EXISTENCE OF MINIMIZERS FOR THE REIFENBERG PLATEAU PROBLEM

YANGQIN FANG

ABSTRACT. That is, given a compact set $B \subset \mathbb{R}^n$ (the boundary) and a subgroup $L$ of the Čech homology group $\tilde{H}_{d-1}(B; G)$ of dimension $d$ over some commutative group $G$, we find a compact set $E \supset B$ such that the image of $L$ by the natural map $\tilde{H}_{d-1}(B; G) \to \tilde{H}_{d-1}(S; G)$ induced by the inclusion $B \to E$, is reduced to $\{0\}$, and such that the Hausdorff measure $\mathcal{H}^d(E \setminus B)$ is minimal under these constraints. Thus we have no restriction on the group $G$ or the dimensions $0 < d < n$.

1. INTRODUCTION

Plateau problems usually concern the existence of surfaces that minimize an area under some boundary constraints, but many different meanings can be given to the terms “surface” and “area”, and many different boundary constraints can be considered.

In the present text, we shall prove an existence result for a minor variant of the homological Plateau problem considered by Reifenberg [18]. That is, we shall give ourselves dimensions $0 < d < n$, a compact set $B \subset \mathbb{R}^n$, a commutative group $G$, and a subgroup $L$ of the Čech homology group $\tilde{H}_{d-1}(B; G)$, and we shall find a compact set $E \supset B$ that minimizes the Hausdorff measure $\mathcal{H}^d(E \setminus B)$ under the constraint that the restriction to $L$ of the natural map $\tilde{H}_{d-1}(B; G) \to \tilde{H}_{d-1}(S; G)$ induced by the inclusion $B \to E$, is trivial. See the slightly more precise definitions below.

This problem was first studied by Reifenberg [18], who gave a general existence result when the group $G$ is compact.

Also, Almgren [1] announced an extension of Reifenberg’s result, obtained in connection to varifolds, and where the Hausdorff measure $\mathcal{H}^d$ is no longer necessarily minimized alone, but integrated against an elliptic integrand.

More recently, De Pauw [16] proved the existence of minimizers also when $G = \mathbb{Z}$ is the group of integers, $n = 3$, $d = 2$, and $B$ is a nice curve.

Here we remove these restrictions, and also use a quite different method of proof, based on a construction of quasiminimal sets introduced by Feuvrier [12].
Let us introduce some notation and definitions, and then we will rapidly discuss our main result and its background. When $B \subset \mathbb{R}^n$ is a compact set, $G$ is a commutative group, and $k \geq 0$ is an integer, we shall denote by $H_k(B; G)$ and $\check{H}_k(B; G)$ the singular and Čech homology groups on $B$, of order $k$ and with the group $G$; we refer to [8] for a definition and basic properties.

If $S$ is another compact set that contains $B$, we shall denote by $i_{B,S} : B \to S$ the natural inclusion, by $H_k(i_{B,S}) : H_k(B; G) \to H_k(S; G)$ the corresponding homomorphism between homology groups, and by $\check{H}_k(i_{B,S}) : \check{H}_k(B; G) \to \check{H}_k(S; G)$ the corresponding homomorphism between Čech homology groups.

**Definition 1.1.** Fix a compact set $B \subset \mathbb{R}^n$, an integer $0 < d < n$, a commutative group $G$, and a subgroup $L$ of $\check{H}_{d-1}(B; G)$. We say that the compact set $S \supset B$ spans $L$ in Čech homology if $L \subset \ker \check{H}_{d-1}(i_{B,S})$.

A simple case is when $L$ is the full group $\check{H}_d(B; G)$; then $S \supset B$ spans $L$ in Čech homology precisely when the mapping $H_d(i_{B,S})$ is trivial. But it may be interesting to study other other subgroups $L$, and this will not make the proofs any harder.

We have a similar definition of “$S \supset B$ spans $L$ in singular homology”, where we just replace $\check{H}_{d-1}(i_{B,S})$ with $H_{d-1}(i_{B,S})$. It would be very nice if our main statement was in terms of singular homology, but unfortunately we cannot prove the corresponding statement at this time.

We shall denote by $H^d(E)$ the $d$-dimensional Hausdorff measure of the Borel set $E \subset \mathbb{R}^n$. Recall that

$$H^d(E) = \lim_{\delta \to 0^+} H^d_\delta(E),$$

where

$$H^d_\delta(E) = \inf \left\{ \sum \text{diam}(U_j)^d \left| E \subset \bigcup_j U_j, \text{diam}(U_j) < \delta \right. \right\},$$

i.e., the infimum is over all the coverings of $E$ by a countable collection of sets $U_j$ with diameters less than $\delta$. We refer to [9, 14] for the basic properties of $H^d$; notice incidentally that we could also have used the spherical Hausdorff measure, or even some more exotic variants, essentially because the competition will rather fast be restricted to rectifiable sets, for which the two measures are equal.

For our main result, we are given $B \subset \mathbb{R}^n$, $d \in (0, n)$, $G$, and a subgroup $L$ of $H_{d-1}(B; G)$, and we set

$$\mathcal{F} = \mathcal{F}(B, G, L) = \left\{ S \subset \mathbb{R}^n \left| \begin{array}{c} S \text{ is a compact set that contains } B \\ \text{and spans } L \text{ in Čech homology} \end{array} \right. \right\}$$
For any set which cannot be mapped into any Lipschitz map functions $h$, we can easily check that all elliptic integrands and all continuous introduced elliptic integrands in the papers [2, p.423] and [1, p.322].

We set $\mathcal{F}_\kappa(E) = \kappa \mathcal{H}^d(E_{\text{irr}}) + \int_{x \in E} F(x, T_x E_{\text{rec}}) d\mathcal{H}^d(x)$.

We shall define a class of integrands $\bar{\mathcal{F}}$, that are integrands $F$ satisfying the following properties: For all $x \in \mathbb{R}^n$, $\delta > 0$, there exists $\varepsilon(x, \cdot) : \mathbb{R}^+ \to \mathbb{R}^+$ with $\lim_{r \to 0} \varepsilon(x, r) = 0$ such that for all $\pi \in G(n, d)$,

$$\mathcal{F}_\kappa(D_{\pi,r}) \leq \mathcal{F}_\kappa(S) + \varepsilon(x, r)^d,$$

where $0 < r < \delta$, $D_{\pi,r} = \pi \cap B(x, r)$, $S \subset \overline{B(x, r)}$ is a compact $d$-rectifiable set which cannot be mapped into $\partial D_{\pi,r} := \pi \cap \partial B(x, r)$ by any Lipschitz map $\varphi : \mathbb{R}^n \to \mathbb{R}^n$ with $\varphi|_{\partial D_{\pi,r}} = \text{id}_{\partial D_{\pi,r}}$.

