Spectral Theorem for Definitizable Normal Linear Operators on Krein Spaces

Michael Kaltenbäck

Abstract. In the present note a spectral theorem for normal definitizable linear operators on Krein spaces is derived by developing a functional calculus $\phi \mapsto \phi(N)$ which is the proper analogue of $\phi \mapsto \int \phi dE$ in the Hilbert space situation. This paper is the first systematical study of definitizable normal operators on Krein spaces.

Mathematics Subject Classification. 47A60, 47B50, 47B15.

Keywords. Krein space, Definitizable operators, Spectral theorem.

1. Introduction

A bounded linear operator $N$ on a Krein space $(\mathcal{K}, [[.,.]])$ is called normal, if $N$ commutes with its Krein space adjoint $N^+$, i.e. $NN^+ = N^+N$. This is equivalent to the fact that its real part $A := \frac{N+N^+}{2}$ and its imaginary part $B := \frac{N-N^+}{2i}$ commute. We call $N$ definitizable whenever the selfadjoint operators $A$ and $B$ are both definitizable in the classical sense. This means the existence of so-called definitizing polynomials $p(z), q(z) \in \mathbb{R}[z] \setminus \{0\}$ such that $[p(A)x, x] \geq 0$ and $[q(B)x, x] \geq 0$ for all $x \in \mathcal{K}$; see [4].

In the Hilbert space setting the spectral theorem for bounded linear, normal operators is a well-known functional analysis result. It is almost as folklore as the spectral theorem for bounded linear, selfadjoint operators.

In the Krein space world there exists no similar result for general selfadjoint operators. Assuming in addition definitizability, a spectral theorem could be derived by Heinz Langer; cf. [4]. This theorem became an important starting point for various spectral results. The main difference to selfadjoint operators on Hilbert spaces is the appearance of a finite number of critical points, where the spectral projections no longer behave like a measure.

Only a rather small number of publications dealt with the situation of a normal (definitizable) operators on a Krein space. The Pontryagin space case

This work was supported by a joint project of the Austrian Science Fund (FWF, I1536-N25) and the Russian Foundation for Basic Research (RFBR, 13-01-91002-ANF).
was studied up to a certain extent for example in [7] and [5]. Special normal operators on Krein spaces were considered for example in [1] and [6]. But until now no adequate version of a spectral theorem on normal definitizable operators in Krein spaces has been found.

In the present paper we derive a spectral theorem for bounded linear, normal, definitizable operators formulated in terms of a functional calculus generalizing the functional calculus $\phi \mapsto \int \phi dE$ in the Hilbert space case. Thus, we provide the first systematical study of definitizable normal operators and their spectral properties on Krein spaces. In order to achieve this goal, we use the methods developed in [2] for definitizable selfadjoint operators and extend them for two commuting definitizable selfadjoint operators.

Let us anticipate a little more explicitly what happens in this note. Denoting by $p(z)$ and $q(z)$ the definitizing real polynomials for $A$ and $B$, respectively, we build a Hilbert space $\mathcal{V}$ which is continuously and densely embedded in the given Krein space $\mathcal{K}$. Denoting by $T : \mathcal{V} \to \mathcal{K}$ the adjoint of the embedding, we have $TT^+ = p(A) + q(B)$. Then we use the *-homomorphism $\Theta : (TT^+)' (\subseteq B(\mathcal{K})) \to (T^+)\prime (\subseteq B(\mathcal{V}))$, $C \mapsto (T \times T)^{-1}(C)$, studied in [2], in order to drag our normal operator $N \in (TT^+)' \subseteq B(\mathcal{K})$ into $(T^+)\prime \subseteq B(\mathcal{V})$. The resulting normal operator $\Theta(N)$ acts on a Hilbert space. Therefore, it has a spectral measure $E(\Delta)$ on $\mathbb{C}$.

The proper family $\mathcal{F}_N$ of functions suitable for the aimed functional calculus are bounded and measurable functions on

$$(\sigma(\Theta(N)) \cup (Z_p^R + iZ_q^R)) \cup Z^i (\subseteq \mathbb{C} \cup \mathbb{C}^2).$$

Here $Z_p^R = p^{-1}\{0\} \cap \mathbb{R}$ and $Z_q^R = q^{-1}\{0\} \cap \mathbb{R}$ denote the real zeros of $p(z)$ and $q(z)$, respectively, and $Z^i = (p^{-1}\{0\} \times q^{-1}\{0\}) \setminus (\mathbb{R} \times \mathbb{R})$. Moreover, the functions $\phi \in \mathcal{F}_N$ assume values in $\mathbb{C}$ on $\sigma(\Theta(N)) \setminus (Z_p^R + iZ_q^R)$, values in $\mathbb{C}^{p, (Re z) \cdot \delta_q (Im z) + 2}$ at $z \in Z_p^R + iZ_q^R$ and values in $\mathbb{C}^{q, (\xi) \cdot \delta_q (\eta)}$ at $z = (\xi, \eta) \in Z^i$. Here $\delta_p(w) := \min\{j : p^{(j)}(w) \neq 0\}$ ($\delta_q(w) := \min\{j : q^{(j)}(w) \neq 0\}$) denotes $p$'s ($q$'s) degree of zero at $w$. Finally, $\phi \in \mathcal{F}_N$ satisfies a growth regularity condition at all points from $Z_p^R + iZ_q^R$ which are not isolated in $\sigma(\Theta(N)) \cup (Z_p^R + iZ_q^R)$.

Any polynomial $s(z, w) \in \mathbb{C}[z, w]$ can be seen as a function $s_N \in \mathcal{F}_N$. The nice thing about these, somewhat tediously defined functions $\phi \in \mathcal{F}_N$ is the fact that

$$\phi(z) = s_N(z) + (p_N + q_N)(z) \cdot g(z) \quad \text{for all } z \in \sigma(\Theta(N)), \quad (1.1)$$

for a suitable polynomial $s \in \mathbb{C}[z, w]$ in two variables and a function $g : \sigma(\Theta(N)) \to \mathbb{C} \cup \mathbb{C}^2$, where $g : \sigma(\Theta(N)) \setminus (Z_p^R + iZ_q^R) \to \mathbb{C}$ is bounded and measurable, and where $g : \sigma(\Theta(N)) \cap (Z_p^R + iZ_q^R) \to \mathbb{C}^2$.

We then define $\phi(N) := s(A, B) + T \int_{\sigma(\Theta(N))}^R g dE T^+$, show that this operator does not depend on the actual decomposition (1.1) and that $\phi \mapsto \phi(N)$ is indeed a *-homomorphism. Here $\int_{\sigma(\Theta(N))}^R g dE$ is the integral of $g$ with respect to the spectral measure $E$ taking into account the fact that $g$ has values in $\mathbb{C}^2$ on $\sigma(\Theta(N)) \cap (Z_p^R + iZ_q^R)$.
If $\phi$ stems from a characteristic function corresponding to a Borel subset $\Delta$ of $\mathbb{C}$ such that no point of $Z^R_p + iZ^R_q$ belongs to the boundary of $\Delta$, then $\phi(N)$ is a selfadjoint projection on $\mathcal{K}$.

2. Multiple Embeddings

In the present section we fix a Krein space $(\mathcal{K},[\cdot,\cdot])$ and Hilbert spaces $(\mathcal{V},[\cdot,\cdot])$, $(\mathcal{V}_1, [\cdot,\cdot])$ and $(\mathcal{V}_2, [\cdot,\cdot])$. Moreover, let $T_1 : \mathcal{V}_1 \to \mathcal{K}$, $T_2 : \mathcal{V}_2 \to \mathcal{K}$ and $T : \mathcal{V} \to \mathcal{K}$ be bounded linear, injective mappings such that

$$TT^+ = T_1T_1^+ + T_2T_2^+$$

holds true. Since for $x \in \mathcal{K}$ we have

$$[T^+x, T^+x]_\mathcal{V} = [TT^+x, x]$$

$$= [T_1T_1^+x, x] + [T_2T_2^+x, x] = [T_1^+x, T_1^+x]_{\mathcal{V}_1} + [T_2^+x, T_2^+x]_{\mathcal{V}_2},$$

one easily concludes that $T^+x \mapsto T_j^+x$ constitutes a well-defined, contractive linear mapping from $\text{ran} \, T^+$ onto $\text{ran} \, T_j^+$ for $j = 1, 2$. As $(\text{ran} \, T^+)^\perp = \text{ker} \, T = \{0\}$ and $(\text{ran} \, T_j^+)^\perp = \text{ker} \, T_j = \{0\}$ these ranges are dense in the Hilbert spaces $\mathcal{V}$ and $\mathcal{V}_j$. Hence, there exists a unique bounded linear continuation of $T^+x \mapsto T_j^+x$ to $\mathcal{V}$, which has dense range in $\mathcal{V}_j$.

Denoting by $R_j$ the adjoint mapping of this continuation, we clearly have $T_j = TR_j$ and $\text{ker} \, R_j = (\text{ran} \, R_j^\ast)^\perp = \{0\}$. From $TT^+ = T_1T_1^+ + T_2T_2^+$ we conclude

$$T(I)T^+ = TT^+ = TR_1R_1^*T^+ + TR_2R_2^*T^+ = T(R_1R_1^* + R_2R_2^*)T.$$  

$\text{ker} \, T = \{0\}$ and the density of $\text{ran} \, T^+$ yields $R_1R_1^* + R_2R_2^* = I$.

If $T_1T_1^+$ and $T_2T_2^+$ commute, then by $TT^+ = T_1T_1^+ + T_2T_2^+$ also $T_jT_j^+$ and $TT^+$ commute. Moreover, in this case

$$T(\text{ran} \, TR_jR_j^*)T^+ = TT^+T_jT_j^+ = T_jT_j^+TT^+ = T(R_jR_j^*T^+T)T^+.$$  

Employing again $T$’s injectivity and the density of $\text{ran} \, T^+$, we see that $R_jR_j^*$ and $T^+T$ commute for $j = 1, 2$. We also obtain

$$T_j^+T_jR_j^*R_j = R_j^*(T^+T_j^TR_jR_j^*)R_j = R_j^*(R_jR_j^*T^+)R_j = R_j^*R_jT_j^+T_j.$$  

Thus, we showed

**Lemma 2.1.** With the above notations and assumptions there exist injective contractions $R_1 : \mathcal{V}_1 \to \mathcal{V}$ and $R_2 : \mathcal{V}_2 \to \mathcal{V}$ such that $T_1 = TR_1$, $T_2 = TR_2$ and $R_1R_1^* + R_2R_2^* = I$.

If $T_1T_1^+$ and $T_2T_2^+$ commute, then the operators $R_jR_j^*$ and $T^+T$ on $\mathcal{V}$ commute as well as the operators $R_j^*R_j$ and $T_j^+T_j$ on $\mathcal{V}_j$ for $j = 1, 2$.  

