Abstract This paper takes the mathematical software Maple as the auxiliary tool to study four types of integrals. We can obtain the Fourier series expansions of these four types of integrals by using integration term by term theorem. On the other hand, we provide two examples to do calculation practically. The research methods adopted in this study involved finding solutions through manual calculations and verifying these solutions by using Maple.

Keywords Integrals, Fourier Series Expansions, Integration Term By Term Theorem, Maple

1. Introduction

In calculus and engineering mathematics courses, we learnt many methods to solve the integral problems including change of variables method, integration by parts method, partial fractions method, trigonometric substitution method, and so on. In this paper, we mainly study the following four types of integrals which are not easy to obtain their answers using the methods mentioned above.

\[
\int \sin[r \cos(at + b)] \cosh[r \sin(at + b)] dt
\]

\[
\int \cos[r \cos(at + b)] \sinh[r \sin(at + b)] dt
\]

\[
\int \cosh[r \cos(at + b)] \sin[r \sin(at + b)] dt
\]

\[
\int \sinh[r \cos(at + b)] \sin[r \sin(at + b)] dt
\]

Where \( r, a, b \) are real numbers, \( a \neq 0 \). We can obtain the Fourier series expansions of these four types of integrals by using integration term by term theorem; these are the major results of this paper (i.e., Theorems 1, 2). As for the study of related integral problems can refer to [1-15]. On the other hand, we propose some integrals to do calculation practically. The research methods adopted in this study involved finding solutions through manual calculations and verifying these solutions by using Maple. This type of research method not only allows the discovery of calculation errors, but also helps modify the original directions of thinking from manual and Maple calculations. For this reason, Maple provides insights and guidance regarding problem-solving methods.

2. Main Results

Firstly, we introduce a notation and some formulas used in this study.

2.1. Notation

Let \( z = a + ib \) be a complex number, where \( i = \sqrt{-1} \), \( a, b \) are real numbers. We denote \( a \) the real part of \( z \) by \( \text{Re}(z) \), and \( b \) the imaginary part of \( z \) by \( \text{Im}(z) \).

2.2. Formulas

2.2.1. Euler’s formula

\( e^{i\theta} = \cos \theta + i \sin \theta \), where \( \theta \) is any real number.

2.2.2. De Moivre’s formula

\( (\cos \theta + i \sin \theta)^n = \cos n\theta + i \sin n\theta \), where \( n \) is any integer, \( \theta \) is any real number.

2.2.3. ([16, p25])

\( \sin(u + iv) = \sin u \cosh v + i \cos u \sinh v \), where \( u, v \) are real numbers.

2.2.4. ([16, p25])

\( \cos(u + iv) = \cos u \cosh v – i \sin u \sinh v \), where \( u, v \) are real numbers.

2.2.5. ([16, p63])

\[ \sin z = \sum_{k=0}^{\infty} (-1)^k \frac{1}{(2k+1)!} z^{2k+1}, \text{ where } z \text{ is any complex number.} \]

2.2.6. ([16, p63])

\[ \cos z = \sum_{k=0}^{\infty} (-1)^k \frac{1}{(2k)!} z^{2k}, \text{ where } z \text{ is any complex number.} \]
Next, we introduce an important theorem used in this paper.

2.3. Integration term by term theorem ([17, p269])

Suppose \( \{g_k(t)\}_{k=0}^{\infty} \) is a sequence of Lebesgue integrable functions defined on an interval \([c, d]\). If \( \sum_{k=0}^{\infty} \int_{c}^{d} g_k(t) \, dt \)

is convergent, then \( \int_{c}^{d} \sum_{k=0}^{\infty} g_k(t) \, dt = \sum_{k=0}^{\infty} \int_{c}^{d} g_k(t) \, dt \).

The following is the first major result of this study, we obtain the Fourier series expansions of the integrals (1) and (2).

2.4. Theorem 1

Assume \( r, a, b, c \) are real numbers, \( a \neq 0 \). Then there exists a constant \( C_1 \) such that for all \( x \in R \), the integral

\[
\int_{c}^{x} \sin[r \cos(ax + b)] \cosh[r \sin(ax + b)] \, dt
\]

\[
= \frac{1}{a} \sum_{k=0}^{\infty} (-1)^k \frac{r^{2k+1}}{(2k+1)!(2k+1)} \sin[(2k + 1)(ax + b)] + C_1
\]

(5)

And there exists a constant \( C_2 \) such that for all \( x \in R \), the integral

\[
\int_{c}^{x} \cos[r \cos(ax + b)] \sinh[r \sin(ax + b)] \, dt
\]

\[
= \frac{-1}{a} \sum_{k=0}^{\infty} (-1)^k \frac{r^{2k+1}}{(2k+1)!(2k+1)} \cos[(2k + 1)(ax + b)] + C_2
\]