It is easy to see that the class $\bar{\mathcal{F}}$ does not depend on $\kappa$. Almgren introduced elliptic integrands in the papers [2, p.423] and [1, p.322]. One can easily check that all elliptic integrands and all continuous functions $h : \mathbb{R}^n \to [a, b]$ with $0 < a < b < +\infty$ are contained in the class $\bar{\mathcal{F}}$.

We set

$$m = m(B, G, L, F, \kappa) = \inf \{ \mathcal{F}_\kappa(S \setminus B) : S \in \mathcal{F}(B, G, L) \}.$$

As the reader may have guessed, we want to find $E \in \mathcal{F}$ such that $\mathcal{F}_\kappa(S \setminus B) = m$. Of course the problem will only be interesting when $m < +\infty$, which is usually fairly easy to arrange. We subtracted $B$ because this way we shall not need to assume that $\mathcal{H}^d(B) < +\infty$, but of course if $\mathcal{H}^d(B) < +\infty$ we could replace $\mathcal{F}_\kappa(S \setminus B)$ with $\mathcal{F}_\kappa(S)$ in the definition. Our theorem is thus the following.

**Theorem 1.2.** Let the compact set $B \subset \mathbb{R}^n$, a commutative group $G$, and a subgroup $L$ of $H_{d-1}(B; G)$ be given. Suppose that $m(B, G, L, F, \kappa) < +\infty$. Then there exists a compact set $E \in \mathcal{F}(B, G, L)$ such that $\mathcal{F}_\kappa(E \setminus B) = m(B, G, L, F, \kappa)$.

Notice that the statement is still true when $m = +\infty$, but not interesting.
As was mentioned before, this theorem was proved by Reifenberg in [18], under the additional assumption that $G$ be compact.

A slightly unfortunate feature of both statements is that they use the Čech homology groups. A similar statement with the singular homology groups would be very welcome, both because they are simpler and because connections with the theories of flat chains and currents would be much simpler. Unfortunately, singular homology does not pass to the limit as nicely as Čech homology.

Reifenberg was not the first person to give beautiful results on the Plateau Problem. Douglas [6] gave an essentially optimal existence result for the following parameterization problem: given a simple closed curve $\gamma$ in $\mathbb{R}^n$, find a surface $E$, parameterized by the closed unit disk in the plane, so that the restriction of the parameterization to the unit circle parameterizes $\gamma$, and for which the area (computed with the Jacobian and counting multiplicity) is minimal.

But the most popular way to state and prove existence results for the Plateau problem has been through sets of finite perimeter (De Giorgi) and currents (Federer and Fleming). In particular, Federer and Fleming [10] gave a very general existence result for integral currents $S$ whose mass is minimal under the boundary constraint $\partial S = T$, where $T$ is a given integral current such that $\partial T = 0$. Mass-minimizing currents also have a very rich regularity theory; we refer to [15] for a nice overview.

In the author’s view, Reifenberg’s homological minimizers often give a better description of soap film than mass minimizers, and they are much closer to (the closed support of) size minimizing currents. Those are currents $S$ that minimize the quantity $\text{Size}(S)$ under a boundary constraint $\partial S = T$ as before, but where $\text{Size}(S)$ is, roughly speaking, the $\mathcal{H}^d$-measure of the set where the multiplicity function that defines $S$ as an integral current is nonzero. Thus the mass counts the multiplicity, but not the size. We refer to [16] for precise definitions, and a more detailed account of the Plateau problem for size minimizing currents. We shall just mention two things here, in connection to the Reifenberg problem. Figure 1 depicts the support of a current which is size minimizing, but not mass minimizing (the multiplicity on the central disk is 2, so the mass is larger than the size).

Even when the boundary current $T$ is the current of integration on a smooth (but possibly linked) curve in $\mathbb{R}^3$, there is no general existence for a size minimizing current. However, Franck Morgan proved existence of a size minimizing current [15] when the boundary is a smooth submanifold contained in the boundary of a convex body, and in [17], Thierry de Pauw and Robert Hardt proved the existence of currents which minimize energies that lie somewhere between mass and size (typically, obtained by integration of some small power of the multiplicity).
The reason why the usual proof of existence for mass minimizers, using a compactness theorem, does not work for size minimizers, is that the size of $S$ does not give any control on the multiplicity, and so the limit of a minimizing sequence may well not have finite mass (or even not exist as currents). This issue is related to the reason why Reifenberg restricted to compact groups (so that multiplicities don’t go to infinity).

In [1], F. Almgren proposed a scheme for proving Reifenberg’s theorem, and even extending it to general groups and elliptic integrands. The scheme uses the then recently discovered varifolds, or flat chains, and a multiple layers argument to get rid of high multiplicities, but it is also very subtle and elliptic. Incidentally, Almgren uses Vietoris relative homology groups $H^v_d$ instead of Čech homology groups. In his paper, a boundary $B$ is a compact $(d-1)$-rectifiable subset of $\mathbb{R}^n$ with $\mathcal{H}^{d-1}(B) < +\infty$, a surface $S$ is a compact $d$-rectifiable subset of $\mathbb{R}^n$. For any $\sigma \in H^v_d(\mathbb{R}^n, B; G)$, a surface $S$ spans $\sigma$ if $i_k(\sigma) = 0$, where we denote by $H^v_d(\mathbb{R}^n, B; G)$ the $d$-th Vietoris relative homology groups of $(\mathbb{R}^n, B)$, and

$$i_k : H^v_d(\mathbb{R}^n, B; G) \to H^v_d(\mathbb{R}^n, B \cup S; G)$$

is the homomorphism induced by the inclusion map $i : B \to B \cup S$. But we should mention that Dowker, in [7, Theorem 2a], proved that Čech and Vietoris homology groups over an abelian group $G$ are isomorphic for arbitrary topological spaces.

There is some definite relation between Reifenberg’s homological Plateau problem and the size minimizing currents, and for instance T. De Pauw [16] shows that in the simple case when $B$ is a curve, the infimums for the two problems are equal. In the same paper, T. De Pauw also extends Reifenberg’s result (for curves in $\mathbb{R}^3$) to the group $G = \mathbb{Z}$. Unfortunately, even though the proof uses minimizations among currents,
this does not yet give a size minimizer (one would need to construct an appropriate current on the minimizing set).

Our proof here is more in the spirit of the initial proof of Reifenberg, but will rely on two more recent developments that make it work more smoothly and ignore multiplicity issues.

