \mathcal{F}_n(u_n, A) : \ u_n \to u \text{ in measure on } A \right\}
\]

(6.1)

for all \(u \in PR(\Omega)\) and \(A \in \mathcal{A}(\Omega)\).

Lemma 6.1 (Properties of \(\Gamma\)-liminf and \(\Gamma\)-limsup). Let \(\Omega \subset \mathbb{R}^d\) open, bounded with Lipschitz boundary. Let \(\mathcal{F}_n : PR(\Omega) \times B(\Omega) \to [0, \infty)\) be a sequence of functionals satisfying \((H_1),(H_3)\) for the same \(0 < \alpha < \beta\) and \(\sigma : [0, +\infty) \to [0, \beta]\). Define \(F'\) and \(F''\) as in (6.1). Then we have

(i) \(F'(u, A) \leq F'(u, B), \quad F''(u, A) \leq F''(u, B)\) whenever \(A \subset B\),

(ii) \(\alpha \mathcal{H}^{d-1}(J_u \cap A) \leq F'(u, A) \leq F''(u, A) \leq \beta \mathcal{H}^{d-1}(J_u \cap A)\),

(iii) \(F'(u, A) = \sup_{B \subset \subset A} F'(u, B), \quad F''(u, A) = \sup_{B \subset \subset A} F''(u, B)\) whenever \(A \in \mathcal{A}_0(\Omega)\),

(iv) \(F'(u, A \cup B) \leq F'(u, A) + F'(u, B), \quad F''(u, A \cup B) \leq F''(u, A) + F''(u, B)\) whenever \(A, B \in \mathcal{A}_0(\Omega)\).

(6.2)

Proof. First, (i) is clear as all \(\mathcal{F}_n(u, \cdot)\) are measures. The upper bound in (ii) follows from \((H_4)\) by taking the constant sequence \(u_n = u\) in (6.1). For the lower bound in (ii), we take an (almost) optimal sequence in (6.1), use \((H_4)\), as well as the lower semicontinuity stated in Lemma 3.3(ii).

To see (iii), we fix \(D \in \mathcal{A}_0(\Omega)\) and first prove that for all sets \(E, F \in \mathcal{A}_0(\Omega), \ E \subset \subset F \subset \subset D\), we have

\[
F'(u, D) \leq F'(u, F) + F'(u, D \setminus \mathcal{E}), \quad F''(u, D) \leq F''(u, F) + F''(u, D \setminus \mathcal{E}).
\]

(6.3)

(We use different notation for the sets to avoid confusion with the notation in Lemma 6.1.) Indeed, let \((u_n)_n, (v_n)_n \subset PR(\Omega)\) be sequences converging in measure to \(u\) on \(F\) and \(D \setminus \mathcal{E}\), respectively, such that

\[
F''(u, F) = \limsup_{n \to \infty} \mathcal{F}_n(u_n, F), \quad F''(u, D \setminus \mathcal{E}) = \limsup_{n \to \infty} \mathcal{F}_n(v_n, D \setminus \mathcal{E}).
\]

(6.4)

We apply Lemma 6.1 for \(\psi(t) := \frac{t}{1 + t}, \ A = F, \ B = D \setminus \mathcal{E}, \) and some \(A' \in \mathcal{A}_0(\Omega), \ E \subset \subset A' \subset \subset F,\) to obtain \(w_n \in PR(D)\) satisfying (see 6.2(i))

\[
\mathcal{F}_n(w_n, D) \leq (\mathcal{F}_n(u_n, F) + \mathcal{F}_n(v_n, D \setminus \mathcal{E}))(1 + \eta + \rho_n) + C(\eta + \rho_n),
\]

(6.5)

where \(C\) depends on \(E, F, D, \) and for brevity we set \(\rho_n := M\sigma(A(u_n, v_n))\). We observe that \(u_n - v_n\) tends to 0 in measure on \(F \setminus \mathcal{E}\), which is equivalent to

\[
\int_{F \setminus \mathcal{E}} \psi(|u_n - v_n|) \to 0
\]

for \(\psi(t) = \frac{t}{1 + t}\). Hence, \(A(u_n, v_n) \to 0\) by 6.1(i), which implies \(\rho_n \to 0\). Since by assumption \(u_n \to u\) and \(v_n \to u\) in measure on \(F\) and \(D \setminus \mathcal{E}\), respectively, and \(\|\min\{|w_n - u_n|, |w_n - v_n|\}\|_{L^\infty(D)} \leq A(u_n, v_n)\) by 6.2(ii), the functions \(w_n\) converge to \(u\) in measure on \(D\). Thus, passing to the limit \(n \to \infty\) and using (6.1), (6.4), (6.5), we obtain

\[
F''(u, D) \leq \limsup_{n \to \infty} \mathcal{F}_n(w_n, D) \leq (F''(u, F) + F''(u, D \setminus \mathcal{E}))(1 + \eta) + C\eta.
\]

Since \(\eta > 0\) was arbitrary, we obtain (6.3) for \(F''\). For \(F'\) we argue in a similar fashion.
By (6.3) and (6.2) (ii) we get \( F''(u, D) \leq F''(u, F) + \beta \mathcal{H}^{d-1}(J_u \cap (D \setminus E)) \). As \( \mathcal{H}^{d-1}(J_u \cap (D \setminus E)) \) can be taken arbitrarily small and \( F''(u, \cdot) \) is an increasing set function, we obtain \( F''(u, D) \leq \sup_{F \subset D} F''(u, F) \). This shows (iii) for \( F'' \). The proof of \( F' \) is similar.

We finally show (iv). Observe that the inequalities are clear if \( A \cap B = \emptyset \). Let \( A, B \in \mathcal{A}_0(\Omega) \) with nonempty intersection. Given \( \varepsilon > 0 \), one can choose \( M \subset M' \subset A \) and \( N \subset N' \subset B \) such that \( M, M', N, N' \in \mathcal{A}_0(\Omega) \), \( M' \cap N' = \emptyset \), and \( \mathcal{H}^{d-1}(J_u \cap ((A \cup B) \setminus (M \cup N))) \leq \varepsilon \), see [37] Proof of Lemma 5.2 for details. Then using (6.2) (i), (ii) and (6.3)

\[
F''(u, A \cup B) \leq F''(u, M' \cup N') + F''(u, A \cup B \setminus (M' \cup N)) \leq F''(u, M') + F''(u, N') + \beta \varepsilon
\]

Here, we also used \( F''(u, M' \cup N') \leq F''(u, M') + F''(u, N') \) which holds due to \( M' \cap N' = \emptyset \). The statement follows as \( \varepsilon \) was arbitrary. The proof for \( F' \) is again the same. \( \square \)

The previous lemma allows us to identify a \( \Gamma \)-limit on \( PR(\Omega) \).

**Lemma 6.2.** Let \( \Omega \subset \mathbb{R}^d \) open, bounded with Lipschitz boundary. Let \( F_n : PR(\Omega) \times B(\Omega) \to [0, \infty) \) be a sequence of functionals satisfying (H1), (H2)–(H4) for the same \( 0 < \alpha < \beta \) and \( \sigma : [0, +\infty) \to [0, \beta] \). Then there exists \( F : PR(\Omega) \times B(\Omega) \to [0, \infty] \) and a subsequence (not relabeled) such that \( F(\cdot, A) = \Gamma_\ast \lim_{n \to \infty} F_n(\cdot, A) \) with respect to the topology of the convergence in measure, for all \( A \in \mathcal{A}_0(\Omega) \). The functional \( F \) satisfies (H1)–(H4).

**Proof.** We apply a compactness result for \( \bar{F} \)-convergence, see [37] Theorem 16.9, to find an increasing sequence of integers \( (n_k)_k \) such that the objects \( F' \) and \( F'' \) defined in (6.1) with respect to \( (n_k)_k \)

\[
F'(\cdot, A) = \Gamma_\ast \lim_{n \to \infty} F_n(\cdot, A)
\]

for all \( u \in PR(\Omega) \) and \( A \in \mathcal{A}(\Omega) \), where \( (F')_\ast \) and \( (F'')_\ast \) denote the inner regular envelope defined by

\[
(F')_\ast(u, A) = \sup_{B \subset A, B \in \mathcal{A}(\Omega)} F'(u, B), \quad (F'')_\ast(u, A) = \sup_{B \subset A, B \in \mathcal{A}(\Omega)} F''(u, B).
\] (6.7)

We write \( F_0 := (F'')_\ast \) for simplicity. This along with (6.1) and Lemma 6.1 (i) yields

\[
F_0 = (F')_\ast \leq F' \leq F''.
\] (6.8)

We now check that

\[
F''(u, A) = F_0(u, A) \quad \text{for all } u \in PR(\Omega) \text{ and all } A \in \mathcal{A}_0(\Omega).
\] (6.9)

In view of (6.9), it suffices to show \( F_0(u, A) \geq F''(u, A) \). To this end, we fix \( u \in PR(\Omega), A \in \mathcal{A}_0(\Omega) \), and \( \varepsilon > 0 \). We choose sets \( A' \subset A \subset A' \) such that \( A' \in \mathcal{A}_0(\Omega) \), \( A \setminus A' \in \mathcal{A}_0(\Omega) \), and \( \mathcal{H}^{d-1}(J_u \cap (A \setminus A')) \leq \varepsilon \). We then find by Lemma 6.1 (ii), (iv) and (6.7)

\[
F''(u, A) \leq F''(u, A') + F''(u, A \setminus A') \leq F''(u, A') + \beta \varepsilon \leq F_0(u, A) + \beta \varepsilon.
\]

As \( \varepsilon \) is arbitrary, the desired inequality follows.

Now (6.3)–(6.9) show that the \( \Gamma \)-limit exists for all \( u \in PR(\Omega) \) and all \( A \in \mathcal{A}_0(\Omega) \). It remains to extend \( F_0 : PR(\Omega) \times A(\Omega) \to [0, \infty] \) to a functional \( F \) defined on \( PR(\Omega) \times B(\Omega) \). To this end, we first note that \( F_0 \) is superadditive and inner regular, see [37] Proposition 16.12 and Remark
16.3. Moreover, $\mathcal{F}_0$ is subadditive. In fact, for $A, B \in \mathcal{A}(\Omega)$, we choose $A', B' \in \mathcal{A}_0(\Omega)$ with $A' \subset A$, $B' \subset B$, and since $\mathcal{F}_1$ is subadditive on $\mathcal{A}_0(\Omega)$ (see Lemma 6.1(iv) and (6.9)), we get

$$\mathcal{F}_0(u, A' \cup B') \leq \mathcal{F}_0(A') + \mathcal{F}_0(B') \leq \mathcal{F}_0(A) + \mathcal{F}_0(B).$$

Then $\mathcal{F}_0(u, A \cup B) \leq \mathcal{F}_0(A) + \mathcal{F}_0(B)$ follows from the inner regularity of $\mathcal{F}_0$. By De Giorgi-Letta (see [37, Theorem 14.23]), $\mathcal{F}_0(u, \cdot)$ can thus be extended to a Borel measure.

Lemma 6.1 also yields that the extended functional $\mathcal{F}$ satisfies (H$_1$), (H$_3$)–(H$_4$). The lower semicontinuity (H$_2$) of $\mathcal{F}(\cdot, A) = \mathcal{F}(\cdot, A)$ for $A \in \mathcal{A}(\Omega)$ follows from [37, Remark 16.3].