By $\Theta_j : (T_j T_j^+)' \subseteq B(K) \to (T_j^+ T_j)' \subseteq B(V_j)$, $j = 1, 2$, and by $\Theta : (TT^+)' \subseteq B(K) \to (T^+ T)' \subseteq B(V)$ we shall denote the $*$-algebra homomorphisms mapping the identity operator to the identity operator as in Theorem 5.7 in [2] corresponding to the mappings $T_j$, $j = 1, 2$, and $T$:

$$
\Theta_j(C) = (T_j \times T_j)^{-1}(C) = T_j^{-1}CT_j, \quad C \in (T_j T_j^+)',
$$
$$
\Theta(C) = (T \times T)^{-1}(C) = T^{-1}CT, \quad C \in (TT^+)'.
$$

(2.1)

Here $S'$ denotes the commutant of the bounded linear operator $S : \mathcal{X} \to \mathcal{X}$ in $B(\mathcal{X})$. We can apply Theorem 5.7 in [2] also to the bounded linear, injective $R_j : \mathcal{V}_j \to \mathcal{V}$, $j = 1, 2$, and denote the corresponding $*$-algebra homomorphisms by $\Gamma_j :(R_j R_j^*)' \subseteq B(V) \to (R_j^* R_j)' \subseteq B(V_j)$:

$$
\Gamma_j(D) = (R_j \times R_j)^{-1}(D) = R_j^{-1}DR_j, \quad D \in (R_j R_j^*)'.
$$

(2.2)

**Proposition 2.2.** With the above notations and assumptions we have $(T_1 T_1^+)' \cap (T_2 T_2^+)' \subseteq (TT^+)'$ and $\Theta((T_1 T_1^+)' \cap (T_2 T_2^+)') \subseteq (R_1 R_1^*)' \cap (R_2 R_2^*)' \cap (T^+ T)'$, where in fact $(j = 1, 2)$

$$
\Theta(C) R_j R_j^* = R_j \Theta_j(C) R_j^* = R_j R_j^* \Theta(C)
$$

(2.2)

and

$$
\Theta_j(C) = \Gamma_j \circ \Theta(C) \quad \text{for all} \quad C \in (T_1 T_1^+)' \cap (T_2 T_2^+)'.
$$

(2.3)

**Proof.** $(T_1 T_1^+)' \cap (T_2 T_2^+)' \subseteq (TT^+)'$ is clear from $TT^+ = T_1 T_1^+ + T_2 T_2^+$. According to Theorem 5.7 in [2] for $j = 1, 2$ we have $\Theta_j(C) T_j^+ = T_j^+ C$ and $\Theta(C) T_j^+ = T_j^+ C$ for $C \in (T_1 T_1^+)' \cap (T_2 T_2^+)'$. Therefore,

$$
T(R_j \Theta_j(C) R_j^*) T_j^+ = T_j \Theta_j(C) T_j^+ = T_j T_j^+ C
$$

$$
= TR_j R_j^* T_j^+ C = TR_j R_j^* \Theta(C) T_j^+ T_j^\top.
$$

From $\ker T = \{0\}$ and the density of $\text{ran} \ T^+$ we obtain $R_j \Theta_j(C) R_j^* = R_j R_j^* \Theta(C)$. Applying this equation to $C^+$ and taking adjoints yields $R_j \Theta_j(C) R_j^* = \Theta(C) R_j R_j^*$. In particular, $\Theta(C) \in (R_j R_j^*)'$. Therefore, we can apply $\Gamma_j$ to $\Theta(C)$ and get

$$
\Gamma_j \circ \Theta(C) = R_j^{-1} T^{-1} C T R_j = T_j^{-1} C T_j = \Theta_j(C).
$$

(2.3)

For the following assertion note that, by (2.3) and by the fact that $\Gamma_j$ is a $*$-algebra homomorphism mapping the identity operator to the identity operator, we have $(j = 1, 2)$

$$
\sigma(\Theta(C)) \supseteq \sigma(\Theta_j(C)) \quad \text{for all} \quad C \in (T_1 T_1^+)' \cap (T_2 T_2^+)'.
$$

(2.4)
Corollary 2.3. With the above notations and assumptions let \( N \in (T_1T_1^\dagger)' \cap (T_2T_2^\dagger)' \) be normal. Then \( \Theta(N), \Theta_1(N), \Theta_2(N) \) are all normal operators in the Hilbert spaces \( \mathcal{V}, \mathcal{V}_1, \mathcal{V}_2 \), respectively. If \( E(E_1,E_2) \) denotes the spectral measure for \( \Theta(N) (\Theta_1(N), \Theta_2(N)) \), then \( E(\Delta) \in (R_1R_1^*)' \cap (R_2R_2^*)' \cap (T^\dagger T)' \) and \((j=1,2)\)

\[
\Gamma_j(E(\Delta)) = E_j(\Delta)
\]

for all Borel subsets \( \Delta \) of \( \mathbb{C} \), where \( E_j(\Delta) \in (R_j^*R_j)' \cap (T_j^+T_j)' \).

Moreover, \( \int h \ dE \in (R_1R_1^*)' \cap (R_2R_2^*)' \cap (T^\dagger T)' \) and

\[
\Gamma_j \left( \int h \ dE \right) = \int h \ dE_j
\]

for any bounded and measurable \( h : \sigma(\Theta(N)) \to \mathbb{C} \), where \( \int h \ dE_j \) belongs to \((R_j^*R_j)' \cap (T_j^+T_j)'\).

Proof. The normality of \( \Theta(N), \Theta_1(N) \) and \( \Theta_2(N) \) is clear, since \( \Theta, \Theta_1, \Theta_2 \) are \(*\)-homomorphisms. From Proposition 2.2 we know that \( \Theta(N) \in (R_1R_1^*)' \cap (R_2R_2^*)' \cap (T^\dagger T)' \). According to the well known properties of \( \Theta(N)'s \) spectral measure we obtain \( E(\Delta) \in (R_1R_1^*)' \cap (R_2R_2^*)' \cap (T^\dagger T)' \) and, in turn, \( \int h \ dE \in (R_1R_1^*)' \cap (R_2R_2^*)' \cap (T^\dagger T)' \). In particular, \( \Gamma_j \) can be applied to \( E(\Delta) \) and \( \int h \ dE \). Similarly, \( \Theta_j(N) \in (T_j^+T_j)' \) implies \( E_j(\Delta) \), \( \int h \ dE_j \in (T_j^+T_j)' \) for a bounded and measurable \( h \).

Recall from Theorem 5.7 in [2] that \( \Gamma_j(D)R_j^*x = R_j^*D \) for \( D \in (R_jR_j^*)' \). For \( x \in \mathcal{V} \) and \( y \in \mathcal{V}_j \) we therefore have

\[
[\Gamma_j(E(\Delta))R_j^*x, y] = [R_j^*E(\Delta)x, y] = [E(\Delta)x, R_jy]
\]

and, in turn,

\[
\int_{\mathbb{C}} s(z, \bar{z}) \ d[\Gamma_j(E)R_j^*x, y] = \int_{\mathbb{C}} s(z, \bar{z}) \ d[Ex, R_jy] = [s(\Theta(N), \Theta(N)^*)x, R_jy]
\]

\[
= [R_j^*s(\Theta(N), \Theta(N)^*)x, y] = [\Gamma_j(s(\Theta(N), \Theta(N)^*))R_j^*x, y]
\]

for any trigonometric polynomial \( s(z, \bar{z}) \in \mathbb{C}[z, \bar{z}] \). By (2.3) and the fact that \( \Gamma_j \) is a \(*\)-homomorphism we have \( \Gamma_j(s(\Theta(N), \Theta(N)^*)) = s(\Theta_j(N), \Theta_j(N)^*) \). Consequently,

\[
\int_{\mathbb{C}} s(z, \bar{z}) \ d[\Gamma_j(E)R_j^*x, y] = \int_{\mathbb{C}} s(z, \bar{z}) \ d[E_jR_j^*x, y].
\]

Since \( E(\mathbb{C} \setminus K) = 0 \) and \( E_j(\mathbb{C} \setminus K) = 0 \) for a certain compact \( K \subseteq \mathbb{C} \) and since \( \mathbb{C}[z, \bar{z}] \) is densely contained in \( C(K) \), we obtain from the uniqueness assertion of the Riesz Representation Theorem that

\[
[\Gamma_j(E(\Delta))R_j^*x, y] = [E_j(\Delta)R_j^*x, y] \quad \text{for all} \quad x \in \mathcal{V}, \ y \in \mathcal{V}_j,
\]

for all Borel subsets \( \Delta \) of \( \mathbb{C} \). Due to the density of \( \text{ran} \ R_j^* \) in \( \mathcal{V}_j \) we even have \( [\Gamma_j(E(\Delta))z, y] = [E_j(\Delta)z, y], \ y, z \in \mathcal{V}_j \) and, hence, \( \Gamma_j(E(\Delta)) = E_j(\Delta) \). Since \( \Gamma_j \) maps into \((R_j^*R_j)' \), we have \( E_j(\Delta) \in (R_j^*R_j)' \) and, in turn, \( \int h \ dE_j \in (R_j^*R_j)' \) for any bounded and measurable \( h \).
If \( h : \sigma(\Theta(N)) \to \mathbb{C} \) is bounded and measurable, then, clearly, also its restriction to \( \sigma_j(\Theta_j(N)) = \sigma(\Gamma_j \circ \Theta(N)) \) is bounded and measurable; see (2.4). Due to \( E_j(\Delta)R_j^* = \Gamma_j(E(\Delta))R_j^* = R_j^*E(\Delta) \) for \( x \in \mathcal{V} \) and \( y \in \mathcal{V}_j \) we have

\[
\begin{align*}
\left[ \Gamma_j \left( \int h \, dE \right) R_j^*x, y \right] &= \left[ R_j^* \left( \int h \, dE \right) x, y \right] = \left[ \left( \int h \, dE \right) x, R_j y \right] \\
&= \int h \, d[E x, R_j y] = \int h \, d[E_j R_j^* x, y] \\
&= \left[ \left( \int h \, dE_j \right) R_j^*x, y \right].
\end{align*}
\]

Again the density of \( \text{ran } R_j^* \) yields \( \Gamma_j \left( \int h \, dE \right) = \int h \, dE_j. \) \( \Box \)

Recall from Theorem 5.10 in [2] the mappings \( (j = 1, 2) \)

\[
\Xi_j : (T_j^+ T_j')' (\subseteq B(\mathcal{V}_j)) \to (T_j T_j^+)' (\subseteq B(\mathcal{K})), \quad \Xi_j(D_j) = T_j D_j T_j^+,
\]

(2.5)

and \( \Xi : (T^+ T)' (\subseteq B(\mathcal{V})) \to (TT^+)' (\subseteq B(\mathcal{K})), \ \Xi(D) = TDT^+. \) By \( (j = 1, 2) \)

\[
\Lambda_j : (R_j^* R_j)' (\subseteq B(\mathcal{V}_j)) \to (R_j R_j^*)' (\subseteq B(\mathcal{V})), \quad \Lambda_j(D_j) = R_j D_j R_j^*,
\]

we shall denote the corresponding mappings outgoing from the mappings \( R_j : \mathcal{V}_j \to \mathcal{V} \). By Lemma 2.1 we have

\[
\Xi_j(D_j) = T R_j D_j R_j^* T^+ = \Xi \circ \Lambda_j(D_j) \quad \text{for} \quad D_j \in (R_j^* R_j)' \cap (T_j^+ T_j)'.
\]

According to Lemma 5.10 in [2], \( \Lambda_j \circ \Gamma_j(D) = DR_j R_j^* \). Hence, using the notation from Corollary 2.3

\[
\Xi_j \left( \int h \, dE_j \right) = \Xi \circ \Lambda_j \circ \Gamma_j \left( \int h \, dE \right) = \Xi \left( R_j R_j^* \int h \, dE \right).
\]

(2.6)

Finally, \( T^{-1} T_j T_j^+ T = T^{-1} T R_j R_j^* T^+ T = R_j R_j^* T^+ T \). In case that \( T_1 T_1^+ \) and \( T_2 T_2^+ \) commute we have \( T_1 T_1^+, T_2 T_2^+ \in (TT^+)' \) and the later equality can be expressed as \( (j = 1, 2) \)

\[
\Theta(T_j T_j^+ \ldots) = R_j R_j^* T^+ T.
\]

(2.7)

3. Normal Definitizable Operators

**Definition 3.1.** We will call a bounded linear and normal operator \( N \) on a Krein space **definitizable** if its real part \( A := \frac{N + N^*}{2} \) and its imaginary part \( B := \frac{N - N^*}{2i} \) are both definitizable, i.e. there exist real polynomials \( p, q \in \mathbb{R}[z] \setminus \{0\} \) such that \( p \) is definitizing for \( A ([p(A)x, x] \geq 0, x \in \mathcal{K}) \) and such that \( q \) is definitizing for \( B ([q(B)x, x] \geq 0, x \in \mathcal{K}) \); see [4]. \( \diamond \)

By Corollary 7.15 in [2] the definitizability of \( A \) and \( B \) is equivalent to the concept of definitizability in [2]. Also note that in Pontryagin spaces any bounded linear and normal operator is definitizable in the above sense; see Example 6.2 in [2].
Proposition 3.2. Let $A$ and $B$ be commuting, bounded linear, selfadjoint and definitizable operators on a Krein space $(\mathcal{K}, [\cdot, \cdot])$ with definitizing polynomials $p \in \mathbb{R}[z] \setminus \{0\}$ for $A$ and $q \in \mathbb{R}[z] \setminus \{0\}$ for $B$. Then there exist Hilbert spaces $(\mathcal{V}_1, [\cdot, \cdot]), (\mathcal{V}_2, [\cdot, \cdot]), (\mathcal{V}, [\cdot, \cdot])$ and bounded linear and injective operators $T_1 : \mathcal{V}_1 \to \mathcal{K}, T_2 : \mathcal{V}_2 \to \mathcal{K}, T : \mathcal{V} \to \mathcal{K}$ such that
\[ T_1 T_1^+ = p(A), \quad T_2 T_2^+ = q(B), \quad TT^+ = p(A) + q(B) = T_1 T_1^+ + T_2 T_2^+ \]
with commuting $T_1 T_1^+$ and $T_2 T_2^+$. Moreover, if $\Theta : (TT^+)' (\subseteq B(\mathcal{K})) \to (T^+T)' (\subseteq B(\mathcal{V}))$ is as in (2.1) and $R_j : \mathcal{V}_j \to \mathcal{V}$ ($j = 1, 2$) are as in Lemma 2.1, then
\[ p(\Theta(A)) = R_1 R_1^* (p(\Theta(A)) + q(\Theta(B))), \]
\[ q(\Theta(B)) = R_2 R_2^* (p(\Theta(A)) + q(\Theta(B))), \]
where $R_1 R_1^*$ and $R_2 R_2^*$ commute with $p(\Theta(A)) + q(\Theta(B))$.

