Discrete time approximation of decoupled Forward-Backward SDE driven by pure jump Lévy-processes

Soufiane Aazizi

October 25, 2011

Abstract

We present a new algorithms to discretize a decoupled forward backward stochastic differential equations driven by pure jump Lévy process (FBSDEL in short). The method is built in two steps. Firstly, we approximate the FBSDEL by a forward backward stochastic differential equations driven by a Brownian motion and Poisson process (FBSDEBP in short), in which we replace the small jumps by a Brownian motion. Then, we prove the convergence of the approximation when the size of small jumps $\varepsilon$ goes to 0. In the second step, we obtain the $L^p$ Hölder continuity of the solution of FBSDEBP and we construct two numerical schemes for this FBSDEBP. Based on the $L^p$ Hölder estimate, we prove the convergence of the scheme when the number of time steps $n$ goes to infinity. Combining these two steps leads to prove the convergence of numerical schemes to the solution of FBSDEL.

Key words : Discrete-time approximation, Euler scheme, decoupled forward-backward SDE with jumps, Small jumps, Malliavin calculus.

1 Introduction and summary

In this paper, we are concerned by discretization of a system of decoupled forward-backward stochastic differential equation (FBSDEs in short) driven by a pure jump Lévy process

\[
\begin{align*}
X_t &= X_0 + \int_0^t b(X_r) dr + \int_0^t f(\Theta_r) dr - \int_0^t \int \beta(X_r^-) \bar{M}(de,dr), \\
Y_t &= g(X_T) + \int_t^T f(\Theta_r) dr - \int_t^T \int \bar{V}_r \bar{M}(de,dr)
\end{align*}
\]

(1.1)

Here \( \Theta := (X,Y,\int E \rho(e) V \nu(de)) \) and \( \bar{M}(E,t) = \int_{E \times [0,t]} e \bar{\mu}(de,dr) \) where \( \bar{\mu}(de,dr) := \mu(de,dr) - \nu(de) dr \) an independent compensated Poisson measure and \( \mu \) a Poisson random measure on \( \mathbb{R} \times [0,T] \) with intensity \( \nu \) satisfying \( \int 1 \wedge |e|^2 \nu(de) < \infty \).

Numerical discretization schemes for FBSDEs have been studied by many authors. In the no-jump case, Ma et al. [21] developed the first step algorithm to solve a class of general forward-backward SDE. Douglas et al. [14] suggest a finite difference approximation of the associated PDE. Other discrete scheme have been considered in [7], [8] and [11] mainly based on approximation of the Brownian motion by some discrete process, Gobet et al. [18] proposed an adapted Longstaff and Schwartz algorithm based on non-parametric regressions. In the jump case, to our knowledge, there is only the work of Bouchard and Elie [5] in which the authors propose a Monte-Carlo methods in the case when \( \nu(\mathbb{R}) < \infty \).

The main motivation to study the numerical scheme of a systems of above form, is to treat the case when \( \nu(\mathbb{R}) = \infty \), which means the existence of an infinite number of jumps in every interval of non-zero length a.s.. In this sense, we should mention the important work on the approximation of stochastic differential equation studied by Kohatsu-Higa and Tankov [20].

Since we are interested in the case of \( \nu(\mathbb{R}) = \infty \), we will follow the idea of [20] to approximate [12] without cutoff the small jumps smaller than \( \varepsilon \), which should improve the approximation scheme. Then by using the approximation result of Asmussen and Rosinski [2] we replace the small jumps of the driven-Lévy process with \( \sigma(\varepsilon) W \) where \( W \) is a standard Brownian motion and \( \sigma^2(\varepsilon) := \int E e^2 \nu(de) \).

In the aim to approximate (1.1), we cut the jumps at \( \varepsilon \) as the following

\[
\begin{align*}
X_t^\varepsilon &= X_0 + \int_0^t b(X_r^\varepsilon) dr + \int_0^t \beta(X_r^-) \varepsilon \bar{M}(de,dr), \\
Y_t^\varepsilon &= g(X_T^\varepsilon) + \int_t^T f(\Theta_r^\varepsilon) dr - \int_t^T \int E \varepsilon \bar{V}_r \bar{M}(de,dr)
\end{align*}
\]

(1.2)

where \( R_t = \int_0^t \int |\varepsilon| \bar{M}(de,dr) \), \( E^\varepsilon := \{ e \in \mathbb{R}, \ s.t \ / |e| \leq \varepsilon \} \), \( E_\varepsilon := \{ e \in \mathbb{R}, \ s.t \ / |e| > \varepsilon \} \)

and \( E := \mathbb{R} = E^\varepsilon \cup E_\varepsilon \).

The idea we propose is to discretize the solution of (1.1) in two steps. In the first step, we approximate (1.2) by the following FBSDE:

\[
\begin{align*}
X_t^\varepsilon &= X_0^\varepsilon + \int_0^t b(X_r^\varepsilon) dr + \int_0^t \beta(X_r^-) \varepsilon \sigma(\varepsilon) dW_r + \int_0^t \int E \varepsilon \beta(X_r^-) \bar{M}(de,dr), \\
Y_t^\varepsilon &= g(X_T^\varepsilon) + \int_t^T f(\Theta_r^\varepsilon) dr - \int_t^T \int E \varepsilon \bar{Z}_r dW_r - \int_t^T \int E \varepsilon \bar{U}_r(\varepsilon) \bar{M}(de,dr)
\end{align*}
\]

(1.3)
Here $\Theta^\varepsilon := (X^\varepsilon, Y^\varepsilon, \Gamma^\varepsilon)$ and $\Gamma^\varepsilon := \int_{E^\varepsilon} \rho(e)U^\varepsilon(e)\nu(de)$. Further, we show that for a finite measure $m$ defined by $m(E) := \int_{E} e^2\nu(de)$, our error

$$Err^2_\varepsilon(Y, V) := \mathbb{E} \left[ \sup_{t \leq T} |Y_t - Y_t^\varepsilon|^2 \right] + \mathbb{E} \left[ \sup_{t \leq T} \left| \int_0^t V_r dR_r - \int_0^t Z_r^\varepsilon dW_r \right|^2 \right]$$

$$+ \mathbb{E} \left[ \int_0^T \int_{E^\varepsilon} |V_r - U_r^\varepsilon(e)|^2 m(de) dr \right],$$

is controlled by $\sigma(\varepsilon)^2$, which means that the solution of (1.3) converges to the solution of (1.1), as the size of small jumps $\varepsilon$ goes to 0 (See Remark 2.1). We also derive the upper bound

$$\mathbb{E} \left[ \sup_{t \leq T} |X_t - X_t^\varepsilon|^2 \right] \leq C\sigma(\varepsilon)^2. \quad (1.4)$$

The second step consists of discretizing the approximated FBSDE (1.3) and studying its convergence to (1.2). For this purpose we consider two numerical schemes, the first one is based on discrete-time approximation of decoupled FBSDE derived by Bouchard and Elie [5]. More precisely, for a fixed $\varepsilon$, given a regular grid $\pi = \{ t_i = iT/n, i = 0, 1, \ldots, n \}$, the authors approximate $X^\varepsilon$ by its Euler scheme $X^\pi$ and $(Y^\varepsilon, Z^\varepsilon, \Gamma^\varepsilon)$ by the discrete-time process $(\bar{Y}^\pi_t, \bar{Z}^\pi_t, \bar{\Gamma}^\pi_t)$

\[
\begin{align*}
\bar{X}^\pi_{t_{i+1}} &= \bar{X}^\pi_{t_i} + \frac{1}{n}b(\bar{X}^\pi_{t_i}) + \beta(\bar{X}^\pi_{t_i})\sigma(\varepsilon)\Delta W_{i+1} + \int_{E^\varepsilon} \beta(\bar{X}^\pi_{t_i}) \bar{M}(de, (t_i, t_{i+1})]
\bar{Z}^\pi_t &= n\mathbb{E} \left[ \bar{Y}^\pi_{t_{i+1}} \Delta W_{i+1} / F_{t_i} \right]
\bar{\Gamma}^\pi_t &= n\mathbb{E} \left[ \bar{Y}^\pi_{t_{i+1}} \int_{E^\varepsilon} \rho(e) \bar{M}(de, (t_i, t_{i+1})] / F_{t_i} \right]
\bar{Y}^\pi_t &= \mathbb{E} \left[ \bar{Y}^\pi_{t_{i+1}} / F_{t_i} \right] + \frac{1}{n}f(\bar{X}^\pi_{t_i}, \bar{Y}^\pi_{t_i}, \bar{\Gamma}^\pi_{t_i})
\end{align*}
\]

on each interval $[t_i, t_{i+1})$, where the terminal value $\bar{Y}^\pi_{t_n} := g(\bar{X}^\pi_{t_n})$. Under Lipschitz continuity of the solution, the authors proved that the discretization error

$$Err^2_n(Y^\varepsilon, Z^\varepsilon, \Gamma^\varepsilon) := \sup_{t \leq T} \mathbb{E} \left[ |Y^\varepsilon_t - \bar{Y}^\pi_t|^2 \right] + \int_0^T \mathbb{E} \left[ |Z^\varepsilon_t - \bar{Z}^\pi_t|^2 + |\Gamma^\varepsilon_t - \bar{\Gamma}^\pi_t|^2 \right] dt \quad (1.6)$$

achieves the optimal convergence rate $n^{-1/2}$. Finally, we derive the first main result of this paper in Proposition 3.1, showing that the approximation-discretization error

$$Err^2_{(n, \varepsilon)}(Y, V) := \sup_{t \leq T} \mathbb{E} \left[ |Y_t - \bar{Y}^\pi_t|^2 + \left| \int_0^t V_r dR_r - \int_0^t \bar{Z}^\pi_r dW_r \right|^2 \right] + \| \Gamma - \bar{\Gamma}^\pi_t \|^2_{H^2}(1.7)$$

is bounded by $C(n^{-1} + \sigma(\varepsilon)^2)$ and converges to 0 as $(n, \varepsilon)$ tends to $(\infty, 0)$, where $\Gamma := \int_{E^\varepsilon} \rho(e) V e \nu(de)$. Taking $\varepsilon = n^{-1/2}$, our approximation-discretization achieves the optimal convergence rate $n^{-1/2}$.

The second numerical scheme has been inspired from the paper of Hu, Nualart and Song [19]. Where the authors study a backward stochastic differential equation driven by a Brownian motion with general terminal variable $\xi$. They propose a new scheme using the
representation of $Z^\varepsilon$ as the trace of the Malliavin derivatives of $Y^\varepsilon$. Their discretization scheme is based on the $L^p$-H"older continuity of the solution $Z^\varepsilon$, to obtain an estimate of the form

$$\mathbb{E}|Z^\varepsilon_t - Z^\varepsilon_s|^p \leq K|t - s|^p,$$

which implies the existence of a $\gamma$-H"older continuous version of the process $Z^\varepsilon$ for any $\gamma < \frac{1}{2} - \frac{1}{p}$. In this sense, our article extend the work done in [19] to a forward-backward stochastic differential equation with jumps and terminal value $g(X^\varepsilon_T)$. Similarly to [19], we obtain the following regularity of $\Gamma^\varepsilon$

$$\mathbb{E}|\Gamma^\varepsilon_t - \Gamma^\varepsilon_s|^p \leq C|t - s|^p,$$

which allows us to deduce the existence of a $\gamma$-H"older continuous version of the process $\Gamma^\varepsilon$ for any $\gamma < \frac{1}{2} - \frac{1}{p}$. Finally, on one hand, we use the representation of $Z^\varepsilon$ and $\Gamma^\varepsilon$ as the trace of Malliavin derivative of $Y^\varepsilon$ to derive our a new extended discretization scheme for the solution $(Y^\varepsilon, Z^\varepsilon, \Gamma^\varepsilon)$ of (1.3). From other hand we approximate $X^\varepsilon$ by $X^\pi$ the continuous-time version of the Euler scheme, that is for a fixed $\varepsilon > 0$

\[
\begin{align*}
X^\pi_t &= X^\pi_{t_n} + \varepsilon b(X^\pi_{t_i})(t - \phi^\pi_n) + \varepsilon \beta(X^\pi_{t_i}) W(t - \phi^\pi_n) + \int_{t_i}^{t} \beta(X^\pi_{\phi^\pi_n}) M(de, (t, \phi^\pi_n)), \\
Y^\pi_t &= \mathbb{E} \left[ Y^\pi_{t+1} + f(\Theta^\pi_{t+1}) \Delta t / F_t \right], \\
Z^\pi_t &= \mathbb{E} \left[ \varepsilon^\pi_{t+1} \partial_x g(X^\pi_T) D_t X^\pi_T + \sum_k \varepsilon^\pi_{t+1} \varepsilon^\pi_{t_k} \Delta t_k / F_t \right], \\
\Gamma^\pi_t &= \mathbb{E} \left[ \int_{t_i}^{t} \partial_x \rho(e) \varepsilon^\pi_{t_i} \varepsilon^\pi_{t_i} \Delta t_i / F_t \right]
\end{align*}
\]

with terminal values $Y^\pi_{t_n} = g(X^\pi_T)$, $Z^\pi_{t_n} = \varepsilon \beta(X^\pi_T)$ and $U_{t_n, \varepsilon} = g(X^\pi_T + \beta(X^\pi_T)) - g(X^\pi_T)$, where $\phi^\pi_n$, $\varepsilon^\pi_{t_i, t_j}$ and $\varepsilon^\pi_{t_i, t_j}$ are detailed in section 4.

The key-ingredient for computation of discretization error, is based on the $L^p$-H"older continuity of the solution $(Y^\varepsilon, Z^\varepsilon, \Gamma^\varepsilon)$. This allows us to prove that

$$\text{Err}^2_n(Y^\varepsilon, Z^\varepsilon, \Gamma^\varepsilon) := \mathbb{E} \max_{0 \leq i \leq n} \left[ |Y^\varepsilon_{t_i} - Y^\pi_{t_i}|^2 + |Z^\varepsilon_{t_i} - Z^\pi_{t_i}|^2 + |\Gamma^\varepsilon_{t_i} - \Gamma^\pi_{t_i}|^2 \right],$$

is controlled by $|\pi|^{1-\frac{1}{\log(1+|\pi|)}}$. Then we obtain the second main result of this article in Theorem 1.3 which stating that

$$\text{Err}^2_{n, \varepsilon}(Y, V) := \max_{0 \leq i \leq n} \sup_{t_i, t_{i+1}} \mathbb{E} \left[ |Y^\varepsilon_{t_i} - Y^\pi_{t_i}|^2 \right] + \mathbb{E} \left[ \int_0^T V_r dR_r - \sum_{i=0}^{n-1} Z^\pi_{t_i} \Delta W_{t_i} \right]^2 + \sum_{i=0}^{n-1} \int_{t_i}^{t_{i+1}} \mathbb{E} |\Gamma^\varepsilon_t - \Gamma^\pi_t|^2 dt,$$

is of the order $\sigma(\varepsilon)^2 + |\pi|^{1-\frac{1}{\log(1+|\pi|)}}$ and converges to 0 as the discretization step $(\varepsilon, n)$ tends to $(0, \infty)$. 