The first development is a lemma introduced by Dal Maso, Morel, and Solimini [13] in the context of the Mumford-Shah functional, and which gives a sufficient condition, on a sequence of sets $E_k$ that converges to a limit $E$ in Hausdorff distance, for the lower semicontinuity inequality

$$\mathcal{H}^d(E) \leq \liminf_{k \to +\infty} \mathcal{H}^d(E_k).$$

It is very convenient here because we want to work with sets and we do not want to use weak limits of currents. Since we want to deal with integrands, we will show the following lower semicontinuity inequality,

$$F_{\kappa}(E) \leq \liminf_{k \to +\infty} F_{\kappa}(E_k).$$

But our main tool will be a recent result of V. Feuvrier [12], where he uses a construction of polyhedral networks adapted to a given set (think about the usual dyadic grids, but where you manage to have faces that are very often parallel to the given set) to construct a minimizing sequence for our problem, but which has the extra feature that it is composed of locally uniformly quasiminimal sets, to which we can apply Dal Maso, Morel, and Solimini’s lemma.

Such a construction was used by Xiangyu Liang, to prove existence results for sets that minimize Hausdorff measure under some homological generalization of a separation constraint (in codimension larger than 1).

2. Existence of minimizers under Reifenberg homological conditions

In this section we prove an existence theorem for sets in $\mathbb{R}^n$ that minimize the Hausdorff measure under Reifenberg homological conditions.

**Definition 2.1.** A polyhedral complex $\mathcal{S}$ is a finite set of closed convex polytopes in $\mathbb{R}^n$, such that two conditions are satisfied:

1. If $Q \in \mathcal{S}$, and $F$ is a face of $Q$, then $F \in \mathcal{S}$;
2. If $Q_1, Q_2 \in \mathcal{S}$, then $Q_1 \cap Q_2$ is a face of $Q_1$ and $Q_2$ or $Q_1 \cap Q_2 = \emptyset$.

The subset $|\mathcal{S}| := \bigcup_{Q \in \mathcal{S}} Q$ of $\mathbb{R}^n$ equipped with the induced topology is called the underlying space of $\mathcal{S}$. The $d$-skeleton of $\mathcal{S}$ is the union of the faces whose dimension is at most $d$.

A dyadic complex is a polyhedral complex consisting of closed dyadic cubes.
Let \( \Omega \subset \mathbb{R}^n \) be an open subset, \( 0 < M < +\infty \), \( 0 < \delta \leq +\infty \), \( \ell \in \mathbb{N} \), \( 0 \leq \ell \leq n \). Let \( f : \Omega \to \Omega \) be a Lipschitz map; we set
\[
W_f = \{ x \in \Omega \mid f(x) \neq x \}.
\]

**Definition 2.2.** Let \( E \) be a relatively closed set in \( \Omega \). We say that \( E \) is an \((\Omega, M, \delta)\)-quasiminimal set of dimension \( \ell \) if, \( \mathcal{H}^\ell(E \cap B) < +\infty \) for every closed ball \( B \subset \Omega \), and
\[
\mathcal{H}^\ell(E \cap W_f) \leq M \mathcal{H}^\ell(f(E \cap W_f))
\]
for every Lipschitz map \( f : \Omega \to \Omega \) such that \( W_f \cup f(W_f) \) is relatively compact in \( \Omega \) and \( \text{diam}(W \cup f(W_f)) < \delta \).

We denote by \( \text{QM}(\Omega, M, \delta, \mathcal{H}^\ell) \) the collection of all \((\Omega, M, \delta)\)-quasiminimal sets of dimension \( \ell \).

We note that, for any open set \( \Omega' \subset \Omega \), any positive numbers \( \delta' \leq \delta \), and any \( M' \geq M \), if \( E \in \text{QM}(\Omega, M, \delta, \mathcal{H}^\ell) \), then \( E \cap \Omega' \in \text{QM}(\Omega', M', \delta', \mathcal{H}^\ell) \).

**Definition 2.3.** Let \( \Omega \) be an open subset of \( \mathbb{R}^n \). A relatively closed set \( E \subset \Omega \) is said to be locally Ahlfors-regular of dimension \( d \) if there is a constant \( C > 0 \) and \( r_0 > 0 \) such that
\[
C^{-1} r^d \leq \mathcal{H}^d(E \cap B(x, r)) \leq C r^d
\]
for all \( 0 < r < r_0 \) with \( B(x, 2r) \subset \Omega \).

**Lemma 2.4.** Let \( E \) be a \( d \)-rectifiable subset of \( \mathbb{R}^n \). If \( E \) is a local Ahlfors-regular and \( \mathcal{H}^d(E) < +\infty \), then for \( \mathcal{H}^d \)-a.e. \( x \in E \), \( E \) has a true tangent plane at \( x \), i.e., there exists a \( d \)-plane \( \pi \) such that for any \( \varepsilon > 0 \), there is a \( r_\varepsilon > 0 \) such that
\[
E \cap B(x, r) \subset C(x, \pi, r, \varepsilon), \quad \text{for } 0 < r < r_\varepsilon,
\]
where
\[
C(x, \pi, r, \varepsilon) = \{ y \in B(x, r) \mid \text{dist}(y, \pi) \leq \varepsilon |y - x| \}.
\]

**Proof.** Since \( E \) is rectifiable, by Theorem 15.11 in [14], for \( \mathcal{H}^d \)-a.e. \( x \in E \), \( E \) has an approximate tangent plane \( \pi \) at \( x \), i.e.
\[
\limsup_{\rho \to 0} \frac{\mathcal{H}^d(E \cap B(x, \rho))}{\rho^d} > 0,
\]
and there exists a \( d \)-plane \( \pi \) such that for all \( \varepsilon > 0 \),
\[
\lim_{\rho \to 0} \rho^{-d} \mathcal{H}^d(E \cap B(x, \rho) \setminus C(x, \pi, \rho, \varepsilon)) = 0.
\]

We will show that \( \pi \) is a true tangent plane. Suppose not, that is, there exists an \( \varepsilon > 0 \) such that for all \( \rho > 0 \), \( E \cap B(x, \rho) \setminus C(x, \pi, \rho, \varepsilon) \neq \emptyset \). We take a sequence of points \( y_n \in E \setminus C(x, \pi, \rho, \varepsilon) \) with \( |y_n - x| \to 0 \), we put \( \rho_n = 2|y_n - x| \), then
\[
B(x, \rho_n) \setminus C(x, \pi, \rho_n, \varepsilon) \supset B\left(\frac{\varepsilon \rho_n}{4}\right)
\]
and
\[
\rho_n^{-d} \mathcal{H}^d \left( E \cap B(x, \rho_n) \setminus C \left( x, \pi, \rho_n, \frac{\varepsilon}{2} \right) \right) \geq \rho_n^{-d} \mathcal{H}^d \left( E \cap B \left( y_n, \varepsilon \rho_n, \frac{\varepsilon}{4} \right) \right) \\
\geq C^{-1} \left( \frac{\varepsilon}{4} \right)^d,
\]
this is in contradiction with (2.1), so we proved the lemma. □

Let \( \{ E_k \} \) be a sequence of closed sets in \( \Omega \), and \( E \) a closed set of \( \Omega \). We say that \( E_k \) converges to \( E \) if
\[
\lim_{k \to \infty} d_K(E, E_k) = 0
\]
for every compact set \( K \subset \Omega \), where
\[
d_K(E, E_k) = \sup \{ \text{dist}(x, E_k) \mid x \in E \cap K \} + \sup \{ \text{dist}(x, E) \mid x \in E_k \cap K \}.
\]

For any set \( E \subset \mathbb{R}^n \), we set
\[
E^* = \{ x \in E \mid \mathcal{H}^d(E \cap B(x, r)) > 0, \forall r > 0 \}.
\]
we call \( E^* \) the core of \( E \). We will prove the following lower semicontinuity properties.