Proof. Let $(\mathcal{V}_1, [\cdot, \cdot])$ be the Hilbert space completion of $\mathcal{K}/\ker p(A)$ with respect to $[p(A), \cdot]$ and let $T_1 : \mathcal{V}_1 \to \mathcal{K}$ be the adjoint of the embedding of \( \mathcal{K} \) into \( \mathcal{V}_1 \). Since $T_1^+$ has dense range, $T_1$ is injective. Analogously let $(\mathcal{V}_2, [\cdot, \cdot])$ be the Hilbert space completion of $\mathcal{K}/\ker q(B)$ with respect to $[q(B), \cdot]$ and denote by $T_2 : \mathcal{V}_2 \to \mathcal{K}$ the injective adjoint of the embedding of $\mathcal{K}$ into $\mathcal{V}_2$.

Finally, let $(\mathcal{V}, [\cdot, \cdot])$ be the Hilbert space completion of $\mathcal{K}/(\ker p(A) + q(B))$ with respect to $[(p(A) + q(B)), \cdot]$ and let $T : \mathcal{V} \to \mathcal{K}$ be the injective adjoint of the embedding of $\mathcal{K}$ into $\mathcal{V}$.

From (2.7) and Theorem 5.7 in [2] we obtain
\[ p(\Theta(A)) = \Theta(p(A)) = \Theta(T_1 T_1^+) = R_1 R_1^* T_1^+ T = R_1 R_1^* \Theta(TT^+) = R_1 R_1^* (p(\Theta(A)) + q(\Theta(B))). \]
Similarly, $q(\Theta(B)) = R_2 R_2^* (p(\Theta(A)) + q(\Theta(B)))$. Finally, $R_1 R_1^*$ and $R_2 R_2^*$ commute with $T^+ T = p(\Theta(A)) + q(\Theta(B))$ by Lemma 2.1.

The fact that a normal operator is definitizable implies certain spectral properties of $\Theta(N)$.

Lemma 3.3. With the notation of Proposition 3.2 applied to the real part $A := \frac{N+N^+}{2}$ and the imaginary part $B := \frac{N-N^+}{2i}$ of a bounded linear, normal and definitizable operator $N$ we have
\[ \{ z \in \mathbb{C} : |p(\Re z)| > \| R_1 R_1^* \| \cdot |p(\Re z) + q(\Im z)| \} \subseteq \rho(\Theta(N)), \]
and
\[ \{ z \in \mathbb{C} : |q(\Im z)| > \| R_2 R_2^* \| \cdot |p(\Re z) + q(\Im z)| \} \subseteq \rho(\Theta(N)). \]
In particular, the zeros of $p(\Re z) + q(\Im z)$ are contained in $\rho(\Theta(N)) \cup \{z \in \mathbb{C} : p(\Re z) = 0 = q(\Im z)\}$. 

Proof. We are going to show the first inclusion. The second one is shown in the same manner. For this let \( n \in \mathbb{N} \) and set

\[
\Delta_n := \left\{ z \in \mathbb{C} : |p(\Re z)|^2 > \frac{1}{n} + \| R_1 R_1^* \|^2 \cdot |p(\Re z) + q(\Im z)|^2 \right\}.
\]

For \( x \in E(\Delta_n)(\mathcal{V}) \) we then have

\[
\|p(\Theta(A))x\|^2 = \int_{\Delta_n} |p(\Re \zeta)|^2 d[E(\zeta)x, x] \\
\geq \int_{\Delta_n} \frac{1}{n} d[E(\zeta)x, x] + \| R_1 R_1^* \|^2 \int_{\Delta_n} |p(\Re \zeta) \\
+ q(\Im \zeta)|^2 d[E(\zeta)x, x] \\
\geq \frac{1}{n} \|x\|^2 + \| R_1 R_1^* (p(\Theta(A)) + q(\Theta(B)))x\|^2.
\]

By (3.1) this inequality can only hold for \( x = 0 \). Since \( \Delta_n \) is open, by the Spectral Theorem for normal operators on Hilbert spaces we have \( \Delta_n \subseteq \rho(N) \). The asserted inclusion finally follows from

\[
\{ z \in \mathbb{C} : |p(\Re z)| > \| R_1 R_1^* \| \cdot |p(\Re z) + q(\Im z)| \} = \bigcup_{n \in \mathbb{N}} \Delta_n.
\]

\( \Box \)

Corollary 3.4. With the notation and assumptions from Lemma 3.3 we have

\[
R_1 R_1^* E\{ z \in \mathbb{C} : p(\Re z) \neq 0 \text{ or } q(\Im z) \neq 0 \} = \int_{\{ z \in \mathbb{C} : p(\Re z) \neq 0 \text{ or } q(\Im z) \neq 0 \}} \frac{p(\Re z)}{p(\Re z) + q(\Im z)} dE(z)
\]

and

\[
R_2 R_2^* E\{ z \in \mathbb{C} : p(\Re z) \neq 0 \text{ or } q(\Im z) \neq 0 \} = \int_{\{ z \in \mathbb{C} : p(\Re z) \neq 0 \text{ or } q(\Im z) \neq 0 \}} \frac{q(\Re z)}{p(\Re z) + q(\Im z)} dE(z)
\]

Proof. First note that the integrals on the right hand sides exist as bounded operators, because by Lemma 3.3 we have \( |p(\Re z)| \leq \| R_1 R_1^* \| \cdot |p(\Re z) + q(\Im z)| \) and \( |q(\Im z)| \leq \| R_2 R_2^* \| \cdot |p(\Re z) + q(\Im z)| \) on \( \sigma(\Theta(N)) \).

Clearly, both sides vanish on the range of \( E\{ z \in \mathbb{C} : p(\Re z) = 0 = q(\Im z) \} \). Its orthogonal complement

\[
\mathcal{H} : = \text{ran} E\{ z \in \mathbb{C} : p(\Re z) = 0 = q(\Im z) \}^\perp
= \text{ran} E\{ z \in \mathbb{C} : p(\Re z) \neq 0 \text{ or } q(\Im z) \neq 0 \},
\]

is invariant under \( \int (p(\Re z) + q(\Im z)) dE(z) = (p(\Theta(A)) + q(\Theta(B))) \). By Lemma 3.3 the restriction of this operator to \( \mathcal{H} \) is injective, and hence, has dense range in \( \mathcal{H} \). If \( x \) belongs to this dense range, i.e. \( x = (p(\Theta(A)) + q(\Theta(B))) \).
Definition 4.1. For \( m, n \in \mathbb{N} \) and definitizable operator in a Krein space \( H \), the multiplicative unit in \( B \) is the identity.

By a density argument the first asserted equality of the present corollary holds true on \( H \) and in turn on \( V \). The second equality is shown in the same manner.

\[ \int_{\{z \in \mathbb{C} : p(\mathbb{R}z) \neq 0 \text{ or } q(\mathbb{I}m z) \neq 0\}} \frac{p(\mathbb{R}z)}{p(\mathbb{R}z) + q(\mathbb{I}m z)} \, dE(z) \, x = \int_{\{z \in \mathbb{C} : p(\mathbb{R}z) \neq 0 \text{ or } q(\mathbb{I}m z) \neq 0\}} p(\mathbb{R}z) \, dE(z) \, y = p(\Theta(A)) \, y \]

\[ = R_1 R_1^* (p(\Theta(A)) + q(\Theta(B))) \, y = R_1 R_1^* \, x. \]

By a density argument the first asserted equality of the present corollary holds true on \( H \) and in turn on \( V \). The second equality is shown in the same manner.

\[ q(\Theta(B))) \, y \text{ with } y \in H, \text{ then} \]

\[ \int_{\{z \in \mathbb{C} : p(\mathbb{R}z) \neq 0 \text{ or } q(\mathbb{I}m z) \neq 0\}} \frac{p(\mathbb{R}z)}{p(\mathbb{R}z) + q(\mathbb{I}m z)} \, dE(z) \, x = \int_{\{z \in \mathbb{C} : p(\mathbb{R}z) \neq 0 \text{ or } q(\mathbb{I}m z) \neq 0\}} p(\mathbb{R}z) \, dE(z) \, y = p(\Theta(A)) \, y \]

\[ = R_1 R_1^* (p(\Theta(A)) + q(\Theta(B))) \, y = R_1 R_1^* \, x. \]

4. The Proper Function Class

In order to introduce a functional calculus we have to introduce an algebra structure on \( A_{m,n} := (\mathbb{C}^m \otimes \mathbb{C}^n) \times \mathbb{C}^2 \cong \mathbb{C}^{m \cdot n + 2} \) and on \( B_{m,n} := \mathbb{C}^m \otimes \mathbb{C}^n \cong \mathbb{C}^{m \cdot n} \) for \( m, n \in \mathbb{N} \).

\[ \text{Definition 4.1. For } m, n \in \mathbb{N} \text{ we provide } A_{m,n} \text{ with the componentwise addition and scalar multiplication. Moreover, writing the elements } a \in A_{m,n} \text{ as } a = (a_{k,l})_{(k,l) \in I_{m,n}}, \text{ with index set } I_{m,n} := \{(0, \ldots, m-1) \times \{0, \ldots, n-1\}\} \cup \{(m,0), (0,n)\}, \text{ we set } \pi := (\bar{a}_{k,l})_{(k,l) \in I_{m,n}}, \text{ and define the multiplication of elements } a = (a_{k,l})_{(k,l) \in I_{m,n}}, b = (b_{k,l})_{(k,l) \in I_{m,n}} \text{ from } A_{m,n} \text{ by} \]

\[ a \cdot b := \left( \sum_{c=0}^{k} \sum_{d=0}^{l} a_{c,d} b_{k-c,l-d} \right)_{(k,l) \in I_{m,n}}. \]

On \( B_{m,n} \) we define addition, scalar multiplication, multiplication and conjugation in the same way only neglecting the entries with indices \( (m,0) \) and \( (0,n) \).

Finally, for \( m, n \in \mathbb{N} \) we introduce the projection \( \pi : A_{m,n} \rightarrow B_{m,n}, \)

\[ (a_{k,l})_{(k,l) \in I_{m,n}} \mapsto (a_{k,l})_{0 \leq k \leq m-1}. \]

On \( B_{m,n} \) we assume \( \pi \) to be the identity.

\[ \diamond \]

Remark 4.2. It is easy to check that \( A_{m,n} \) and \( B_{m,n} \) are commutative, unital \( * \)-algebras. Setting \( e_{0,0} = 1 \) and \( e_{k,l} = 0, \) \( (k,l) \neq (0,0), \) it is easy to verify that \( (e_{k,l})_{(k,l) \in I_{m,n}} \) is the multiplicative unit in \( A_{m,n} \) and \( (e_{k,l})_{0 \leq k \leq m-1} \) is the multiplicative unit in \( B_{m,n} \). We shall denote these units by \( e \).