4
The importance of the above scheme, is it can be adapted to the case when the a terminal value is not given by the forward diffusion equation $X^\varepsilon$, as it’s the case in [19]. However, this scheme remains to be further investigated.

The two numerical schemes above are not directly implemented in practice and require an important procedure to simulate the conditional expectation. However, there exist different technics which can be adapted to our setting to compute this conditional expectation and we shall only mention the papers: [3], [6], [9] and [18].

The paper is organized as follows. In Section 2, we prove the convergence of the approximated scheme. In Section 3, we describe discrete-time scheme introduced in [5] and state our first main convergence result. In section 4, we extend the new discrete scheme of [19] and state our second main result. We also discuss a general case of BSDE. Section 5, is devoted to Malliavin calculus for a class of FBSDE with jumps, we then get the $L^p$-Hölder continuity of $Z^\varepsilon$ and $\Gamma^\varepsilon$ via the trace of the Malliavin derivatives of $Y^\varepsilon$.

2 Approximation of decoupled FBSDE driven by pure jump Lévy processes

Let $(\Omega, \mathcal{F}, \mathbb{F} = (\mathcal{F}_t)_{t \leq T}, \mathbb{P})$ be a stochastic basis such that $\mathcal{F}_0$ contains the $\mathbb{P}$-null sets, $\mathcal{F}_T = \mathcal{F}$ and $\mathbb{F}$ satisfies the usual assumptions. We assume that $\mathbb{F}$ is generated by a one-dimensional Brownian motion $W$ and an independent Poisson measure $\mu$ on $[0, T] \times E$. We denote by $\mathbb{P}^W = (\mathcal{F}_t^W)_{t \leq T}$ (resp. $\mathbb{P}^\mu = (\mathcal{F}_t^\mu)_{t \leq T}$) the $\mathbb{P}$-augmentation of the natural filtration of $W$ (resp. $\mu$). As usual, we denote by $\mathcal{B}(X)$ the Borel set of topological set $X$. We introduce the following subset: $E^\varepsilon := \{ e \in \mathbb{R}, \text{s.t. } |e| \leq \varepsilon \}$, $E^\varepsilon := \{ e \in \mathbb{R}, \text{s.t. } |e| > \varepsilon \}$, $E := \mathbb{R} = E^\varepsilon \cup E^\varepsilon$.

The martingale measure $\bar{\mu}$ is the compensated measure corresponding to Poisson random measure $\mu$, such that $\bar{\mu}(de, dr) = \mu(de, dr) - \nu(de)dr$, where $\nu$ is a Lévy measure on $E$ endowed with its Borel tribe $\mathcal{E}$. The Lévy measure $\nu$ will be assumed to satisfy $\nu(\mathbb{R}) = \infty$ and $\int_{\mathbb{R}} |e|^2 \nu(de) < \infty$. Throughout this paper we deal with the measure $\bar{M}$ defined by

$$\bar{M}(t, B) = \int_{[0,t] \times B} e\bar{\mu}(dr, de), \quad B \in \mathcal{B}(E)$$

which can be considered as a compensated Poisson random measure on $[0, T] \times E$ and $\int_{[0,t] \times E} e\mu(dr, de)$ is a compound Poisson random variable. We associate to $\bar{M}$ the $\sigma$-finite measure

$$m(B) := \int_B e^2 \nu(de), \quad B \in \mathcal{B}(E). \quad (2.1)$$

In particular, we have $\sigma(\varepsilon)^2 = m(E^\varepsilon)$.

The measure $\bar{M}$ is taken to drive the jump noise instead of $\bar{\mu}$, in the aim to adopt the concept of Malliavin calculus on the canonical Lévy space from [12].

For some constant $K > 0$, we consider four $K$-Lipschitz functions with bounded derivatives $\beta : \mathbb{R} \to \mathbb{R}$, $b : \mathbb{R} \to \mathbb{R}$, $g : \mathbb{R} \to \mathbb{R}$ and $f : \Omega \times \mathbb{R} \times \mathbb{R} \times L^2(\mathcal{E}, \mathcal{E}, \nu, \mathbb{R}) \to \mathbb{R}$, where the first
derivative of $b$, $\beta$ and $g$ are bounded.

Define $\rho$ to be a measurable function $\rho : E \to \mathbb{R}$ such that:

$$\sup_{e \in E} |\rho(e)| < K. \quad (2.2)$$

For any $p \geq 2$ we consider the following class of processes:

- $S^p$ is the set of real valued adapted rcll process $Y$ such that:

$$\|Y\|_{S^p} := \mathbb{E} \left( \sup_{0 \leq t \leq T} |Y_t|^p \right)^{\frac{1}{p}} < \infty.$$

- $H^p$ is the set of progressively measurable $\mathbb{R}$-valued processes $Z$ such that:

$$\|Z\|_{H^p} := \left( \mathbb{E} \left( \int_0^T |Z_r|^2 dr \right)^{\frac{p}{2}} \right)^{\frac{1}{p}} < \infty.$$

- $L^p$ is the set of $\mathcal{P} \otimes \mathcal{E}$ measurable map $U : \Omega \times [0,T] \times E \to \mathbb{R}$ such that:

$$\|U\|_{L^p} := \left( \mathbb{E} \int_0^T \int_E |U_r(e)|^p \nu(de) dr \right)^{\frac{1}{p}} < \infty.$$

- The space $\mathcal{B}^p := S^p \times H^p \times L^p$ is endowed with the norm

$$\|(Y, Z, U)\|_{\mathcal{B}^p} := \left( \|Y\|_{S^p}^p + \|Z\|_{H^p}^p + \|U\|_{L^p}^p \right)^{\frac{1}{p}}.$$

- $M^{2,p}$ the class of square integrable random variable $F$ of the form:

$$F = \mathbb{E}F + \int_0^T U_r dW_r + \int_0^T \int_E \psi(r, e) \mu(de, dr),$$

where $u$ (resp. $\psi$) is a progressively measurable (resp. measurable) process satisfying $\sup_{t \leq T} \mathbb{E}|u_t|^p < \infty$ (resp. $\sup_{t \leq T} \mathbb{E} \int_E |\psi(t, e)|^p \nu(de) < \infty$).

### 2.1 Approximation scheme

In this subsection, we show that the approximation error

$$Err_\varepsilon^2(Y, V) := \mathbb{E} \left[ \sup_{t \leq T} |Y_t - Y_\varepsilon^t|^2 \right] + \mathbb{E} \left[ \sup_{t \leq T} \int_0^t V_r dR_r - \int_0^t Z_\varepsilon^r dW_r \right]^2 + \mathbb{E} \left[ \int_0^T \int_E |V_r - U_\varepsilon^r(e)|^2 m(de) dr \right],$$

converges to 0 as $\varepsilon$ goes to 0.
Theorem 2.1 Under the space \((\Omega, \mathcal{F}, \mathbb{P})\),

1. There exist a solution \(X\) on \([0, T]\) of
   \[
   X_t = X_0 + \int_0^t b(X_r) dr + \int_0^t \beta(X_r) dL_r,
   \]  
   (2.3)
   where \(X_0 \in \mathbb{R}\).

2. There exist a solution \(X^\varepsilon\) on \([0, T]\) of
   \[
   X^\varepsilon_t = X^\varepsilon_0 + \int_0^t b(X^\varepsilon_r) dr + \int_0^t \beta(X^\varepsilon_r) \sigma(\varepsilon) dW_r + \int_0^t \int_{E^\varepsilon} \beta(X^\varepsilon_r) \bar{M}(dr, de),
   \]  
   (2.4)
   where \(X^\varepsilon_0 \in \mathbb{R}\).

Moreover
   \[
   \mathbb{E}\left( \sup_{0 \leq t \leq T} |X_t - X^\varepsilon_t|^2 \right) \leq C \sigma(\varepsilon)^2.
   \]  
   (2.5)

For the proof, we state firstly the following Lemma

Lemma 2.1 On the space \((\Omega, \mathcal{F}, \mathbb{P})\), fixing \(\varepsilon > 0\), we have for \(p \geq 2\):

\[
\mathbb{E}\left( \sup_{0 \leq t \leq T} |X_t|^p \right) < \infty.
\]  
   (2.6)

\[
\mathbb{E}\left( \sup_{0 \leq t \leq T} |X^\varepsilon_t|^p \right) < \infty.
\]  
   (2.7)

Proof. We denote by \(C\) a constant whose value may change from line to line. Using
Jensen’s inequality, Burkholder-Davis-Gundy inequality and Lipschitz property of \(b\) and \(\beta\)
we have:

\[
\mathbb{E}\left( \sup_{0 \leq s \leq t} |X_s|^p \right) \leq C \mathbb{E}\left( \sup_{0 \leq s \leq t} \left[ |X_0|^p + \left( \int_0^s b(X_r) dr \right)^p + \int_0^s \int_{E^\varepsilon} \beta(X_r) \bar{M}(dr, de) \right]^p \right)
\leq C \left( |X_0|^p + \int_0^t \mathbb{E}\left[ |b(X_0)| + |X_0| \right]^p e^p \nu(de) dr \right)
\leq C \left( |X_0|^p + |b(X_0)|^p + |X_0|^p + \int_0^t \mathbb{E}\left( \sup_{0 \leq u \leq r} |X_u|^p dr \right) \right),
\]

where \(C\) depends on \(t\), \(b(X_0)\) and \(\beta(X_0)\). We conclude the first assertion by Gronwall’s
Lemma.

Following the same arguments, we obtain the second assertion.

Proof of Theorem 2.1 The existence and uniqueness of such SDEs was already studied
in the literature see e.g. [17] and [1]. Then it remains to prove the estimate (2.5).
Using Jensen’s inequality leads to:

\[
\mathbb{E} \sup_{0 \leq u \leq t} |X_u - X_u^\varepsilon|^2 \leq C \left( \mathbb{E} \left[ \int_0^t |b(X_r) - b(X_r^\varepsilon)| dr \right]^2 + \mathbb{E} \left[ \int_0^t \int_{E^\varepsilon} |\beta(X_r) - \beta(X_r^\varepsilon)| M(dr,de) \right]^2 \right).
\]

By Burkholder-Davis-Gundy inequality, we get

\[
\mathbb{E} \sup_{0 \leq u \leq t} |X_u - X_u^\varepsilon|^2 \leq C \left( t \mathbb{E} \left[ \int_0^t (b(X_r) - b(X_r^\varepsilon))^2 dr \right] + \mathbb{E} \left[ \int_0^t \int_{E^\varepsilon} (\beta(X_r) - \beta(X_r^\varepsilon))^2 m(de)dr \right] + \mathbb{E} \left[ \int_0^t \beta(X_r)^2 m(de)dr \right] + C \mathbb{E} \left[ \int_0^t \beta(X_r^\varepsilon)^2 \sigma(\varepsilon)^2 dr \right] \right).
\]

By Lipschitz property of \(b\) and \(\beta\)

\[
\mathbb{E} \sup_{0 \leq u \leq t} |X_u - X_u^\varepsilon|^2 \leq C \left( \mathbb{E} \left[ \int_0^t (X_r - X_r^\varepsilon)^2 dr \right] + \sigma(\varepsilon)^2 \mathbb{E} \left[ \int_0^t \left( \beta^2(X_0) + \beta^2(X_0^\varepsilon) + |X_r^\varepsilon|^2 + |X_r|^2 \right) dr \right] \right)
\]

\[
\leq C \left( \int_0^t \mathbb{E} \left[ \sup_{u \leq r} |\delta X_u| \right] dr + \sigma(\varepsilon)^2 \right).
\]

The result follows from Gronwall’s Lemma.

Finally, we can now state the main result of this section.

\textbf{Theorem 2.2} Under the space \((\Omega, \mathcal{F}, \mathbb{P})\),

1. There exist a unique pair \((Y, V) \in S^2 \times H^2\), which solves the BSDE:

\[
Y_t = g(X_T) + \int_t^T f(\Theta_r)dr - \int_t^T V_r dL_r, \quad (2.8)
\]

where \(\Theta := \left( X, Y, \int_{E^\varepsilon} \rho(e)V e\nu(de) \right)\).

2. For a fixed \(\varepsilon > 0\), There exist a unique solution \((Y^\varepsilon, Z^\varepsilon, U^\varepsilon) \in B^2\) of the following BSDE:

\[
Y_t^\varepsilon = g(X_T^\varepsilon) + \int_t^T f(\Theta_r^\varepsilon)dr - \int_t^T Z_r^\varepsilon dW_r - \int_t^T \int_{E^\varepsilon} U_r^\varepsilon(e) M(dr,de). \quad (2.9)
\]

with \(\Theta^\varepsilon := \left( X^\varepsilon, Y^\varepsilon, \Gamma^\varepsilon \right)\) and \(\Gamma^\varepsilon := \int_{E^\varepsilon} \rho(e) U^\varepsilon(e) e\nu(de)\).
Moreover, if \( \sup_{t \leq T} E|V_t|^2 < \infty \), then there exist a constant \( C \) such that:

\[
Err^2_{\varepsilon}(Y, V) \leq C\sigma(\varepsilon)^2. \tag{2.10}
\]

**Remark 2.1** Observe that

\[
\mathbb{E} \left[ \sup_{t \leq T} |Y_t - Y_{\varepsilon}^t|^2 \right] + \mathbb{E} \left[ \sup_{t \leq T} \left| \int_t^T \int_{E_{\varepsilon}} V_r \bar{M}(de, dr) \right|^2 \right]
\]

\[
- \int_0^t Z_r^\varepsilon dW_r - \int_0^T \int_{E_{\varepsilon}} U_r^\varepsilon(e) \bar{M}(de, dr) \right|^2 \right]
\]

\[
\leq Err^2_{\varepsilon}(Y, V) \leq \sigma(\varepsilon)^2.
\]

Which shows clearly the convergence of the approximated scheme \([1.3]\) to \([1.1]\).

**Proof. of Theorem 2.2** Existence and uniqueness of the solutions of BSDEs \([2.8]\) and \([2.10]\) was already proved, see e.g \([4]\).