We are now in the position to prove Theorem 2.8.

**Proof of Theorem 2.8.** We observe that $\mathcal{F}$ satisfies (6.6) and (H$_1$)–(H$_4$) by Lemma 6.2. Since we assume (2.8), we can apply Corollary 5.5, so that $\mathcal{F}$ admits the integral representation

$$\mathcal{F}(u, B) = \int_{J_u \cap B} f(x, [u](x), \nu_u(x)) \, dH^{d-1}(x)$$

with the density $f$ given in (2.7).

We are only left to show that (H$_5$) holds. We will equivalently prove that $f$ satisfies

$$|f(x_0, \xi, \nu) - f(x_0, \xi', \nu)| \leq \alpha^{-1} \beta \sigma(|\xi - \xi'|)$$

for all $x_0 \in \Omega$, $\xi, \xi' \in \mathbb{R}^d$, and $\nu \in S^{d-1}$. This shows that (H$_5$) holds for the modulus of continuity $\alpha^{-1} \beta \sigma$. To this end, it suffices to prove that for all $x_0 \in \Omega$, $\xi, \xi' \in \mathbb{R}^d$, and $\nu \in S^{d-1}$ one has

$$\left| \limsup_{\varepsilon \to 0} \frac{\mathcal{F}(u_{x_0, \xi', \nu}, B_\varepsilon(x_0)) - \mathcal{F}(u_{x_0, \xi, \nu}, B_\varepsilon(x_0))}{\omega_{d-1} \varepsilon^{d-1}} \right| \leq \alpha^{-1} \beta \sigma(|\xi - \xi'|).$$

Indeed, then the statement follows from (2.7).

Let us show (6.10). We first observe that, in view of (2.8), it suffices to prove

$$|\mathcal{F}(u_{x_0, \xi, \nu}, B_\varepsilon(x_0)) - \mathcal{F}(u_{x_0, \xi', \nu}, B_\varepsilon(x_0))| \leq \omega_{d-1} \varepsilon^{d-1} \alpha^{-1} \beta \sigma(|\xi - \xi'|)$$

for every $n \in \mathbb{N}$. Indeed, once (6.11) is proved, we conclude as follows: without restriction we suppose that the term inside the brackets on the left hand side of (6.10) is nonnegative as otherwise we interchange the roles of $\xi$ and $\xi'$. By (2.8), for each $\varepsilon > 0$, choose $n(\varepsilon) \in \mathbb{N}$ and $\varepsilon'(< \varepsilon$ with

$$\mathcal{F}(u_{x_0, \xi, \nu}, B_\varepsilon(x_0)) \leq \mathcal{F}(u_{x_0, \xi, \nu}, B_{\varepsilon'}(x_0)) + \varepsilon' \omega_{d-1} \varepsilon'^{d-1},$$

$$\mathcal{F}(u_{x_0, \xi', \nu}, B_{\varepsilon'}(x_0)) \leq \mathcal{F}(u_{x_0, \xi', \nu}, B_{\varepsilon'}(x_0)) + \varepsilon' \omega_{d-1} \varepsilon'^{d-1}.$$

Then, since $\varepsilon' = \varepsilon'(\varepsilon) < \varepsilon$, we get by (6.11)

$$0 \leq \limsup_{\varepsilon \to 0} \frac{\mathcal{F}(u_{x_0, \xi, \nu}, B_\varepsilon(x_0)) - \mathcal{F}(u_{x_0, \xi', \nu}, B_\varepsilon(x_0))}{\omega_{d-1} \varepsilon^{d-1} \varepsilon'(\varepsilon)^{d-1}} \leq \alpha^{-1} \beta \sigma(|\xi - \xi'|).$$

This gives (6.10). It thus remains to show (6.11). To this end, let $\delta > 0$ and choose $z \in PR(B_\varepsilon(x_0))$ with $z = u_{x_0, \xi, \nu}$ in a neighborhood of $\partial B_\varepsilon(x_0)$ and

$$\mathcal{F}(z, B_\varepsilon(x_0)) \leq \mathcal{F}_n(u_{x_0, \xi, \nu}, B_\varepsilon(x_0)) + \delta. \quad (6.12)$$

Clearly, in view of (H$_4$), $\mathcal{F}_n(u_{x_0, \xi, \nu}, B_\varepsilon(x_0)) \leq \omega_{d-1} \varepsilon^{d-1} \beta$ by taking $u_{x_0, \xi, \nu}$ as competitor. Therefore, (H$_4$) implies

$$\mathcal{H}^{d-1}(J_z) \leq (\omega_{d-1} \varepsilon^{d-1} \beta + \delta) \alpha^{-1}.$$
Let $P = \{z = \xi\}$ and note that $P$ is a set of finite perimeter. (In fact, up to set of negligible $\mathcal{L}^d$-measure, it coincides with one component of its pairwise distinct representation, see (3.11).) We define $z' = z + (\xi' - \xi)\chi_P$ and observe that $z' \in PR(B_\varepsilon(x_0))$ and that $z' = u_{x_0,\xi',\nu}$ in a neighborhood of $\partial B_\varepsilon(x_0)$. Moreover, we have $J_{z'} \subset J_z$, $[z'] = [z] \mathcal{H}^{d-1}$-a.e. on $J_{z'} \setminus \partial^* P$, and $[z'] = [z] + \xi - \xi' \mathcal{H}^{d-1}$-a.e. on $J_z \cap \partial^* P$. Since the functionals $\mathcal{F}_n$ satisfy (H$_5$) uniformly, we get

$$m_{\mathcal{F}_n}(u_{x_0,\xi',\nu}, B_\varepsilon(x_0)) \leq \mathcal{F}_n(z', B_\varepsilon(x_0)) \leq \mathcal{F}_n(z, B_\varepsilon(x_0)) + \int_{J_{z'} \cap \partial^* P} \sigma(|\xi' - \xi|) \, d\mathcal{H}^{d-1}.$$  

Then by (6.12) and (6.13) we derive

$$m_{\mathcal{F}_n}(u_{x_0,\xi',\nu}, B_\varepsilon(x_0)) \leq m_{\mathcal{F}_n}(u_{x_0,\xi,\nu}, B_\varepsilon(x_0)) + \delta + (\omega_{d-1}z^{d-1}\beta + \delta)\alpha^{-1}\sigma(|\xi' - \xi|).$$  

As $\delta > 0$ was arbitrary, we obtain one inequality in (6.11). The other inequality can be obtained in a similar fashion by interchanging the roles of $\xi$ and $\xi'$.  

The above proof makes use of the assumption (2.8), which is not a-priori guaranteed for our functionals, due to lack of coerciveness. As a matter of fact, we below prove that the first inequality in (2.8) holds always true in our setting. In the next section, we will then show how, under an additional assumption on $\mathcal{F}_n$ and for specific choices of $L$, also the second one can be confirmed. This yields a finer $\Gamma$-convergence result for those cases.

**Lemma 6.3** (Convergence of minima, upper bound). Let $\Omega \subset \mathbb{R}^d$ open, bounded with Lipschitz boundary. Let $\mathcal{F}_n : PR(\Omega) \times B(\Omega) \rightarrow [0, \infty)$ be a sequence of functionals satisfying (H$_1$), (H$_3$)–(H$_5$) for the same $0 < \alpha < \beta$ and $\sigma : [0, +\infty) \rightarrow [0, \beta]$. Let $\mathcal{F} : PR(\Omega) \times B(\Omega) \rightarrow [0, \infty]$ be the $\Gamma$-limit identified in Lemma 6.2. Then for all $A \in A_0(\Omega)$ and all $u \in PR(\Omega)$ we have

$$\limsup_{n \rightarrow \infty} m_{\mathcal{F}_n}(u, A) \leq m_{\mathcal{F}}(u, A).$$

**Proof.** Let $D \in A_0(\Omega)$ and let $\delta > 0$. (It will be convenient to view from a notational point of view to use $D$ instead of $A$.) Let $v \in PR(D)$ with $\mathcal{F}(v, D) \leq m_{\mathcal{F}}(u, D) + \delta$ and $v = u$ on $N$, where $N \subset D$ is a neighborhood of $\partial D$ such that $N \in A_0(\Omega)$ and

$$\mathcal{H}^{d-1}(J_v \cap N) = \mathcal{H}^{d-1}(J_u \cap N) \leq \delta. \quad (6.14)$$

Let $(v_n)_n \subset PR(D)$ be a recovery sequence for $v$, i.e.,

$$\int_D \psi(|v_n - v|) \, dx \rightarrow 0 \quad \text{for } n \rightarrow \infty, \quad (6.15)$$

where $\psi(t) := \frac{t}{1+t}$, and

$$\lim_{n \rightarrow \infty} \mathcal{F}_n(v_n, D) = \mathcal{F}(v, D) \leq m_{\mathcal{F}}(u, D) + \delta. \quad (6.16)$$

We need to adjust the boundary data of $v_n$ to obtain competitors for the minimization problems $m_{\mathcal{F}_n}(u, D)$. To this end, choose further neighborhoods $N', N'' \subset D$ of $\partial D$ satisfying $N'' \subset N' \subset \overline{N'} \subset N$ and $D \setminus \overline{N'} \setminus D \setminus \overline{N''} \in A_0(\Omega)$. We apply Lemma 4.13 with $A' = D \setminus \overline{N'}$, $A = D \setminus \overline{N''}$, $B = N$, and some $\eta > 0$ for the functions $u = v_n | A \in PR(A)$ and $v = v | B \in PR(B)$. We note that (4.13) is satisfied for $n$ sufficiently large since the right hand side is independent of $n$ and the left hand side converges to zero by (4.14) and (6.15). Consequently, we obtain a function $w_n \in PR(D)$, which satisfies $w_n = v = u$ on $N''$ by (4.17)(iii). Moreover, (4.17)(i) yields

$$\mathcal{F}_n(w_n, D) \leq \mathcal{F}_n(v_n, D) + \mathcal{F}_n(v, N) + (C_\delta + \mathcal{F}_n(v_n, D) + \mathcal{F}_n(v, N))(2\eta + \rho_n),$$

where $C_\delta \in (0, 1)$ is chosen such that $C_\delta < 1 - \delta$.
where $C_\delta$ depends on $D, N, N'$ (and thus on $\delta$), and $\rho_n$ is a sequence converging to zero by (4.8) and (6.15). In view of (6.14), (6.16), and the fact that (H$_4$) holds for each $\mathcal{F}_n$, we then derive
\[
\limsup_{n \to \infty} m_{\mathcal{F}_n}(u, D) \leq \limsup_{n \to \infty} \mathcal{F}_n(w_n, D) \leq (m_{\mathcal{F}}(u, D) + \delta + \beta \delta)(1 + 2\eta) + 2C_3\eta.
\]

Letting first $\eta \to 0$ and afterwards $\delta \to 0$, we obtain the desired inequality. □

7. Examples

In this final section, we focus on the case $L = \mathbb{R}^{d \times d}$ and $L = SO(d)$, with $d = 2, 3$, which is relevant from the point of view of the applications. We consider an additional assumption (H$_6$) (in the spirit of [25, 49]) for the functionals $\mathcal{F}_n$, and use it to truncate piecewise rigid functions at a low energy expense. This will allow us to overcome the lack of coercivity of our functionals, and to deduce the lower bound in the inequality (2.8) (see Lemma 7.5). With this, a full integral representation result for the $\Gamma$-limit holds true, which we state in Theorem 7.6.