Moreover, it is straight forward to check that an element \( (a_{k,l}) \) of \( A_{m,n} \) (of \( B_{m,n} \)) has a multiplicative inverse in \( A_{m,n} \) (in \( B_{m,n} \)) if and only if \( a_{0,0} \neq 0 \).

\[ \diamond \]

For the rest of the paper assume that \( N \) is a bounded linear, normal and definitizable operator in a Krein space \( K \) with real part \( A \) and imaginary part \( B \). Moreover, we fix definitizing polynomials \( p \in \mathbb{R}[z] \setminus \{0\} \) for \( A \) and \( q \in \mathbb{R}[z] \setminus \{0\} \) for \( B \).
We define the functions \( \varphi_p, \varphi_q : \mathbb{C} \to \mathbb{N} \cup \{0\} \) by \( \varphi_p(z) := \min\{j \in \mathbb{N} \cup \{0\} : p^{(j)}(z) \neq 0\} \) and \( \varphi_q(z) := \min\{j \in \mathbb{N} \cup \{0\} : q^{(j)}(z) \neq 0\} \). Moreover, we shall denote the set of their real zeros by \( Z^R_p \) and \( Z^R_q \), i.e.

\[
Z^R_p := p^{-1}\{0\} \cap \mathbb{R}, \quad Z^R_q := q^{-1}\{0\} \cap \mathbb{R},
\]

and we set \( Z^i := (p^{-1}\{0\} \times q^{-1}\{0\}) \setminus (\mathbb{R} \times \mathbb{R}) \).

Now we introduce the following classes of functions:

(i) By \( \mathcal{M}_N \) we denote the set of functions \( \phi \) defined on

\[
(\sigma(\Theta(N)) \cup (Z^R_p + iZ^R_q)) \cup Z^i
\]

with \( \phi(z) \in \mathcal{C}(z) \), where \( \mathcal{C}(z) := \mathcal{B}_{\varphi_p}(\xi, \varphi_q(\eta)) \) for \( z = (\xi, \eta) \in Z^i \), \( \mathcal{C}(z) := \mathcal{A}_{\varphi_p(\text{Re } z), \varphi_q(\text{Im } z)} \) for \( z \in (Z^R_p + iZ^R_q) \) and \( \mathcal{C}(z) := \mathcal{C} \) for \( z \in \sigma(\Theta(N)) \setminus (Z^R_p + iZ^R_q) \).

(ii) We provide \( \mathcal{M}_N \) pointwise with scalar multiplication, addition and multiplication, where the operations on \( \mathcal{A}_{\varphi_p(\text{Re } z), \varphi_q(\text{Im } z)} \) or \( \mathcal{B}_{\varphi_p(\xi), \varphi_q(\eta)} \) are as in Definition 4.1. We also define a conjugate linear involution \( \# \) on \( \mathcal{M}_N \) by

\[
\phi^\#(z) = \overline{\phi(z)} \quad \text{for} \quad z \in \sigma(\Theta(N)) \cup (Z^R_p + iZ^R_q),
\]

\[
\phi^\#(\xi, \eta) = \overline{\phi(\xi, \eta)} \quad \text{for} \quad (\xi, \eta) \in Z^i.
\]

(iii) By \( \mathcal{R} \) we denote the set of all elements \( \phi \in \mathcal{M}_N \) such that \( \pi(\phi(z)) = 0 \) for all \( z \in (Z^R_p + iZ^R_q) \cup Z^i \); see Definition 4.1.

With the operations introduced in Definition 4.3 \( \mathcal{M}_N \) is a commutative \( * \)-algebra as can be verified in a straightforward manner. Moreover, \( \mathcal{R} \) is an ideal of \( \mathcal{M}_N \).

Definition 4.4. Let \( f : \text{dom } f \to \mathbb{C} \) be a function with \( \text{dom } f \subseteq \mathbb{C}^2 \) such that

\[
\tau(\sigma(\Theta(N)) \cup (Z^R_p + iZ^R_q)) \subseteq \text{dom } f,
\]

where \( \tau : \mathbb{C} \to \mathbb{C}^2, \ (x + iy) \mapsto (x, y) \), such that \( f \circ \tau \) is sufficiently smooth—more exactly, at least \( \max_{x,y \in \mathbb{R}} \varphi_p(x) + \varphi_q(y) - 1 \) times continuously differentiable—on an open neighbourhood of \( Z^R_p + iZ^R_q \), and such that \( f \) is holomorphic on an open neighbourhood of \( Z^i \).

Then \( f \) can be considered as an element \( f_N \) of \( \mathcal{M}_N \) by setting \( f_N(z) := f \circ \tau(z) \) for \( z \in \sigma(\Theta(N)) \setminus (Z^R_p + iZ^R_q) \), by

\[
f_N(z) := \left( \frac{1}{k!} \frac{\partial^{k+l}}{\partial x^k \partial y^l} f \circ \tau(z) \right)_{(k,l) \in I_{\varphi_p(\text{Re } z), \varphi_q(\text{Im } z)}},
\]

for \( z \in Z^R_p + iZ^R_q \), and by

\[
f_N(\xi, \eta) := \left( \frac{1}{k!} \frac{\partial^{k+l}}{\partial z^k \partial w^l} f(\xi, \eta) \right)_{0 \leq k \leq \varphi_p(\xi) - 1}, \quad 0 \leq l \leq \varphi_q(\eta) - 1,
\]

for \( (\xi, \eta) \in Z^i \).

Remark 4.5. By the Leibniz rule \( f \mapsto f_N \) is compatible with multiplication. Obviously, it is also compatible with addition and scalar multiplication. If we define for a function \( f \) as in Definition 4.4 the function \( f^\# \) by \( f^\#(z, w) = \)
Lemma 4.8. Let \( f(\bar{z}, \bar{w}) \), \( (z, w) \in \text{dom } f \), then we also have \((f^\#)_N = (f^\#)_N\). Note that in general \((\bar{f})_N \neq (f^\#)_N\).

\[\text{Example 4.6.}\] For the constant one function \(1\) on \(\mathbb{C}^2\) we have \(1_N(z) = 1\) for all \(z \in (\sigma(\Theta(N)) \cup (Z^R_p + iZ^R_q)) \cup Z^i\), where \(e\) is the multiplicative unit in \(\mathbb{C}\); see Remark 4.2.

\[\text{Example 4.7.}\] \(p(z)\) considered as an element of \(\mathbb{C}[z, w]\) is clearly holomorphic on \(\mathbb{C}^2\). Hence, we can consider \(p_N\) as defined in Definition 4.4. Thereby, \(p_N(z)_{k,l} = 0, (k, l) \in I_{\partial_p(Re z), \partial_q(Im z)} \setminus \{(0, \partial_q(Im z))\}\), and

\[
p_N(z)_{\partial_p(Re z), 0} = \frac{1}{\partial_p(Re z)}[p_{\partial_p(Re z)}](Re z)
\]

for all \(z \in Z^R_p + iZ^R_q\). Since \(\text{Re } z\) is a zero of \(p\) of degree \(\partial_p(Re z)\) the entries with index \((\partial_p(Re z), 0)\) do not vanish. Moreover, \(p_N(\xi, \eta) = 0\) for all \((\xi, \eta) \in Z^i\). Hence, \(p_N \in \mathcal{R}\). Similarly, if \(q(w)\) is considered as an element of \(\mathbb{C}[z, w]\), then \(q_N(z)_{k,l} = 0, (k, l) \in I_{\partial_p(Re z), \partial_q(Im z)} \setminus \{(0, \partial_q(Im z))\}\), and

\[
q_N(z)_{0, \partial_q(Im z)} = \frac{1}{\partial_q(Im z)}[q_{\partial_q(Im z)}](Im z) \neq 0
\]

for all \(z \in Z^R_p + iZ^R_q\). Also here \(q_N(\xi, \eta) = 0\) for all \((\xi, \eta) \in Z^i\) and, in turn, \(q_N \in \mathcal{R}\).

We need an easy algebraic lemma based on the Euclidean algorithm.

\[\text{Lemma 4.8.}\] Let \(a(z), b(z) \in \mathbb{C}[z] \setminus \{0\}\) be polynomials of positive degrees \(m\) and \(n\), respectively. By \(a^{-1}\{0\}\) we denote the set of all zeros of \(a\) in \(\mathbb{C}\), and we set \(\partial_a(z) := \min\{j : a^{(j)}(w) \neq 0\}\). The set \(b^{-1}\{0\}\) and the function \(\partial_a(z)\) is defined correspondingly. Then any \(s \in \mathbb{C}[z, w]\) can be written as

\[
s(z, w) = a(z)u(z, w) + b(w)v(z, w) + r(z, w)
\]

with \(u(z, w), v(z, w), r(z, w) \in \mathbb{C}[z, w]\) such that \(r\) ‘s \(z\)-degree is less than \(m\) and its \(w\)-degree is less than \(n\). Here \(u(z, w), v(z, w), r(z, w)\) can be found in \(\mathbb{R}[z, w]\) for \(a(z), b(z) \in \mathbb{R}[z]\) and \(s \in \mathbb{R}[z, w]\).

If we define \(\varpi : \mathbb{C}[z, w] \rightarrow \mathbb{C}^{m \times n}\) by

\[
\varpi(s) = \left(\frac{1}{k!l!} \frac{\partial^{k+l}}{\partial z^k \partial w^l} s(z, w) \right)_{0 \leq k \leq \partial_a(z) - 1, 0 \leq l \leq \partial_b(w) - 1, z \in a^{-1}\{0\}, w \in b^{-1}\{0\}}
\]

then \(s \in \ker \varpi\) if and only if \(s(z, w) = a(z)u(z, w) + b(w)v(z, w)\) for some \(u(z, w), v(z, w) \in \mathbb{C}[z, w]\). Moreover, \(\varpi\) restricted to the space of all polynomials from \(\mathbb{C}[z, w]\) with \(z\)-degree less than \(m\) and \(w\)-degree less than \(n\) is bijective.

\[\text{Proof.}\] Applying the Euclidean algorithm to \(s(z, w) \in \mathbb{C}[z, w]\) and \(a(z)\) we obtain \(s(z, w) = a(z)u(z, w) + t(z, w)\), where \(u(z, w), t(z, w) \in \mathbb{C}[z, w]\) are such that \(t\) ‘s \(z\)-degree is less than \(m\). Applying the Euclidean algorithm to \(t(z, w)\) and \(b(w)\) we obtain

\[
s(z, w) = a(z)u(z, w) + b(w)v(z, w) + r(z, w),
\]
where \( v(z, w), r(z, w) \in \mathbb{C}[z, w] \) are such that \( r \)'s \( z \)-degree is less than \( m \) and its \( w \)-degree is less than \( n \). The resulting polynomials \( u(z, w), t(z, w), v(z, w), r(z, w) \) belong to \( \mathbb{R}[z, w] \) if \( a(z), b(z) \in \mathbb{R}[z], s(z, w) \in \mathbb{R}[z, w] \).

In any case it is easy to check that then \( \varpi(s) = \varpi(r) \). Hence, \( r(z, w) = 0 \) yields \( s(z, w) \in \ker \varpi \). On the other hand, if \( 0 = \varpi(s) = \varpi(r) \), then for each fixed \( \xi \in a^{-1}\{0\} \) and \( k \in \{0, \ldots, \partial_z(\xi) - 1\} \) the function \( w \mapsto \frac{\partial^k}{\partial z^k} r(\xi, w) \) has zeros at all \( w \in b^{-1}\{0\} \) with multiplicity at least \( \partial_b(w) \). Since \( w \mapsto \frac{\partial^k}{\partial z^k} r(\xi, w) \) is of \( w \)-degree less than \( n \), it must be identically equal to zero.