**Theorem 2.5.** Let \( \Omega \subset \mathbb{R}^n \) be an open set. Let \( \{ E_k \}_{k \geq 1} \) be a sequence of quasiminimal sets in \( \text{QM}(\Omega, M, \delta, \mathcal{H}^d) \) such that \( E_k = E_k^* \) and \( E_k \) converges to \( E \). Then for any \( F \in \mathcal{F} \),
\[
\mathbb{F}(E) \leq \liminf_{k \to +\infty} \mathbb{F}(E_k).
\]

**Proof.** We may suppose that
\[
\liminf_{k \to +\infty} \mathbb{F}(E_k) < +\infty.
\]
In particular
\[
\mathcal{H}^d(E) \leq \liminf_{k \to +\infty} \mathcal{H}^d(E_k) \leq \frac{1}{\min \{ \kappa, \inf F \}} \liminf_{k \to +\infty} \mathbb{F}(E_k) < +\infty.
\]

We take \( 0 < \varepsilon < \frac{1}{2}, \varepsilon' > 0 \) and \( \rho \in (0, 1) \) such that \( M^2 3^d \varepsilon < 1, \varepsilon' < \frac{\varepsilon}{8} \) and \( 1 - (1 - \rho)^d < \frac{\varepsilon}{2} \).

Applying Theorem 4.1 in [4], we get that \( E \in \text{QM}(\Omega, M, \delta, \mathcal{H}^d) \), hence rectifiable (see [3]), then by Theorem 17.6 in [14], for \( \mathcal{H}^d \)-a.e. \( x \in E \),
\[
\lim_{r \to 0} \frac{\mathcal{H}^d(E \cap B(x, r))}{\omega_d r^d} = 1,
\]
where \( \omega_d \) denote the Hausdorff measure of \( d \)-dimensional unit ball. So we can find a set \( E' \subset E \) with \( \mathcal{H}^d(E \setminus E') = 0 \) such that for any \( x \in E' \) there exists \( r'(\varepsilon', x) > 0 \),
\[
(1 - \varepsilon') \omega_d r'^d \leq \mathcal{H}^d(E \cap B(x, r)) \leq (1 + \varepsilon') \omega_d r^d,
\]
for all \( 0 < r < r'(\varepsilon', x) \).
Then
\[ H^d(E \cap B(x, r) \setminus B(x, (1 - \rho)r)) \leq (1 + \varepsilon')(1 - \varepsilon')\omega_d(1 - \rho)^d r^d \]
\[ = \frac{(1 + \varepsilon') - (1 - \varepsilon')(1 - \rho)^d}{1 - \varepsilon'}(1 - \varepsilon')\omega_d r^d \]
\[ \leq \left( \frac{2\varepsilon'}{1 - \varepsilon'} + (1 - (1 - \rho)^d) \right) \mathcal{H}^d(E \cap B(x, r)) \]
\[ \leq \varepsilon \mathcal{H}^d(E \cap B(x, r)). \]

Since \( E \) is quasiminimal, by Proposition 4.1 in [5], we know that \( E \) is local Ahlfors regular, since \( E \) is rectifiable and \( \mathcal{H}^d(E) < +\infty \), by lemma 2.4, we have that for \( \mathcal{H}^d \)-a.e. \( x \in E \), \( E \) has a tangent plane \( T_xE \) at \( x \), so we can find \( E'' \subset E' \) with \( \mathcal{H}^d(E' \setminus E'') = 0 \) such that for all \( \varepsilon'' > 0 \) and for all \( x \in E'' \) there exists \( r''(\varepsilon'', x) > 0 \) such that for all \( 0 < r < r''(\varepsilon'', x) \),
\[ E \cap B(x, r) \subset C(x, r, \varepsilon''), \]
where
\[ C(x, r, \varepsilon'') = \left\{ y \in \overline{B(x, r)} \mid \text{dist}(y, T_xE) \leq \varepsilon'' |x - y| \right\}. \]

We consider the function \( \psi_{\rho, r} : \mathbb{R} \to \mathbb{R} \) defined by
\[ \psi_{\rho, r}(t) = \begin{cases} 0, & t \leq (1 - \rho)r \\ \frac{3}{\rho r} (t - (1 - \rho)r), & (1 - \rho)r < t \leq (1 - \frac{2\rho}{3})r \\ 1, & (1 - \frac{2\rho}{3})r < t \leq (1 - \frac{\rho}{3})r \\ -\frac{3}{\rho r} (t - r), & (1 - \frac{\rho}{3})r < t \leq r \\ 0, & t > r, \end{cases} \]
It is easy to see that \( \psi_{\rho, r} \) is a Lipschitz map with Lipschitz constant \( \frac{3}{\rho r} \).

We take the Lipschitz map \( \varphi_{x, \rho, r} : \mathbb{R}^n \to \mathbb{R}^n \) given by
\[ \varphi_{x, \rho, r}(y) = \psi_{\rho, r}(|y - x|)\Pi(y) + (1 - \psi_{\rho, r}(|y - x|))y, \]
where we denote by \( \Pi : \mathbb{R}^n \to T_xE \) the orthogonal projection. It is easy to check that
\[ \varphi_{x, \rho, r}|_{B(x, (1 - \rho)r)} = \text{id}_{B(x, (1 - \rho)r)} \]
and
\[ \varphi_{x, \rho, r}|_{B(x, r)^c} = \text{id}_{B(x, r)^c}. \]