7.1. Truncation. We point out that in general, for a sequence $(u_n)_n \subset PR_L(\Omega)$, the bound $\sup_n \int_{\Omega} \psi(|u_n|) < +\infty$ needed to apply Lemma 6.3(i) is not guaranteed by the growth condition (H$_4$). As a remedy, we will therefore truncate piecewise rigid functions in a suitable way. In this context, we will need to assume

(H$_0$) there exists $c_0 \geq 1$ such that for any $u, v \in PR_L(\Omega)$ and $S \in \mathcal{B}(\Omega)$ with the property $S \subset \{x \in J_u \cap J_v : c_0 \leq [v] \leq c_0^{-1}||u||\}$ we have
\[
\mathcal{F}(v, S) \leq \mathcal{F}(u, S).
\]

This condition can be interpreted as a kind of ‘monotonicity condition at infinity’ for the jump height. A similar assumption was used in [25, 49], we refer to [25, Remark 3.2, 3.3] for more details. Recall the constants $\beta, c_0$ in (H$_4$) and (H$_6$), respectively.

Lemma 7.1 (Truncation). Let $d = 2, 3$, let $\Omega \subset \mathbb{R}^d$ open, bounded with Lipschitz boundary, and let $L = \mathbb{R}^{d \times d}$ skew or $L = SO(d)$. Let $\theta > 0$. Then there exists $C_\theta = C_\theta(\theta, c_0, \Omega) > 0$ such that for every $u \in PR_L(\Omega)$ and every $\lambda \geq 1$ the following holds: there exist a rest set $R \subset \mathbb{R}^d$ with
\[
\mathcal{L}^d(R) \leq \theta(\mathcal{H}^{d-1}(J_u) + \mathcal{H}^{d-1}(\partial\Omega))^{d/(d-1)},
\]
\[
\mathcal{H}^{d-1}(\partial^* R) \leq \theta(\mathcal{H}^{d-1}(J_u) + \mathcal{H}^{d-1}(\partial\Omega)),
\]
and a function $v \in PR_L(\Omega) \cap L^\infty(\Omega; \mathbb{R}^d)$ such that
\begin{align*}
(i) \quad & \{u \neq v\} \subset R \cup \{|u| > \lambda\} \quad \text{up to a set of negligible } \mathcal{L}^d\text{-measure}, \\
(ii) \quad & \|v\|_{L^\infty(\Omega)} \leq C_\theta \lambda, \\
(iii) \quad & \mathcal{F}(v, \Omega) \leq \mathcal{F}(u, \Omega) + \beta \mathcal{H}^{d-1}(\partial^* R)
\end{align*}
for all $\mathcal{F}$ satisfying (H$_1$), (H$_3$), (H$_4$), and (H$_6$).

We remark that the function $v$ also lies in $SBV(\Omega; \mathbb{R}^d)$. For $L = SO(d)$ this is clear. For $L = \mathbb{R}^{d \times d}$ skew, this follows from the (much more general) embedding $SBD^2(\Omega) \cap L^\infty(\Omega; \mathbb{R}^d) \hookrightarrow SBV(\Omega; \mathbb{R}^d)$ (see [48, Theorem 2.7]) or from [34, Theorem 2.2].

Remark 7.2. In the statement of Lemma 7.1, we can additionally get that $R \subset \Omega$ if $L = SO(d)$, as we are going to show in the proof. In the case $L = \mathbb{R}^{d \times d}$ skew, our construction of $R$ might in principle not comply with the above inclusion. It can however be easily recovered a posteriori for many geometries of $\Omega$. Indeed, e.g., for convex $\Omega$, we can simply replace $R$ with $R \cap \Omega$ at the
expense of a larger, but still universal, constant in (7.1) and (7.2)(iii). This follows from the fact that
\[ \mathcal{H}^{d-1}(\partial \Omega \cap R) \leq C \mathcal{H}^{d-1}(\partial^* R). \]  
(7.3)

To see this, we fix a finite subset \( \tilde{S} \subset S^{d-1} \) and we first remark that, up to changing \( R \) on a null set, we can assume that, for \( \nu \in \tilde{S} \) and \( y \in \Pi_\nu := \{ x \in \mathbb{R}^d : \langle x, \nu \rangle = 0 \} \), either the line \( y + \mathbb{R} \nu \) intersects \( R \) on a set of positive Lebesgue measure, or has empty intersection therewith. If now \( \partial \Omega \cap R \cap (y + \mathbb{R} \nu) \neq \emptyset \), on the one hand the line intersects \( \partial \Omega \) at most twice (due to convexity). On the other hand, for \( \mathcal{H}^{d-1} \)-a.e. \( y \in \Pi_\nu \) with \( \partial \Omega \cap R \cap (y + \mathbb{R} \nu) \neq \emptyset \), applying slicing properties \([11] \) Theorem 3.108] for the BV function \( \chi_R \) we have
\[ \mathcal{H}^0((y + \mathbb{R} \nu) \cap \partial^* R) = \mathcal{H}^0(\partial^* ((y + \mathbb{R} \nu) \cap R)) \geq 2 \]
since \( (y + \mathbb{R} \nu) \cap R \) is bounded with positive measure. Thus, for each \( \nu \in \tilde{S} \) there holds by the Slicing Theorem (see, e.g., \([43] \) Theorem 3.2.22))
\[ \int_{\partial \Omega \cap R} |\nu \cdot \nu_\Omega| d\mathcal{H}^{d-1} = \int_{\Pi_\nu} \mathcal{H}^0((y + \mathbb{R} \nu) \cap \partial \Omega \cap R) d\mathcal{H}^{d-1}(y) \leq \int_{\Pi_\nu} \mathcal{H}^0((y + \mathbb{R} \nu) \cap \partial^* R) d\mathcal{H}^{d-1}(y) \leq \mathcal{H}^{d-1}(\partial^* R). \]

This applied for a finite collection of \( (\nu_i)_i \subset S^{d-1} \) such that \( \sup_i |\langle \nu, \nu_i \rangle| \geq \frac{1}{2} \) for all \( \nu \in S^{d-1} \) yields (7.3).

We point out that standard Lipschitz-truncation techniques in SBV, see \([23] \) Lemma 3.5] or \([25] \) Lemma 4.1], are not applicable here as they do not preserve the property that the function is piecewise rigid. The main idea in the construction consists in replacing the function \( u = \sum_j q_j \chi_{P_j} \) by a constant function on components where \( q_j \) is ‘too large’. Since the energy in general depends on the jump height, the energy is affected by such modifications. Thus, this constant has to be chosen in a careful way, and one needs to use \( (H_0) \) to ensure (7.2) (iii). In this context, it is essential to control the maximal and minimal values of \( q_j \) on each component \( P_j \) outside of a rest set \( R \) with small perimeter. To this aim, an additional tool is required when dealing with the case \( L = \mathbb{R}^{d \times d}_{skew} \), namely a careful decomposition of sets (Lemma (7.4) for which an additional rest set \( R_{aux} \) has to be introduced. Our construction is inspired by similar techniques used in \([49] \) Theorem 3.2] and \([51] \) Theorem 4.1].

While Lemma (7.1) can be proved directly in the case \( L = SO(d) \), so that a reader only interested in this case can now already skip to its proof, we need two auxiliary lemmas to deal with the case \( L = \mathbb{R}^{d \times d}_{skew} \). In the sequel, given \( Q \in \mathbb{R}^{d \times d}_{skew} \) and \( b \in \mathbb{R}^d \), we denote by \( \pi_{ker} Q(b) \in \mathbb{R}^d \) the orthogonal projection of \( b \) onto the kernel of \( Q \). Likewise, \( \pi_{ker} Q^\perp(b) \in \mathbb{R}^d \) denotes the projection on the orthogonal complement of \( ker Q \). The first lemma concerns a uniform control for an affine function \( q \) in terms of its minimal modulus on sets whose minimal and maximal distance from the affine space \( \{ q = \pi_{ker} Q(b) \} \) are comparable.

**Lemma 7.3 (Minimal and maximal values of rigid motions).** Let \( d = 2, 3 \), let \( E \subset \mathbb{R}^d \) be a set of finite perimeter, and let \( q = q_{Q, b} \) with \( Q \in \mathbb{R}^{d \times d}_{skew} \) such that
\[ \text{ess sup}_{x \in E} \text{dist}(x, \{ q = \pi_{ker} Q(b) \}) \leq C_0 \text{ess inf}_{x \in E} \text{dist}(x, \{ q = \pi_{ker} Q(b) \}) \]  
(7.4)
for some \( C_0 \geq 1 \). Then there holds
\[ ||q||_{L^\infty(E)} \leq C_0 \text{ess inf}_{x \in E} |q(x)|. \]
Proof. We start with \( d = 2 \). Without restriction we can suppose that \( Q \neq 0 \). Then \( Q \) is invertible, hence \( \ker Q = \{ 0 \} \), and \( \{ q = 0 \} = \{ z \} \) for \( z := -Q^{-1}b \). If \( |Q| \) denotes the Frobenius norm, we have \( |Qy| = \frac{\sqrt{T}}{2}|Q||y| \) for all \( y \in \mathbb{R}^2 \). Then the fact that \( q(z) = 0 \) implies
\[
|q(x)| = |q(x) - q(z)| = |Q(x - z)| = \frac{\sqrt{T}}{2}|Q||x - z| = \frac{\sqrt{T}}{2}|Q| \text{dist}(x, \{ q = 0 \}).
\]
By \( (\ref{eq:7.4}) \) this implies
\[
\text{ess inf}_{x \in E} |q(x)| = \frac{\sqrt{T}}{2}|Q| \text{ess inf}_{x \in E} \text{dist}(x, \{ q = 0 \}) \geq \frac{\sqrt{T}}{2C_0}|Q| \text{ess sup}_{x \in E} \text{dist}(x, \{ q = 0 \})
\]
\[
= \frac{1}{C_0} \| q \|_{L^\infty(E)}.
\]
(7.5)
This yields the statement for \( d = 2 \). The case \( d = 3 \) may simply be reduced to the two-dimensional problem by performing calculation \( (\ref{eq:7.5}) \) restricted to planes which are orthogonal to the line \( \{ q = \pi_{\ker Q}(b) \} \). (Note that \( \{ q = \pi_{\ker Q}(b) \} \) is one-dimensional unless \( Q = 0 \).)

Note that for \( Q \neq 0 \) we have \( \dim \{ q = \pi_{\ker Q}(b) \} = 0 \) if \( d = 2 \) and \( \dim \{ q = \pi_{\ker Q}(b) \} = 1 \) if \( d = 3 \). Property \( (\ref{eq:7.4}) \) can always be achieved by introducing a suitable partition of sets of finite perimeter, as the following lemma shows. Its proof is deferred to Appendix B.