We are going to prove inequality \((2.10)\). By Itô’s formula applied to \(|\delta Y|^2 := |Y - Y_{\varepsilon}|^2\) yields:

\[
|\delta Y_t|^2 + \int_t^T Z_r^2 dr + \int_t^T \int_{E_{\varepsilon}} (U_r^\varepsilon(e) - V_r)^2 m(de)dr
= |g(X_T) - g(X_T^\varepsilon)|^2 + \sigma(\varepsilon)^2 \int_t^T V_r^2 dr - \int_t^T \delta Y_r Z_r^\varepsilon dW_r
+ 2 \int_t^T \delta Y_r (f(\Theta_r) - f(\Theta_r^\varepsilon)) dr + 2 \int_t^T \int_{E_{\varepsilon}} \left[ (\delta Y_{r-} + V_r)^2 - \delta Y_{r-}^2 \right] \bar{M}(de, dr)
- 2 \int_t^T \int_{E_{\varepsilon}} \left[ (\delta Y_{r-} + U_r^\varepsilon(e) - V_r)^2 - \delta Y_{r-}^2 \right] \bar{M}(de, dr). \tag{2.11}
\]

Taking expectation in both hand-side of the above equality we get

\[
\mathbb{E} \left[ \delta Y_t^2 + \int_t^T Z_r^2 dr + \int_t^T \int_{E_{\varepsilon}} (U_r^\varepsilon(e) - V_r)^2 m(de)dr \right]
= \mathbb{E} \left[ |g(X_T) - g(X_T^\varepsilon)|^2 + \sigma(\varepsilon)^2 \int_t^T V_r^2 dr + 2 \int_t^T \delta Y_r (f(\Theta_r) - f(\Theta_r^\varepsilon)) dr \right].
\]

From Lemma 2.1 Lipschitz property of \( g \) and Jensen inequality we obtain:

\[
\mathbb{E} \left[ |Y_t - Y_{\varepsilon}^t|^2 + \int_t^T Z_r^2 dr + \int_t^T \int_{E_{\varepsilon}} (U_r^\varepsilon(e) - V_r)^2 m(de)dr \right]
\leq C (\sigma(\varepsilon)^2 + K \mathbb{E} \int_t^T (Y_r - Y_{\varepsilon}^r)(|X_r - X_{\varepsilon}^r| + |Y_r - Y_{\varepsilon}^r|)dr)
+ K \mathbb{E} \int_t^T \left[ (Y_r - Y_{\varepsilon}^r) \int_{E_{\varepsilon}} \rho(e)\varepsilon U_r^\varepsilon(e) - V_r|\nu(de) | dr 
+ K \mathbb{E} \int_t^T \left[ (Y_r - Y_{\varepsilon}^r) \int_{E_{\varepsilon}} \rho(e)\varepsilon V_r|\nu(de) | dr \right).
\]
Using the fact that \( ab \leq \alpha a^2 + \frac{1}{\alpha} b^2 \) for some \( \alpha > 0 \), yields to

\[
\mathbb{E} \left[ |Y_t - Y_t^\varepsilon|^2 + \int_t^T Z_r^\varepsilon^2 dr + \int_t^T \int_{E_r} (U_r^\varepsilon(e) - V_r)^2 m(de) dr \right] 
\leq C \left( \sigma(\varepsilon)^2 + K(1 + \alpha^2 + \gamma^2 + \eta^2) \mathbb{E} \int_t^T (Y_r - Y_r^\varepsilon)^2 dr + \frac{K}{\alpha^2} \mathbb{E} \int_t^T |X_r - X_r^\varepsilon|^2 dr \right. \\
+ \left. \frac{K}{\gamma^2} \mathbb{E} \int_t^T \int_{E_r} (U_r^\varepsilon(e) - V_r)^2 m(de) dr + \frac{K}{\eta^2} \mathbb{E} \int_t^T \int_{0\leq|e|\leq\varepsilon} \rho(e)^2 V_r^2 m(de) dr \right),
\]

where \( \alpha \) and \( \gamma \) are two constants taken such that \( \frac{K}{\alpha^2} = \frac{K^3}{\gamma^2} = \frac{1}{2} \), we then get

\[
\mathbb{E} \left[ |Y_t - Y_t^\varepsilon|^2 + \int_t^T Z_r^\varepsilon^2 dr + \int_t^T \int_{E_r} (U_r^\varepsilon(e) - V_r)^2 m(de) dr \right] 
\leq C \left( \sigma(\varepsilon)^2 + (K + 2K^2 + 2K\gamma^2) \mathbb{E} \int_t^T (Y_r - Y_r^\varepsilon)^2 dr \right). \tag{2.12}
\]

Using Gronwall's Lemma, we deduce that

\[
\mathbb{E} |Y_t - Y_t^\varepsilon|^2 \leq C \sigma(\varepsilon)^2. \tag{2.13}
\]

Plugging this estimate in the previous upper bound, we get

\[
\mathbb{E} \int_0^T Z_r^\varepsilon^2 dr + \mathbb{E} \int_0^T \int_{E_r} (U_r^\varepsilon(e) - V_r)^2 m(de) dr \leq C \sigma(\varepsilon)^2, \tag{2.14}
\]

Then

\[
\mathbb{E} |\delta Y_t|^2 + \mathbb{E} \int_0^T Z_r^\varepsilon^2 dr + \mathbb{E} \int_0^T \int_{E_r} (U_r^\varepsilon(e) - V_r)^2 m(de) dr \leq C \sigma(\varepsilon)^2. \tag{2.15}
\]

Now using Burkholder-Davis-Gundy inequality, we have

\[
\mathbb{E} \sup_{t\leq T} |\delta Y_t|^2 + \mathbb{E} \int_0^T Z_r^\varepsilon^2 dr + \mathbb{E} \int_0^T \int_{E_r} (U_r^\varepsilon(e) - V_r)^2 m(de) dr \leq C \sigma(\varepsilon)^2. \tag{2.16}
\]

From other side, it follows by Burkholder-Davis-Gundy inequality and \( \mathbf{(2.16)} \) that:

\[
\mathbb{E} \left[ \sup_{t\leq T} \left| \int_0^t Z_r dW_r - \int_0^t V_r dR_r \right|^2 \right] \leq C \mathbb{E} \left[ \sup_{t\leq T} \left| \int_0^t Z_r^\varepsilon dW_r \right|^2 + \sup_{t\leq T} \left| \int_0^t V_r dR_r \right|^2 \right] 
\leq C \mathbb{E} \left[ \int_0^T Z_r^\varepsilon^2 dr + \sigma(\varepsilon)^2 \int_0^T V_r^2 dr \right] 
\leq \mathbb{E} \int_0^T Z_r^\varepsilon^2 dr + C \sigma(\varepsilon)^2. \tag{2.17}
\]

The result now follows by combining \( \mathbf{(2.16)} \) and \( \mathbf{(2.17)} \). \qed
Remark 2.2 One can show that \( \sup_{t \leq T} \mathbb{E}|V_t|^2 < \infty \), following the same arguments as in Remark 2.8 in [19].

Remark 2.3 In the BSDE (2.9), each time we change \( \varepsilon \), there exist a unique pair \((Z^\varepsilon, U^\varepsilon)\) of predictable process, such that the BSDE (2.9) has a solution.

3 Forward-backward Euler scheme

In this section, we discretize the solution \((X^\varepsilon, Y^\varepsilon, Z^\varepsilon, \Gamma^\varepsilon)\) of (1.3) by \((X^n, Y^n, Z^n, \Gamma^n)\) defined by induction in (3.3) and then we show the convergence of \((X^n, Y^n, Z^n, \Gamma^n)\) to the solution of (1.2). Thus let us recall some definition and notation.

For each \( t \in [t_i, t_{i+1}) \), we define:

\[
\bar{Z}_t = n \mathbb{E} \left[ \int_{t_i}^{t_i+1} Z_s ds / \mathcal{F}_{t_i} \right], \quad \bar{\Gamma}_t = n \mathbb{E} \left[ \int_{t_i}^{t_i+1} \Gamma_s ds / \mathcal{F}_{t_i} \right],
\]

and

\[
\bar{Z}_t^n = n \mathbb{E} \left[ \int_{t_i}^{t_i+1} Z^n_s ds / \mathcal{F}_{t_i} \right], \quad \bar{\Gamma}_t^n = n \mathbb{E} \left[ \int_{t_i}^{t_i+1} \Gamma^n_s ds / \mathcal{F}_{t_i} \right].
\]

The process \( \bar{Z}_t \) and \( \bar{\Gamma}_t \) (resp. \( \bar{Z}_t^n \) and \( \bar{\Gamma}_t^n \)) can be interpreted as the best approximation of \( Z_{t_i} \) and \( \Gamma_{t_i} \) (resp. \( Z^n_{t_i} \) and \( \Gamma^n_{t_i} \)). We know from Bouchard and Elie [5], that FBSDE (2.8) has a backward Euler scheme taking the form:

\[
\begin{align*}
\bar{X}^n_{t_{i+1}} &= \bar{X}^n_{t_i} + \frac{1}{n} b(\bar{X}^n_{t_i}) + \sigma(\varepsilon) \Delta W_{i+1} + \int_{t_i}^{t_i+1} \beta(\bar{X}^n_{t_i}) \bar{M} (\varepsilon, t_i, t_{i+1}) d\varepsilon, \\
\bar{Z}^n_t &= n \mathbb{E} \left[ \int_{t_i}^{t_i+1} \bar{Z}^n_s ds / \mathcal{F}_{t_i} \right], \\
\bar{\Gamma}^n_t &= n \mathbb{E} \left[ \int_{t_i}^{t_i+1} \bar{\Gamma}^n_s ds / \mathcal{F}_{t_i} \right], \\
\bar{Y}^n_t &= \mathbb{E} \left[ \bar{Y}^n_{t_{i+1}} / \mathcal{F}_{t_i} \right] + \frac{1}{n} f(\bar{X}^n_{t_i}, \bar{Y}^n_{t_i}, \bar{\Gamma}^n_{t_i}),
\end{align*}
\]

for which the discretization error:

\[
\overline{\text{Err}}_n(Y^\varepsilon, Z^\varepsilon, \Gamma^\varepsilon) := \sup_{t \leq T} \mathbb{E} \left[ |Y^\varepsilon_t - \bar{Y}^n_t|^2 + \|Z^\varepsilon_t - \bar{Z}^n_t\|^2_H + \|\Gamma^\varepsilon_t - \bar{\Gamma}^n_t\|^2_H \right]^{1/2}
\]

converges to 0 as the discretization step \( \frac{T}{n} \) tends to 0. Means that the discretization scheme (3.3) achieves the optimal convergence rate \( n^{-1/2} \). The regularity of \( Z^\varepsilon \) and \( \Gamma^\varepsilon \) has been studied in \( L^2 \) sense in [5] when the terminal value is a functional of forward diffusion.

It is well known also that

\[
\max_{1 \leq n} \mathbb{E} \left[ \sup_{t \in [t_i, t_{i+1}]} |X^\varepsilon_{t_i} - \bar{X}^n_{t_i}|^2 \right] \leq C n^{-1/2}.
\]

11
Our aim in this part, is to show that the approximation-discretization error between BSDE (1.2) and (3.3):

$$
\overline{Err}_{(n,\epsilon)}^2(Y, V) := \sup_{t \leq T} E \left[ |Y_t - \tilde{Y}^\epsilon_t|^2 \right] + \sup_{t \leq T} E \left[ \int_0^t V_r dR_r - \int_0^t \tilde{Z}^\epsilon_r dW_r \right]^2 + \|\Gamma - \tilde{\Gamma}\|_{H^2}^2,
$$

converges to 0 as \((\epsilon, n) \to (0, \infty)\).

The first main result of this paper is:

**Proposition 3.1** Assuming Lipschitz property of coefficients \(b\) and \(\beta\), the approximation-discretization error defined in (3.5) is bounded by:

$$
\overline{Err}_{(n,\epsilon)}(Y, V) \leq C \left( n^{-1/2} + \sigma(\epsilon) \right).
$$

Means that:

$$
\overline{Err}_{(n,\epsilon)}(Y, V) \xrightarrow{(n,\epsilon)\to(\infty, 0)} 0.
$$

**Proof.** From (3.5), Jensen inequality and Burkholder-Davis-Gundy inequality, we have:

$$
\overline{Err}_{(n,\epsilon)}^2(Y, V) \leq C \left( \sup_{t \leq T} E \left[ |Y_t - Y^\epsilon_t|^2 + |Y^\epsilon_t - \tilde{Y}^\epsilon_t|^2 \right] + \|\Gamma - \tilde{\Gamma}\|_{H^2}^2 + \|\Gamma - \tilde{\Gamma}\|^2_{H^2} + \sup_{t \leq T} \int_0^t V_r dR_r - \int_0^t \tilde{Z}^\epsilon_r dW_r \right)^2 + \|\tilde{Z}^\epsilon - \tilde{\tilde{Z}}\|_{H^2}^2.
$$

From other side, it follows from Hölder inequality that:

$$
\int_{E_\epsilon} \rho(e)e(V_r - U^\epsilon_r(e))\nu(de) \leq K \left( \int_{E_\epsilon} (V_r - U^\epsilon_r(e))^2 m(de) \right)^{1/2} \nu(E_\epsilon)^{1/2}.
$$

Recalling that \(\nu(E_\epsilon) < \infty\) so that \(\nu\) has a.s. only a finite number of big jumps on \([0, T]\). Combining the two inequalities with (3.4) leads to:

$$
\overline{Err}_{(n,\epsilon)}^2(Y, V) \leq C \left( n^{-1} + \sup_{t \leq T} E \left[ |Y_t - Y^\epsilon_t|^2 \right] + \sup_{t \leq T} E \left[ \int_0^t V_r dR_r - \int_0^t \tilde{Z}^\epsilon_r dW_r \right]^2 \right.

