This PDF file includes:

- Figs. S1 to S7
- Tables S1 to S3
Fig. S1. Workflow for cryo-EM data processing.
Fig. S2. Comparison of reported cryo-EM structures of S-D614G. Top views of individual cryo-EM structures with the RBD (residues 330-521) colored in blue. The RBDs that are in the up conformations are indicated by yellow asterisks. Details of the constructs designs of individual structures are tables in Table S2. Note that the PDB entry 6xs6 lacks resolved EM density for the RBD, but it was concluded by the authors that all three RBDs are in the up conformation.
Fig. S3. Comparison of RBD orientations of reported S-D614G and S-D614 structures. Cartoon representations of RBD-up and RBD-down protomers derived from previously reported cryo-EM structures and our current study. The PDB accession codes of individual structures are shown above. The PDB entries of the representative spike variants are 6VSB (S-D614 in an 1 RBD-up), 6VXX (all RBD-down, closed state), 6XM3 (1 RBD-up, at pH 5.5), 6XKL (engineering thermal-stable mutant, HexaPro, 1 RBD-up), and 6ZGG (furin-cleaved, one RBD-up). All protomers were superimposed with respect to the S2 domains of S-D614G of this study. After the alignment with respect to the S2 domain, the displacement between the centers of mass (Dcm; indicated by spheres) of previously reported RBD structure and ours is calculated by UCSF-Chimera, which is indicated below each structure.
Fig. S4. Superposition of the structural elements surrounding the D614G mutation site from within the three protomers (chains) of S-D614G (chains A, B, and C). The results indicated that local structures of the mutation site are essentially identical, despite the difference of their corresponding RBD orientations. The protomers are colored in wheat (protomer A, RBD-up), green (protomer B, RBD-down), and pink (protomer C, RBD-down), respectively. The first GlcNAc moiety that is linked to the side chain of N616 is shown in sticks.
Fig. S5. Conformational disorder around the D614G mutation site. (A) Structural comparison of the inter-protomer interaction between S-D614G and S-D614 (two conformations: all RBD-down and one RBD-up). The dash lines indicate the distance between G614 (or D614) and K854. The structure of S-D614G is colored in tan. The structures of S-D614 with all RBD-down (PDB code: 6ZGE; left panel) and with one RBD-up (PDB code: 6VSB; right panel) are colored in blue and pink, respectively. (B) The loop on which K584 resides is disordered in all the selected cryo-EM structures, which is manifested in the lack of defined cryo-EM maps for residues 825-850 as indicated on the right.
Fig. S6. Purification of recombinant S-D614 and S-D614G. (A) Overlaid SEC chromatograms of S-D614 (grass green) and S-D614G (yellow). (B) Coomassie Brilliant Blue stained SDS-PAGE, which illustrated the purity and integrity of the purified recombinant S-D614 and S-D614G.
Fig. S7. Representative NSEM image and 2D classes of S-D614G incubated at 37 ºC for 60 days. The 3D model derived from the NSEM data was shown on the upper right corner.
Table S1. Parameters of cryo-EM data collection, processing and model validation.