Lemma 7.4 (Decomposition of sets). There exists a universal constant \( c > 0 \) such that the following holds for each \( 0 < \theta < 1 \):

(a) For each \( x_0 \in \mathbb{R}^2 \) and each indecomposable, bounded set of finite perimeter \( E \subset \mathbb{R}^2 \) there exists \( R \subset \mathbb{R}^2 \) with \( H^1(\partial^* R) \leq \theta H^1(\partial^* E) \) such that
\[
\text{ess sup}_{x \in E \setminus R} |x - x_0| \leq c\theta^{-1} \text{ess inf}_{x \in E \cap R} |x - x_0|.
\]
(7.6)

(b) For each line \( K = x_0 + \mathbb{R} \nu \subset \mathbb{R}^3 \), \( x_0, \nu \in \mathbb{R}^3 \), and each indecomposable, bounded set of finite perimeter \( E \subset \mathbb{R}^3 \) there exist pairwise disjoint sets of finite perimeter \( R \) and \( (D_j)_{j=1}^J \) satisfying \( \bigcup_{j=1}^J D_j \subset E \subset R \cup \bigcup_{j=1}^J D_j \) and
\[
H^2(\partial^* R) \leq \theta H^2(\partial^* E), \quad \sum_{j=1}^J H^2(\partial^* D_j \setminus \partial^* E) \leq \theta H^2(\partial^* E)
\]
(7.7)

such that
\[
\text{ess sup}_{x \in D_j} \text{dist}(x, K) \leq c\theta^{-3} \text{ess inf}_{x \in D_j} \text{dist}(x, K) \quad \text{for all } j = 1, \ldots, J.
\]
(7.8)

We now proceed with the proof of Lemma 7.4.

Proof of Lemma 7.4. We first provide the proof for \( L = \mathbb{R}^3_{\text{skew}} \). Then, we briefly indicate the necessary changes for the two-dimensional case \( L = \mathbb{R}^2_{\text{skew}} \). In both cases, an additional step using the previous lemmata is needed to construct an auxiliary rest set \( R_{\text{aux}} \) and to derive \( (\ref{eq:7.9}) - (\ref{eq:7.11}) \). We then sketch the proof for the nonlinear case \( L = SO(d) \), \( d = 2, 3 \), which follows by a similar argument but does not need Lemmata 7.3 and 7.4. We note that it suffices to prove the lemma for \( \theta \leq \theta_0 \) for some small \( \theta_0 \leq \frac{1}{2} \) depending on \( c_0 \) and \( \Omega \).

Proof for \( L = \mathbb{R}^3_{\text{skew}} \). Let \( u \in PR_L(\Omega) \) and let \( u = \sum_{i \in \mathbb{N}} q_i^l \chi_{P_i}^3 \) be an indecomposable representation (see Section 3.2). On each \( P_i^l \) with \( Q_i^l \neq 0 \), we have \( \dim \{ q_i^l = \pi_{\ker Q_i^l}(b_i^l) \} = 1 \). Hence, we may apply Lemma 7.4(b) for \( K = \{ q_i^l = \pi_{\ker Q_i^l}(b_i^l) \} \) to obtain a covering \( P_i^l \subset R_i \cup \bigcup_{j=1}^J D_j^i \) with \( D_j^i \subset P_i^l \), \( j = 1, \ldots, J_i \), satisfying \( (\ref{eq:7.7}) - (\ref{eq:7.8}) \). Otherwise, if \( Q_i^l = 0 \), it trivially holds \( \{ q_i^l = \pi_{\ker Q_i^l}(b_i^l) \} = \mathbb{R}^3 \). On such components \( P_i^l \), we simply set \( R_i = \emptyset \) and \( D_j^i = P_i^l \).
We define \( R_{\text{aux}} = \bigcup_{i \in \mathbb{N}} R_i \) and denote by \((P_j)_{j \in \mathbb{N}}\) the partition of \( \Omega \setminus R_{\text{aux}} \) consisting of the sets \((D_j^i \setminus R_{\text{aux}})_{i,j}\). For each \( j \in \mathbb{N} \), we let \( q_j = q_{i_j, b_j} = q_{i_j} \), where the index \( i_j \in \mathbb{N} \) is chosen such that \( P_j \subset P_{i_j} \). From (7.14)–(7.15) and Theorem 3.1, we then obtain

\[
\mathcal{H}^2(\partial^* R_{\text{aux}}) \leq \theta \sum_{i \in \mathbb{N}} \mathcal{H}^2(\partial^* P_i),
\]

\[
\sum_{j \in \mathbb{N}} \mathcal{H}^2\left( \partial^* P_j \setminus \bigcup_{i \in \mathbb{N}} \partial^* P_i \right) \leq \sum_{i \in \mathbb{N}} \sum_{j=1}^{J_i} \mathcal{H}^2(\partial^* D_j^i \setminus \partial^* P_i) + \mathcal{H}^2(\partial^* R_{\text{aux}}) \leq \theta \sum_{i \in \mathbb{N}} \mathcal{H}^2(\partial^* P_i) + \mathcal{H}^2(\partial^* R_{\text{aux}}) \leq 2\theta \sum_{i \in \mathbb{N}} \mathcal{H}^2(\partial^* P_i).
\]

Moreover, we have

\[
\text{ess sup}_{x \in P_j} \text{dist}(x, \{q_j = \pi_{\ker Q_j(b_j)}\}) \leq c\theta^{-3} \text{ess inf}_{x \in P_j} \text{dist}(x, \{q_j = \pi_{\ker Q_j(b_j)}\})
\]

for all \( j \in \mathbb{N} \). Indeed, if \( \dim\{q_j = \pi_{\ker Q_j(b_j)}\} = 1 \), (7.10) follows from (7.8) and the fact that \( P_j \subset D_k^i \) for some \( D_k^i \). If \( q_j = \pi_{\ker Q_j(b_j)} = \mathbb{R}^3 \), it is trivially satisfied. We also note that (3.2) (7.9), and Theorem 3.1 imply

\[
\sum_{j \in \mathbb{N}} \mathcal{H}^2(\partial^* P_j) \leq c \sum_{i \in \mathbb{N}} \mathcal{H}^2(\partial^* P_i) \leq c(\mathcal{H}^2(J_u) + \mathcal{H}^2(\partial\Omega)),
\]

where \( c > 0 \) is universal.

We define \( I_\lambda = \{ j \in \mathbb{N} : \|q_j\|_{L^\infty(P_j)} > \lambda^{-6}\} \) and introduce a decomposition of \( I_\lambda \) according to the \( L^\infty \)-norms of the rigid motions: for \( k \in \mathbb{N} \) we introduce the set of indices

\[
I_\lambda^k = \{ j \in I_\lambda : \lambda^{-6k} \leq \|q_j\|_{L^\infty(P_j)} \leq \lambda^{-6(k+1)} \}
\]

and define \( s_k = \sum_{j \in I_\lambda^k} \mathcal{H}^2(\partial^* P_j) \) for \( k \in \mathbb{N} \). By (7.11) we find some \( K_\theta \in \mathbb{N} \), \( K_\theta \leq \theta^{-1} \), such that

\[
s_{K_\theta} \leq c\theta(\mathcal{H}^2(J_u) + \mathcal{H}^2(\partial\Omega)).
\]

We define the index set

\[
I = \bigcup_{k > K_\theta} I_\lambda^k,
\]

and introduce the rest set

\[
R = \bigcup_{j \in I_{K_\theta}} P_j \cup R_{\text{aux}}.
\]

By Theorem 3.1, (7.9), (7.11), and (7.13) we find

\[
\mathcal{H}^2(\partial^* R) \leq \sum_{j \in I_{K_\theta}} \mathcal{H}^2(\partial^* P_j) + \mathcal{H}^2(\partial^* R_{\text{aux}}) \leq s_{K_\theta} + \theta \sum_{i \in \mathbb{N}} \mathcal{H}^2(\partial^* P_i) \leq c\theta(\mathcal{H}^2(J_u) + \mathcal{H}^2(\partial\Omega)).
\]

In view of Lemma 7.3 and (7.10), we obtain for each \( j \in I \)

\[
\|q_j\|_{L^\infty(P_j)} \leq \lambda^{-3} \text{ess inf}_{x \in P_j} \|q_j(x)\| \leq (3\theta^4)^{-1} \text{ess inf}_{x \in P_j} \|q_j(x)\|,
\]

where the last step holds for \( \theta_0 \) sufficiently small. We define \( U = R \cup \bigcup_{j \in I} P_j \) and get by (7.12), (7.14)–(7.16), and (7.17) that

(i) \( \|u\|_{L^\infty(\Omega \cap U)} \leq \lambda^{-6K_\theta} \),

(ii) \( \text{ess inf}\{\|u(x)\| : x \in \Omega \setminus R\} \geq 3\theta^4\lambda^{-6(K_\theta + 1)} = 3\lambda^{-6K_\theta - 2} \).

We define \( v \in PR_L(\Omega) \cap L^\infty(\Omega; \mathbb{R}^3) \) by

\[
v := u \chi_{\Omega \setminus U} + be_1 \chi_U, \quad \text{where } b := \lambda^{-6K_\theta - 1}.
\]
We now show (7.1) and start with (7.2). First, (7.2) (i) follows from (7.18) (ii). Setting $C_\theta = \theta^{-6}/\theta^{-1}$, (7.2) (ii) follows from (7.18) (i), (7.19), and the fact that $K_\theta \leq 1/\theta$.

We now address (7.2) (iii). As a preparation, we compare the jump sets of $u$ and $v$. First, (7.18) (i) and (7.19) show that $J_u \supset \partial^* U \cap \Omega$ up to an $\mathcal{H}^2$-negligible set. Choose the orientation of $\nu_v(x)$ for $x \in \partial^* U \cap \Omega$ such that $v^+(x)$ coincides with the trace of $v\chi_{\Omega \cup U}$ at $x$ and $v^-(x)$ coincides with the trace of $v\chi_{\Omega \cup U}$ at $x$. (The traces have to be understood in the sense of [11] Theorem 3.77.) Moreover, we suppose that $\theta \leq \theta_0 \leq 1/2$. For $\mathcal{H}^2$-a.e. $x \in (\partial^* U \cap \Omega) \setminus \partial^* R$ we derive by (7.18)–(7.19) and $[v](x) = v^+(x) - v^-(x) = bc_1 - u^-(x)$ that $\lambda\theta^{-6K_\theta} \leq b - ||u||_{L^\infty(\Omega \cup U)} \leq ||v||_{L^\infty(\Omega \cup U)} \leq 2\lambda\theta^{-6K_\theta} - 1$. We further observe by (7.12) and (7.14) that we have for each $x \in (\partial^* U \cap \Omega)$ the inequality

$$\lambda \theta^{-6K_\theta} \leq ||u||_{L^\infty(\Omega \cup U)} \leq ||v||_{L^\infty(\Omega \cup U)} \leq 2\lambda \theta^{-6K_\theta} - 1.$$ 

In a similar fashion, we obtain

$$\lambda \theta^{-6K_\theta} \leq ||u||_{L^\infty(\Omega \cup U)} \leq ||v||_{L^\infty(\Omega \cup U)} \leq 2\lambda \theta^{-6K_\theta} - 1.$$ 

Therefore, since $\lambda \geq 1$ and $K_\theta \geq 1$, we find

$$\theta^{-1} \leq ||v||(x) \leq \theta ||u||(x)$$

(7.20) for $\mathcal{H}^2$-a.e. $x \in (\partial^* U \cap \Omega) \setminus \partial^* R$. We are now in a position to show (7.2) (iii). By (H$_1$), (H$_3$), $u = v$ on $\Omega \setminus U$, and the fact that $v$ is constant on $U$, we get

$$\mathcal{F}(v, \Omega) = \mathcal{F}(v, (U)^1) + \mathcal{F}(v, (\Omega \setminus U)^1) + \mathcal{F}(v, \partial^* U \cap \Omega) = \mathcal{F}(u, (\Omega \setminus U)^1) + \mathcal{F}(v, \partial^* U \cap \Omega) \leq \mathcal{F}(u, (\Omega \setminus U)^1) + \mathcal{F}(v, \partial^* U \cap \Omega) + \mathcal{F}(v, (\partial^* U \cap \Omega) \cap \Omega) + \mathcal{F}(v, \partial^* R \cap \Omega).$$

By (H$_4$), (H$_6$), and (7.20) for $\theta$ sufficiently small such that $\theta^{-1} \geq c_0$ we get

$$\mathcal{F}(v, \Omega) \leq \mathcal{F}(u, (\Omega \setminus U)^1) + \mathcal{F}(u, (\partial^* U \setminus \partial^* R) \cap \Omega) + \beta \mathcal{H}^1(\partial^* R) \leq \mathcal{F}(u, \Omega) + \beta \mathcal{H}^1(\partial^* R),$$

where in the last step we again used (H$_1$) and the fact that $\mathcal{F}(u, (U)^1) \geq 0$. This concludes the proof of (7.2) (iii).