Let \( \varepsilon'' \) and \( h \) be such that \( \varepsilon'' < \frac{\rho}{3} \) and \( 0 < \varepsilon'' < h < \frac{\rho}{3} \), and put
\[ A_h = \left\{ y \in \overline{B(x, r)} \mid \text{dist}(y, T_xE) \leq hr \right\}, \]
then \( C(x, r; \varepsilon'') \subset A_h \). We will show that
\[ \text{Lip} (\varphi_{x, \rho, r}|_{A_h}) \leq 2 + \frac{3h}{\rho}. \]
We set \( \Pi^\perp(y) = y - \Pi(y), \ y \in \mathbb{R}^n \),
then
\[
|\Pi^\perp(y)| \leq hr, \ \forall y \in A_h.
\]

For any \( y_1, y_2 \in \mathcal{A}_h \),
\[
\varphi_{x,\rho,r}(y_1) - \varphi_{x,\rho,r}(y_2) = y_1 - y_2 + \psi_{\rho,r}(|y_1 - x|) \Pi^\perp(y_1) - \psi_{\rho,r}(|y_2 - x|) \Pi^\perp(y_2)
\]
\[
= (y_1 - y_2) + \psi_{\rho,r}(|y_1 - x|) (\Pi^\perp(y_1) - \Pi^\perp(y_2))
\]
\[
+ (\psi_{\rho,r}(|y_1 - x|) - \psi_{\rho,r}(|y_2 - x|)) \Pi^\perp(y_2),
\]
thus
\[
|\varphi_{x,\rho,r}(y_1) - \varphi_{x,\rho,r}(y_2)| \leq |y_1 - y_2| + |y_1 - y_2| + \frac{3}{\rho r} ||y_1 - y_2|| rh
\]
\[
\leq \left( 2 + \frac{3h}{\rho} \right) |y_1 - y_2|,
\]
and we get that
\[
\text{Lip} (\varphi_{x,\rho,r}|_{A_h}) \leq 2 + \frac{3h}{\rho}.
\]

Since \( E_k \to E \) in \( \Omega \), and \( \overline{B(x,r)} \subset \Omega \) and
\[
E \cap \overline{B(x,r)} \subset \mathcal{C}(x,r,\varepsilon'') \subset A_h,
\]
there exist a number \( k_h \) such that for \( k \geq k_h \),
\[
E_k \cap \overline{B(x,r)} \subset A_h.
\]

Since
\[
\varphi_{x,\rho,r}|_{B(x,r)}^c = \text{id}_{B(x,r)^c}
\]
and
\[
\varphi_{x,\rho,r}(B(x,r)) \subset B(x,r),
\]
we have that
\[
\varphi_{x,\rho,r}(E_k \cap B(x,r)) = \varphi_{x,\rho,r}(E_k) \cap B(x,r).
\]
We put \( r' = (1 - \frac{\rho}{3}) r, \ r'' = (1 - \frac{2\rho}{3}) r, \ r''' = (1 - \rho)r, \ \pi = T_x E \). Note that
\[
\partial B (x, r') \cap \pi \subset \varphi_{x,\rho,r}(E_k)
\]
and
\[
\varphi_{x,\rho,r}(E_k) \cap B (x, r') \subset B (x, r'') \cup ((B(x, r') \setminus B(x, r'')) \cap \pi).
\]
We put
\[
D_{\pi,r''} = \overline{B (x, r'')} \cap \pi
\]
and
\[
S_{k,r''} = \varphi_{x,\rho,r}(E_k) \cap \overline{B (x, r'''}).
\]
EXISTENCE OF MINIMIZERS FOR THE REIFENBERG PLATEAU PROBLEM

We will show that for any Lipschitz mapping \( \varphi : \mathbb{R}^n \to \mathbb{R}^n \) which is identity on \( \partial D_{\pi,r''} \) cannot map \( S_{k,r''} \) into \( \partial D_{\pi,r''} \). Suppose not, that is, there is a Lipschitz map \( \varphi_k : \mathbb{R}^n \to \mathbb{R}^n \) such that

\[
\varphi_k |_{\partial D_{\pi,r''}} = \text{id}_{\partial D_{\pi,r''}}
\]

and

\[
\varphi_k(S_{k,r''}) \subset \partial D_{\pi,r''}.
\]

We consider the map

\[
\tilde{\varphi}_k : B(x,r')^c \cup [(B(x,r') \setminus B(x,r'')) \cap \pi] \cup B(x,r'') \to \mathbb{R}^n
\]

defined by

\[
\tilde{\varphi}_k(x) = \begin{cases} 
  x, & x \in B(x,r')^c \cup [(B(x,r') \setminus B(x,r'')) \cap \pi] \\
  \varphi_k(x), & x \in B(x,r'') 
\end{cases}
\]

It is easy check that \( \tilde{\varphi}_k \) is a Lipschitz map, by Kirszbraun’s theorem, see for example [9, 2.10.43 Kirszbraun’s theorem], we can get a Lipschitz map \( \phi_k : \mathbb{R}^n \to \mathbb{R}^n \) such that

\[
\phi_k |_{B(x,r'')} = \varphi_k |_{B(x,r'')}
\]

and

\[
\phi_k |_{B(x,r')} = \text{id}_{B(x,r')}^c,
\]

and

\[
\phi_k |_{(B(x,r') \setminus B(x,r'')) \cap \pi} = \text{id}_{(B(x,r') \setminus B(x,r'')) \cap \pi}.
\]

By the construction of \( \phi_k \), we have that

\[
\phi_k(S_{k,r''}) = \tilde{\phi}_k(S_{k,r''}) \subset \partial D_{\pi,r''}.
\]

Since

\[
\varphi_{x,\rho,r}(E_k) \cap (B(x,r') \setminus B(x,r'')) \subset (B(x,r') \setminus B(x,r'')) \cap \pi
\]

we have that

\[
\phi_k(\varphi_{x,\rho,r}(E_k) \cap B(x,r') \setminus B(x,r'')) \subset (B(x,r') \setminus B(x,r'')) \cap \pi.
\]

Thus

\[
\phi_k(\varphi_{x,\rho,r}(E_k \cap B(x,r))) = \phi_k(\varphi_{x,\rho,r}(E_k) \cap B(x,r)) \subset \varphi_{x,\rho,r}(E_k) \cap (B(x,r') \setminus B(x,r'')) \subset \varphi_{x,\rho,r}(E_k \cap B(x,r) \setminus B(x,r'')).
\]