(6)

2.4.1. Proof

Because

\[
\sin[r \cos(ax + b)] \cosh[r \sin(ax + b)] = \text{Re}\{\exp[i(ax + b)]\}
\]

(By Formula 2.2.3)

\[
= \text{Re} \left[ \sum_{k=0}^{\infty} (-1)^k \frac{1}{(2k+1)!} [r \exp(i(ax + b))]^{2k+1} \right]
\]

(Using Formula 2.2.5)

\[
= \text{Re} \left[ \sum_{k=0}^{\infty} (-1)^k \frac{r^{2k+1}}{(2k+1)!} \exp[i(2k + 1)(ax + b)] \right]
\]

(By DeMoivre’s formula)

\[
= \sum_{k=0}^{\infty} (-1)^k \frac{r^{2k+1}}{(2k+1)!} \cos[(2k + 1)(ax + b)]
\]

(7)

Thus, for all \( x \in R \), the integral

\[
\int_{c}^{x} \sin[r \cos(ax + b)] \cosh[r \sin(ax + b)] \, dt
\]

\[
= \int_{c}^{x} \sum_{k=0}^{\infty} (-1)^k \frac{r^{2k+1}}{(2k+1)!} \cos[(2k + 1)(ax + b)] \, dt
\]

\[
= \sum_{k=0}^{\infty} (-1)^k \frac{r^{2k+1}}{(2k+1)!} \int_{c}^{x} \cos[(2k + 1)(ax + b)] \, dt
\]

(By integration term by term theorem)

\[
= \frac{1}{a} \sum_{k=0}^{\infty} (-1)^k \frac{r^{2k+1}}{(2k+1)!(2k+1)} \sin[(2k + 1)(ax + b)] + C_1
\]

Where \( C_1 \) is some constant.

On the other hand, using Euler’s formula, DeMoivre’s formula and Formula 2.2.3, 2.2.5, we have

\[
\cos[r \cos(ax + b)] \sinh[r \sin(ax + b)]
\]

\[
= \text{Im}\{\exp[i(ax + b)]\}
\]

\[
= \sum_{k=0}^{\infty} (-1)^k \frac{r^{2k+1}}{(2k+1)!} \cos[(2k + 1)(ax + b)] + C_2
\]

(8)

Therefore, by integration term by term theorem, we can show that there exists a constant \( C_2 \) such that for all \( x \in R \), the integral

\[
\int_{c}^{x} \cos[r \cos(ax + b)] \sinh[r \sin(ax + b)] \, dt
\]

\[
= \frac{-1}{a} \sum_{k=0}^{\infty} (-1)^k \frac{r^{2k+1}}{(2k+1)!(2k+1)} \cos[(2k + 1)(ax + b)] + C_2
\]

q.e.d.

2.5. Remark 1

In Theorem 1, because for each \( x \in R \),

\[
\sum_{k=0}^{\infty} \int_{c}^{x} (-1)^k \frac{r^{2k+1}}{(2k+1)!} \cos[(2k + 1)(ax + b)] \, dt
\]

\[
\leq \frac{1}{|a|} \sum_{k=0}^{\infty} \frac{|r|^{2k+1}}{(2k+1)!(2k+1)} \int_{c}^{x} \cos[(2k + 1)(ax + b)] \, dt
\]

\[
\leq \frac{1}{|a|} \sum_{k=0}^{\infty} \frac{|r|^{2k+1}}{(2k+1)!(2k+1)} < \infty
\]

It follows that we can use integration term by term theorem to show that (5) holds. The same reason that we can prove (6) by using integration term by term theorem.

Next, we determine the Fourier series expansions of the integrals (3) and (4).

2.6. Theorem 2

If the assumptions are the same as Theorem 1. Then there
exists a constant \( C_3 \) such that for all \( x \in R \), the integral
\[
\int_c^x \cos(r \cos(at + b)) \cosh(r \sin(at + b)) \, dt = x + 1 \cdot \sum_{k=1}^{\infty} (-1)^k \frac{r^{2k}}{(2k)!2k} \sin((2k)(ax + b)) + C_3
\]
(9)

And there exists a constant \( C_4 \) such that for all \( x \in R \), the integral
\[
\int_c^x \sin(r \cos(at + b)) \sinh(r \sin(at + b)) \, dt = \frac{1}{a} \cdot \sum_{k=1}^{\infty} (-1)^k \frac{r^{2k}}{(2k)!2k} \cos((2k)(ax + b)) + C_4
\]
(10)