It remains to show (7.1). By (7.10) and the isoperimetric inequality we obtain the desired estimate with $c\theta$ in place of $\theta$. Clearly, the constant $c$ can be absorbed in $\theta$ by repeating the above arguments for $\theta/c$ in place of $\theta$. This concludes the proof for $L = \mathbb{R}^3_{\text{skew}}$.

Adaptions for $L = \mathbb{R}^2_{\text{skew}}$. For the two-dimensional case $L = \mathbb{R}^2_{\text{skew}}$, the following small adaptation is necessary: before (7.3), for components $P_j$ with $\dim\{q_j = 0\} = 0$ (i.e., $Q_j \neq 0$), we apply Lemma 7.4 (a) in place of Lemma 7.4 (b). (This case is even easier since the collection $(D_j)_j$ consists of one set only.)

Proof for $L = SO(d)$, $d = 2, 3$: Here, we do not need to introduce a decomposition using Lemma 7.4 and we can work directly with the indecomposable representation $u = \sum_{j \in \mathbb{N}} q_j \chi_{P_j}$. We define the index sets $I_\lambda$, the integer $K_\theta$, and the index set $I$ exactly as in (7.11)–(7.14). We set

$$R = \bigcup_{j \in I_\lambda}^k P_j.$$ 

Notice that, by construction, we have $R \subset \Omega$ as stated in Remark 7.2. By Theorem 3.1 and (7.13) we find

$$\mathcal{H}^{d-1}(\partial^* R) \leq \sum_{j \in I_\lambda} \mathcal{H}^{d-1}(\partial^* P_j) \leq s_{K_\theta} \leq \theta(\mathcal{H}^{d-1}(J_u) + \mathcal{H}^{d-1}(\partial\Omega)).$$ 

We further observe by (7.12) and (7.14) that we have for each $j \in I$ that $\|q_j\|_{L^\infty(P_j)} \geq \lambda \theta^{-6} \geq 2\dim(\Omega)$, where the second step holds for $\theta_0$ sufficiently small. As $q_j$ is an isometry, there holds

$$\|q_j\|_{L^\infty(P_j)} \leq \text{ess inf}_{x \in P_j} |q_j(x)| + \text{diam}(\Omega) \leq \text{ess inf}_{x \in P_j} |q_j(x)| + \frac{1}{2} \|q_j\|_{L^\infty(P_j)}.$$
which in turn implies \( \| q_j \|_{L^\infty(P_j)} \leq 2 \text{ess inf}_{x \in P_j} |q_j(x)| \) for all \( j \in I \). This inequality clearly yields (7.17). The result then follows by verbatim repeating the argument after (7.17). \( \square \)

7.2. A finer \( \Gamma \)-convergence result. We first show that, under assumption (H\(_0\)) and for \( L = \mathbb{R}^{d \times d}_{\text{skew}} \) or \( L = SO(d) \), \( d = 2, 3 \), the second inequality in (2.8) holds as a consequence of Lemma 7.1

**Lemma 7.5** (Convergence of minima, lower bound). Let \( d = 2, 3 \), and let \( L = \mathbb{R}^{d \times d}_{\text{skew}} \) or \( L = SO(d) \). Let \( \Omega \subset \mathbb{R}^d \) open, bounded with Lipschitz boundary. Let \( F_n : PR_1(\Omega) \times \mathcal{B}(\Omega) \to [0, \infty) \) be a sequence of functionals satisfying (H\(_1\)), (H\(_3\))–(H\(_6\)) for the same \( 0 < \alpha < \beta \), \( c_0 \geq 1 \), and \( \sigma : [0, +\infty) \to [0, \beta] \). Let \( F : PR_1(\Omega) \times \mathcal{B}(\Omega) \to [0, \infty) \) be the \( \Gamma \)-limit identified in Lemma 6.3. Then for each ball \( B_\varepsilon(x_0) \subset \Omega \) and all \( u \in PR_1(\Omega) \) we have

\[
\sup_{0 < \varepsilon' < \varepsilon} \liminf_{n \to \infty} m_{F_n}(u, B_{\varepsilon'}(x_0)) \geq m_F(u, B_{\varepsilon}(x_0)).
\]

**Proof.** For convenience, we again drop the subscript \( L \) in the proof and write \( A = B_\varepsilon(x_0) \). Let \( \theta > 0 \). Fix \( u \in PR(\Omega) \) and choose a ball \( A' := B_{\varepsilon'}(x_0) \), \( \varepsilon' < \varepsilon \), such that

\[
\mathcal{H}^{d-1}(J_u \cap (A \setminus A')) \leq \theta. \tag{7.21}
\]

As \( u \) is measurable, we may fix a nonnegative, monotone increasing, and coercive function \( \psi \) with

\[
\int_A \psi(|u|) \, dx < +\infty. \tag{7.22}
\]

Now, let \( u = \sum_{j \in \mathbb{N}} q_j \chi_{P_j} \) be the piecewise distinct representation. In view of Theorem 3.1 we can choose \( J \in \mathbb{N} \) sufficiently large such that the set \( S_0 := \cup_{j > J} P_j \) satisfies

\[
\mathcal{H}^{d-1}(J_u \cap (\partial^* S_0 \cup (S_0)^1)) \leq \theta, \tag{7.23}
\]

where \((S_0)^1\) denotes the set of points with density 1. Since \( J \) is finite, we may fix \( \lambda_0 \geq 1 \) such that

\[
\| u \|_{L^\infty(A \setminus S_0)} < \lambda_0. \tag{7.24}
\]

We now consider a sequence \((v_n)_n \subset PR(A')\) with \( v_n = u \) in a neighborhood \( N_n \subset A' \) of \( \partial A' \) and

\[
F_n(v_n, A') \leq m_{F_n}(u, A') + 1/n. \tag{7.25}
\]

Without restriction we can suppose that \( F_n(v_n, A') < +\infty \), i.e., \( \sup_n \mathcal{H}^{d-1}(J_{v_n}) < +\infty \) by (H\(_4\)). We apply Lemma 7.1 and Remark 7.2 with \( A' \) in place of \( \Omega \) and for \( \lambda = \lambda_0 \) on each \( v_n \) and find \( v_n' \in PR(A') \cap L^\infty(A'; \mathbb{R}^d) \) and sets of finite perimeter \( R_n^\theta \subset A' \) such that by (7.1) and (7.2)(iii)

\[
F_n(v_n', A') \leq C \theta, \quad \mathcal{H}^{d-1}(\partial^* R_n^\theta) \leq C \theta, \tag{7.26}
\]

where \( C \) depends on \( A \) and \( \sup_n \mathcal{H}^{d-1}(J_{v_n}) < +\infty \). Observe by (7.2)(i) that we have \( \{ v_n \neq v_n' \} \subset R_n^\theta \cup \{ |v_n| > \lambda_0 \} \), so that using (7.24) we deduce that \( v_n' = u \) on \( N_n \setminus (R_n^\theta \cup S_0) \).

We introduce the functions \( v_n^\theta \in PR(A) \) by

\[
v_n^\theta = \begin{cases} 
  u & \text{on } (A \setminus \overline{A'}) \cup S_0, \\
  v_n' & \text{else}.
\end{cases} \tag{7.27}
\]

By (H\(_1\)), (H\(_3\)), and (H\(_4\)) this implies

\[
F_n(v_n^\theta, A) \leq F(u, (A \setminus \overline{A'}) \cup (S_0)^1) + F_n(v_n', A' \cap (S_0)^0) + \beta \mathcal{H}^{d-1}(\partial^* S_0) + \beta \mathcal{H}^{d-1}(J_{v_n^\theta} \cap \partial A' \cap (S_0)^0), \tag{7.28}
\]

\( \square \)
where \((S_\theta)^0\) denotes the set of points with density 0. Since \(v_n = u\) on \(N_\theta \setminus (R_\theta^0 \cup S_\theta)\), we have \(J_{v_n} \cap \partial A' \cap (S_\theta)^0 \subset \partial^* R_n^0\). With this, using \((7.28)\), \((H_1)\), and \((H_4)\), we get
\[
\mathcal{F}_n(v_n^0, A) \leq \mathcal{F}_n(v_n^0, A') + \beta \mathcal{H}^{d-1}(J_{u} \cap (A \setminus A') \cup (S_\theta)^0) + \beta \mathcal{H}^{d-1}(\partial^* R_n^0).
\]
Therefore, by \((7.21)\), \((7.23)\), and \((7.26)\) we get
\[
\mathcal{F}_n(v_n^0, A) \leq \mathcal{F}_n(v_n, A^\prime) + C \beta \theta. \tag{7.29}
\]
Since \(\sup_n \mathcal{F}_n(v_n, A') < +\infty\), we get \(\sup_n \mathcal{H}^{d-1}(J_{\theta}) < +\infty\) by \((H_4)\) and \((7.29)\). By \((7.22)\) and the construction in \((7.27)\), it holds \(|v_n^\theta(x)| \leq \max\{C_\theta \lambda_\theta, |u(x)|\}\) for a.e. \(x \in A\), where \(C_\theta\) is the constant in \((7.2)\) (ii). With \((7.22)\) we then have \(\sup_n \int_A \psi(|v_n^\theta|) dx < +\infty\). Hence, we can apply Lemma \(6.3(i)\) to find \(v^\theta \in PR(A)\) such that, up to a subsequence (not relabeled), \(v_n^\theta \to v^\theta\) in measure on \(A\). Clearly, by \((7.27)\) we have \(v^\theta = u\) on \(A \setminus \overline{A^\prime}\). By \((6.0)\), \((7.25)\), and \((7.29)\) we get
\[
\mathcal{F}(v^\theta, A) \leq \liminf_{n \to \infty} \mathcal{F}_n(v_n^0, A) \leq \liminf_{n \to \infty} \mathcal{F}_n(v_n, A^\prime) + C \beta \theta \leq \liminf_{n \to \infty} m_{\mathcal{F}_n}(u, A^\prime) + C \beta \theta.
\]
As \(v^\theta = u\) in a neighborhood of \(\partial A\), we get
\[
m_{\mathcal{F}_n}(u, A) \leq \mathcal{F}(v^\theta, A) \leq \liminf_{n \to \infty} m_{\mathcal{F}_n}(u, A^\prime) + C \beta \theta \leq \sup_{0 < c < \epsilon} \liminf_{n \to \infty} m_{\mathcal{F}_n}(u, B_{c}(x_0)) + C \beta \theta,
\]
where in the last step we used that \(A' = B_{c}(x_0)\). By passing to \(\theta \to 0\) we conclude the proof. \(\square\)

By combining the above lemma with Theorem \(2.3\) and Lemma \(6.3\) we finally get a full integral representation result for the \(\Gamma\)-limit in the setting considered in this section.