This implies that for any \( \eta \in \mathbb{C} \) the polynomial \( z \mapsto r(z, \eta) \) has zeros at all \( \xi \in a^{-1}\{0\} \) with multiplicity at least \( \partial_a(\xi) \). Since the degree of this polynomial in \( z \) is less than \( m \), we obtain \( r(z, \eta) = 0 \) for any \( z \in \mathbb{C} \). Thus, \( r \equiv 0 \).

Our description of \( \ker \varpi \) shows in particular that \( \varpi \) restricted to the space of all polynomials from \( \mathbb{C}[z, w] \) with \( z \)-degree less than \( m \) and \( w \)-degree less than \( n \) is one-to-one. Comparing dimensions shows that this restriction of \( \varpi \) is also onto. \( \square \)

**Corollary 4.9.** With the notation from Definition 4.3 for any \( \phi \in \mathcal{M}_N \) we find an \( s \in \mathbb{C}[z, w] \) such that \( \phi - s_N \in \mathcal{R} \).

**Proof.** By Lemma 4.8 there exists an \( s \in \mathbb{C}[z, w] \) such that \( \varpi(s)_{\Re z, \Im z} = \pi(\phi(z)) \) for all \( z \in Z_p^R + iZ_q^R \), and such that \( \varpi(s)_{\xi, \eta} = \phi(\xi, \eta) \) for all \( (\xi, \eta) \in Z^i \). Hence, by the definition of \( \mathcal{R} \) we obtain \( \phi - s_N \in \mathcal{R} \). \( \square \)

**Remark 4.10.** Recall from Lemma 3.3 that \( p(\Re z) + q(\Im z) = 0 \) with \( z \in \sigma(\Theta(N)) \) implies \( p(\Re z) = 0 = q(\Im z) \), i.e. \( z \in Z_p^R + iZ_q^R \).

If \( \phi \in \mathcal{R} \), then we find a function \( g \) on \( \sigma(\Theta(N)) \) with \( g(z) \in \mathbb{C} \) for \( z \in \sigma(\Theta(N)) \setminus (Z_p^R + iZ_q^R) \) and \( g(z) \in \mathbb{C}^2 \) for \( z \in \sigma(\Theta(N)) \cap (Z_p^R + iZ_q^R) \), such that \( \phi(z) = (p_N + q_N)(z) \cdot g(z), z \in \sigma(\Theta(N)) \). Here we define \( (p_N + q_N)(z) \cdot g(z) \) as the usual multiplication on \( \mathbb{C} \) for \( z \in \sigma(\Theta(N)) \setminus (Z_p^R + iZ_q^R) \), whereas

\[
((p_N + q_N)(z) \cdot g(z))_{k, l} = 0, \quad k = 0, \ldots, \partial_p(\Re z) - 1; \quad l = 0, \ldots, \partial_q(\Im z) - 1,
\]

and

\[
((p_N + q_N)(z) \cdot g(z))_{\partial_p(\Re z), 0} = (p_N + q_N)(z)_{\partial_p(\Re z), 0} \cdot g_1(z), \quad ((p_N + q_N)(z) \cdot g(z))_{0, \partial_q(\Im z)} = (p_N + q_N)(z)_{0, \partial_q(\Im z)} \cdot g_2(z).
\]

for \( z \in \sigma(\Theta(N)) \cap (Z_p^R + iZ_q^R) \); see Example 4.7.

In fact, we set \( g(z) := \frac{\phi(z)}{p(\Re z) + q(\Im z)} \) for \( z \in \sigma(\Theta(N)) \setminus (Z_p^R + iZ_q^R) \) and

\[
g_1(z) := \frac{\partial_p(\Re z)! \cdot \phi(z)_{\partial_p(\Re z), 0}}{p(\Re z)!} \cdot g(z), \quad g_2(z) := \frac{\partial_q(\Im z)! \cdot \phi(z)_{0, \partial_q(\Im z)}}{q(\Im z)!} \cdot g(z)
\]

for \( z \in \sigma(\Theta(N)) \cap (Z_p^R + iZ_q^R) \). \( \diamond \)

We are going to introduce a subclass of \( \mathcal{M}_N \), which will be the suitable class, in order to build up our functional calculus.
Definition 4.11. With the notation from Definition 4.3 we denote by \( \mathcal{F}_N \) the set of all elements \( \phi \in \mathcal{M}_N \) such that \( z \mapsto \phi(z) \) is Borel measurable and bounded on \( \sigma(\Theta(N)) \setminus (Z_p^R + iZ_q^R) \), and such that for each \( w \in \sigma(\Theta(N)) \cap (Z_p^R + iZ_q^R) \)

\[
\phi(z) - \sum_{k=0}^{\delta_p(\text{Re } w)-1} \sum_{l=0}^{\delta_q(\text{Im } w)-1} \phi(w)_{k,l} \text{Re}(z-w)^k \text{Im}(z-w)^l \max(|\text{Re}(z-w)|^{\delta_p(\text{Re } w)}, |\text{Im}(z-w)|^{\delta_q(\text{Im } w)})
\]

(4.1)
is bounded for \( z \in \sigma(\Theta(N)) \cap U(w) \setminus \{w\} \), where \( U(w) \) is a sufficiently small neighbourhood of \( w \).

Note that (4.1) is immaterial if \( w \) is an isolated point of \( \sigma(\Theta(N)) \).

Example 4.12. For \( \zeta \in (Z_p^R + iZ_q^R) \cup \mathbb{Z}_i \) and \( a \in \mathcal{C}(\zeta) \) consider the functions \( a\delta_\zeta \in \mathcal{M}_N \) which assumes the value \( a \) at \( \zeta \) and the value zero on the rest of \( (\sigma(\Theta(N)) \cup (Z_p^R + iZ_q^R)) \cup \mathbb{Z}_i \).

If \( \zeta \) belongs to \( \mathbb{Z}_i \) or if \( \zeta \) is an isolated point of \( \sigma(\Theta(N)) \cup (Z_p^R + iZ_q^R) \), then \( a\delta_\zeta \) belongs to \( \mathcal{F}_N \).

Remark 4.13. Let \( h \) be defined on an open subset \( D \) of \( \mathbb{C} \) with values in \( \mathbb{C} \). Moreover, assume that for given \( m, n \in \mathbb{N} \) the function \( h \) is \( m + n - 1 \) times continuously differentiable, and fix \( w \in D \). The well-known Taylor Approximation Theorem for multidimensional calculus then yields

\[
h(z) = \sum_{j=0}^{m+n-2} \sum_{k,l \in [0]_{j=0}} \frac{1}{k!l!} \frac{\partial^j h}{\partial x^k \partial y^l}(w) \text{Re}(z-w)^k \text{Im}(z-w)^l + O(|z-w|^{m+n-1})
\]

for \( z \to w \). From

\[
|z-w|^{m+n-1} \leq 2^{m+n-1} \max(|\text{Re}(z-w)|^{m+n-1}, |\text{Im}(z-w)|^{m+n-1})
\]

\[
= O(\max(|\text{Re}(z-w)|^m, |\text{Im}(z-w)|^n))
\]

and from \( \text{Re}(z-w)^k \text{Im}(z-w)^l = O(\max(|\text{Re}(z-w)|^m, |\text{Im}(z-w)|^n)) \) for \( k \geq m \) or \( l \geq n \), we conclude that also

\[
h(z) = \sum_{k=0}^{m-1} \sum_{l=0}^{n-1} \frac{1}{k!l!} \frac{\partial^{k+l} h}{\partial x^k \partial y^l}(w) \text{Re}(z-w)^k \text{Im}(z-w)^l + O(\max(|\text{Re}(z-w)|^m, |\text{Im}(z-w)|^n)).
\]

Lemma 4.14. Let \( f : \text{dom } f \subseteq \mathbb{C}^2 \to \mathbb{C} \) be a function with the properties mentioned in Definition 4.4. Then \( f_N \) belongs to \( \mathcal{F}_N \).

Proof. For a fixed \( w \in \sigma(\Theta(N)) \cap (Z_p^R + iZ_q^R) \) and \( z \in \sigma(\Theta(N)) \setminus (Z_p^R + iZ_q^R) \) by Remark 4.13 the expression

\[
f_N(z) - \sum_{k=0}^{\delta_p(\text{Re } w)-1} \sum_{l=0}^{\delta_q(\text{Im } w)-1} f_N(w)_{k,l} \text{Re}(z-w)^k \text{Im}(z-w)^l \]

\[
= f \circ \tau(z) - \sum_{k=0}^{\delta_p(\text{Re } w)-1} \sum_{l=0}^{\delta_q(\text{Im } w)-1} \frac{1}{k!l!} \frac{\partial^{k+l} f \circ \tau}{\partial x^k \partial y^l}(w) \text{Re}(z-w)^k \text{Im}(z-w)^l
\]
is a \( O(\max(|\Re(z - w)|^{p}(\Re w), |\Im(z - w)|^{q}(\Im w))) \) for \( z \to w \). Therefore, \( f_{N} \in \mathcal{F}_{N} \).

In order to be able to prove spectral results for our functional calculus, we need that with \( \phi \) also \( z \mapsto \phi(z)^{-1} \) belongs to \( \mathcal{F}_{N} \) if \( \phi \) is bounded away from zero.

**Lemma 4.15.** If \( \phi \in \mathcal{F}_{N} \) is such that \( \phi(z) \) is invertible in \( \mathbb{C}(z) \) (see Remark 4.2) for all \( z \in (\sigma(\Theta(N)) \cup (Z_{p}^{\mathbb{R}} + iZ_{q}^{\mathbb{R}})) \cup Z_{i} \) and such that 0 does not belong to the closure of \( \phi(\sigma(\Theta(N))) \setminus (Z_{p}^{\mathbb{R}} + iZ_{q}^{\mathbb{R}}) \), then \( \phi^{-1} : z \mapsto \phi(z)^{-1} \) also belongs to \( \mathcal{F}_{N} \).

**Proof.** By the first assumption \( \phi^{-1} \) is a well-defined object belonging to \( \mathcal{M}_{N} \). Clearly, with \( \phi \) also \( z \mapsto \phi(z)^{-1} = \frac{1}{\phi(z)} \) is measurable on \( \sigma(\Theta(N)) \setminus (Z_{p}^{\mathbb{R}} + iZ_{q}^{\mathbb{R}}) \).

By the second assumption \( z \mapsto \phi(z)^{-1} = \frac{1}{\phi(z)} \) is bounded on this set.