+ \int_0^T \int_{E_\epsilon} |V_r|^2 m(de) dr + \left. \int_0^T \int_{E_\epsilon} |U^\epsilon_r(e) - V_r|^2 m(de) dr \right).
$$

By Theorem 2.2 we get:

$$
\overline{Err}_{(n,\epsilon)}(Y, V) \leq C \left( n^{-1/2} + \sigma(\epsilon) \right),
$$

where \(C\) depends on \(K\). \(\square\)

**Remark 3.1** In the general case, as we neglect the small jump, the Brownian part in (1.3) disappears. In this case the assertion (3.6) can be replaced by:

$$
\overline{Err}_{(n,\epsilon)}(Y, V) \leq C n^{-1/2}.
$$

**Remark 3.2** Taking \(\epsilon = n^{-1/2}\), we obtain the optimal convergence rate \(n^{-1/2}\) in (3.6),

$$
\overline{Err}_{(n,\epsilon)}(Y, V) \leq C n^{-1/2},
$$

which is exactly the approximation error in (3).
4 A discrete scheme via Malliavin derivatives

In this section, we generalize the new discrete scheme recently introduced by Hu, Nualard and Song \[19\] from a general BSDE, to our framework of decoupled forward-backward SDEs with jumps. For this aim, we use the Malliavin derivatives of $Y$ to derive the discrete scheme. We first fix a regular grid $\pi := \{t_i := iT/n, i = 0, ..., n\}$ on $[0, T]$ and approximate the forward SDE $X^t$ in (3.3) by its Euler scheme $X^{\pi}$ already defined in (3.3). It’s hard to prove existence and convergence of Malliavin derivatives of $X^{\pi}$. However, to avoid this problem, we can instead consider the continuous-time version of the Euler scheme, then we define the function $\phi$ for each $t \in [0, T]$:

$$\phi_t^n := \max\{t_i, \ i = 0, ..., n. / t_i \leq t\}, \quad (4.1)$$

for which we associate:

$$X^{\pi}_t := X^{\pi}_{\phi_t^n} + \sigma(\varepsilon)b(X^{\pi}_{\phi_t^n})(t - \phi_t^n) + \sigma(\varepsilon)\beta(X^{\pi}_{\phi_t^n})(W_t - W_{\phi_t^n}) + \int_{E_\varepsilon} \beta(X^{\pi}_{\phi_t^n}) \bar{M}(de, (t, \phi_t^n)).$$

It could be written as

$$X^t_t := X_0 + \int_0^t b(X^\pi_r)dr + \int_0^t \sigma(\varepsilon)\beta(X^{\pi}_r)dW_r + \int_0^t \int_{E_\varepsilon} \beta(X^{\pi}_r) \bar{M}(de, dr).$$

It is well known that under Lipschitz property of the coefficients

$$\mathbb{E} \left[ \sup_{t \in [0, T]} |X^t_t - X^{\pi}_t|^p \right]^{1/p} \leq C \pi^{1/2}. \quad (4.2)$$

The Malliavin derivatives of the continuous-time version of Euler scheme for $\theta \leq s$ a.e. are:

$$D_\theta X^t_t = \int_0^t \partial_x b(X^\pi_r)D_\theta X^\pi_r dr + \int_0^t \int_{E_\varepsilon} \partial_x \beta(X^\pi_r)D_\theta X^\pi_r \bar{M}(de, dr) + \sigma(\varepsilon)\beta(X^\pi_r) + \sigma(\varepsilon) \int_\theta^t \partial_x \beta(X^\pi_r)D_\theta X^\pi_r dW_r,$$

$$D_{\theta, \varepsilon} X^t_t = \int_0^t D_{\theta, \varepsilon} b(X^\pi_r) dr + \int_0^t \int_{E_\varepsilon} D_{\theta, \varepsilon} \beta(X^\pi_r) \bar{M}(de, dr) + \sigma(\varepsilon) \int_\theta^t D_{\theta, \varepsilon} \beta(X^\pi_r) dW_r + \beta(X^\pi_r).$$

We introduce some additional assumptions:

(A1) $f(t, y, \gamma)$ doesn’t depend on $x$.

(A2) The first derivative of $b$ and $\beta$ and $g$ is a K-Lipschitz function

$$|b'(x) - b'(y)| + |\beta'(x) - \beta'(y)| + |g'(x) - g'(y)| \leq K|x - y|.$$

(A3) $f(t, y, \gamma)$ is linear with respect to $t$, $y$ and $\gamma$. Moreover, there exist three bounded functions $f_1$, $f_2$ and $f_3$ such that:

$$f(t, y, u) = f_1(t) + f_2(t)y + f_3(t)\gamma. \quad (4.3)$$
Lemma 4.1 Under Lipschitz continuity of $b$ and $\beta$, we have for any $q \geq 1$

\[
\sup_{0 \leq \theta \leq T} \sup_{n \geq 1} \mathbb{E} \left[ \sup_{\theta \leq t \leq T} \| D_{\theta} X^\pi_t \|^{2q} \right] < \infty, \tag{4.4}
\]

\[
\sup_{0 \leq \theta \leq T} \sup_{n \geq 1} \mathbb{E} \left[ \sup_{\theta \leq t \leq T} \| D_{\theta,e} X^\pi_t \|^{2q} \right] < \infty. \tag{4.5}
\]

For the proof see the Appendix.

We then derive the following theorem

**Theorem 4.1** Under assumption (A2), Lipschitz continuity of $b$ and $\beta$ and for any $p \geq 2$, we have,

\[
\mathbb{E} \left[ \sup_{t \in [0,T]} | D_{\theta} X^\pi_t - D_{\theta} X^\epsilon_t |^p \right]^{1/p} \leq C_p \pi^{1/2}. \tag{4.6}
\]

\[
\mathbb{E} \left[ \sup_{t \in [0,T]} | D_{\theta,e} X^\pi_t - D_{\theta,e} X^\epsilon_t |^p \right]^{1/p} \leq C_p \pi^{1/2}. \tag{4.7}
\]

**Proof.** Using Burkholder-Davis-Gundy inequality, Jensen inequality, inequality (4.2) and Lemma 4.1

\[
\mathbb{E} \left[ \sup_{s \in [0,t]} | D_{\theta} X^\pi_s - D_{\theta} X^\epsilon_s |^p \right] \leq C_p \mathbb{E} \left[ \int_0^t | \partial_x b(X^\pi_{s\cdot}) D_{\theta} X^\pi_{s\cdot} - \partial_x b(X^\epsilon_t) D_{\theta} X^\epsilon_t |^p \, dr \right.
\]

\[
+ \int_0^t \int_{E_s} \left| \partial_x \beta(X^\pi_{s\cdot}) D_{\theta} X^\pi_{s\cdot} - \partial_x \beta(X^\epsilon_t) D_{\theta} X^\epsilon_t \right| \nu(de) dr
\]

\[
+ \sigma^p(\varepsilon) \left( \int_0^t \left| \partial_x \beta(X^\pi_{s\cdot}) D_{\theta} X^\pi_{s\cdot} - \partial_x \beta(X^\epsilon_t) D_{\theta} X^\epsilon_t \right|^2 \, dr \right)^{p/2}
\]

\[
+ \sigma^p(\varepsilon) \left| \beta(X^\pi_{\theta}) - \beta(X^\epsilon_{\theta}) \right|^p.
\]

which leads to

\[
\leq C_p \mathbb{E} \left[ \int_0^t | D_{\theta} X^\pi_t |^p \left| \partial_x b(X^\pi_t) - \partial_x b(X^\epsilon_t) \right| + | \partial_x \beta(X^\pi_t) - \partial_x \beta(X^\epsilon_t) |^p \right] dr
\]

\[
+ \int_0^t | D_{\theta} X^\pi_t - D_{\theta} X^\epsilon_t |^p \left| \partial_x b(X^\pi_{s\cdot}) |^p + | \partial_x \beta(X^\pi_{s\cdot}) |^p \right] dr
\]

\[
+ | X^\pi_{\theta} - X^\epsilon_{\theta} |^p
\]

\[
\leq C_p \mathbb{E} \left( \pi^{p/2} + \int_0^t \sup_{u \in [0,r]} | D_{\theta} X^\pi_u - D_{\theta} X^\epsilon_u |^p \, dr \right).
\]

We conclude by using Gronwall’s Lemma. Following the same arguments, we prove the second assertion.

\[\square\]

Now we derive the discrete scheme using the expression of $Z^\varepsilon$ and $U^\varepsilon$ as the trace of
Malliavin derivatives of $Y$. From equation (5.15) and (5.17), the two Malliavin derivatives $D_0 Y_t$, $D_{\theta,e} Y_t$ could be expressed as:

$$D_0 Y_t^\pi = \mathbb{E} \left( \mathcal{E}_{t,T} \partial_x g(X_T^\pi) D_0 X_T^\pi + \int_t^T \mathcal{E}_{t,r} \partial_x f(\Theta_r^\pi) D_0 X_r^\pi dr / \mathcal{F}_t \right)$$

(4.8)

$$D_{\theta,e} Y_t^\pi = \mathbb{E} \left( \mathcal{E}_{t,T}^{\theta,e} D_{\theta,e} g(X_T^\pi) + \int_t^T \mathcal{E}_{t,r}^{\theta,e} D_{\theta,e} X_r^\pi dr / \mathcal{F}_t \right),$$

(4.9)

where

$$\mathcal{E}_{t,r} = \exp \left\{ \int_t^r \left( \partial_y f(\Theta_u^\pi) - \frac{1}{2} \int_{E_\varepsilon} \partial_y f^2(\Theta_u^\pi) \rho_2(e) m(de) \right) du + \int_t^r \int_{E_\varepsilon} \partial_y f(\Theta_u^\pi) \rho(e) M(de, du) \right\}$$

and

$$\mathcal{E}_{t,r}^{\theta,e} := \exp \left\{ \int_t^r \left[ \alpha_{\theta,u} - \frac{1}{2} \alpha_{\theta,u}^2 \int_{E_\varepsilon} \rho_2(e) m(de) \right] du + \int_t^r \int_{E_\varepsilon} \alpha_{\theta,u} \rho(e) M(de, du) \right\}$$

Thus, we define our discrete scheme for $i = n - 1, \ldots, 1, 0$ and $t \in [t_i, t_{i+1})$ by induction

$$\begin{align*}
Y_{t_i}^\pi &= \mathbb{E} \left[ Y_{t_{i+1}}^\pi + f(\Theta_{t_{i+1}}^\pi) \Delta t_{i+1} / \mathcal{F}_{t_i} \right] \\
Z_{t_i}^\pi &= \mathbb{E} \left[ \mathcal{E}_{t_i+1,t_{i+1}} \partial_x g(X_T^{\pi}) D_{t_i} X_T^{\pi} + \sum_{k=1}^{n-1} \mathcal{E}_{t_{i+1},t_{i+k+1}} \partial_x f(\Theta_{t_{i+k+1}}^\pi) D_{t_i} X_T^{\pi} \Delta t_k / \mathcal{F}_{t_i} \right] \\
\Gamma_{t_i}^\pi &= \mathbb{E} \left[ \int_{E_\varepsilon} \rho(e) \left[ \mathcal{E}_{t_{i+1},t_{i+1}}^{\theta,e} D_{t_i} e g(X_T^{\pi}) + \sum_{k=1}^{n-1} \mathcal{E}_{t_{i+1},t_{i+k+1}}^{\theta,e} \alpha_{\theta,1,t_{i+k+1}} D_{t_i} e X_T^{\pi} \Delta t_k \right] \nu(de) / \mathcal{F}_{t_i} \right]
\end{align*}$$

(4.10)

where $Y_{t_i}^\pi = g(X_T^\pi)$, $Z_{t_i}^\pi = \sigma(\varepsilon) \partial_x g(X_T^\pi) \beta(X_T^\pi)$, $U_{t_i,e}^\pi = g(X_T^\pi + \beta(X_T^\pi)) - g(X_T^\pi)$, and

$$\begin{align*}
\mathcal{E}_{t_i,t_j} &= \exp \left\{ \sum_{k=1}^{j-1} \int_{t_k}^{t_{k+1}} \left[ \partial_y f(\Theta_{t_k}^\pi) - \frac{1}{2} \int_{E_\varepsilon} \partial_y f^2(\Theta_{t_k}^\pi) \rho_2(e) m(de) \right] dr \\
& \quad + \sum_{k=1}^{j-1} \int_{t_k}^{t_{k+1}} \int_{E_\varepsilon} \partial_y f(\Theta_{t_k}^\pi) \rho(e) M(de, dr) \right\} \\
\mathcal{E}_{t_i,t_j}^{\theta,e} &= \exp \left\{ \sum_{k=1}^{j-1} \int_{t_k}^{t_{k+1}} \left[ \alpha_{\theta,r,t_k} - \frac{1}{2} \alpha_{\theta,r,t_k}^2 \int_{E_\varepsilon} \rho_2(e) m(de) \right] dr \\
& \quad + \sum_{k=1}^{j-1} \int_{t_k}^{t_{k+1}} \int_{E_\varepsilon} \alpha_{\theta,r,t_k} \rho(e) M(de, dr) \right\}
\end{align*}$$

(4.11)

and

$$\begin{align*}
\alpha_{\theta,r,t_k}^\pi &= \frac{f(\Theta_{t_k}^\pi + D_{\theta,e} \Theta_{t_k}^\pi) - f(\Theta_{t_k}^\pi)}{D_{\theta,e} X_{t_k}^{\pi} + D_{\theta,e} Y_{t_k}^{\pi} + D_{\theta,e} \Gamma_{t_k}^\pi} \times 1_{\{D_{\theta,e} X_{t_k}^{\pi} + D_{\theta,e} Y_{t_k}^{\pi} + D_{\theta,e} \Gamma_{t_k}^\pi \neq 0\}}, \\
\Gamma_{t_k}^\pi &= \int_{E_\varepsilon} U_{t_k,e}^\pi \rho(e) \nu(de),
\end{align*}$$

where

$$\begin{align*}
\mathcal{E}_{t_i,t_j} &= \exp \left\{ \sum_{k=1}^{j-1} \int_{t_k}^{t_{k+1}} \left[ \partial_y f(\Theta_{t_k}^\pi) - \frac{1}{2} \int_{E_\varepsilon} \partial_y f^2(\Theta_{t_k}^\pi) \rho_2(e) m(de) \right] dr \\
& \quad + \sum_{k=1}^{j-1} \int_{t_k}^{t_{k+1}} \int_{E_\varepsilon} \partial_y f(\Theta_{t_k}^\pi) \rho(e) M(de, dr) \right\}, \\
\mathcal{E}_{t_i,t_j}^{\theta,e} &= \exp \left\{ \sum_{k=1}^{j-1} \int_{t_k}^{t_{k+1}} \left[ \alpha_{\theta,r,t_k} - \frac{1}{2} \alpha_{\theta,r,t_k}^2 \int_{E_\varepsilon} \rho_2(e) m(de) \right] dr \\
& \quad + \sum_{k=1}^{j-1} \int_{t_k}^{t_{k+1}} \int_{E_\varepsilon} \alpha_{\theta,r,t_k} \rho(e) M(de, dr) \right\}
\end{align*}$$

(4.12)
with $\Theta^\pi_{t_k} = (r, X^\pi_{t_k}, Y^\pi_{t_k}, \Gamma^\pi_{t_k})$.

We are going to compute the discretization error of our discrete scheme and prove the convergence of the above scheme. We recall the expression of the error between the solution of (1.3) and (4.10):

$$\text{Err}^p_{p^n}(Y^\epsilon_t, Z^\epsilon_t, \Gamma^\epsilon_t) := \max_{0 \leq i \leq n} \left[ |Y^\epsilon_{t_i} - Y^\pi_{t_i}|^p + |Z^\epsilon_{t_i} - Z^\pi_{t_i}|^p + |\Gamma^\epsilon_{t_i} - \Gamma^\pi_{t_i}|^p \right],$$

where, $\Gamma^\pi_{t_i} = \int_{E^\epsilon} \rho(e)U^\pi_{t_i,e} \nu(de)$.

We also recall the expression of discretization-approximation error between (1.2) and (4.10)

$$\text{Err}^2_{n,\epsilon}(Y, V) := \max_{0 \leq i \leq n} \sup_{t \in [t_i, t_{i+1}]} \mathbb{E} \left[ |Y_t - Y^\pi_{t_i}|^2 \right] + \mathbb{E} \left[ \int_0^T V_t dR_t - \sum_{i=0}^{n-1} Z^\pi_{t_i} \Delta W_{t_i} \right]^2 + \sum_{i=0}^{n-1} \int_{t_i}^{t_{i+1}} \mathbb{E} |\Gamma_t - \Gamma^\pi_{t_i}|^2 dt.$$

We conclude this section with the following Theorems whose proof are at the end of section 5.