**Theorem 7.6.** Let \(d = 2, 3\), and let \(L = \mathbb{R}^{d, \text{skew}}\) or \(L = SO(d)\). Let \(\Omega \subset \mathbb{R}^d\) open, bounded with Lipschitz boundary. Let \(\mathcal{F}_n : PR_L(\Omega) \times B(\Omega) \to [0, \infty)\) be a sequence of functionals satisfying \((H_1)\), \((H_3)\)–\((H_4)\) for the same \(0 < \alpha < \beta\), \(c_\theta \geq 1\), and \(\sigma : [0, +\infty) \to [0, \beta]\). Then there exists \(\mathcal{F} : PR_L(\Omega) \times B(\Omega) \to [0, \infty)\) satisfying \((H_1)\)–\((H_5)\) and a subsequence (not relabeled) such that
\[
\mathcal{F}(\cdot, A) = \Gamma^- \lim_{n \to \infty} \mathcal{F}_n(\cdot, A) \quad \text{with respect to convergence in measure on } A
\]
for all \(A \in A_0(\Omega)\). Moreover, \(\mathcal{F}\) admits the representation \((2.0)\)–\((2.7)\).

**Appendix A. Proof of Proposition 2.1**

**Proof.** We give the proof only for \(d = 3\) since it is similar and simpler for \(d = 2\). Consider the exponential map \(S \mapsto \exp(S)\), which is surjective from a compact subset of \(\mathbb{R}^{3, \text{skew}}\) to \(SO(3)\). Clearly, once we have proved property \((2.2)\) for \(\exp\), the desired map \(\Psi_L\) can be defined as the composition of \(\exp\) with the canonical isomorphism between \(\mathbb{R}^{3, \text{skew}}\) and \(\mathbb{R}^3\). Throughout the proof, we denote by \(|\cdot|\) the Frobenius norm of a matrix, by \(|\cdot|\) its spectral norm, and with \(c_2 \in (0, 1)\) an equivalence constant between the two norms. Since in this case \(r_L < +\infty\) (we can take for instance \(r_L = 2\pi\)), up to rescaling the constant, it is equivalent to prove \((2.2)\) for a ball of radius \(c_0\) in place of \(c_L r_L\).
We start by fixing $c_0 < \frac{1}{2}$ and $\hat{R} \in SO(3)$. If $|\hat{R} - I| \leq \frac{1}{2}$, then $|R - I| < \frac{3}{4}$ for all $R \in B_{c_0}(\hat{R})$: therefore, a smooth inverse given by a matrix logarithm is well-defined in $B_{c_0}(\hat{R})$ through the usual Taylor expansion around the identity. By its smoothness it clearly satisfies \(^{(22)}\).

We therefore focus on the case where $|\hat{R} - I| > \frac{1}{2}$. Since $c_0 < \frac{1}{4}$, there holds
\[
|R - I| \geq \frac{1}{4} \quad \text{for all} \quad R \in B_{c_0}(\hat{R}).
\] (A.1)

In view of Rodrigues’ rotation formula and the power series expansion of exp, for each $R \in B_{c_0}(\hat{R}) \cap SO(3)$ there exists a unit vector $n_R$ and an angle $\theta_R$ such that
\[
R = I + \sin(\theta_R) N_R + (1 - \cos(\theta_R)) N_R^2 = \exp(\theta_R N_R),
\] (A.2)

where $N_R \in \mathbb{R}^{3 \times 3}_{skew}$ denotes the unique matrix with $N_R u = n_R \times u$ for all $u \in \mathbb{R}^3$. In particular, for each $u \in \mathbb{R}^3$ there holds with the help of the Graßmann identity $n_R \times (n_R \times u) = n_R (n_R, u) - u$
\[
Ru = \cos(\theta_R) u + \sin(\theta_R) (n_R \times u) + \langle n_R, u \rangle (1 - \cos(\theta_R)) n_R.
\] (A.3)

Thus, our goal is to specify the choice of $N_R$ and $\theta_R$. The desired matrix $S_R \in \mathbb{R}^{3 \times 3}_{skew}$ is then defined by $S_R = \theta_R N_R$ since $\exp(S_R) = R$, see \((A.2)\). We start with some preliminary facts (Step 1). Then, we define the map $R \mapsto S_R$ on $B_{c_0}(\hat{R}) \cap SO(3)$ and show that it is Lipschitz (Step 2).

**Step 1: Preliminary facts.** Let $R \not\equiv I$ be a rotation. Then there exists a unit eigenvector $n$ of $R$ with eigenvalue 1 which corresponds to the rotation axis. Let $n^\perp = \{ w \in \mathbb{R}^3 : \langle n, w \rangle = 0 \}$. Since $Rn = n$, for all $w \in n^\perp$ with $|w| = 1$ there holds that
\[
|\langle R - I \rangle w | = | R - I |_2
\] (A.4)
is constant with respect to $w$. Indeed, the fact that $|\langle R - I \rangle w |$ is constant follows from the Rodrigues’ rotation formula \((A.3)\), and the second implication immediately follows by the definition of the spectral norm. Notice also that for $R, n$ as before, and for all $w \in n^\perp$ with $|w| = 1$ it holds $|\langle R - I \rangle w |^2 = -2 |\langle R - I \rangle w, w |$ since $R$ is a rotation. Combining with \((A.4)\) we get
\[
\langle (R - I)w, w \rangle = -\frac{1}{2} | R - I |_2^2.
\] (A.5)

As a further preparation, we show that for $R_1, R_2 \in B_{c_0}(\hat{R}) \cap SO(3)$ there holds
\[
\sqrt{1 - |\langle n_1, n_2 \rangle|^2} \leq 4c_2^{-1} | R_1 - R_2 | \leq 8c_2^{-1} c_0,
\] (A.6)
where $n_i$ are unit eigenvectors of $R_i$ with eigenvalue 1 for $i = 1, 2$. The second inequality is clear. To see the first, by $R_2 n_2 = n_2$ we get on the one hand
\[
|\langle R_1 - I \rangle n_2 | = |\langle R_1 - R_2 \rangle n_2 | \leq | R_1 - R_2 |.
\]

On the other hand, writing $n_2 = \mu n_1 + \sqrt{1 - \mu^2} y$, where $\mu = |\langle n_1, n_2 \rangle|$ and $y \in n^\perp$ with $|y| = 1$, we have by \((A.1), (A.3)\), and $R_1 n_1 = n_1$
\[
|\langle R_1 - I \rangle n_2 | = \sqrt{1 - \mu^2} |\langle R_1 - I \rangle y | = \sqrt{1 - \mu^2} |R_1 - I |_2 \geq c_2 \sqrt{1 - \mu^2} |R_1 - I | \geq \frac{1}{4} c_2 \sqrt{1 - \mu^2}.
\]

where we also used $| \cdot |_2 \geq c_2 | \cdot |$. By combining the two estimates we get \((A.6)\).

**Step 2: Construction of the inverse mapping.** Given $\hat{R}$, we define a positive orthonormal basis $\{ \check{n}, \check{w}, \check{z} \}$ of $\mathbb{R}^3$ with $\hat{R} \check{n} = \check{n}$. Consider $R \in B_{c_0}(\hat{R}) \cap SO(3)$ and let $n$ be a unit vector with $Rn = n$. Provided that we let $c_0 \leq c_2/16$, $n$ can be chosen such that $\langle \check{n}, \check{n} \rangle \geq \frac{3}{4}$, see \((A.6)\). We define a positive orthonormal basis $\{ n, w, z \}$ by $w = (\check{z} \times n)/| \check{z} \times n |$ and $z = n \times w$. Since $R \in SO(3)$ and $Rn = n$, the vectors $\{ n, Rw, Rz \}$ form a positive orthonormal basis of $\mathbb{R}^3$ as well. Hence, we get the equalities
\[
Rw = \langle Rw, w \rangle w + \langle Rw, z \rangle z, \quad Rz = -\langle Rw, z \rangle w + \langle Rw, w \rangle z.
\]
Now, the point $(\langle Rw, w \rangle, \langle Rw, z \rangle)$ lies in $S^1$. By an elementary computation along with [A.1] and [A.5] we get
\[
|\langle (Rw, w) \rangle, \langle Rw, z \rangle \rangle - (1, 0)| = \sqrt{2|I - R|w, w| = |R - I|2 \geq c_2|R - I| \geq c_2/4.
\]
Hence, we can consider a smooth inverse $\Theta$ of the mapping $\theta \mapsto (\cos(\theta), \sin(\theta))$ defined on $S^1 \setminus B_{c_2/4}(1, 0)$ and with values in a compact interval of the form $[\eta, 2\pi - \eta]$. We define
\[
\theta_R = \Theta(\langle (Rw, w) \rangle, \langle Rw, z \rangle). 
\]
(A.7)
The function $\Theta$ can be taken globally Lipschitz on its domain since the latter is at positive distance at (1, 0).

Summarizing, given $R \in B_{c_0}(\hat{R}) \cap SO(3)$, we let $n_R = n$ with $Rn = n$, $|n| = 1$, $N_R \in \mathbb{R}^{3 \times 3}$ with $N_Ru = n_R \times u$ for all $u \in \mathbb{R}^3$, $\theta_R$ as in [A.7], and $S_R = \theta_R N_R$. Recall that $R = \exp(S_R)$, see [A.2]. Finally, to check that $R \mapsto S_R$ is Lipschitz, we first note that $R \mapsto n_R$ is Lipschitz. Indeed, let $n_1$ and $n_2$ be the rotation axes corresponding to $R_1$ and $R_2$ with $\langle n_i, \bar{n} \rangle \geq \frac{\pi}{4}$ for $i = 1, 2$. Then it is elementary to check that $n_1 - n_2 \geq 1$ and $n_1 - \bar{n} \geq \frac{1}{4} \geq 0$. By [A.9] we then get
\[
|n_1 - n_2| = \sqrt{2 - 2(n_1, n_2)} \leq \sqrt{2(1 + (n_1, n_2))(1 - (n_1, n_2))} \leq 4\sqrt{2}c_1 |R_1 - R_2|.
\]
(A.8)
In a similar fashion, $R \mapsto \theta_R$ is Lipschitz with $\theta_R$ from [A.7]. In fact, $\Theta$ is globally Lipschitz on $S^1 \setminus B_{c_2/4}(1, 0)$, and by construction together with [A.8] there holds
\[
|w_1 - w_2| \leq C|R_1 - R_2|, \quad |z_1 - z_2| \leq C|R_1 - R_2|
\]
for some universal $C > 0$, where $w_i = (\bar{z} - n_i)/|\bar{z} - n_i|$ and $z_i = n_i \times w_i$ for $i = 1, 2$. 