It remains to verify the boundedness of (4.1) on a certain neighbourhood of \( w \) for each \( w \in \sigma(\Theta(N)) \cap (Z_{p}^{\mathbb{R}} + iZ_{q}^{\mathbb{R}}) \) for \( \phi^{-1} \). To do so, for \( z \in \sigma(\Theta(N)) \setminus (Z_{p}^{\mathbb{R}} + iZ_{q}^{\mathbb{R}}) \) we calculate

\[
\phi^{-1}(z) = \frac{1}{\phi(z)} - \sum_{l=0}^{1} \phi^{-1}(w)_{k,l} \Re(z - w)^{k} \Im(z - w)^{l} (4.2)
\]

\[
= \sum_{l=0}^{\phi(\Re w) - 1} \phi^{-1}(w)_{k,l} \Re(z - w)^{k} \Im(z - w)^{l} - \sum_{l=0}^{\phi(\Im w) - 1} \phi^{-1}(w)_{k,l} \Re(z - w)^{k} \Im(z - w)^{l} (4.3)
\]

The expression in (4.3) can be written as

\[
\frac{1}{\phi(z)} \cdot \left( \frac{1}{\phi(z)} - \frac{1}{\phi(z)} \sum_{l=0}^{\phi(\Re w) - 1} \phi^{-1}(w)_{k,l} \Re(z - w)^{k} \Im(z - w)^{l} \right)
\]

\[
\cdot \left( \phi(z) - \sum_{l=0}^{\phi(\Re w) - 1} \phi^{-1}(w)_{k,l} \Re(z - w)^{k} \Im(z - w)^{l} \right) (4.4)
\]

Here \( \frac{1}{\phi(z)} \) is bounded by assumption. The assumed invertibility of \( \phi(w) \) means \( \phi(w)_{0,0} \neq 0 \). Hence,

\[
\frac{1}{\phi(z)} \cdot \left( \frac{1}{\phi(z)} - \frac{1}{\phi(z)} \sum_{l=0}^{\phi(\Re w) - 1} \phi^{-1}(w)_{k,l} \Re(z - w)^{k} \Im(z - w)^{l} \right)
\]

\[
\cdot \left( \phi(z) - \sum_{l=0}^{\phi(\Re w) - 1} \phi^{-1}(w)_{k,l} \Re(z - w)^{k} \Im(z - w)^{l} \right) = O(1)
\]

for \( z \to w \). As \( \phi \in \mathcal{F}_{N} \) we conclude that the expression (4.3) is a \( O(\max(|\Re(z - w)|^{p}(\Re w), |\Im(z - w)|^{q}(\Im w))) \) for \( z \to w \).
Because of $\phi(w) \cdot \phi^{-1}(w) = e$ (4.4) can be rewritten as

$$
\frac{1}{\sum_{k=0}^{d_p(\Re w)-1} \sum_{l=0}^{d_q(\Im w)-1} \phi(w)_{k,l} \Re(z - w)^k \Im(z - w)^l} \\
\cdot \left( \sum_{k=0}^{d_p(\Re w)-1} \sum_{l=0}^{d_q(\Im w)-1} \Re(z - w)^k \Im(z - w)^l \right).
$$

$$
\sum_{c=0}^{k} \sum_{d=0}^{l} \phi(w)_{c,d} \cdot \phi^{-1}(w)_{k-c,l-d} + O(\max(|\Re(z - w)|^{d_p(\Re w)}, |\Im(z - w)|^{d_q(\Im w)})) - 1)
$$

$$
= O(1) \cdot O(\max(|\Re(z - w)|^{d_p(\Re w)}, |\Im(z - w)|^{d_q(\Im w)}))
$$

$$
= O(\max(|\Re(z - w)|^{d_p(\Re w)}, |\Im(z - w)|^{d_q(\Im w)}))
$$

for $z \to w$. Thus, $\phi^{-1} \in F_N$ since we verified that the expression (4.2) is a $O(\max(|\Re(z - w)|^{d_p(\Re w)}, |\Im(z - w)|^{d_q(\Im w)}))$.

\[\Box\]

5. Functional Calculus

In this section we employ the same assumptions and notation as in the previous one.

Lemma 5.1. For any $\phi \in F_N$ there exists a polynomial $s \in \mathbb{C}[z,w]$ and a function $g$ on $\sigma(\Theta(N))$ with values in $\mathbb{C}$ on $\sigma(\Theta(N)) \setminus (Z_p^R + iZ_q^R)$ and values in $\mathbb{C}^2$ on $\sigma(\Theta(N)) \cap (Z_p^R + iZ_q^R)$ such that $\phi - s_N \in R$, such that $g$ is bounded and measurable on $\sigma(\Theta(N)) \setminus (Z_p^R + iZ_q^R)$, and such that

$$
\phi(z) = s_N(z) + (p_N + q_N)(z) \cdot g(z), \quad z \in \sigma(\Theta(N)), \quad (5.1)
$$

where the multiplication here has to be understood in the sense of Remark 4.10.

Proof. According to Corollary 4.9 there exists an $s \in \mathbb{C}[z,w]$ such that $\phi - s_N \in R$, and by Remark 4.10 we then find a function $g$ such that (5.1) holds true. The measurability of

$$
g(z) = \frac{\phi(z) - s(\Re z, \Im z)}{p(\Re z) + q(\Im z)} \quad \text{on} \quad \sigma(\Theta(N)) \setminus (Z_p^R + iZ_q^R)
$$

follows from the assumption $\phi \in F_N$; see Definition 4.11.

In order to show $g$’s boundedness, first recall from Lemma 3.3 that

$$
\max(|p(\Re z)|, |q(\Im z)|) \leq \max(||R_1 R_1^*||, ||R_2 R_2^*||) |p(\Re z) + q(\Im z)|
$$

for $z \in \sigma(\Theta(N))$. Hence, for $z \in \sigma(\Theta(N)) \setminus (Z_p^R + iZ_q^R)$ we have

$$
\max(|p(\Re z)|, |q(\Im z)|) |p(\Re z) + q(\Im z)| \leq \max(||R_1 R_1^*||, ||R_2 R_2^*||).
$$

As $\phi \in F_N$ for each $w \in \sigma(\Theta(N)) \cap (Z_p^R + iZ_q^R)$ we find an open neighbourhood $U(w)$ of $w$ such that (4.1) is bounded for $z \in U(w) \setminus \{w\}$. Clearly, we can make the neighbourhoods $U(w)$ smaller so that they are pairwise disjoint.
Since for $w \in \sigma(\Theta(N)) \cap (Z_p^R + iZ_q^R)$ the real number $\text{Re} w$ (Im $w$) is a zero of $p(\text{Re} z)$ ($q(\text{Im} z)$) with multiplicity $\vartheta_p(\text{Re} w)$ ($\vartheta_q(\text{Im} w)$), we have
\[
 c|\text{Re}(z-w)|^{\vartheta_p(\text{Re} w)} \leq |p(\text{Re} z)| \quad \text{and} \quad d|\text{Im}(z-w)|^{\vartheta_q(\text{Im} w)} \leq |q(\text{Im} z)|
\]
for $z \in U(w)$ with constants $c, d > 0$. Hence,
\[
\frac{\max(|\text{Re}(z-w)|^{\vartheta_p(\text{Re} w)}, |\text{Im}(z-w)|^{\vartheta_q(\text{Im} w)})}{\max(|p(\text{Re} z)|, |q(\text{Im} z)|)} \leq C_w
\]
on $\sigma(\Theta(N)) \cap U(w) \setminus \{w\}$ for some $C_w > 0$. By what was said in Remark 4.13 we also have
\[
s(\text{Re} z, \text{Im} z) = \sum_{k=0}^{\vartheta_p(\text{Re} w)-1} \sum_{l=0}^{\vartheta_q(\text{Im} w)-1} \phi(w)_{k,l} \text{Re}(z-w)^k \text{Im}(z-w)^l + O\left(\max(|\text{Re}(z-w)|^{\vartheta_p(\text{Re} w)}, |\text{Im}(z-w)|^{\vartheta_q(\text{Im} w)})\right),
\]

because $\phi - s_N \in \mathcal{R}$ implies $\phi(w)_{k,l} = \frac{1}{k!l!} I_{\vartheta_p(\text{Re} w)}(\vartheta_q(\text{Im} w)) \frac{\partial^{k+l} \phi}{\partial x^k \partial y^l}(\text{Re} w, \text{Im} w)$. Using the boundedness of (4.1), altogether we obtain the boundedness of
\[
g(z) = \frac{\phi(z) - s(\text{Re} z, \text{Im} z)}{p(\text{Re} z) + q(\text{Im} z)} = \frac{\max(|p(\text{Re} z)|, |q(\text{Im} z)|)}{p(\text{Re} z) + q(\text{Im} z)} \cdot \frac{\max(|\text{Re}(z-w)|^{\vartheta_p(\text{Re} w)}, |\text{Im}(z-w)|^{\vartheta_q(\text{Im} w)})}{\max(|\text{Re}(z-w)|^{\vartheta_p(\text{Re} w)}, |\text{Im}(z-w)|^{\vartheta_q(\text{Im} w)})} \cdot \phi(z) - s(\text{Re} z, \text{Im} z)
\]
for $z \in \sigma(\Theta(N)) \cap U(w) \setminus \{w\}$. Since by Lemma 3.3 the function $\frac{1}{p(\text{Re} z) + q(\text{Im} z)}$ is continuous, and hence bounded on $\sigma(\Theta(N)) \setminus \bigcup_{w \in \sigma(\Theta(N)) \cap (Z_p^R + iZ_q^R)} U(w)$, we see that $(5.2)$ is even bounded for $z \in \sigma(\Theta(N)) \setminus (Z_p^R + iZ_q^R)$.

**Definition 5.2.** For any $\phi \in \mathcal{F}_N$ we define
\[
\phi(N) := s(A, B) + \mathbb{E}\left(\int_{\sigma(\Theta(N))} R_1 R_2 \cdot g \, dE\right),
\]
where $s \in \mathbb{C}[z, w]$ and $g$ is a function on $\sigma(\Theta(N))$ with the properties mentioned in Lemma 5.1, and where
\[
\int_{\sigma(\Theta(N))} R_1 R_2 \cdot g \, dE := \int_{\sigma(\Theta(N)) \setminus (Z_p^R + iZ_q^R)} g \, dE + \sum_{w \in \sigma(\Theta(N)) \cap (Z_p^R + iZ_q^R)} \{g(w)R_1 R_1 \cdot E\{w\} + g(w)R_2 R_2 \cdot E\{w\}\}.\]

First we show that $\phi(N)$ is well defined.
Theorem 5.3. Let \( \phi \in \mathcal{F}_N \), \( s, \tilde{s} \in \mathbb{C}[z, w] \) and functions \( g, \tilde{g} \) on \( \sigma(\Theta(N)) \) be given, such that the assertion of Lemma 5.1 holds true for \( s, g \) as well as for \( \tilde{s}, \tilde{g} \). Then
\[
s(A, B) + \Xi \left( \int_{\sigma(\Theta(N))}^{} \! g \, dE \right) = \tilde{s}(A, B) + \Xi \left( \int_{\sigma(\Theta(N))}^{} \! \tilde{g} \, dE \right).
\]

Proof. By assumption we have \( \phi - s_N, \phi - \tilde{s}_N \in \mathcal{R} \). Subtracting these functions yields \( \tilde{s}_N - s_N \in \mathcal{R} \). Using the notation of Lemma 4.8 this gives \( \Xi(s - \tilde{s})_{\xi, \eta} = 0 \) for \( (\xi, \eta) \in p^{-1}\{0\} \times q^{-1}\{0\} \). According to Lemma 4.8 we then have
\[
\tilde{s}(z, w) = s(z, w) = p(z)u(z, w) + q(w)v(z, w) \quad (5.3)
\]
for some \( u(z, w), v(z, w) \in \mathbb{C}[z, w] \).