**Theorem 4.2** Under assumption 5.1, we assume the existence of a constant $L_3 > 0$ such that:

$$|f(t_2, y, u) - f(t_1, y, u)| \leq L_3 |t_2 - t_1|^{\frac{1}{2}}. \tag{4.13}$$

Then there exist a positive constant $C$ independent of $\pi$ such that:

$$\text{Err}^p_{n,\epsilon}(Y^\epsilon_t, Z^\epsilon_t, \Gamma^\epsilon_t) \leq C^\epsilon|\pi|^{\frac{p}{2}} \left( \frac{1}{2} - \frac{p}{2\log |\pi|} \right). \tag{4.14}$$

The second main result of this paper is summarized in the following theorem:

**Theorem 4.3** Under the same assumptions as Theorem 4.2, we have

$$\text{Err}^2_{n,\epsilon}(Y, V) \leq C \left( \sigma(\epsilon) + |\pi|^{\frac{1}{2}} \frac{1}{2\log |\pi|} \right). \tag{4.15}$$

**Remark 4.1** The importance of the above scheme is it can be adapted to a backward SDE when the generator does not depend on the terminal value of a forward equation.

Consider the following backward stochastic differential equation driven by pure jump Lévy processes

$$\hat{Y}_t = \hat{\xi} + \int_t^T f(r, \hat{Y}_r, \int_{E^\epsilon} \rho(e)\hat{V}_r e\nu(de)) dr - \int_t^T \hat{V}_r dL_r \tag{4.16}$$

Which we approximate by

$$\hat{Y}^\epsilon_t = \hat{\xi} + \int_t^T f(r, \hat{Y}^\epsilon_r, \int_{E^\epsilon} \rho(e)\hat{V}_r e\nu(de)) dr - \int_t^T \hat{Z}^\epsilon_r dW_s - \int_t^T \int_{E^\epsilon} \hat{U}^\epsilon_r(e) M(dr, de) \tag{4.17}$$
We finally propose the below discrete time scheme, defined by terminal values \( \hat{Y}_{t_n}^\pi = \xi \), \( \hat{Z}_{t_n}^\pi = D\tau \xi \) and \( \hat{\Gamma}_{t_n}^\pi = D\tau, e\xi \)

\[
\begin{aligned}
\hat{Y}_{t_n}^\pi &= \mathbb{E}\left[ \hat{Y}_{t_{n+1}}^\pi + f(\hat{\Theta}_{t_{n+1}}^\pi)\Delta t_{n+1}/\mathcal{F}_{t_n} \right] \\
\hat{Z}_{t_n}^\pi &= \mathbb{E}\left[ \mathcal{E}_{t_{n+1},t_n}^\pi D_{t_n} \hat{\xi} + \sum_{k=1}^{n-1} \mathcal{E}_{t_{k+1},t_k}^\pi \partial_x f(\hat{\Theta}_{t_{k+1}}^\pi) D_{t_k} X_{t_k}^{\pi,\Delta t_k}/\mathcal{F}_{t_k} \right] \\
\hat{\Gamma}_{t_n}^\pi &= \mathbb{E}\left[ \int_{\mathcal{E}_c} \rho(e) \left( \mathcal{E}_{t_{n+1},t_n}^\pi D_{t_n} \hat{e} \hat{\xi} + \sum_{k=1}^{n-1} \mathcal{E}_{t_{k+1},t_k}^\pi \alpha_{t_k} \mathcal{E}_{t_{k+1},t_k}^\pi D_{t_k} X_{t_k}^{\pi,\Delta t_k} \right) \nu(de)/\mathcal{F}_{t_k} \right]
\end{aligned}
\]

(4.18)

with \( \hat{\Theta}_{t_k}^\pi = (r, \hat{Y}_{t_k}^\pi, \hat{\Gamma}_{t_k}^\pi) \).

Under the same assumptions of Theorem 4.2 we prove the convergence of the system (4.18) to BSDE (4.16). Moreover, we obtain the upper bound

\[
\begin{aligned}
\max_{0 \leq t \leq n} \sup_{t \in [t_{n-1}]} \mathbb{E} \left[ |Y_t - Y_{t_n}^\pi|^2 \right] + \mathbb{E} \left[ \int_0^T V_r dR_r - \sum_{i=0}^{n-1} Z_{t_i}^\pi \Delta W_{t_i} \right]^2 + \sum_{i=0}^{n-1} \int_{t_i}^{t_{i+1}} \mathbb{E} |\Gamma_t - \Gamma_{t_i}^\pi|^2 dt \\
&\leq C \left( \sigma^2 (\varepsilon) + |\pi| \frac{1 - \frac{1}{\ln^2 \pi}}{\ln \pi} \right).
\end{aligned}
\]

(4.19)

5 Malliavin calculus for FBSDEs

For ease of notations, we shall denote throughout this section the process \((X^\varepsilon, Y^\varepsilon, Z^\varepsilon, \Gamma^\varepsilon)\) by \((X, Y, Z, \Gamma)\).

In this section, we study some regularity properties of the solution \((X, Y, Z, \Gamma)\). We recall the system (4.3) using the new notations

\[
\begin{aligned}
X_t &= X_0 + \int_0^t b(X_r) dr + \int_0^t \beta(X_r) \sigma(\varepsilon) dW_r + \int_0^t \int_{\mathcal{E}_c} \beta(X_{r-}) \bar{M}(dr, de) \\
Y_t &= g(X_T) + \int_t^T f(\Theta_r) dr - \int_t^T Z_r dW_r - \int_t^T \int_{\mathcal{E}_c} U_r(e) \bar{M}(dr, de)
\end{aligned}
\]

(5.1)

In fact, there are many methods to develop Malliavin calculus for Lévy processes. In our paper, we opt for the approach of Solé et al. [25], based on a chaos decomposition in terms of multiple stochastic integrals with respect to the random measure \(\bar{M}\). Adopting notation of [12], we will recall the suitable canonical space we adopt to our setting.

We start by introducing some additional notations and definitions. We assume that the probability space \((\Omega, \mathcal{F}, \mathbb{P})\) is the product of two canonical spaces \((\Omega_0 \times \Omega_\mu, \mathcal{F}_W \times \mathcal{F}_\mu, \mathbb{P}_W \times \mathbb{P}_\mu)\) and the filtration \(\mathcal{F} = (\mathcal{F}_t)_{t \in [0,T]}\) the canonical filtration completed for \(\mathbb{P}\) (for details concerning this construction, see Section 2 in [12]).

We consider the finite measure \(q\) defined on \([0, T] \times \mathbb{R}\) by

\[
q(B) = \int_{B(0)} dt + \int_{B'} e^2 \nu(de) dt, \quad B \in \mathcal{B}([0, T] \times \mathbb{R}),
\]

where \(B(0) = \{ t \in [0, T]; (t, 0) \in B \}, B' = B - B(0)\) and the random measure \(Q \in [0, T] \times \mathbb{R}:\)

\[
Q(B) = \int_{B(0)} dW_t + \int_{B'} e\bar{\mu}(dt, de), \quad B \in \mathcal{B}([0, T] \times \mathbb{R}).
\]
For $n \in \mathbb{N}$, a simple function $h_n = 1_{E_1 \times \ldots \times E_n}$ with pairwise disjoints sets $E_1, \ldots, E_n \in \mathcal{B}([0,T] \times \mathbb{R})$, we define:

$$I_n(h_n) = \int_{([0,T] \times \mathbb{R})^n} h(t_1, e_1, \ldots, t_n, e_n) Q(dt_1, de_1) \cdots Q(dt_n, de_n).$$

We define the following spaces:

1. $L^2_{T,q,n}(\mathbb{R})$ the space of product measurable deterministic functions $h : ([0,T] \times \mathbb{R})^n \to \mathbb{R}$ satisfying $\|h\|^2_{L^2_{T,q,n}} < \infty$, where

$$\|h\|^2_{L^2_{T,q,n}} = \int_{([0,T] \times \mathbb{R})^n} |h(t_1, e_1, \ldots, t_n, e_n)|^2 q(dt_1, de_1) \cdots q(dt_n, de_n).$$

2. $D^{1,2}(\mathbb{R})$ denote the space of $\mathbb{F}$-measurable random variables $H \in L^2(\mathbb{R})$ with the representation $H = \sum_{n=0}^{\infty} I_n(h_n)$ and satisfying

$$\sum_{n=0}^{\infty} nn! \|h_n\|^2_{L^2_{T,q,n}} < \infty.$$

3. $L^{1,2}(\mathbb{R})$ denote the space of product measurable and $\mathbb{F}$-adapted processes $G : \Omega \times \mathbb{R} \to \mathbb{R}$ satisfying

$$\mathbb{E} \left( \int_{[0,T] \times \mathbb{R}} |G(s, y)|^2 q(ds, dy) \right) < \infty$$

$$G(s, y) \in D^{1,2}(\mathbb{R}), \text{ for } q - a.e \ (s, y) \in [0,T] \times \mathbb{R}$$

$$\mathbb{E} \left( \int_{([0,T] \times \mathbb{R})^2} |D_{t,z}G(s, y)|^2 q(ds, dy)q(dt, dz) \right) < \infty.$$ 

This space is endowed with the norm

$$\|G\|^2_{L^{1,2}} = \mathbb{E} \left( \int_{[0,T] \times \mathbb{R}} |G(s, y)|^2 q(ds, dy) \right) + \mathbb{E} \left( \int_{([0,T] \times \mathbb{R})^2} |D_{t,z}G(s, y)|^2 q(ds, dy)q(dt, dz) \right).$$

We should mention that the derivative $D_{t,0}$ coincide with $D_t$ the classical Malliavin derivative with respect to Brownian motion.

To study the regularity of $Z$ and $U$, we shall also introduce the following assumption:

**Assumption 5.1** For $2 \leq p \leq \frac{q}{2}$

1. The generator $f$ has continuous and uniformly bounded first and second order partial derivative with respect to $x$, $y$ and $\gamma$. 

---

18
2. For each \((x, y, \gamma) \in \mathbb{R}^3\), \(\partial_x f(\Theta), \partial_y f(\Theta)\) and \(\partial_\gamma f(\Theta)\) belong to \(L^1,2\) and satisfy

\[
\sup_{0 \leq \theta \leq T} \mathbb{E} \left( \int_0^T |D_\theta \partial_i f(\Theta_r)|^2 dr \right)^{\frac{q}{2}} < \infty,
\]

where \(i := x, y, \gamma\).

There exist a constant \(K > 0\) such that for any \(e \in (\mathbb{R} - \{0\})\), \(t \in [0, T]\) and \(0 \leq \theta, u \leq t \leq T\):

\[
\mathbb{E} |D_{\theta, e} g(X_T) - D_u g(X_T)|^p \leq K |\theta - u|^\frac{p}{2}.
\]

\[
\sup_{0 \leq \theta \leq T, 0 \leq u \leq T} \mathbb{E} \left( \int_\theta^T |D_u D_\theta f(\Theta_r)|^2 dr \right)^{\frac{q}{2}} < \infty,
\]

Additionally to Assumption 5.1, we assume that

**Assumption 5.2** For any \(\lambda > 0\) and \(q \geq 1\), we consider three progressive measurable processes \(\{\alpha_t\}_{0 \leq t \leq T}, \{\beta_t\}_{0 \leq t \leq T}\) and \(\{\gamma_t\}_{0 \leq t \leq T}\) such that:

\[
\mathbb{E} \exp \left( \lambda \int_0^T (|\beta_r| + |\gamma_r|^2) dr \right) < \infty,
\]

\[
\sup_{0 \leq t \leq T} \mathbb{E} \left( |\alpha_t|^q + |\gamma_t|^q \right) < \infty.
\]

**Proposition 5.1** Under Assumption 5.2, the discontinuous semi-martingale \(\mathcal{E}_t\):

\[
d\mathcal{E}_t = \mathcal{E}_t \beta_t dt + \mathcal{E}_t \gamma_t \int_{E_e} \rho(e) \bar{M}(de, dt),
\]

has the following properties

1. \(\mathbb{E} \sup_{0 \leq t \leq T} \mathcal{E}_t^n < \infty\), for any \(n \in \mathbb{R}\).

2. The process \(Z_t := \mathcal{E}_t^{-1}\) satisfies the following linear SDE:

\[
\frac{dZ_t}{Z_t} = \left( -\beta_t + \gamma_t^2 \int_{E_e} \rho^2(e) m(de) \right) dt - \gamma_t \int_{E_e} \rho(e) \bar{M}(de, dt).
\]

Moreover, we have for any \(p \geq 2\):

\[
\mathbb{E} |Z_t - Z_s|^p \leq C |t - s|^p.
\]
Proof. $\mathcal{E}$ could be written as :

$$
\mathcal{E}_t = \exp \left\{ \int_0^t \left[ \beta_r - \frac{1}{2} \int_{E_t} \gamma^2_r \rho^2(e) m(de) \right] dr + \int_0^t \int_{E_t} \gamma_r \rho(e) \tilde{M}(de, dr) \right\}.
$$

Under Assumption 5.2, we get the first assertion. The second assertion is deduced from first one, Hölder inequality and Burkholder-Davis-Gundy inequality. \(\square\)

The following Theorem constitutes the main tool to prove Theorem 5.3.

**Theorem 5.1** Suppose that $\mathcal{E}_T X_T$ and $\int_0^T \alpha_r D_d X_r dr$ are in $M^{2q}$. The following linear BSDE

$$
Y_t = g(X_T) X_T + \int_t^T \left[ \alpha_r X_r + \beta_r Y_r + \gamma_r \Gamma_r \right] dr - \int_t^T Z_r dW_r
$$

$$
- \int_t^T \int_{E_t} U_r(e) \tilde{M}(dr, de), \quad 0 \leq t \leq T
$$

has a unique solution $(Y, Z, U)$ and there is a constant $C > 0$ such that

$$
\mathbb{E} \left| Y_t - Y_s \right|^p \leq C |t - s|^\frac{p}{2} \quad \text{for all } s, t \in [0, T].
$$

**Proof.** Applying Itô’s formula to $\mathcal{E}_t Y_t$, we obtain

$$
d(\mathcal{E}_t Y_t) = -\mathcal{E}_t \alpha_t X_T dt + \mathcal{E}_t Z_t dW_t + \mathcal{E}_t \int_{E_t} (Y_t \gamma_t \rho(e) + U_t(e)) \tilde{M}(de, dt).
$$

Then

$$
Y_t = \mathbb{E} \left( \mathcal{E}_{t,T} g(X_T) X_T + \int_t^T \mathcal{E}_{t,r} \alpha_r X_r dr / \mathcal{F}_t \right),
$$

where $\mathcal{E}_{t,r} = Z_t \mathcal{E}_r$.