APPENDIX B. PROOF OF LEMMA 7.4

Proof. For the proof we use the notation $\text{diam}(F) = \text{ess sup}\{|x - y| : x, y \in F\}$ and
\[
\text{diam}_1(F) = \text{ess sup}\{|\langle x - y, e_1 \rangle| : x, y \in F\}
\]
for bounded, measurable sets $F \subset \mathbb{R}^d, d = 2, 3$.

Part (a) relies on the property that for each indecomposable, bounded set of finite perimeter $E$ one has
\[
\text{diam}(E) \leq \mathcal{H}^1(\partial^* E). \quad (B.1)
\]
For a proof we refer to [52] Proposition 12.19, Remark 12.28. Then the statement follows simply by letting $R = B_r(x_0)$ be the circle with center $x_0$ and radius $r = \frac{1}{\theta} \text{diam}(E)$. Then [B.1] implies $\mathcal{H}^1(\partial R) \leq \theta \mathcal{H}^1(\partial^* E)$ and [E.6] holds since
\[
\text{ess sup}_{x \in E \setminus R}|x - x_0| \leq \text{ess inf}_{x \in E \setminus R}|x - x_0| + \text{diam}(E) \leq (1 + 2\pi \theta^{-1}) \text{ess inf}_{x \in E \setminus R}|x - x_0|.
\]
For (b), we may suppose that $K = \mathbb{R} \times \{(0, 0)\}$ after applying an isometry. The proof is considerably more difficult than the one in (a) since an estimate of the form $[B.1]$ is wrong in general and the object
\[
r := (\text{diam}_1(E))^{-1} \mathcal{H}^2(\partial^* E)
\]
(B.2)
might be much smaller than 1. To this end, we will first need to construct a decomposition of $E$ into pieces with smaller diameter in $e_1$ direction (Step 1) which allows us to control the relation of perimeter and $\text{diam}_1$ (see Step 2). Afterwards, a further tubular decomposition of each of these pieces is needed (Step 3). In Step 4 we will finally show that the constructed partition satisfies (L7) - (L8). Throughout Steps 1 - 2 we will assume that $\text{diam}_1(E) > 2\mathcal{H}^2(\partial^* E) \frac{1}{2}$, so that in particular $\text{diam}_1(E) > 0$ and $\text{diam}_1(E) > 4r$. If instead $\text{diam}_1(E) \leq 2\mathcal{H}^2(\partial^* E) \frac{1}{2}$ holds, one can
directly skip to Step 3, consider a single $T_1 = E$ in Step 3 - 4, and observe that in this case \[ (B.10) \] is clearly satisfied for $\theta \leq c_{\pi, 2}$, where this latter is the isoperimetric constant in the plane.

**Step 1 (Cutting in $e_1$ direction):** The goal of this step is to construct a decomposition of $E$ into pairwise disjoint sets $(T_i)_{i=1}^I$ of the form $T_i = E \cap ((t_{i-1}, t_i) \times \mathbb{R}^2)$, $i = 1, \ldots, I$, for suitable $t_0 < t_1 < \ldots < t_I$, which satisfy

$$ \sum_{i=1}^I \mathcal{H}^2(\partial^* T_i \setminus \partial^* E) \leq c \mathcal{H}^2(\partial^* E) \quad (B.3) $$

for a universal constant $c > 0$ and

$$ \mathcal{H}^2(E \cap ((t) \times \mathbb{R}^2)) > \theta \mathcal{H}^2(\partial^* E \cap ((t_{i-1}, t_i) \times \mathbb{R}^2)) \text{ for } \mathcal{H}^1\text{-a.e. } t_{i-1} + r \leq t \leq t_i - r. \quad (B.4) $$

We point out that $\text{diam}_1(T_i) = t_i - t_{i-1} < 2r$ is possible. In this case, condition \[ (B.4) \] is trivial.

To achieve this, we perform an iterative decomposition of the set $E$. Choose the largest $t' \in \mathbb{R}$ and the smallest $t'' > t'$ such that $E \subset (t', t'') \times \mathbb{R}^2$ up to a set of negligible $\mathcal{L}^1$-measure. We start to construct a first auxiliary decomposition $(S_j)_{j=1}^J$. We describe the first step of the construction of $(S_j)_{j=1}^J$ in detail: choose $s_1 \in (t', t'')$ such that

(i) $\mathcal{H}^2(E \cap ((s_1) \times \mathbb{R}^2)) \leq 2\theta \mathcal{H}^2(\partial^* E \cap ((t', s_1) \times \mathbb{R}^2))$ or $s_1 = t''$,

(ii) $\mathcal{H}^2(E \cap ((t) \times \mathbb{R}^2)) > 2\theta \mathcal{H}^2(\partial^* E \cap ((t', t) \times \mathbb{R}^2))$ for $\mathcal{H}^1\text{-a.e. } t' + r \leq t \leq s_1 - r. \quad (B.5) $  

In fact, this is possible: let $M = \{ t \in (t' + r, t'') : \mathcal{H}^2(E \cap ((t) \times \mathbb{R}^2)) \leq 2\theta \mathcal{H}^2(\partial^* E \cap ((t', t) \times \mathbb{R}^2)) \}$. If $M \neq \emptyset$, select $s_1 \in M$ such that $(t' + r, s_1 - r) \cap M = \emptyset$. (This is indeed possible by choosing $s_1 \in M \cap [\inf M, \inf M + r]$.) As pointed out below \[ (B.3) \], $s_1 - t' < 2r$ is admissible. In this case, the interval is empty and condition \[ (B.5) \] (ii) is trivial.) If $M = \emptyset$, let $s_1 = t''$. Define $S_1 := ((t', s_1) \times \mathbb{R}^2) \cap E$. Observe that this also implies $\text{diam}_1(S_1) \geq r$.

We now proceed iteratively: suppose that $(S_j)_{j=1}^J$ have been defined and let $E_k = E \setminus \bigcup_{j=1}^k S_j$. As long as $\text{diam}_1(E_k) > r$, we then repeat the above procedure for $E_k$ in place of $E$. Hereby, after a finite number of iterations, we obtain a decomposition $E = \bigcup_{j=1}^J S_j$, where $\text{diam}_1(S_j) \geq r$ for all $j = 1, \ldots, J - 1$. (Note that the control from below by $r$ on $\text{diam}_1$ ensures that the iteration procedure stops after a finite number of steps.) Setting $s_0 = t'$ and $s_J = t''$ for convenience, we find by \[ (B.5) \] (ii)

$$ \mathcal{H}^2(E \cap ((t) \times \mathbb{R}^2)) > 2\theta \mathcal{H}^2(\partial^* E \cap ((s_{j-1}, t) \times \mathbb{R}^2)) \text{ for } \mathcal{H}^1\text{-a.e. } s_{j-1} + r \leq t \leq s_j - r \quad (B.6) $$

for all $j = 1, \ldots, J$. Moreover, by using \[ (B.5) \] (i) (with $s_{j-1}$ and $s_j$ in place of $t'$ and $s_1$) we get

$$ \sum_{j=1}^J \mathcal{H}^2(\partial^* S_j \setminus \partial^* E) \leq 2 \sum_{j=1}^J \mathcal{H}^2(E \cap ((s_j) \times \mathbb{R}^2)) $$

$$ \leq 4\theta \sum_{j=1}^J \mathcal{H}^2(\partial^* E \cap ((s_{j-1}, s_j) \times \mathbb{R}^2)) \leq 4\theta \mathcal{H}^2(\partial^* E). \quad (B.7) $$

We now repeat the above procedure for each $S_j$ in place of $E$ starting from the right instead of from the left: the first set in the decomposition of each $S_j$ is obtained by choosing $s_j^1 \in [s_{j-1}, s_j)$ such that

(i) $\mathcal{H}^2(S_j \cap ((s_j^1) \times \mathbb{R}^2)) \leq 2\theta \mathcal{H}^2(\partial^* S_j \cap ((s_j^1, s_j) \times \mathbb{R}^2))$ or $s_j^1 = s_{j-1},$ \quad (B.8)

(ii) $\mathcal{H}^2(S_j \cap ((t) \times \mathbb{R}^2)) > 2\theta \mathcal{H}^2(\partial^* S_j \cap ((t, s_j) \times \mathbb{R}^2))$ for $\mathcal{H}^1\text{-a.e. } s_j^1 + r \leq t \leq s_j - r.$

We set $S_j^k := (s_j^1, s_j) \cap S_j = (s_j^1, s_j) \cap E$ and proceed iteratively as before to define sets $(S_j^k)_{k \geq 1}$ of the form $S_j^k = ((s_j^{k+1}, s_j^k) \times \mathbb{R}^2) \cap E$. 

For convenience, we denote the decomposition \((S_j^{k})_{j,k}\) of \(E\) by \((T_i)_{i=1}^{I}\) and observe that there exist \(t' = t_0 < t_1 < \ldots < t_J = t''\) such that \(T_i = E \cap ((t_{i-1}, t_i) \times \mathbb{R}^2)\) for all \(i = 1, \ldots, I\).

We show \([B.4]\): first, by \([B.6]\) and the fact that \((s_j^{k+1}, t) \in (s_{j-1}, t)\) for all \(s_j^{k+1} + r \leq t \leq s_j^{k} - r\) we get
\[
\mathcal{H}^2\left(E \cap ((t) \times \mathbb{R}^2)\right) > 2\theta \mathcal{H}^2\left(\partial^* E \cap ((t_{i-1}, t) \times \mathbb{R}^2)\right) \quad \text{for } \mathcal{H}^1\text{-a.e. } t_{i-1} + r \leq t \leq t_i - r.
\]

The fact that in \([B.5]\) (ii) we may replace \(S_j\) by \(E\) without changing the estimate yields
\[
\mathcal{H}^2\left(E \cap ((t) \times \mathbb{R}^2)\right) > 2\theta \mathcal{H}^2\left(\partial^* E \cap ((t, t_i) \times \mathbb{R}^2)\right) \quad \text{for } \mathcal{H}^1\text{-a.e. } t_{i-1} + r \leq t \leq t_i - r.
\]

Combining the previous two estimates and using that \(\mathcal{H}^2(\partial^* E \cap ((t) \times \mathbb{R}^2)) = 0\) for \(\mathcal{H}^1\text{-a.e. } t\), we get \([B.4]\). Moreover, repeating the argument \([B.7]\) we derive
\[
\sum_{k \geq 1} \mathcal{H}^2(\partial^* S_j^k \setminus \partial^* S_j) \leq 4\theta \mathcal{H}^2(\partial^* S_j)
\]
for all \(j = 1, \ldots, J\). Then from \([B.7]\) and \([B.9]\) we obtain
\[
\sum_{i=1}^{I} \sum_{j=1}^{J} \mathcal{H}^2(\partial^* T_i \setminus \partial^* E) + \sum_{j=1}^{J} \sum_{k \geq 1} \mathcal{H}^2(\partial^* S_j^k \setminus \partial^* S_j) \\
\leq 4\theta \mathcal{H}^2(\partial^* E) + \sum_{j=1}^{J} \mathcal{H}^2(\partial^* S_j) \leq 4\theta \left(\mathcal{H}^2(\partial^* E) + 2\mathcal{H}^2\left(\bigcup_{j=1}^{J} \partial^* S_j\right)\right) \\
\leq 12\theta \mathcal{H}^2(\partial^* E) + 8\theta \sum_{j=1}^{J} \mathcal{H}^2(\partial^* S_j) \leq (12\theta + 32\theta^2) \mathcal{H}^2(\partial^* E),
\]
where we also used that each \(x \in \mathbb{R}^3\) lies in at most two different \(\partial^* S_j\). This yields \([B.3]\).