Since \( H^d(E) < \infty \), we have that \( H^d(E \cap \partial B(x,r)) = 0 \) for almost everywhere \( r \in (0,r''(\epsilon'', x)) \), if we take any \( r \in (0,r''(\epsilon'', x)) \) with
$\mathcal{H}^d(E \cap \partial B(x, r)) = 0$ and $r < \delta$, then we have the following inequality:

$$
\mathcal{H}^d\left(E \cap \overline{B(x, r)}\right) = \mathcal{H}^d(E \cap B(x, r)) \leq \liminf_{k \to +\infty} \mathcal{H}^d(E_k \cap B(x, r)) \leq \liminf_{k \to +\infty} M \mathcal{H}^d(\phi_k \circ \varphi_{x, r}(E_k \cap B(x, r))) \leq \liminf_{k \to +\infty} M \mathcal{H}^d(\varphi_{x, r}(E_k \cap B(x, r) \setminus B(x, r''))) \leq \liminf_{k \to +\infty} M \mathcal{H}^d\left(\varphi_{x, r}(E_k \cap \overline{B(x, r)} \setminus B(x, r''))\right) \leq \limsup_{k \to +\infty} M \left(2 + \frac{3h}{\rho}\right)^d \mathcal{H}^d\left(E_k \cap \overline{B(x, r)} \setminus B(x, r'')\right) \leq M \left(2 + \frac{3h}{\rho}\right)^d \mathcal{H}^d\left(E \cap \overline{B(x, r)} \setminus B(x, r'')\right) \leq M^2 \left(2 + \frac{3h}{\rho}\right)^d \varepsilon \mathcal{H}^d\left(E \cap \overline{B(x, r)}\right) \leq M^23^d\varepsilon \mathcal{H}^d\left(E \cap \overline{B(x, r)}\right).
$$

This is a contradiction since $M^23^d\varepsilon < 1$ and $\mathcal{H}^d\left(E \cap \overline{B(x, r)}\right) > 0$.

Since $F \in \mathcal{F}$, by the definition, we have that

$$\mathbb{P}_\kappa(D_{\pi,r''}) \leq \mathbb{P}_\kappa(S_{k,r''}) + \varepsilon(x, r'')(r'')^d.$$

Since $E$ is a $d$-rectifiable set and $\mathcal{H}^d(E) < +\infty$, the function $f : E \to G(n, d)$ defined by $f(x) = T_x E$ is $\mathcal{H}^d$-measurable. By Lusin’s theorem, see for example [9, 2.3.5. Lusin’s theorem], we can find a closed set $N \subset E$ with $\mathcal{H}^d(E \setminus N) < \varepsilon$ such that $f$ restricted to $N$ is continuous. We put $E'' = (E'' \cap N)$, then $E'' \subset E$ and

$$\mathcal{H}^d(E \setminus E'') < \varepsilon,$$

by Lemma 15.18 in [14], we have that for $\mathcal{H}^d$-a.e. $x \in E''$,

$$T_x E'' = T_x N = T_x E.$$

The map $\tilde{f} : E'' \to \mathbb{R}^n \times G(n, d)$ given by $\tilde{f}(x) = (x, T_x E)$ is continuous. Since $F$ is continuous, thus the function $F \circ \tilde{f} : E'' \to \mathbb{R}$ is continuous, for any $x \in E''$, we can find $r(\varepsilon, x) > 0$ such that

$$(1 - \varepsilon)F(x, T_x E) \leq F(y, T_y E) \leq (1 + \varepsilon)F(x, T_x E),$$

for any $y \in E'' \cap B(x, r(\varepsilon, x))$. Thus, for all $0 < r < r(\varepsilon, x)$,

$$(1 - \varepsilon)\mathbb{P}_\kappa(T_x E \cap B(x, r)) \leq \mathbb{P}_\kappa(E'' \cap B(x, r)) \leq (1 + \varepsilon)\mathbb{P}_\kappa(T_x E \cap B(x, r)).$$
For any $x \in \mathbb{R}^n$, there exists $r''''(\varepsilon, x) > 0$ such that $\varepsilon(x, r) < \varepsilon$ for all $0 < r < r''''(\varepsilon, x)$. We put

$$r(x) = \min(r(\varepsilon, x), r'(\varepsilon', x), r''(\varepsilon'', x), r'''(\varepsilon, x), \delta),$$

for $x \in E''''$, then

$$\{ B(x, r) \mid x \in E'''' , 0 < r < r(x), \mathcal{H}^d(E \cap \partial B(x, r)) = 0 \}$$

is a Vitali covering of $E''''$, so we can find a countable family of balls $(B_i)_{i \in J}$ such that

$$\mathcal{H}^d\left( E'''' \setminus \bigcup_{i \in J} B_i \right) = 0,$$

and

$$\sum_{i \in J} (r_i)^d < \mathcal{H}^d(E''') + \varepsilon.$$

We choose a finite set $I \subset J$ such that

$$\mathcal{H}^d\left( E'''' \setminus \bigcup_{i \in I} B_i \right) < \varepsilon.$$

We assume that $B_i = B(x_i, r_i)$. We put

$$\varphi = \prod_{i \in I} \varphi_{x_i, r_i, r_i}.$$

Since $\varphi|_{B_i} = \varphi_{x_i, r_i, r_i}|_{B_i}$, we have that $\varphi|_{B(x_i, r_i''''')} = \text{id}_{B(x_i, r_i''''')}$, and

$$\varphi(E_k) \cap B(x_i, r_i''''') \setminus B(x_i, r_i''''') \subset \varphi(E_k \cap B(x_i, r_i) \setminus B(x_i, r_i'''''))$$

and

$$\pi_i \cap B = \pi_i \cap ((B(x_i, r_i) \setminus B(x_i, r_i''''')) \cup (B(x_i, r_i''') \setminus B(x_i, r_i'''')) \cup (B(x_i, r_i''''))) ,$$

so we get that

$$\mathbb{F}_\rho(E''') = \sum_{i \in J} \mathbb{F}_\rho(E'''' \cap B_i) \leq \sum_{i \in I} \mathbb{F}_\rho(E'''' \cap B_i) + (\sup F) \varepsilon.$$
For any $i \in I$,

$$F_{\kappa}(E''') \cap B_i \leq (1 + \varepsilon)F_{\kappa}(\pi_i \cap B_i)$$

$$\leq (1 + \varepsilon) \left( F_{\kappa}(\pi_i \cap B(x_i, r_i) \setminus B(x_i, r_i''')) + F_{\kappa}(\pi_i \cap B(x_i, r_i''')) \right)$$

$$\leq (1 + \varepsilon) \left( F_{\kappa}(S_{k,r''}) + \varepsilon(x, r''')(r''')^d + (\sup F)(r_i^d - (r_i''')^d) \right)$$

$$\leq (1 + \varepsilon)F_{\kappa}(S_{k,r''}) + 2\varepsilon(r_i''')^d + 2(\sup F)((r_i^d - (r_i''')^d))$$

$$\leq (1 + \varepsilon)F_{\kappa}(E_k \cap B(x_i, r_i'''')) + (1 + \varepsilon)F_{\kappa}(\varphi(E_k \cap B(x_i, r_i) \setminus B(x_i, r_i'''))))$$