2.6.1. Proof
By Euler's formula, DeMoivre's formula and Formula 2.2.4, 2.2.6, we have
\[
\cos(r \cos(at + b)) \cosh(r \sin(at + b)) = \Re \{ \cos(r \exp(i \pi/3)) \} = \sum_{k=0}^{\infty} (-1)^k \frac{r^{2k}}{(2k)!} \cos((2k)(ax + b))
\]
(11)

Thus, for all \( x \in R \), the integral
\[
\int_c^x \cos(r \cos(at + b)) \cosh(r \sin(at + b)) \, dt = x + \frac{1}{a} \cdot \sum_{k=1}^{\infty} (-1)^k \frac{r^{2k}}{(2k)!2k} \sin((2k)(ax + b)) + C_3
\]
(12)

Where \( C_3 \) is some constant.

Similarly, by Euler's formula, DeMoivre's formula and Formula 2.2.4, 2.2.6, we obtain
\[
\sin(r \cos(at + b)) \sinh(r \sin(at + b)) = -\Im \{ \cos(r \exp(i \pi/3)) \} = -\sum_{k=1}^{\infty} (-1)^k \frac{r^{2k}}{(2k)!} \sin((2k)(ax + b))
\]
(13)

By integration term by term theorem, it follows that for all \( x \in R \), the integral
\[
\int_c^x \sin(r \cos(at + b)) \sinh(r \sin(at + b)) \, dt = \frac{1}{a} \cdot \sum_{k=1}^{\infty} (-1)^k \frac{r^{2k}}{(2k)!2k} \cos((2k)(ax + b)) + C_4
\]
Where \( C_4 \) is some constant. q.e.d.

2.7. Remark 2
In Theorem 2, the reason that we can use integration term by term theorem to prove (9) and (10) is the same as Remark 1.

3. Examples
In the following, for the four types of integrals in this study, we propose some integrals and use Theorems 1, 2 to determine their Fourier series expansions. In addition, we evaluate some definite integrals and employ Maple to calculate the approximations of these definite integrals and their solutions for verifying our answers.

3.1. Example 1
In Theorem 1, taking \( r = 5, a = 2, b = \pi / 3 \) into (5), we obtain the following integral
\[
\int_c^x \sin(5 \cos(2t + \pi/3)) \cosh(5 \sin(2t + \pi/3)) \, dt = \frac{1}{2} \cdot \sum_{k=0}^{\infty} (-1)^k \frac{5^{2k+1}}{(2k+1)!(2k+1)} \sin((2k+1)(2x + \pi/3)) + C_1
\]
(14)

Thus, we can determine the definite integral from \( t = \pi/12 \) to \( t = \pi / 6 \),
\[
\int_{\pi/12}^{\pi/6} \sin(5 \cos(2t + \pi/3)) \cosh(5 \sin(2t + \pi/3)) \, dt = \frac{1}{2} \cdot \sum_{k=0}^{\infty} (-1)^k \frac{5^{2k+1}}{(2k+1)!(2k+1)} \sin((2k+1)(2x + \pi/3))
\]
(15)

We use Maple to verify the correctness of (14).
\[
> \text{evalf(} \text{int(} \sin(5 \cos(2*t+Pi/3)) \cosh(5 \sin(2*t+Pi/3)), t=\text{Pi/12..Pi/6}, 14);\text{)}
\]
\[
-11.041067811822 + 0.1
\]

We use Maple to verify the correctness of (14).
\[
> \text{evalf(} 1/2*\text{sum((-1)^k*5^(2*k+1)/(2*k+1)!(2*k+1))*sin((4*k+2)*Pi/3),k=0..\text{infinity});\text{)}
\]
\[
-11.041067811821 + 0.1
\]

The above answers obtained by Maple appears I
(= √−1), it is because Maple calculates by using special functions built in. Both the imaginary parts of the above answers are zero, so can be ignored.

On the other hand, in Theorem 1, taking $r = √2, a = 5, b = −3π / 4$ into (6), we have the following integral

$$
\int_{c}^{x} \cos \left( \sqrt{2} \cos \left( 5t - \frac{3π}{4} \right) \right) \sinh \left( \sqrt{2} \sin \left( 5t - \frac{3π}{4} \right) \right) dt
$$

$$
= -\frac{1}{5} \cdot \sum_{k=0}^{∞} (-1)^{k} \frac{(\sqrt{2})^{2k+1}}{(2k+1)!} \cos \left( (2k+1) \left( 5x - \frac{3π}{4} \right) \right) + C_{2}
$$