By Lemma 5.10 in [2] we have
\[
\Xi_1(u(\Theta_1(A), \Theta_1(B))) = \Xi_1(\Theta_1(u(A, B))) = p(A)u(A, B),
\]
\[
\Xi_2(v(\Theta_2(A), \Theta_2(B))) = \Xi_2(\Theta_2(v(A, B))) = q(B)v(A, B),
\]
where \( \Xi_j, j = 1, 2 \), are as defined in (2.5). Since \( u(\Theta_1(A), \Theta_1(B)) = \int u(\text{Re } z, \text{Im } z) \, dE_1(z) \), we obtain from (2.6)
\[
\Xi_1(u(\Theta_1(A), \Theta_1(B))) = \Xi \left( R_1 R_1^* \int u(\text{Re } z, \text{Im } z) \, dE(z) \right).
\]
Similarly, \( \Xi_2(v(\Theta_2(A), \Theta_2(B))) = \Xi (R_2 R_2^* \int v(\text{Re } z, \text{Im } z) \, dE(z)) \). Therefore, employing Corollary 3.4 we get
\[
\tilde{s}(A, B) - s(A, B) = p(A)u(A, B) + q(B)v(A, B)
\]
\[
= \Xi \left( R_1 R_1^* \int u(\text{Re } z, \text{Im } z) \, dE(z) + R_2 R_2^* \int v(\text{Re } z, \text{Im } z) \, dE(z) \right)
\]
\[
= \Xi \left( \int_{\sigma(\Theta(N)) \cap (Z_p^\mathbb{R} + iZ_q^\mathbb{R})} \frac{p(\text{Re } z)u(\text{Re } z, \text{Im } z) + q(\text{Im } z)v(\text{Re } z, \text{Im } z)}{p(\text{Re } z) + q(\text{Im } z)} \, dE(z) \right.
\]
\[
+ \left. \sum_{w \in \sigma(\Theta(N)) \cap (Z_p^\mathbb{R} + iZ_q^\mathbb{R})} (u(\text{Re } w, \text{Im } w) R_1 R_1^* E\{w\} + v(\text{Re } w, \text{Im } w) R_2 R_2^* E\{w\}) \right).
\]

(5.4)

On the other hand, since (5.1) holds true for \( s, g \) and \( \tilde{s}, \tilde{g} \), we have
\[
(\tilde{s}_N - s_N)(z) = (p_N + q_N)(z) \cdot (g(z) - \tilde{g}(z)), \quad z \in \sigma(\Theta(N)). \quad (5.5)
\]

For \( z \in \sigma(\Theta(N)) \setminus (Z_p^\mathbb{R} + iZ_q^\mathbb{R}) \) by (5.3) this means
\[
p(\text{Re } z)u(\text{Re } z, \text{Im } z) + q(\text{Im } z)v(\text{Re } z, \text{Im } z)
\]
\[
= \tilde{s}(\text{Re } z, \text{Im } z) - s(\text{Re } z, \text{Im } z) = (p(\text{Re } z) + q(\text{Im } z)) \cdot (g(z) - \tilde{g}(z))
\]
and, in turn,
\[
g(z) - \tilde{g}(z) = \frac{p(\text{Re } z)u(\text{Re } z, \text{Im } z) + q(\text{Im } z)v(\text{Re } z, \text{Im } z)}{p(\text{Re } z) + q(\text{Im } z)}.
\]
Considering for $z \in \sigma(\Theta(N)) \cap (Z_p^R + iZ_q^R)$ the entries of (5.5) with indices $(\partial_p(\text{Re } z), 0)$ and $(0, \partial_q(\text{Im } z))$ together with (5.3) we get

$$\frac{1}{\partial_p(\text{Re } z)!} p^{(\partial_p(\text{Re } z))}(\text{Re } z) u(\text{Re } z, \text{Im } z) = \frac{1}{\partial_p(\text{Re } z)!} \frac{\partial^{\partial_p(\text{Re } z)}}{\partial x^{\partial_p(\text{Re } z)}} (\tilde{s}(\text{Re } z, \text{Im } z) - s(\text{Re } z, \text{Im } z))$$

and

$$\frac{1}{\partial_q(\text{Im } z)!} q^{(\partial_q(\text{Im } z))}(\text{Im } z) v(\text{Re } z, \text{Im } z) = \frac{1}{\partial_q(\text{Im } z)!} \frac{\partial^{\partial_q(\text{Im } z)}}{\partial y^{\partial_q(\text{Im } z)}} (\tilde{s}(\text{Re } z, \text{Im } z) - s(\text{Re } z, \text{Im } z))$$

where we employed the product rule and the fact that $p^{(k)}(\text{Re } z) = 0 = q^{(l)}(\text{Im } z)$ for $0 \leq k < \partial_p(\text{Re } z), 0 \leq l < \partial_q(\text{Im } z)$. Since $p^{(\partial_p(\text{Re } z))}(\text{Re } z)$ and $q^{(\partial_q(\text{Im } z))}(\text{Im } z)$ do not vanish for $z \in \sigma(\Theta(N)) \cap (Z_p^R + iZ_q^R)$, we obtain $u(\text{Re } z, \text{Im } z) = g(z)_1 - \tilde{g}(z)_1$ and $v(\text{Re } z, \text{Im } z) = g(z)_2 - \tilde{g}(z)_2$. Therefore, we can write (5.4) as

$$\tilde{s}(A, B) - s(A, B) = \Xi \left( \int_{\sigma(\Theta(N))}^{R_1, R_2} (g - \tilde{g}) \, dE \right),$$

showing the asserted equality.

Theorem 5.4. The mapping $\phi \mapsto \phi(N)$ constitutes a *-homomorphism from $\mathcal{F}_N$ into $\{N, N^+\}'' (\subseteq B(K))$ with $s_N(N) = s(A, B)$ for all $s \in \mathbb{C}[z, w]$.

Proof. From Theorem 5.3 we infer $s_N(N) = s(A, B)$ for all $s \in \mathbb{C}[z, w]$ because we have $s_N = s_N + (p_N + q_N)(z) \cdot 0$ for all $z \in \sigma(\Theta(N))$.

Assume that for $\phi, \psi \in \mathcal{F}_N$ we have $s, t \in \mathbb{C}[z, w]$ and functions $g, h$ on $\sigma(\Theta(N))$ such that $\phi - s_N, \psi - r_N \in \mathcal{R}$, such that $g$ and $h$ are bounded and measurable on $\sigma(\Theta(N))$ \ $(Z_p^R + iZ_q^R)$, and such that (5.1) as well as

$$\psi(z) = r_N(z) + (p_N + q_N)(z) \cdot h(z)$$

hold true; see Lemma 5.1. Then for $\lambda, \mu \in \mathbb{C}$ we get from Remark 4.5

$$(\lambda \phi + \mu \psi)(z) = (\lambda s + \mu r)_N(z) + (p_N + q_N)(z) \cdot (\lambda g(z) + \mu h(z))$$

for $z \in \sigma(\Theta(N))$, where $\lambda \phi + \mu \psi - (\lambda s + \mu r)_N = \lambda (\phi - s_N) + \mu (\psi - r_N) \in \mathcal{R}$, and where $\lambda g + \mu h$ is bounded and measurable on $\sigma(\Theta(N))$ \ $(Z_p^R + iZ_q^R)$. Since the definition of $\phi(N)$ in Definition 5.2 depends linearly on $s$ and $g$, we conclude from Theorem 5.3 that

$$(\lambda \phi + \mu \psi)(N) = \lambda \phi(N) + \mu \psi(N).$$

Similarly, $\phi^\#(z) = (s^\#)_N(z) + (p_N + q_N)(z) \cdot \tilde{g}(z)$ for $z \in \sigma(\Theta(N))$; see Remark 4.5. Thereby, $\phi^\# - (s^\#)_N = (\phi - s_N)^\# \in \mathcal{R}$ holds true due to the fact that
\( \varphi_p(\xi) = \varphi_q(\bar{\xi}) \) and \( \varphi_q(\eta) = \varphi_q(\bar{\eta}) \) for all \( (\xi, \eta) \in Z^i \). Since \( \bar{g} \) is bounded and measurable on \( \sigma(\Theta(N)) \setminus (Z^R_p + iZ^R_q) \), and since

\[
\phi(N)^+ = s^\#(A, B) + \Xi \left( \int_{\sigma(\Theta(N))}^\rho g dE \right),
\]

we again obtain from Theorem 5.3 that \( \phi^+(N) = \phi(N)^+ \).

Concerning the compatibility with \( \cdot \), first note that by Remark 4.5

\[
\phi(z) \cdot \psi(z) = (s \cdot r)_N(z) + (p_N + q_N)(z) \cdot \omega(z)
\]

for \( z \in \sigma(\Theta(N)) \).

Here we have

\[
\omega(z) = s(z)h(z) + r(z)g(z) + g(z)h(z)(p(Re z) + q(Im z))
\]

for \( z \in \sigma(\Theta(N)) \setminus (Z^R_p + iZ^R_q) \) and \( \omega(z)_j = s(z)h(z)_j + r(z)g(z)_j \), \( j = 1, 2 \) for \( z \in \sigma(\Theta(N)) \cap (Z^R_p + iZ^R_q) \) because \( a, b \in \ker \pi \) implies \( a \cdot b = 0 \) and, in turn, \( (p_N + q_N)(z) \cdot (p_N + q_N)(z) = 0 \) for \( z \in \sigma(\Theta(N)) \cap (Z^R_p + iZ^R_q) \).

On the other hand, by Lemma 5.10 in [2] we have

\[
\Xi(D) = \Xi(\Theta(C)D), \quad \Xi(D_1)\Xi(D_2) = \Xi(D_1D_2T^+T),
\]

where \( T^+T = p(\Theta(A)) + q(\Theta(B)) \). Hence,

\[
\phi_N(\psi(N)) = s(A, B) r(A, B) + \Xi \left( \int_{\sigma(\Theta(N))}^\rho g dE \right) r(A, B)
\]

\[
+ s(A, B) \Xi \left( \int_{\sigma(\Theta(N))}^\rho h dE \right)
\]

\[
+ \Xi \left( \int_{\sigma(\Theta(N))}^\rho g dE \right) \Xi \left( \int_{\sigma(\Theta(N))}^\rho h dE \right)
\]

\[
= (s \cdot r)(A, B) + \Xi \left( \int_{\sigma(\Theta(N))}^\rho (g \cdot r + h \cdot s) dE \right)
\]

\[
+ \int_{\sigma(\Theta(N)) \setminus (Z^R_p + iZ^R_q)} (p(Re(.)) + q(Im(.))) \cdot h \cdot g dE
\]

\[
= (s \cdot r)(A, B) + \Xi \left( \int_{\sigma(\Theta(N))}^\rho \omega dE \right).
\]

Here \( \omega \) is bounded and measurable on \( \sigma(\Theta(N)) \setminus (Z^R_p + iZ^R_q) \) and, using the fact that \( \mathcal{R} \) is an ideal,

\[
\phi \cdot \psi - (s \cdot r)_N = (\phi - s_N) \cdot \psi + (\psi - r_N) \cdot s_N \in \mathcal{R}.
\]

Hence, we again obtain from Theorem 5.3 that \( \phi(N) \cdot \psi(N) = (\phi \cdot \psi)(N) \).

Finally, we shall show that \( \phi(N) \in \{N, N^+\}' \). Clearly, \( s(A, B) \in \{A, B\}'' \). If \( C \in \{A, B\} \subseteq (p(A) + q(B))' = (TT^+)' \), then \( \Theta(C) \in \Theta(A, \Theta(B))' \) because \( \Theta \) is a homomorphism. By the spectral theorem for normal operators \( \Theta(C) \) commutes with

\[
D := \int_{\sigma(\Theta(N))}^\rho g dE.
\]
According to Lemma 5.10 in [2] we then get
\[ \Xi(D)C = \Xi(D\Theta(C)) = \Xi(\Theta(C)D) = C\Xi(D). \]
Hence, \( \Xi(D) \in \{A, B\}'' = \{N, N^+\}'' \), and altogether \( \phi(N) \in \{A, B\}'' = \{N, N^+\}'' \).
\[ \square \]

**Example 5.5.** We want to discuss the simple case of a normal \( N \) on a Krein space \( K \) such that its real part \( A \) and its imaginary part \( B \) are both non-negative, i.e. \([Ax, x] \geq 0\) and \([Bx, x] \geq 0\) for all \( x \in K \). According to these assumptions the polynomial \( p(t) := t = q(t) \) is definitizing for \( A \) and \( B \). Consequently, \( Z^p_0 = \{0\} = Z^q_0 \), \( Z^t = \emptyset \) and \( \delta_p = \delta_0 = \delta_q \).