Step 2 (Relation of \(\text{diam}_1\) and perimeter): We now prove a fundamental \(\text{diam}_1\)-perimeter-relation of the sets \((T_i)_{i=1}^{I}\) which have been constructed in Step 1: each \(T_i\) with \(\text{diam}_1(T_i) \geq 4R\) satisfies
\[
\text{diam}_1(T_i) \leq 2\sqrt{c_{\pi,2}\sigma_i/\theta},
\]
where \(c_{\pi,2}\) denotes the isoperimetric constant in dimension two and for brevity we use the notation
\[
\sigma_i := \mathcal{H}^2(\partial^* E \cap ((t_{i-1}, t_i) \times \mathbb{R}^2)).
\]

We prove \([B.10]\). Since we are assuming \(\text{diam}_1(T_i) \geq 4\theta\), \([B.4]\) is nontrivial and yields
\[
\theta \sigma_i < \mathcal{H}^2(\cap ((t) \times \mathbb{R}^2))
\]
for \(\mathcal{H}^1\text{-a.e. } t_{i-1} + r \leq t \leq t_i - r\). Thus, the isoperimetric inequality in dimension two applied on the sets \(E \cap ((t) \times \mathbb{R}^2)\) implies for \(\mathcal{H}^1\text{-a.e. } t_{i-1} + r \leq t \leq t_i - r\) that
\[
\theta \sigma_i \leq c_{\pi,2}\left(\mathcal{H}^1(\partial^* E \cap ((t) \times \mathbb{R}^2))\right)^2.
\]

We recall that the coarea formula on rectifiable sets (see, e.g., \([52\text{ Theorem 18.8 and Formula (18.25)]}\)) gives, for all \(a, b \in \mathbb{R}\), that
\[
\mathcal{H}^2(\partial^* E \cap ((a, b) \times \mathbb{R}^2)) \geq \int_{a}^{b} \mathcal{H}^1(\partial^* E \cap ((t) \times \mathbb{R}^2)) dt = \int_{a}^{b} \mathcal{H}^1(\partial^* E \cap ((t) \times \mathbb{R}^2)) dt,
\]
where the last equality is proved, for instance, in \([52\text{ Theorem 18.11}]\). With this, by using \(t_i - t_{i-1} - 2r = \text{diam}_1(T_i) - 2r \geq \text{diam}_1(T_i)/2\) and by integrating from \(t_{i-1} + r\) to \(t_i - r\) we find
\[
\frac{1}{2}\text{diam}_1(T_i)\sqrt{\theta \sigma_i} \leq (t_i - t_{i-1} - 2r)\sqrt{\theta \sigma_i} \leq \sqrt{c_{\pi,2}} \int_{t_{i-1} + r}^{t_i - r} \mathcal{H}^1(\partial^* E \cap ((t) \times \mathbb{R}^2)) dt \leq \sqrt{c_{\pi,2}}\sigma_i,
\]
where the last step follows from the shorthand \([B.11]\). This yields \([B.10]\) and concludes the proof of this step.
Step 3 (Tubular covering of each $T_i$): Consider $T_i = ((t_{i-1}, t_i) \times \mathbb{R}^2) \cap E$. For notational convenience, we will often not add indices $i$, even if the following objects depend on $i$. We set $w_j = j^{\theta^3} \|H^2(\partial^* T_i)\|^{1/2}$ for all $j \in \mathbb{N}$. We introduce the function $f : \mathbb{R}^3 \to \mathbb{R}$ defined by $f(x) = \text{dist}(x, \mathcal{R} e_1) = \sqrt{x_2^2 + x_3^2}$ for $x \in \mathbb{R}^3$. We now decompose $T_i$ into sublevel sets of the function $f$: define $z_0 = \theta^3 \|H^2(\partial^* T_i)\|^{1/2}$ and choose $z_j \in (w_j, w_{j+1})$ for $j \in \mathbb{N}$ such that

$$\mathcal{H}^2(\{ f = z_j \} \cap T_i) \leq \frac{1}{w_{j+1} - w_j} \int_{w_j}^{w_{j+1}} \mathcal{H}^2(\{ f = z \} \cap T_i) \, dz = \frac{1}{w_1} \int_{w_j}^{w_{j+1}} \mathcal{H}^2(\{ f = z \} \cap T_i) \, dz,$$

where the last step follows from the definition of $w_j$.

We define a covering of $T_i$ by setting $U_0^i := ((t_{i-1}, t_i) \times \mathbb{R}^2) \cap \{ f \leq z_0 \}$ and $U_j^i := T_i \cap \{ z_{j-1} < f \leq z_j \}$ for $j \geq 1$. We observe that this decomposition is finite since $E$ (and thus $T_i$) is a bounded set in $\mathbb{R}^3$. For later purposes, we observe that

$$\inf_{x \in U_j^i} f(x) \geq z_0 = \theta^3 w_1 = \frac{1}{2} \theta^3 w_2 \geq \frac{1}{2} \theta^3 w_1 \geq \frac{1}{2} \theta^3 \sup_{x \in U_j^i} f(x),$$

and in a similar fashion, for all $j \geq 2$,

$$\inf_{x \in U_j^i} f(x) \geq z_{j-1} \geq w_{j-1} = \frac{j - 1}{j + 1} w_{j+1} \geq \frac{1}{3} \sup_{x \in U_j^i} f(x).$$

(Clearly, the above property is false for $U_0^i$. ) We now estimate the perimeter of the sets $(U_j^i)_{j \geq 0}$. First, observe that by construction we clearly have $\sigma_i \leq \mathcal{H}^2(\partial^* T_i)$, where $\sigma_i$ was defined in \eqref{B.11}. Moreover, by \eqref{B.10} we get $diam(1(T_i)) \leq 2\sqrt{c_{r,2} \sigma_i} \theta$ if $diam(1(T_i)) \geq 4r$ and $diam(1(T_i)) \leq 2\sqrt{c}\diam(1(T_i))^{1/2}$ otherwise. To summarize both cases, by recalling the previous observation, we can write

$$\diam(1(T_i)) \leq 2\sqrt{c_{r,2}/\theta \mathcal{H}^2(\partial^* T_i)^{1/2}} + 2\sqrt{c}\diam(1(T_i))^{1/2}.$$

Thus, recalling $z_0 = \theta^3 \|H^2(\partial^* T_i)\|^{1/2}$ we can estimate the perimeter of the cylinder $U_0^i$ by

$$\mathcal{H}^2(\partial^* U_0^i) = 2 \cdot \pi z_0^2 \pi z_0 \diam(1(T_i)) \leq c \theta \mathcal{H}^2(\partial^* T_i) + c \theta \mathcal{H}^2(\partial^* T_i)^{1/2} \diam(1(T_i)) \leq c \theta \mathcal{H}^2(\partial^* T_i) + c \theta (\mathcal{H}^2(\partial^* T_i))^{1/2} \sqrt{\diam(1(T_i))^{1/2}},$$

where in the last step we suitably enlarged the absolute constant $c$ and also used $\theta^m \leq \theta$ for $m \geq 1$. By using \eqref{B.12} and the coarea formula we get

$$\mathcal{H}^2(\partial^* U_0^i \setminus \partial^* T_i) \leq 2 \sum_{j \geq 1} \mathcal{H}^2(\{ f = z_j \} \cap T_i) \leq \frac{2}{w_1} \int_0^{\infty} \mathcal{H}^2(\{ f = z \} \cap T_i) \, dz = \frac{2}{w_1} \mathcal{L}^3(T_i),$$

since $|\nabla f| = 1$ a.e. in $\mathbb{R}^3$. Then the isoperimetric inequality in dimension three applied on the set $T_i$ yields

$$\sum_{j \geq 1} \mathcal{H}^2(\partial^* U_j^i \setminus \partial^* T_i) \leq \frac{2c_{r,3}}{w_1} \mathcal{H}^2(\partial^* T_i)^{3/2} \leq 2c_{r,3} \theta \mathcal{H}^2(\partial^* T_i),$$

where $c_{r,3}$ denotes the isoperimetric constant in dimension three. Here, in the last step we used the definition $w_1 = \theta^{-1}(\mathcal{H}^2(\partial^* T_i))^{1/2}$.

Step 4 (Conclusion): We are now in a position to define the covering of $E$ and to confirm \eqref{7.7}–\eqref{7.8}. Define $R = \bigcup_{i=1}^{I} U_0^i$ and let $(D_j)_{j=1}^I$ be the partition of $E \setminus R$ consisting of the sets $\{ U_j^i : i = 1, \ldots, I, j \geq 1 \}$ constructed in Step 3. Then \eqref{7.8} follows directly from \eqref{B.13}–\eqref{B.14}. To see
we first recall \( \sum_{i=1}^{J} H^2(\partial^* T_i) \leq c \sum_{i=1}^{J} H^2(\partial^* E) \) by (B.3) and that \( \sum_{i=1}^{J} \text{diam}_1(T_i) = \text{diam}_1(E) \). We compute by (B.15) and Hölder’s inequality

\[
H^2(\partial^* R) \leq \sum_{i=1}^{J} H^2(\partial^* U_i) \leq c \theta \sum_{i=1}^{J} H^2(\partial^* T_i) + c \sqrt{\tau} \sum_{i=1}^{J} (H^2(\partial^* T_i))^{1/2} (\text{diam}_1(T_i))^{1/2} \\
\leq c \theta H^2(\partial^* E) + c \theta \sqrt{T}(\text{diam}_1(E))^{1/2} (H^2(\partial^* E))^{1/2} \leq c \theta H^2(\partial^* E),
\]

where the last step follows from the definition of \( r \) in (B.2). In a similar fashion, by using (B.3) and (B.10) we get

\[
\sum_{j=1}^{J} H^2(\partial^* D_j \setminus \partial^* E) \leq \sum_{i=1}^{J} \sum_{j \geq 1} \sum_{i=1}^{J} H^2(\partial^* U_j \setminus \partial^* T_i) + \sum_{i=1}^{J} H^2(\partial^* T_i \setminus \partial^* E) \\
\leq c \theta \sum_{i=1}^{J} H^2(\partial^* T_i) + c \theta H^2(\partial^* E) \leq c \theta H^2(\partial^* E).
\]

The previous two estimates show (7.7) and conclude the proof. (Clearly, the constant \( c \) can be absorbed in \( \theta \) by repeating the above arguments for \( \theta/c \) in place of \( \theta \).) \( \square \)