Hence, we can determine the definite integral from $t = π / 10$ to $t = 2π / 5$,

$$
\int_{π/10}^{π/5} \cos \left( \sqrt{2} \cos \left( 5t - \frac{3π}{4} \right) \right) \sinh \left( \sqrt{2} \sin \left( 5t - \frac{3π}{4} \right) \right) dt
$$

$$
= -\frac{1}{5} \cdot \sum_{k=0}^{∞} (-1)^{k} \frac{(\sqrt{2})^{2k+1}}{(2k+1)!} \cos \left( (2k+1) \left( 5x - \frac{3π}{4} \right) \right) + C_{2}
$$

Next, we use Maple to verify the correctness of (16).

$$\text{evalf}(-\sum_{k=0}^{∞} \frac{(-1)^{k} \sqrt{2}^{2k+1}}{35 \cdot (2k+1)!} \cos \left( (2k+1) \left( 5x - \frac{3π}{4} \right) \right) )$$

$$= 0.44168906329422 + 0.1 i$$

Using Maple to verify the correctness of (17) as follows:

$$\text{evalf}(-\sum_{k=0}^{∞} \frac{(-1)^{k} \sqrt{2}^{2k+1}}{35 \cdot (2k+1)!} \cos \left( (2k+1) \left( 5x - \frac{3π}{4} \right) \right) )$$

$$= 0.44168906329422 + 0.1 i$$

Also, both the imaginary parts of the above answers obtained by Maple are zero, so can be ignored.

In Theorem 2, if taking $r = 9, a = 4, b = -2π / 3$ into (10), we obtain the following integral

$$\int_{c}^{x} \sin \left( 9 \cos \left( 4t - \frac{2π}{3} \right) \right) \sinh \left( 9 \sin \left( 4t - \frac{2π}{3} \right) \right) dt$$

$$= \frac{1}{4} \cdot \sum_{k=1}^{∞} (-1)^{k} \frac{9 \cdot 2^{2k}}{(2k)!} \cos \left( 2k \left( 4x - \frac{2π}{3} \right) \right) + C_{4}$$

Therefore, we have the definite integral from $t = π / 6$ to $t = π / 3$,

$$\int_{π/6}^{π/3} \sin \left( 9 \cos \left( 4t - \frac{2π}{3} \right) \right) \sinh \left( 9 \sin \left( 4t - \frac{2π}{3} \right) \right) dt$$

$$= \frac{1}{4} \cdot \sum_{k=1}^{∞} (-1)^{k} \frac{9 \cdot 2^{2k}}{(2k)!} \cos \left( 2k \left( 4x - \frac{2π}{3} \right) \right) + C_{4}$$

Using Maple to verify the correctness of (20) as follows:

$$\text{evalf}(-\sum_{k=1}^{∞} \frac{(-1)^{k} \sqrt{2}^{2k+1}}{35 \cdot (2k+1)!} \cos \left( (2k+1) \left( 5x - \frac{3π}{4} \right) \right) )$$

$$= 0.78316978454223 + 0.1 i$$

$$\text{evalf}(-\sum_{k=1}^{∞} \frac{(-1)^{k} \sqrt{2}^{2k+1}}{35 \cdot (2k+1)!} \cos \left( (2k+1) \left( 5x - \frac{3π}{4} \right) \right) )$$

$$= 0.78316978454223 + 0.1 i$$

3.2. Example 2

In Theorem 2, taking $r = 4 / 3, a = 7, b = 5π / 6$ into (9), we can determine the following integral

$$\int_{c}^{x} \cos \left( \frac{4}{3} \cos \left( 7t + \frac{5π}{6} \right) \right) \cosh \left( \frac{4}{3} \sin \left( 7t + \frac{5π}{6} \right) \right) dt$$

$$= x + \frac{1}{7} \cdot \sum_{k=1}^{∞} (-1)^{k} \frac{(4 / 3)^{2k}}{(2k)!} \sin \left( (2k) \left( 7x + \frac{5π}{6} \right) \right) + C_{3}$$

Thus, we obtain the definite integral from $t = π / 14$ to $t = 2π / 7$,
The imaginary parts of the above answers obtained by Maple are either zero or very small, so can be ignored.

4. Conclusion

From the above discussion, we know the integration term by term theorem plays a significant role in the theoretical inferences of this study. In fact, the application of this theorem is extensive, and can be used to easily solve many difficult problems; we endeavor to conduct further studies on related applications. On the other hand, Maple also plays a vital assistive role in problem-solving. In the future, we will extend the research topic to other calculus and engineering mathematics problems and solve these problems by using Maple. These results will be used as teaching materials for Maple on education and research to enhance the connotations of calculus and engineering mathematics.