Therefore, the elements \( \phi \in \mathcal{M}_N \) are functions defined on \( \sigma(\Theta(N)) \cup \{0\} \) with \( \phi(z) \in \mathbb{C} \) for \( z \neq 0 \) and \( \phi(0) \in \mathcal{A}_{1,1} \cong \mathbb{C}^3 \). Such a \( \phi \) belongs to \( \mathcal{F}_N \) if \( \phi|_{\sigma(\Theta(N))\setminus\{0\}} \) is bounded and measurable and, in case that 0 is an accumulation point of \( \sigma(\Theta(N)) \), if
\[ \frac{\phi(z) - \phi(0),0,0}{\max(|\text{Re } z|, |\text{Im } z|)} \]
is locally bounded for \( z \in \sigma(\Theta(N)) \setminus \{0\} \) near 0. If we split up a given \( \phi \in \mathcal{F}_N \) as \( \phi = \phi_1 + \phi_2 \), where \( \phi_1|_{\sigma(\Theta(N))\setminus\{0\}} = \phi|_{\sigma(\Theta(N))\setminus\{0\}}, \phi_2|_{\sigma(\Theta(N))\setminus\{0\}} = 0 \) and \( \phi_1(0),0,0 = \phi(0),0,0, \phi_2(0),1,0 = \phi(0),1,0, \phi_2(0),0,1 = \phi(0),0,1, \phi_1(0),1,0 = \phi_1(0),0,1 = \phi_2(0),0,0 = 0 \), then \( \phi_1, \phi_2 \in \mathcal{F}_N \) with \( \phi_2^2 = 0 \). Hence,
\[ \phi(N) = \phi_1(N) + \phi_2(N), \tag{5.6} \]
where \( \phi_2(N)^2 = 0 \). Applying Lemma 5.1 to \( \phi \) and \( \phi_1, \phi_2 \) we see that the polynomial \( s(z,w) \) for \( \phi_2 \) can be chosen to be the zero polynomial and that the polynomial \( s(z,w) \) for \( \phi \) and \( \phi_1 \) can be choose to be equal. Moreover, the corresponding functions \( g \) in (5.1) vanish at 0 for \( \phi_1 \) and assumes the value \( (\phi(0),1,0,\phi(0),0,1) \in \mathbb{C}^2 \) for \( \phi_2 \); see also Remark 4.10. Thus,
\[ \phi_1(N) = s(A,B) + T \int_{\sigma(\Theta(N))\setminus\{0\}} g \, dE \, T^+, \]
\[ \phi_2(N) = T \left( \phi(0),1,0 R_1^* R_1 E\{0\} + \phi(0),0,1 R_2^* R_2 E\{0\} \right) T^+. \]
The decomposition in (5.6) can be seen as generalization of the result in [3] saying that any non-negative operator \( H \) on a Krein space can be written as the sum \( S + \int_{-\infty}^{\infty} t \, dF \), where \( S \) satisfies \( S^2 = 0 \) and where \( F \) is the classical Krein space spectral function of \( H \).
\[ \diamondsuit \]

### 6. Spectral Properties

**Remark 6.1.** For \( \zeta \in \mathbb{Z}^i \) or for an isolated \( \zeta \in \sigma(\Theta(N)) \cup (Z^p_0 + iZ^q_0) \) we saw in Example 4.12 that \( a \delta_\zeta \in \mathcal{F}_N \). If \( a \) is the unit \( e \in \mathcal{C}(\zeta) \) (see Remark 4.2), then \( (e \delta_\zeta) \cdot (e \delta_\zeta) = (e \delta_\zeta) \) together with Theorem 5.4 shows that \( (e \delta_\zeta)(N) \) is a projection. It is a kind of Riesz projection corresponding to \( \zeta \).

We set \( \xi := \text{Re } \zeta, \eta := \text{Im } \zeta \) if \( \zeta \in \sigma(\Theta(N)) \cup (Z^p_0 + iZ^q_0) \) and \( (\xi, \eta) := \zeta \) if \( \zeta \in \mathbb{Z}^i \). For \( \lambda \in \mathbb{C} \setminus \{\xi + i\eta\} \) and for \( s(z,w) := z + i w - \lambda \) we then have \( s_N \cdot (e \delta_\zeta) = (s_N(\zeta)) \delta_\zeta \), where the entry \( s(\xi, \eta) \) of \( s_N(\zeta) \) with index \((0,0)\) does
not vanish. By Remark 4.2 it therefore has a multiplicative inverse \( b \in \mathcal{C}(\zeta) \). We obtain

\[ s_N \cdot (e^{\delta \zeta}) \cdot (b^{\delta \zeta}) = e^{\delta \zeta}. \]

From \( s_N(N) = N - \lambda \) we then see that \( N|_{\text{ran}(e^{\delta \zeta})} - \lambda \) has \( (b^{\delta \zeta})(N)|_{\text{ran}(e^{\delta \zeta})}(N) \) as its inverse operator. Thus, \( \sigma(N|_{\text{ran}(e^{\delta \zeta})}) \subseteq \{ \xi + i\eta \} \).

**Lemma 6.2.** If for \( \phi \in \mathcal{F}_N \) we have \( \phi(z) = 0 \) for all \( z \in (\sigma(\Theta(N)) \cup ((Z^R_p + iZ^R_q) \cap \sigma(N))) \cup \{ (\alpha, \beta) \in Z^i : \alpha + i\beta, \alpha + i\bar{\beta} \in \sigma(N) \} \), then \( \phi(N) = 0 \).

**Proof.** Since any \( \zeta \in (Z^R_p + iZ^R_q) \setminus \sigma(N) \) is isolated in \( \sigma(\Theta(N)) \cup (Z^R_p + iZ^R_q) \), we can apply Remark 6.1. Hence, for

\[ \zeta \in \left( \frac{(Z^R_p + iZ^R_q) \setminus \sigma(N)}{=} \cup \{ (\alpha, \beta) \in Z^i : \alpha + i\beta \in \rho(N) \} \right) =: Z_1 \]

the expression \( (e^{\delta \zeta})(N) \) is a bounded projection commuting with \( N \). Hence, \( (e^{\delta \zeta})(N) \) also commutes \( (N - (\xi + i\eta))^{-1} \), where \( \xi := \text{Re} \zeta, \eta := \text{Im} \zeta \) if \( \zeta \in Z_1 \) and \( (\xi, \eta) := \zeta \) if \( \zeta \in Z_2 \).

Consequently, \( N|_{\text{ran}(e^{\delta \zeta})} - (\xi + i\eta) \) is invertible on \( \text{ran}(e^{\delta \zeta})(N) \), i.e. \( \xi + i\eta \not\in \sigma(N|_{\text{ran}(e^{\delta \zeta})}) \). By Remark 6.1 we have \( \sigma(N|_{\text{ran}(e^{\delta \zeta})}) \subseteq \{ \xi + i\eta \} \).

Hence, \( \sigma(N|_{\text{ran}(e^{\delta \zeta})}) = \emptyset \), which is impossible for \( \text{ran}(e^{\delta \zeta})(N) \neq \{0\} \). Thus, \( (e^{\delta \zeta})(N) = 0 \). For

\[ (\xi, \eta) \in Z_3 := \{ (\alpha, \beta) \in Z^i : \alpha + i\bar{\beta} \in \rho(N) \} \]

we have \( (\bar{\xi}, \bar{\eta}) \in Z_2 \), and in turn

\[ 0 = (e^{\delta \bar{\zeta}, \bar{\eta}})(N) = (e^{\delta \xi, \eta})(N). \]

By our assumption \( \phi \) is supported on \( Z_1 \cup Z_2 \cup Z_3 \). Therefore,

\[ \phi(N) = \sum_{\zeta \in Z_1 \cup Z_2 \cup Z_3} \phi(\zeta) \delta \zeta \]

\[ = \sum_{\zeta \in Z_1 \cup Z_2 \cup Z_3} \phi(\zeta) (e^{\delta \zeta})(N) = 0. \]

\[ \square \]

**Remark 6.3.** As a consequence of Lemma 6.2 for \( \phi \in \mathcal{F}_N \) the operator \( \phi(N) \) only depends on \( \phi \)'s values on

\[ \sigma_N := \left( \sigma(\Theta(N)) \cup ((Z^R_p + iZ^R_q) \cap \sigma(N)) \cup \{ (\alpha, \beta) \in Z^i : \alpha + i\beta, \alpha + i\bar{\beta} \in \sigma(N) \} \right). \]

Thus, we can re-define the function class \( \mathcal{F}_N \) for our functional calculus so that the elements \( \phi \) of \( \mathcal{F}_N \) are functions on this set with \( \phi(z) \in \mathcal{C}(z) \) such that \( z \mapsto \phi(z) \) is measurable and bounded on \( \sigma(\Theta(N)) \setminus (Z^R_p + iZ^R_q) \) and such that (4.1) is bounded locally at \( w \) for all \( w \in \sigma(\Theta(N)) \cap (Z^R_p + iZ^R_q) \).

\[ \diamond \]

**Lemma 6.4.** If \( \phi \in \mathcal{F}_N \) is such that \( \phi(z) \) is invertible in \( \mathcal{C}(z) \) for all \( z \in \sigma_N \) and such that \( 0 \) does not belong to the closure of \( \phi(\sigma(\Theta(N)) \setminus (Z^R_p + iZ^R_q)) \), then \( \phi(N) \) is a boundedly invertible operator on \( \mathcal{K} \).
Proof. We think of \( \phi \) as a function on \((\sigma(\Theta(N))) \cup (Z^R_p + iZ^R_q)) \cup Z^i\) by setting \( \phi(z) = e \) (see Remark 4.2) for all \( z \) not belonging to \( \sigma_N \). Then all assumptions of Lemma 4.15 are satisfied. Hence \( \phi^{-1} \in F_N \), and we conclude from Theorem 5.4 and Example 4.6 that
\[
\phi^{-1}(N)\phi(N) = (\phi(N))\phi^{-1}(N) = (\phi \cdot \phi^{-1})(N) = 1_N(N) = I. \quad \square
\]

Corollary 6.5. If \( N \) is a definitizable normal operator on the Krein space \( \mathcal{K} \), then \( \sigma(N) \) equals to
\[
\sigma(\Theta(N)) \cup ((Z^R_p + iZ^R_q) \cap \sigma(N))
\]
\[
\cup \{ \alpha + i\beta : (\alpha, \beta) \in Z^i, \alpha + i\beta, \alpha + i\beta \in \sigma(N) \} \quad (6.1)
\]
Proof. Since \( \Theta \) is a homomorphism, we have \( \sigma(\Theta(N)) \subseteq \sigma(N) \). Hence, (6.1) is contained in \( \sigma(N) \).

For the converse, consider the polynomial \( s(z, w) = z + iw - \lambda \) for a \( \lambda \) not belonging to (6.1). We conclude that for any \( z \in \sigma_N \) the first entry \((s_N(z))_{0,0}\) of \( s_N(z) \in \mathfrak{C}(z) \) does not vanish, i.e. is invertible in \( \mathfrak{C}(z) \). \( (s_N(\sigma(\Theta(N))))_{0,0} = \sigma(\Theta(N)) - \lambda \) being compact, \( 0 \) does not belong to the closure of \( s_N(\sigma(\Theta(N)) \setminus (Z^R_p + iZ^R_q)) \). Applying Lemma 6.4 we see that \( s_N(N) = (N - \lambda) \) is invertible. \( \square \)

Corollary 6.6. For \( \phi \in F_N \) we have
\[
\sigma(\phi(N)) \subseteq \overline{\phi(\sigma_N)_{0,0}}.
\]
Proof. For \( \lambda \notin \phi(\sigma_N)_{0,0} \) and any \( z \in \sigma_N \) we have \((\phi(z) - \lambda 1_N(z))_{0,0} = \phi(z)_{0,0} - \lambda \neq 0 \). Hence \( \phi(z) - \lambda 1_N(z) \) is invertible in \( \mathfrak{C}(z) \).

Moreover, \( 0 \) does not belong to the closure of \( \phi(\sigma(\Theta(N)) \setminus (Z^R_p + iZ^R_q)) - \lambda = (\phi - \lambda 1_N)(\sigma(\Theta(N)) \setminus (Z^R_p + iZ^R_q))_{0,0} \). Therefore, we can apply Lemma 6.4 to \( \phi - \lambda 1_N \), and get \( \lambda \in \rho(\phi(N)) \). \( \square \)

Remark 6.7. For any characteristic function \( 1_\Delta \) of a Borel subset \( \Delta \subseteq \mathbb{C} \) such that \((Z^R_p + iZ^R_q) \cap \sigma(N) \cap \partial\mathbb{C} = \emptyset \) the function \((1_{\tau(\Delta)})_N \) belongs to \( F_N \); see Definition 4.4 and Lemma 4.14. Since this function is idempotent and satisfies \((1_{\tau(\Delta)})^*_N = (1_{\tau(\Delta)})_N \), \((1_{\tau(\Delta)})_N(N) \) is a bounded and self-adjoint projection on the Krein space \( \mathcal{K} \). These projections constitute the family of spectral projections for \( N \). \( \diamond \)