For $0 \leq s \leq t \leq T$, we have:

$$
\mathbb{E} |Y_t - Y_s|^p \leq 3^{p-1} \mathbb{E} \left| \mathcal{E}_{t,T} g(X_T) X_T / \mathcal{F}_t \right| - \mathbb{E} \left( \mathcal{E}_{s,T} g(X_T) X_T / \mathcal{F}_s \right) |^p
$$

$$
+ 3^{p-1} \mathbb{E} \left| \mathbb{E} \left( \int_t^T \mathcal{E}_{t,r} \alpha_r X_r dr / \mathcal{F}_t \right) - \mathbb{E} \left( \int_s^T \mathcal{E}_{s,r} \alpha_r X_r dr / \mathcal{F}_s \right) \right|^p
$$

$$
= 3^{p-1} (I_1 + I_2).
$$

By adapting the argument of Theorem 2.3 in [19] and recall Remark 5.1, we can immediately show that $I_1 \leq C |t - s|^\frac{p}{2}$ and $I_2 \leq C |t - s|^\frac{p}{2}$. \(\square\)

### 5.1 Malliavin calculus on the Forward SDE

In this section, we recall well-known properties on forwards SDEs, concerning the Malliavin derivatives of the solution of a forward SDE with jump, stated in Nualart [22] in the case of SDE without jumps and in Petrou [24] in case of a Lévy process. The following theorem can be found in [24].
**Theorem 5.2**
Let $X$ be the solution of forward SDE (5.1). Then, for all $t \in [0,T]$ and $(\theta,e) \in [0,T] \times (\mathbb{R}\setminus\{0\})$, the Malliavin derivatives of $X$ satisfy
\[
D_{\theta}X_t = \int_{0}^{t} \partial_x b(X_r) D_{\theta}X_r dr + \int_{0}^{t} \int_{E_\varepsilon} \partial_x \beta(X_r) D_{\theta}X_r \tilde{M}(dr,de) + \sigma(\varepsilon) \beta(X_\theta) + \sigma(\varepsilon) \int_{0}^{t} \partial_x \beta(X_r) D_{\theta}X_r dW_r, \quad 0 \leq \theta \leq t \leq T. \quad (5.13)
\]
And
\[
D_{\theta,e}X_t = \int_{0}^{t} D_{\theta,e}b(X_r) dr + \int_{0}^{t} \int_{E_\varepsilon} D_{\theta,e} \beta(X_r) \tilde{M}(dr,de) + \beta(X_\theta) + \sigma(\varepsilon) \int_{0}^{t} D_{\theta,e} \beta(X_r) dW_r, \quad 0 \leq \theta \leq t \leq T. \quad (5.14)
\]
For all $\theta > t$, we have $D_{\theta,e}X_t = D_{\theta}X_t = 0$ a.s.

**Remark 5.1** Using standard arguments as in the proof of Lemma 4.1, we can prove the following a priori estimate:
\[
\begin{align*}
&\sup_{0 \leq \theta \leq T} \mathbb{E} \left[ \sup_{0 \leq t \leq T} D_{\theta}X_t \right] < \infty, \\
&\sup_{0 \leq \theta \leq T, e \in \mathbb{R}^*} \mathbb{E} \left[ \sup_{0 \leq t \leq T} D_{\theta,e}X_t \right] < \infty, \\
&\sup_{0 \leq u \leq T} \sup_{0 \leq \theta \leq T} \mathbb{E} \left[ \sup_{0 \leq t \leq T} D_u D_{\theta}X_t \right] < \infty, \\
&\sup_{0 \leq u \leq T} \sup_{0 \leq \theta \leq T, e \in \mathbb{R}^*} \mathbb{E} \left[ \sup_{0 \leq t \leq T} D_u D_{\theta,e}X_t \right] < \infty.
\end{align*}
\]

### 5.2 Malliavin calculus on the Backward SDE

In this section, we recall some result of Malliavin derivatives applied to BSDE especially established in [15] and [12] in the aim to generalize the result of Theorem 2.6 in [19].

**Theorem 5.3** Assume that assumption [5.7] hold. There exist a unique solution \{(Y_t, Z_t, U_t(e))\}_{0 \leq t \leq T, e \in (\mathbb{R}\setminus\{0\})} of BSDE (5.17), such that:

1. The first version of Malliavin derivative \{(D_{\theta}Y_t, D_{\theta}Z_t, D_{\theta}U_t(e))\}_{0 \leq \theta, t \leq T, e \in (\mathbb{R}\setminus\{0\})} of the solution \{(Y_t, Z_t, U_t(e))\}_{0 \leq t \leq T, e \in (\mathbb{R}\setminus\{0\})} satisfies the following linear BSDE:
\[
D_{\theta}Y_t = \partial_x g(X_T) D_{\theta}X_T + \int_{t}^{T} f^0(X_r, Y_r, \Gamma_r) dr - \int_{t}^{T} D_{\theta}Z_r dW_r - \int_{t}^{T} \int_{E_\varepsilon} D_{\theta}U_r(e) \tilde{M}(dr,de), \quad 0 \leq \theta \leq t \leq T. \quad (5.15)
\]
where \( f^\theta(\Theta) := \partial_x f(\Theta)D_\theta X_r + \partial_y f(\Theta)D_\theta Y_r + \partial_\gamma f(\Theta)D_\theta \Gamma_r. \)

Moreover \((D_t Y_t)_{0 \leq t \leq T}\) is a version of \((Z_t)_{0 \leq t \leq T}:\)

\[
Z_t = D_t Y_t. \quad \text{a.s.} \quad (5.16)
\]

2. The second version of Malliavin derivative 
\[(D_{\theta, z} Y_t, D_{\theta, z} Z_t, D_{\theta, z} U_t(e))_{0 \leq t \leq T, (e, z) \in (\mathbb{R} - \{0\})^2}\]

of the solution \((Y_t, Z_t, U_t(z))_{0 \leq t \leq T, z \in (\mathbb{R} - \{0\})}\) satisfies the following linear BSDE

\[
D_{\theta, z} Y_t = g(X_T + D_{\theta, z} X_T) - g(X_T) + \int_t^T [f(\Theta_r + D_{\theta, z} \Theta_r) - f(\Theta_r)] dr \quad (5.17)
\]

\[
- \int_t^T D_{\theta, z} Z_r dW_s - \int_t^T \int_{E_e} D_{\theta, z} U_r(e) \bar{M}(dr, de), \quad 0 \leq \theta \leq t \leq T.
\]

Moreover \((D_{t, e} Y_t)_{0 \leq t \leq T, e \in (\mathbb{R} - \{0\})}\) is a version of \((U_t(z))_{0 \leq t \leq T, z \in (\mathbb{R} - \{0\}):}\)

\[
U_t(z) = D_{t, e} Y_t \quad \text{a.s.} \quad (5.18)
\]

And for \((\theta, e) \in [0, T] \times \mathbb{R}\)

\[
D_{\theta, z} Y_t = D_{\theta, z} Z_t = D_{\theta, z} U_t(z) = 0, \quad 0 \leq t < \theta \quad (e, z) \in \mathbb{R} \times (\mathbb{R} - \{0\}).
\]

3. There exist a constant \(C > 0\) such that for all \(s, t \in [0, T]:\)

\[
\mathbb{E}|Z_t - Z_s|^p \leq C|t - s|^{\frac{p}{2}} \quad (5.19)
\]

\[
\mathbb{E}|\Gamma_t - \Gamma_s|^p \leq C|t - s|^{\frac{p}{\gamma}} \quad (5.20)
\]

**Proof.** Existence and uniqueness of solution is similar to Proposition 5.3 in [15] and Theorem 4.1 in [12]. Then we focus our attention to prove inequalities \((5.19)\) and \((5.20).\)

We first prove that \(\mathbb{E}|Z_t - Z_s|^p \leq C|t - s|^{\frac{p}{2}}.\)

Let \(C > 0\) be a constant independent of \(s\) and \(t\), whose value vary from line to line. From \((5.16)\) we have:

\[
Z_t - Z_s = D_t Y_t - D_s Y_s.
\]

Then

\[
\mathbb{E}|Z_t - Z_s|^p \leq \mathbb{E}|D_t Y_t - D_s Y_s|^p.
\]

**Step 1:** Estimate \(\mathbb{E}|D_t Y_t - D_s Y_s|^p.\)
From Lemma (3.1), equation (3.15) and assumption (5.4)-(5.6), we obtain
\[
E|D_t Y_t - D_s Y_t|^p + E \left( \int_t^s |D_t Z_r - D_s Z_r|^2 dr \right)^{\frac{p}{2}}
+ E \left( \int_t^s \int_{E_x} |D_t U_r(e) - D_s U_r(e)|^2 m(de) dr \right)^{\frac{p}{2}}
\leq C E \left( |D_t g(X_T) - D_s g(X_T)|^p \right)
+ C E \left( \int_t^s |D_t f(r, X_r, Y_r, \Gamma_r) - D_s f(r, X_r, Y_r, \Gamma_r)|^2 dr \right)^{\frac{p}{2}}
\leq C |t-s|^{\frac{p}{2}}.
\] (5.21)

**Step 2:** Estimate \( E|D_s Y_t - D_s Y_s|^p. \)

We recall the expression of \( \mathcal{E}_t \)
\[
\mathcal{E}_t = \exp \left\{ \int_0^t \left[ \beta_r - \frac{1}{2} \int_{E_x} \gamma_r^2 \rho^2(e) m(de) \right] dr + \int_0^t \int_{E_x} \gamma_r \rho(e) \tilde{M}(de,dr) \right\}. \] (5.22)

Denote \( \beta_r = \partial_y f(\Theta_r) \) and \( \gamma_r = \partial_{\gamma} f(\Theta_r) \). For any \( 0 \leq \theta \leq t \leq T \), we have:
\[
D_{\theta} \mathcal{E}_t = \mathcal{E}_t \left\{ \int_0^t \int_{E_x} \rho(e) \left[ \partial_{\gamma} f(\Theta_r) D_{\theta} X_r + \partial_{\gamma y} f(\Theta_r) D_{\theta} Y_r + \partial_{\gamma} f(\Theta_r) D_{\theta} \Gamma_r \right] \tilde{M}(de,dr)
+ \int_0^t \int_{E_x} \left[ \partial_{xy} f(\Theta_r) - \rho^2(e) \gamma_r \partial_{xy} f(\Theta_r) \right] D_{\theta} X_r m(de) dr
+ \int_0^t \int_{E_x} \left[ \partial_{yy} f(\Theta_r) - \rho^2(e) \gamma_r \partial_{yy} f(\Theta_r) \right] D_{\theta} Y_r m(de) dr
+ \int_0^t \int_{E_x} \left[ \partial_{y} f(\Theta_r) - \rho^2(e) \gamma_r \partial_{y} f(\Theta_r) \right] D_{\theta} \Gamma_r m(de) dr \right\}.
\]

From other side, by induction on chain rule:
\[
D_{\theta, e} f^2(\Theta) = f^2(\Theta + D_{\theta, e} \Theta) - f^2(\Theta).
\] (5.23)

Using this in the previous equality
\[
D_{\theta, e} \mathcal{E}_t = \mathcal{E}_t \left( \exp \left\{ \int_0^t \left[ \partial_y f(\Theta_r + D_{\theta, e} \Theta_r) - \partial_y f(\Theta_r)
- \frac{1}{2} \int_{E_x} \rho^2(e) \left( \partial_{\gamma} f(\Theta_r + D_{\theta, e} \Theta_r) \right)^2 - \gamma_r^2 \right] m(de) \right] dr
+ \gamma_{\theta} \rho(e) + \int_0^t \int_{E_x} \rho(e) \left[ \partial_{\gamma} f(\Theta_r + D_{\theta, e} \Theta_r) - \gamma_r \right] \tilde{M}(de,dr) \right\} - 1 \right).
\]

From Proposition (5.1) Assumption (5.1) Hölder inequality and Burkholder-Davis-Gundy inequality, we can show for any \( p < q \) that:
\[
\sup_{\theta \in [0,T], e \in \mathbb{R}} \sup_{0 \leq t \leq T} |D_{\theta, e} \mathcal{E}_t|^p < \infty.
\] (5.24)
Now, by Clark-Ocone formula (See Es-Sebaiy and Tudor [16]) on $\mathcal{E}_T D_\theta X_T$:

$$
\mathcal{E}_T D_\theta X_T = \mathbb{E}(\mathcal{E}_T D_\theta X_T) + \int_0^T \mathbb{E}\left(D_r(\mathcal{E}_T D_\theta X_T) / \mathcal{F}_r\right) dW_r \\
+ \int_0^T \int_{E_\varepsilon} \mathbb{E}\left(D_{r,e}(\mathcal{E}_T D_\theta X_T) / \mathcal{F}_r\right) M(dr, de)
$$

$$
= \mathbb{E}(\mathcal{E}_T D_\theta X_T) + \int_0^T u^\theta_r dW_r + \int_0^T \int_{E_\varepsilon} v^\theta_{r,e} M(dr, de).
$$

Where

$$
u^\theta_r := \mathbb{E}\left(D_r \mathcal{E}_T D_\theta X_T + \mathcal{E}_T D_r D_\theta X_T / \mathcal{F}_r\right)
$$

$$
v^\theta_{r,e} := \mathbb{E}\left(D_{r,e} \mathcal{E}_T D_\theta X_T + \mathcal{E}_T D_{r,e} D_\theta X_T + D_{r,e} \mathcal{E}_T D_{r,e} D_\theta X_T / \mathcal{F}_r\right).
$$

Thus it remains to prove that

$$
\sup_{\theta \in [0,T]} \sup_{r \in [0,T]} |u^\theta_r|^p < \infty
$$

$$
\sup_{\theta \in [0,T]} \sup_{r \in [0,T], e \in \mathbb{R}} |v^\theta_{r,e}|^p < \infty.
$$

By Hölder inequality

$$
\mathbb{E}|v^\theta_{r,e}|^p = \mathbb{E}\left|D_{r,e} \mathcal{E}_T D_\theta X_T + \mathcal{E}_T D_{r,e} D_\theta X_T + D_{r,e} \mathcal{E}_T D_{r,e} D_\theta X_T / \mathcal{F}_r\right|^p
\leq 3^{p-1} \left(\mathbb{E}|D_{r,e} \mathcal{E}_T D_\theta X_T|^p + \mathbb{E}|\mathcal{E}_T D_{r,e} D_\theta X_T|^p + \mathbb{E}|D_{r,e} \mathcal{E}_T D_{r,e} D_\theta X_T|^p\right)
\leq 3^{p-1} \left(\left(\mathbb{E}|D_{r,e} \mathcal{E}_T|^{\frac{pq}{q-p}}\right)^{\frac{q-p}{q}} \left(\mathbb{E}|D_\theta X_T|^q\right)^{\frac{p}{q}} + \left(\mathbb{E}|\mathcal{E}_T|^{\frac{pq}{q-p}}\right)^{\frac{q-p}{q}} \left(\mathbb{E}|D_{r,e} D_\theta X_T|^q\right)^{\frac{p}{q}}
\right.
\left. + \left(\mathbb{E}|D_{r,e} \mathcal{E}_T|^{\frac{pq}{q-p}}\right)^{\frac{q-p}{q}} \left(\mathbb{E}|D_{r,e} D_\theta X_T|^q\right)^{\frac{p}{q}} \right).
$$

Combining (5.24) and Remark 5.1 we deduce that $\sup_{\theta \in [0,T]} \sup_{r \in [0,T], e \in \mathbb{R}} |v^\theta_{r,e}|^p < \infty$. Following the same arguments we conclude that $\sup_{\theta \in [0,T]} \sup_{r \in [0,T]} |u^\theta_r|^p < \infty$. As consequence $\mathcal{E}_T D_\theta X_T$ belongs to $M^{2,p}$. Therefore, by Theorem 5.1 we conclude

$$
\mathbb{E}|D_s Y_t - D_s Y_s|^p \leq C|t - s|^p. \quad (5.25)
$$

Now, combining (5.21) and (5.25), we finally obtain for some constant $C > 0$

$$
\mathbb{E}|Z_t - Z_s|^p = \mathbb{E}|D_s Y_t - D_s Y_s|^p \leq C|t - s|^p. \quad (5.26)
$$

We prove that $\mathbb{E}|\Gamma_t - \Gamma_s|^p \leq C|t - s|^p$. 