$$+ \left( 2\varepsilon + 2(\sup F) \left( 1 - \left( 1 - \frac{2\rho}{3} \right)^d \right) \right) r_i^d$$

$$\leq (1 + \varepsilon)F_{\kappa}(E_k \cap B(x_i, r_i'''')) + 2(\sup F)(\text{Lip}\varphi)^d \mathcal{H}^d(E_k \cap B(x_i, r_i) \setminus B(x_i, r_i'''))$$

$$+ \left( 2\varepsilon + 2(\sup F) \cdot \frac{\varepsilon}{2} \right) r_i^d.$$

Hence

$$F_{\kappa}(E''') \leq \sum_{i \in I} F_{\kappa}(E''') \cap B_i + (\sup F)\varepsilon$$

$$\leq (1 + \varepsilon)F_{\kappa}(E_k) + (2\varepsilon + (\sup F)\varepsilon)((\mathcal{H}^d(E''') + \varepsilon) + (\sup F)\varepsilon$$

$$+ 2(\sup F)(\text{Lip}\varphi)^d \sum_{i \in I} \mathcal{H}^d \left( E_k \cap B(x_i, r_i) \setminus B(x_i, r_i''') \right),$$

thus

$$F_{\kappa}(E''') \leq \lim inf_{k \to +\infty} (1 + \varepsilon)F_{\kappa}(E_k) + (2\varepsilon + (\sup F)\varepsilon)((\mathcal{H}^d(E''') + \varepsilon) + (\sup F)\varepsilon$$

$$+ 2(\sup F)(\text{Lip}\varphi)^d \lim inf_{k \to +\infty} \sum_{i \in I} \mathcal{H}^d \left( E_k \cap B(x_i, r_i) \setminus B(x_i, r_i''') \right)$$

$$\leq \lim inf_{k \to +\infty} (1 + \varepsilon)F_{\kappa}(E_k) + (2\varepsilon + (\sup F)\varepsilon)((\mathcal{H}^d(E''') + \varepsilon) + (\sup F)\varepsilon$$

$$+ 2(\sup F)(\text{Lip}\varphi)^d M \sum_{i \in I} \mathcal{H}^d \left( E \cap B(x_i, r_i) \setminus B(x_i, r_i''') \right)$$

$$\leq \lim inf_{k \to +\infty} (1 + \varepsilon)F_{\kappa}(E_k) + (2\varepsilon + (\sup F)\varepsilon)((\mathcal{H}^d(E''') + \varepsilon) + (\sup F)\varepsilon$$

$$+ 2(\sup F)(\text{Lip}\varphi)^d M \varepsilon \mathcal{H}^d(E),$$
and

\[
\mathbb{F}_\kappa(E) = \mathbb{F}_\kappa(E'') + \mathbb{F}_\kappa(E \setminus E'') \\
\leq \mathbb{F}_\kappa(E'') + (\sup F)\mathbb{H}^d(E \setminus E'') \\
\leq (1 + \varepsilon) \liminf_{k \to +\infty} \mathbb{F}_\kappa(E_k) \\
+ \left( (2 + \sup F + 2 \sup F(\text{Lip} \varphi)^d M) (\mathbb{H}^d(E) + \varepsilon) + 2 \sup F \right) \varepsilon.
\]

We can let \(\varepsilon\) tend to 0, we get that

\[
\mathbb{F}_\kappa(E) \leq \liminf_{k \to +\infty} \mathbb{F}_\kappa(E_k).
\]

The following proposition is taken from [16, 3.1 Proposition].

**Proposition 2.6.** Let \(B \subset \mathbb{R}^n\) be a compact subset. Suppose that for \(j = 1, 2, \ldots, S_j \subset \mathbb{R}^n\) is a compact set with \(B \subset S_j\), and that \(S_j\) converge in Hausdorff distance to a compact set \(S \subset \mathbb{R}^n\). Let \(L \subset \mathbf{\check{H}}_{k-1}(B; G)\) be a subgroup such that \(L \subset \ker \mathbf{\check{H}}_{k-1}(i_{B,S_j})\). Then \(L \subset \ker \mathbf{\check{H}}_{k-1}(i_{B,S})\).

The proof of the proposition is essentially the same as the proof of Proposition 3.1 in [16], so we omit the proof.

**Theorem 2.7.** Suppose that \(0 < d < n\) and that \(F \in \mathfrak{F}\) is integrand. Then there is a positive constant \(M > 0\) such that for all open bounded domain \(U \subset \mathbb{R}^n\), for all closed \(d\)-rectifiable set \(E \subset U\) and for all \(\varepsilon > 0\), we can build a \(n\)-dimensional complex \(S\) and a Lipschitz map \(\phi: \mathbb{R}^n \to \mathbb{R}^n\) satisfying the following properties:

1. \(\phi|_{\mathbb{R}^n \setminus U} = \text{id}_{\mathbb{R}^n \setminus U}\) and \(\|\phi - \text{id}_{\mathbb{R}^n}\|_\infty \leq \varepsilon\);
2. \(R(S) \geq M\), where \(R(S)\) is the shape control of \(S\), for the definition see [12, p.8] or [11, Définition 1.2.27];
3. \(\phi(E)\) is contained in the union of \(d\)-skeleton of \(S\), and \(|S| \subset U\);
4. \(\mathbb{F}_\kappa(\phi(E)) \leq (1 + \varepsilon)\mathbb{F}_\kappa(E)\).

This is only a small improvement over Theorem 4.3.17 in [11] and Theorem 3 in [12], but the proof is almost same as that of V. Feuvrier in [11,12]. What we only need to change is following: In the proof of V. Feuvrier, the multiplicity function \(h\) is a continuous bounded function, thus for all \(\varepsilon' > 0\) and all \(x \in U\) there exists \(r'_{\max}(x) > 0\) such that

\[
\forall y \in B(x, r'_{\max}(x)), \ (1 - \varepsilon')h(x) \leq h(y) \leq (1 + \varepsilon')h(x).
\]

But in our paper, we use the integrand \(F\) instead of \(h\), and the inequality (2.2) will not be available, but this not too bad. We consider the function \(f : E \to G(n,d)\) defined by \(f(x) = T_xE\). It is easy to see that \(f\) is measurable. By Lusin’s theorem, see for example [9, 2.3.5.], we can write \(E = E' \cup E''\) such that \(f|_{E'}\) is continuous.
and $H^d(E''') \leq \epsilon' H^d(E)$. Then for all $x \in E'$, there exists $r'_\max(x) > 0$ such that for all $y \in E' \cap B(x, r'_\max(x))$,\
$$ (1 - \epsilon')F(x, Tx E) \leq F(y, Ty E) \leq (1 + \epsilon)F(x, Tx E). $$
The rest of proof of our theorem will be the same as that in [11, 12].