24
By Hölder inequality

\[
\mathbb{E} |\Gamma_t - \Gamma_s|^p = \mathbb{E} \left| \int_{E_\epsilon} \rho(e)(U_t(e) - U_s(e))\nu(de) \right|^p \\
\leq \mathbb{E} \left( \int_{E_\epsilon} |U_t(e) - U_s(e)|^p \nu(de) \right) \left( \int_{E_\epsilon} |\rho(e)|^{p \over p - 1} \nu(de) \right)^{p - 1} \\
\leq C \int_{E_\epsilon} \mathbb{E} |U_t(e) - U_s(e)|^p \nu(de) \\
= C \int_{E_\epsilon} \mathbb{E} |D_{t,e}Y_t - D_{s,e}Y_s|^p \nu(de) \\
\leq C \int_{E_\epsilon} \mathbb{E} \left[ |D_{t,e}Y_t - D_{s,e}Y_t|^p + |D_{s,e}Y_t - D_{s,e}Y_s|^p \right] \nu(de).
\]

**Step 3:** We prove that \( \mathbb{E} |D_{t,e}Y_t - D_{s,e}Y_t|^p \leq C |t-s|^{p \over 2} \).

Under assumption (5.5), (5.7) and from Lemma 6.1

\[
\mathbb{E}|D_{t,e}Y_t - D_{s,e}Y_t|^p + \mathbb{E} \left( \int_t^T |D_{t,e}Z_r - D_{s,e}Z_r|^2 \right)^{p \over 2} \\
+ \mathbb{E} \left( \int_t^T \int_{E_\epsilon} |D_{t,e}U_r(e) - D_{s,e}U_r(e)|^2 \nu(de) dt \right)^{p \over 2} \\
\leq C \mathbb{E} \left[ |D_{t,e}Z_t - D_{s,e}Z_t|^p \right] \\
+ C \mathbb{E} \left( \int_t^T |D_{t,e}f(r, Y_r, U_r) - D_{s,e}f(r, Y_r, U_r)|^2 dr \right)^{p \over 2} \\
\leq C |t-s|^{p \over 2}.
\]

(5.27)

**Step 4:** We prove that \( \mathbb{E} |D_{s,e}Y_t - D_{s,e}Y_s|^p \leq C |t-s|^{p \over 2} \).

We can write BSDE (5.17) as:

\[
D_{\theta,e}Y_t = G(X_T)D_{\theta,e}X_T + \int_t^T \alpha_{\theta,r} \left[ D_{\theta,e}X_r + D_{\theta,e}Y_r + D_{\theta,e}\Gamma_r \right] dr - \int_t^T D_{\theta,e}Z_r dW_s \\
- \int_t^T \int_{E_\epsilon} D_{\theta,e}U_r(e) \tilde{M}(dr, de),
\]

where

\[
G(X_T) := \frac{g(X_T + D_{\theta,e}X_T) - g(X_T)}{D_{\theta,e}X_T} 1_{\{D_{\theta,e}X_T \neq 0\}} \\
\alpha_{\theta,r} := \frac{f(\Theta_r + D_{\theta,e}\Theta) - f(\Theta_r)}{D_{\theta,e}X_r + D_{\theta,e}Y_r + D_{\theta,e}\Gamma_r} 1_{\{D_{\theta,e}X_r + D_{\theta,e}Y_r + D_{\theta,e}\Gamma_r \neq 0\}}.
\]

Then, from Lipschitz continuity of \( f \), we have \( \sup_{0 \leq t \leq T} \mathbb{E}|\alpha_{\theta,t}|^p < \infty \). It remain to show
that $\mathcal{E}_T D_{\theta,e} X_T$ belongs to $M^{2,p}$. In fact, by Clark-Ocone formula applied to $\mathcal{E}_T D_{\theta,e} X_T$:

$$\mathcal{E}_T D_{\theta,e} X_T = \mathbb{E}(\mathcal{E}_T D_{\theta,e} X_T) + \int_0^T \mathbb{E}\left(D_r(\mathcal{E}_T D_{\theta,e} X_T)/\mathcal{F}_r\right)dW_r$$

$$+ \int_0^T \int_{E_r} \mathbb{E}\left(D_{r,e}(\mathcal{E}_T D_{\theta,e} X_T)/\mathcal{F}_r\right) M(dr,de)$$

$$= \mathbb{E}(\mathcal{E}_T D_{\theta,e} X_T) + \int_0^T \tilde{u}_r^\theta dW_r + \int_0^T \int_{E_r} \tilde{v}_{r,e}^\theta M(dr,de),$$

with

$$\tilde{u}_r^\theta := \mathbb{E}\left(D_r \mathcal{E}_T D_{\theta,e} X_T + \mathcal{E}_T D_r D_{\theta,e} X_T/\mathcal{F}_r\right)$$

$$\tilde{v}_{r,e}^\theta := \mathbb{E}\left(D_{r,e} \mathcal{E}_T D_{\theta,e} X_T + \mathcal{E}_T D_{r,e} D_{\theta,e} X_T + D_{r,e} \mathcal{E}_T D_{r,e} D_{\theta,e} X_T/\mathcal{F}_r\right).$$

Following the same argument as Step 2 and using Remark (5.1) we prove that

$$\sup_{\theta \in [0,T], e \in \mathbb{R}} \mathbb{E}\left(|\tilde{u}_r^\theta|^p + |\tilde{v}_{r,e}^\theta|^p\right) < \infty.$$ 

Therefore, $\mathcal{E}_T D_{\theta,e} X_T$ belongs to $M^{2,p}$. Finally, we apply once again the result of Theorem 5.1 to BSDE (5.28) we get:

$$\mathbb{E}|D_{s,e} Y_t - D_{s,e} Y_s| \leq C|t - s|^{\frac{p}{2}}.$$ (5.29)

The result then follows.

We now complete the proof of Section 3

Proof of Theorem 4.2  We adapt the proof of Theorem 5.2 in [19].

Let $i = n - 1, \ldots, 1, 0.$

Step 1. : We show that $\mathbb{E}\left[\sup_{0 \leq t \leq n} |\delta Z_{t_i}^\pi|^p\right] \leq C|\pi|^{p-1}$.

Denote

$$\delta Z_{t_i}^\pi = Z_{t_i} - Z_{t_i}^\pi.$$ 

Combining (4.8) and (4.10)

$$|\delta Z_{t_i}^\pi| \leq \left| \mathbb{E}\left[\mathcal{E}_{t_i,T} \partial_x g(X_T^\pi) D_{t_i} X_T^\pi - \mathcal{E}_{t_i+1,T} \partial_x g(X_T^\pi) D_{t_i} X_T^\pi / \mathcal{F}_{t_i}\right] \right|$$

$$= \left| \mathbb{E}\left[\mathcal{E}_{t_i,T} \left(\partial_x g(X_T^\pi) - \partial_x g(X_T^\pi)\right) D_{t_i} X_T^\pi + \partial_x g(X_T^\pi) \left[D_{t_i} X_T^\pi - D_{t_i} X_T^\pi\right]\right] \right. + \partial_x g(X_T^\pi) D_{t_i} X_T^\pi \left[\mathcal{E}_{t_i,T} - \mathcal{E}_{t_i,T}^\pi\right] |\mathcal{F}_{t_i}|.$$
From Lemma 4.1, inequality (4.6) and Assumption (A2)

\[
\mathbb{E} \sup_{0 \leq t \leq n} |\delta Z_P^t|^p \leq \left[ \mathbb{E} \left( \sup_{0 \leq t \leq n} D_t X_T^\pi \right)^{p-1} \right]^{p-1} \left[ \mathbb{E} \left( \partial_x g(X_T^\pi) - \partial_x g(X_T^\pi) \right)^p \right] + \left[ \mathbb{E} \left( \partial_x g(X_T^\pi) \right)^{p-1} \right] \left[ \mathbb{E} \left( \sup_{0 \leq t \leq n} |D_t X_T^\pi - D_t X_T^\pi|^p \right) \right] + \mathbb{E} \left( \sup_{0 \leq t \leq n} \mathbb{E} \left[ \partial_x g(X_T^\pi) D_t X_T^\pi (\mathcal{E}_{t_i,T} - \mathcal{E}_{t_i,T}^\pi) / \mathcal{F}_{t_i} \right] \right) \leq C_p \left( \pi^{p/2} + \mathbb{E} \sup_{0 \leq t \leq n} |I_i|^p \right).
\]

Using the fact that $|e^x - e^y| \leq (e^x + e^y)|x - y|$, leads to

\[
I_i \leq C \mathbb{E} \left\{ D_t X_T^\pi \mathcal{E}_{t_i,T} + \mathcal{E}_{t_i+1,t_n} \right\} \times \left[ \int_{t_i}^{T} f_2(r) - \frac{1}{2} \int_{E_\epsilon} [f_3(r)]^2 \rho^2(e)m(de) dr + \int_{t_i}^{T} \int_{E_\epsilon} f_3(r) \rho(e) \tilde{M} (de, dr) - \sum_{k=i+1}^{n-1} \int_{t_k}^{t_{k+1}} f_3(r) \rho(e) \tilde{M} (de, dr) - \sum_{k=i+1}^{n-1} \int_{t_k}^{t_{k+1}} f_2(r) + \frac{1}{2} \int_{E_\epsilon} [f_3(r)]^2 \rho^2(e)m(de) dr \right] / \mathcal{F}_{t_i} \right\}
\]

It follows that

\[
I_i \leq C \mathbb{E} \left\{ D_t X_T^\pi \left( \mathcal{E}_{t_i,T} + \mathcal{E}_{t_i+1,t_n} \right) \right\} \times \left[ \int_{t_i}^{t_{i+1}} f_2(r) - \frac{1}{2} \int_{E_\epsilon} [f_3(r)]^2 \rho^2(e)m(de) dr + \int_{t_i}^{t_{i+1}} \int_{E_\epsilon} f_3(r) \rho(e) \tilde{M} (de, dr) \right] / \mathcal{F}_{t_i} \right\}.
\]

From Assumption (A.3), we have

\[
|D_t X_T^\pi \mathcal{E}_{t_i,T}| \leq |D_t X_T^\pi|^p \exp \left\{ \int_{t_i}^{T} f_2(u) du - \frac{1}{2} \int_{t_i}^{T} \int_{E_\epsilon} f_3(u) \rho^2(e)m(de) du \right\} + \int_{t_i}^{T} \int_{E_\epsilon} f_3(u) \rho(e) \tilde{M} (de, du) \leq C \left( \sup_{0 \leq u \leq T} |D_\theta X_T^\pi| \right) \left( \sup_{0 \leq u \leq T} \exp \left\{ \int_{t}^{T} \int_{E_\epsilon} f_3(t) \rho(e) \tilde{M} (de, du) \right\} \right).
\]

Similarly, we have:

\[
|D_t X_T^\pi \mathcal{E}_{t_i+1,t_n}| \leq C \left( \sup_{0 \leq u \leq T} |D_\theta X_T^\pi| \right) \left( \sup_{0 \leq u \leq T} \exp \left\{ \int_{t}^{T} \int_{E_\epsilon} f_3(t) \rho(e) \tilde{M} (de, du) \right\} \right).
\]
From other side, for any \( r \geq 0 \), we have by Hölder inequality and Proposition 5.1:

\[
E \left( \sup_{0 \leq t \leq T} \exp \left( \int_t^T \int_{E_\varepsilon} f_3(r) \rho(e) \tilde{M}(de, dr) \right) \right)^r \\
\leq E \left( \exp \left\{ 2r \int_0^T \int_{E_\varepsilon} f_3(r) \rho(e) \tilde{M}(de, dr) \right\} \right)^{\frac{r}{2}} \\
\times E \left( \sup_{0 \leq t \leq T} \exp \left\{ -2r \int_0^t \int_{E_\varepsilon} f_3(r) \rho(e) \tilde{M}(de, dr) \right\} \right)^{\frac{r}{2}} \\
\leq E \left( \exp \left\{ r^2 \int_0^T \int_{E_\varepsilon} f_3(r) \rho^2(e) m(de) dr \right\} \right) \\
\times E \left( \sup_{0 \leq t \leq T} \exp \left\{ -2r \int_0^t \int_{E_\varepsilon} f_3(r) \rho(e) \tilde{M}(de, dr) \right\} \right)^{\frac{r}{2}} \\
< \infty.
\]

Thus, for \( p' \in (p, \frac{q}{2}) \)

\[
E \sup_{0 \leq i \leq n-1} P_{i}^p \leq C E \left( \sup_{0 \leq t \leq T} |D_tX_T^\pi| \right)^2 \left( \sup_{0 \leq t \leq T} \exp \left\{ \int_t^T \int_{E_\varepsilon} f_3(t) \rho(e) \tilde{M}(de, du) \right\} \right)^p \\
\times \left[ \sup_{0 \leq i \leq n-1} \int_{t_i}^{t_{i+1}} |f_2(r)| dr + \frac{1}{2} \sup_{0 \leq i \leq n-1} \int_{t_i}^{t_{i+1}} \int_{E_\varepsilon} [f_3(r)]^2 \rho^2(e) m(de) dr \\
+ \sup_{0 \leq i \leq n-1} \int_{t_i}^{t_{i+1}} \int_{E_\varepsilon} f_3(r) \rho(e) \tilde{M}(de, dr) \right]^p \\
\leq C \left[ E \left( \sup_{0 \leq t \leq T} |D_tX_T^\pi| \right)^{\frac{2p'}{p'}} \right]^{\frac{p'}{2(p'-p)}} \\
\times E \left( \sup_{0 \leq t \leq T} \exp \left\{ \int_t^T \int_{E_\varepsilon} f_3(t) \rho(e) \tilde{M}(de, du) \right\} \right)^{\frac{2p'}{p'-p}} \\
\times \left[ \sup_{0 \leq i \leq n-1} \left( \int_{t_i}^{t_{i+1}} |f_2(r)| dr \right)^{p'} \\
+ E \sup_{0 \leq i \leq n-1} \left( \int_{t_i}^{t_{i+1}} \int_{E_\varepsilon} [f_3(r)]^2 \rho^2(e) m(de) dr \right)^{p'} \\
+ E \sup_{0 \leq i \leq n-1} \left( \int_{t_i}^{t_{i+1}} \int_{E_\varepsilon} f_3(r) \rho(e) \tilde{M}(de, dr) \right)^{p'} \right]^{\frac{p'}{p'-p}} \\
\leq C \left[ I_1 + I_2 + I_3 \right]^{\frac{p}{p'}}.
\]
We first estimate $I_3$.

By Holder inequality for $r > 1$, Jensen inequality and Burkholder-Davis-Gundy inequality:

$$ I_3^p = \left[ \mathbb{E} \sup_{0 \leq i \leq n-1} \left| \int_{t_i}^{t_{i+1}} \int_{E \varepsilon} f_3(r) \rho(e) \bar{M}(de, dr) \right|^r \right]^{\frac{p}{r}} $$

$$ \leq \mathbb{E} \left( \sum_{0 \leq i \leq n-1} \left| \int_{t_i}^{t_{i+1}} \int_{E \varepsilon} f_3(r) \rho(e) \bar{M}(de, dr) \right|^r \right)^{\frac{p}{r}} $$

$$ \leq C \left( \sum_{0 \leq i \leq n-1} \mathbb{E} \left| \int_{t_i}^{t_{i+1}} \int_{E \varepsilon} [f_3(r)]^2 \rho^2(e) m(de) dr \right|^r \right)^{\frac{p}{r}} $$

$$ \leq C|\pi|^{\frac{p}{2} - \frac{p}{rp'}}. $$

For $\pi$ small enough, we take $r = \frac{2 \log \frac{1}{|\pi|}}{p'},$ then

$$ I_3^p \leq C|\pi|^{\frac{p}{2} - \frac{p}{2 \log \frac{1}{|\pi|}}}.$$

And

$$ \mathbb{E} [I_1 + I_2]^p \leq C|\pi|^p. $$

Consequently,

$$ \mathbb{E} \sup_{0 \leq i \leq n} |\delta Z^\pi_{t_i}|^p \leq C|\pi|^{\frac{p}{2} - \frac{p}{2 \log \frac{1}{|\pi|}}}. \quad (5.30) $$

**Step 2.** We show that

$$ \mathbb{E} \sup_{0 \leq i \leq n} |\delta \Gamma^\pi_{t_i}|^p \leq C|\pi|^{p-1}, $$

where $\delta \Gamma^\pi_{t_i} = \Gamma_{t_i} - \Gamma^\pi_{t_i}$. In fact,

$$ \mathbb{E} \sup_{0 \leq i \leq n} |\delta \Gamma^\pi_{t_i}|^p = \mathbb{E} \sup_{0 \leq i \leq n} \left| \int_{E \varepsilon} \rho(e) \delta U_{t_i, e}^\pi \nu(de) \right|^p $$

$$ \leq C \mathbb{E} \sup_{0 \leq i \leq n} \int_{E \varepsilon} \rho^p(e) |\delta U_{t_i, e}^\pi| \nu(de) $$

$$ \leq C \mathbb{E} \sup_{0 \leq i \leq n} |\delta U_{t_i, e}^\pi|^p $$

However, following exactly the same arguments as **Step 1**, we can prove that:

$$ \mathbb{E} \sup_{0 \leq i \leq n} |\delta U_{t_i, e}^\pi|^p \leq C|\pi|^{\frac{p}{2} - \frac{p}{2 \log \frac{1}{|\pi|}}}, $$

and that

$$ \mathbb{E} \sup_{0 \leq i \leq n} |\delta \Gamma_{t_i}|^p \leq C|\pi|^{\frac{p}{2} - \frac{p}{2 \log \frac{1}{|\pi|}}}. \quad (5.31) $$
Step 3.: We show that

$$\mathbb{E} \sup_{0 \leq i \leq n} |\delta Y_{t_i}^\pi|^p \leq C|\pi|^{p-1}. $$

We have

$$Y_{t_i}^\pi = \mathbb{E} \left( g(X_{t_i}^\pi) + \sum_{k=i+1}^{n-1} f(\Theta_{t_{k+1}}^\pi) \Delta t_k / \mathcal{F}_{t_i} \right),$$

$$Y_{t_i}^\varepsilon = \mathbb{E} \left( g(X_{t_i}^\varepsilon) + \sum_{k=i+1}^{n-1} f(\Theta_{t_{k+1}}^\varepsilon) \Delta t_k / \mathcal{F}_{t_i} \right).$$

Hence by adapted again the argument of [19] to our setting, we have for $i = n-1, n-2, \ldots, 0$.

$$|\delta Y_{t_i}^\pi| \leq \mathbb{E} \left( \sum_{k=i+1}^{n-1} |f(\Theta_{t_{k+1}}^\pi) - f(\Theta_{t_{k+1}}^\varepsilon)| \Delta t_k + |R_{t_i}^\pi| + |\delta g^\pi(X_{t_i}^\pi)| / \mathcal{F}_{t_i} \right)$$

where $|\delta g^\pi(X_{t_i}^\varepsilon)| = |g(X_{t_i}^\varepsilon) - g(X_{t_i}^\pi)|$ and

$$|R_{t_i}^\pi| = \left| \int_t^T f(\Theta_{t_i}^\pi) dr - \sum_{k=i+1}^{n-1} f(\Theta_{t_{k+1}}^\pi) \Delta t_k \right|.$$ 

For $j = n-1, n-2, \ldots, i$

$$|\delta Y_{t_j}^\pi| \leq \mathbb{E} \left( \sum_{k=i+1}^{n-1} |f(\Theta_{t_{k+1}}^\pi) - f(\Theta_{t_{k+1}}^\varepsilon)| \Delta t_k + \sup_{0 \leq t \leq T} |R_{t_i}^\pi| + |\delta g^\pi(X_{t_i}^\pi)| / \mathcal{F}_{t_j} \right)$$

Since we know from [19] that $\mathbb{E} \sup_{0 \leq t \leq T} |R_{t_i}^\pi|^p \leq C|\pi|^{p}$, combining this with standard estimate of $\delta X^\pi$ and Lipschitz property of the generator $f$ we have:

$$\mathbb{E} \sup_{0 \leq j \leq n} |\delta Y_{t_j}^\pi|^p$$

$$\leq C \mathbb{E} \left[ \left( \sum_{k=i+1}^{n-1} |f(\Theta_{t_{k+1}}^\pi) - f(\Theta_{t_{k+1}}^\varepsilon)| \Delta t_k \right)^p + \sup_{0 \leq t \leq T} |R_{t_i}^\pi|^p + |\delta g^\pi(X_T)|^p \right]$$

$$\leq C \mathbb{E} \left[ \left( \sum_{k=i+1}^{n} |\delta X_{t_k}^\pi| \Delta t_k \right)^p + \left( \sum_{k=i+1}^{n} |\delta Y_{t_k}^\pi| \Delta t_k \right)^p + \left( \sum_{k=i+1}^{n} |\delta \Gamma_{t_k}^\pi| \Delta t_k \right)^p + \sup_{0 \leq t \leq T} |R_{t_i}^\pi|^p + |\delta g^\pi(X_T)|^p \right]$$

$$\leq C \left\{ (T - t_i)^p \mathbb{E} \sup_{i+1 \leq k \leq T} |\delta Y_{t_k}^\pi|^p + \left( |\pi|^p \frac{1}{2l_{(i+1)}} + |\pi|^{p/2} \right) \right\}$$

Using similar recursive methods of Theorem 4.2 in [19] we get estimate:

$$\mathbb{E} \sup_{0 \leq j \leq n} |\delta Y_{t_j}^\pi|^p \leq C_p |\pi|^{p - \frac{p}{2l_{(i+1)}}. (5.32)}$$
Finally, combining (5.30)-(5.31) and (5.32) we close this proof.

\[ \square \]

**Proof.** of Theorem 4.3.

For any \( i = n - 1, n - 2, \ldots, 0 \). Observing that

\[
\max_{0 \leq i \leq n} \sup_{t \in [t_i, t_{i+1}]} \mathbb{E} \left[ |Y_t^\varepsilon - Y_t^{\pi}|^2 \right] \leq C \max_{0 \leq i \leq n} \sup_{t \in [t_i, t_{i+1}]} \mathbb{E} \left[ |Y_t^\varepsilon - Y_t|^2 + |Y_t - Y_t^\varepsilon|^2 + |Y_t - Y_t^{\pi}|^2 \right].
\]

Combining (2.10), (4.14) with Corollary 2.7 applied to our setting, we have:

\[
\max_{0 \leq i \leq n} \sup_{t \in [t_i, t_{i+1}]} \mathbb{E} \left[ |Y_t^\varepsilon - Y_t^{\pi}|^2 \right] \leq C \left( \sigma(\varepsilon)^2 + |\pi| \frac{1}{\log |\pi|} \right). \tag{5.33}
\]

Combining (2.10) and (5.30) we obtain

\[
\mathbb{E} \left[ \int_0^T V_r dR_r - \sum_{i=0}^{n-1} Z_{t_i}^{\pi} \Delta W_{t_i} \right]^2 \leq C \left( \mathbb{E} \left| \int_0^T V_r dR_r - \int_0^T Z_r^{\pi} dW_r \right|^2 + \mathbb{E} \sum_{i=0}^{n-1} \int_{t_i}^{t_{i+1}} \left| Z_r^{\varepsilon} - Z_r^{\pi} \right| dW_r \right)^2 \leq C \left( \sigma(\varepsilon)^2 + |\pi| \frac{1}{\log |\pi|} \right). \tag{5.34}
\]

Arguing as above, we obtain

\[
\sum_{i=0}^{n-1} \int_{t_i}^{t_{i+1}} \mathbb{E} |\Gamma_r - \Gamma_r^{\pi}|^2 dt \leq \sum_{i=0}^{n-1} \int_{t_i}^{t_{i+1}} \mathbb{E} \left[ |\Gamma_r - \Gamma_r^{\varepsilon}|^2 + |\Gamma_r^{\varepsilon} - \Gamma_r^{\pi}|^2 + |\Gamma_r^{\varepsilon} - \Gamma_r^{\pi}|^2 \right] dt.
\]

From (2.10), (5.31) and (5.32) we have:

\[
\sum_{i=0}^{n-1} \int_{t_i}^{t_{i+1}} \mathbb{E} |\Gamma_r - \Gamma_r^{\pi}|^2 dt \leq \int_0^T \mathbb{E} \left[ |\Gamma_r - \Gamma_r^{e}|^2 \right] dr + C |\pi| \frac{1}{\log |\pi|} \leq C \left( \int_0^T \int_{E_r} \mathbb{E}|V_r - U_r^{\varepsilon}(e)|^2 m(de)dr + \int_0^T \int_{E_r} \mathbb{E}|V_r|^2 m(de)dr \right) \left[ \Gamma_r - \Gamma_r^{\pi} \right] \leq C \left( \sigma(\varepsilon)^2 + |\pi| \frac{1}{\log |\pi|} \right). \tag{5.35}
\]

Combining (5.33), (5.34) and (5.35) we get the required results.

\[ \square \]
6 Appendix: A priori estimates

Proof. of Lemma 4.1

By Jensen inequality

\[ \sup_{\theta \leq s \leq t} \| D_\theta X^\pi_{t} \|^2p \leq \| X^\pi_{s} \|^2p \] \[ + \sup_{s \leq \theta \leq t} \left( \sup_{s \leq \theta \leq t} \| D_\theta X^\pi_{\theta} \|^2p \right) \leq 3^{2p-1} \sup_{\theta \leq s \leq t} \left( \sup_{s \leq \theta \leq t} \| D_\theta X^\pi_{\theta} \|^2p \right) \]

Taking expectation in both hand side and using H"older inequality, we obtain:

\[ \mathbb{E} \left[ \sup_{\theta \leq s \leq t} \| D_\theta X^\pi_{t} \|^2p \right] \leq C_p \left( \mathbb{E} \left[ \int_{t}^{T} \| D_\theta X^\pi_{\theta} \|^2p \, dr \right] + \mathbb{E} \left[ \int_{0}^{T} \| D_\theta X^\pi_{\theta} \|^2p \, dr \right] \right) \leq C \left( \mathbb{E} \left[ \int_{t}^{T} \| D_\theta X^\pi_{\theta} \|^2p \, dr \right] + B \right)

where \( B := \mathbb{E} \left[ \sup_{0 \leq s \leq T} \| \beta(X^\pi_{s}) \|^2p \right] \). Since the constant \( C \) doesn’t depends on \( \theta \) and \( n \), we conclude by Gronwall lemma that \( \mathbb{E} \left[ \sup_{\theta \leq t \leq T} \| D_\theta X^\pi_{t} \|^2p \right] \) is bounded and therefore \( \sup_{0 \leq \theta \leq T} \sup_{n \geq 1} \mathbb{E} \left[ \sup_{\theta \leq t \leq T} \| D_\theta X^\pi_{t} \|^2p \right] \) is finite.

By the same arguments, we prove that

\[ \sup_{0 \leq \theta \leq T} \sup_{n \geq 1} \mathbb{E} \left[ \sup_{\theta \leq t \leq T} \| D_{\theta \epsilon} X^\pi_{t} \|^2p \right] < \infty. \]

\[ \square \]

Lemma 6.1 Let \( \xi \in L^q(\Omega) \), \( f : \Omega \times [0, T] \times \mathbb{R} \to \mathbb{R} \) be \( \mathcal{P} \times \mathcal{B} \times \mathcal{B}(L^2(\mathcal{E}, \nu; \mathbb{R})) \) measurable, satisfies \( \mathbb{E} \int_{0}^{T} |f(t, 0, 0)|^2 \, dt < \infty \) and uniformly Lipschitz w.r.t \( (y, z) \), such that, for some constant \( K > 0 \) we have:

\[ |f(t, y_1, u_1) - f(t, y_2, u_2)| \leq K (|y_1 - y_2| + |u_1 - u_2|), \]

for all \( y_1, y_2, \in \mathbb{R} \) and \( u_1, u_2 \in L^2(\mathcal{E}, \nu; \mathbb{R}) \).

Then, there exist a unique triple \((Y, Z, U) \in \mathcal{B}^2 \) solution to BSDEs (1.3). Moreover, For \( q \geq 2 \), we have the following a priori estimate:

\[ \mathbb{E} \left[ \sup_{0 \leq t \leq T} |Y_t|^q \right] + \mathbb{E} \left( \int_{0}^{T} |Z_t|^2 \right)^{\frac{q}{2}} + \mathbb{E} \left( \int_{0}^{T} \int_{E} |U_t(e)|^q \nu(de) \, dt \right) \leq C \left( \mathbb{E} |\xi|^q + \mathbb{E} \left( \int_{0}^{T} |f(t, 0, 0)|^2 \, dt \right)^{\frac{q}{2}} \right). \] (6.1)
Proof. Existence and uniqueness of solution of BSDEs with jump are proved in [4] and the estimate (6.1) is a direct consequence of proposition 2.2 in the same reference, with \((f', Q') = (0, 0)\).