Using this theorem, we can prove the following lemma.

**Lemma 2.8.** Suppose that $0 < d < n$ and that $U \subset \mathbb{R}^n$. Suppose that $F \in \mathcal{F}$ is an integrand. Then there is a positive constant $M' > 0$ depending only on $d$ and $n$ such that for all relatively closed $d$-rectifiable set $E \subset U$, for all relatively compact subset $V \subset U$ and for all $\epsilon > 0$, we can find a $n$-dimensional complex $S$ and a subset $E'' \subset U$ satisfying the following properties:

1. $E''$ is a $\text{diam}(U)$-deformation of $E$ over $U$ and by putting $W = |\mathcal{S}|$ we have $V \subset W \subset \overline{W} \subset U$ and there is a $d$-dimensional skeleton $S'$ of $S$ such that $E'' \cap \overline{W} = |S'|$;
2. $\mathbb{F}_n(E'') \leq (1 + \epsilon)\mathbb{F}_n(E)$;
3. there are $d + 1$ complexes $S^0, \ldots, S^d$ such that $S^\ell$ is contained in the $\ell$-skeleton of $S$ and there is a decomposition $E'' \cap W = E^d \sqcup E^{d-1} \sqcup \ldots \sqcup E^0$, where for each $0 \leq \ell \leq d$,

$$ E^\ell \in \text{QM}(W^\ell, M', \text{diam}(W^\ell), \mathcal{H}^\ell), $$

where

$$
\begin{align*}
W^d &= W \\
W^{\ell-1} &= W^\ell \setminus E^\ell \\
E^d &= |S^d| \cap W^d \\
E^\ell &= |S^\ell| \cap W^\ell.
\end{align*}
$$

The proof of this lemma is also the same as the proof of the Lemme 5.2.6 in [11] or the Lemma 9 in [12]. Therefore we omit the proof.

We now turn to prove the main result of this paper.

**Proof of the Theorem 1.2.** We claim that we can find a ball $B(0, R)$ and a sequence of compact sets $(E_k)_{k \geq 1}$ such that $B \subset B(0, R)$, $E_k$ spans $L$ in Čech homology, $E_k \subset B(0, R)$ and

$$ \mathbb{F}_n(E_k \setminus B) \to m(B, G, L, F, \kappa). $$

We take any sequence of compact sets $(E'_k)_{k \geq 1}$ in $\mathcal{F}$ such that

$$ \mathbb{F}_n(E'_k \setminus B) \to m(B, G, L, F, \kappa). $$

We take

$$ U'_k = \{ x \in B(0, R_k) \mid \text{dist}(x, B) > 2^{-k} \}, $$

where

$$ R_k > \max\{k, R_{k-1} + 1, \text{dist}(0, E'_k) + \text{diam}(E'_k) + 1\}. $$
By lemma 2.8, we can find a Lipschitz map \( \phi_k : \mathbb{R}^n \to \mathbb{R}^n \) and a complex \( S_k \) such that

\[
\phi_k|_{U_k'} = \text{id}_{U_k'}, \quad U_{k-1}' \subset |S_k| \subset U_k', \quad E_k' \subset |S_k|, \]

and

\[
\phi_k(E_k') \cap W_k^\prime = F_k \cup F_k',
\]

where \( W_k' = |S_k| \) and

\[
F_k \in \text{QM}(W_k'^\prime, M, \text{diam}(W_k'^\prime), \mathcal{H}^d),
\]

and \( F_k' \) is contained in the union of \((d - 1)\)-dimensional skeleton of \( S_k \).

We now prove that \((F_k)_{k \geq 1}\) is bounded, i.e. we can find a large ball \( B(0, r) \) such that \( B \cup (\bigcup_k F_k) \subset B(0, r) \). Suppose not, that is, suppose that for any large number \( r > R_1 \) there exist \( k > 4r \) such that \( F_k \setminus B(0, 2r) \neq \emptyset \). If \( x \in F_k \setminus B(0, 2r) \), we take a cube \( Q \) centered at \( x \) with \( \text{diam}(Q) = r \), then by using Proposition 4.1 in [5], we have that

\[
\mathcal{H}^d(F_k \cap Q) \geq C^{-1} \text{diam}(Q)^d,
\]

where \( C \) only depend on \( n \) and \( M \). If we take \( r \) large enough, for example

\[
r^d > \frac{2C}{\min\{\inf F, \kappa\}} (m(B, G, L, F, \kappa) + 1),
\]

and take \( k \) large enough such that \( \mathcal{F}_\kappa(E_k') < m(B, G, L, F, \kappa) + 1 \), then

\[
C^{-1} r^d \leq \mathcal{H}^d(F_k \cap Q)
\]

\[
\leq \frac{1}{\min\{\inf F, \kappa\}} \mathcal{F}_\kappa(\phi_k(E_k'))
\]

\[
\leq \frac{(1 + 2^{-k})}{\min\{\inf F, \kappa\}} \mathcal{F}_\kappa(E_k')
\]

\[
< \frac{2}{\min\{\inf F, \kappa\}} (m(B, G, L, F, \kappa) + 1),
\]

this is a contradiction. Thus \( \bigcup_k F_k \) is bounded. It is easy to see that \( \bigcup_k (\phi_k'(E_k') \cap W_k'^\prime) \) is bounded, so we can assume that both \( B \cup (\bigcup_k F_k) \) and \( \bigcup_k (\phi_k'(E_k') \cap W_k'^\prime) \) are contained in a large ball \( B(0, R) \). We take map \( \rho : \mathbb{R}^n \to \mathbb{R}^n \) defined by

\[
\rho(x) = \begin{cases} 
    x, & x \in B(0, R) \\
    \frac{R}{|x|} x, & x \in B(0, R)^c,
\end{cases}
\]

\( \rho \) is 1-Lipschitz map. We put \( E_k = \rho \circ \phi_k'(E_k') \), then \( E_k \in \mathcal{F} \), and

\[
E_k = (\phi_k'(E_k') \cap W_k'^\prime) \cup F_k \cup \rho(F_k').
\]

Since \( \mathcal{H}^d(F_k') = 0 \), we have that

\[
\mathcal{F}_\kappa(E_k \setminus B) = \mathcal{F}_\kappa(\phi_k'(E_k') \setminus B) \leq (1 + 2^{-k}) \mathcal{F}_\kappa(E_k' \setminus B),
\]

therefore

\[
\mathcal{F}_\kappa(E_k \setminus B) \to m(B, G, L, F, \kappa),
\]
and \((E_k)_{k \geq 1}\) is a sequence which we desire.

If \(F_\kappa(E_k \setminus B) = 0\) for some \(k \geq 1\), then \(m(B, G, L, F, \kappa) = 0\) and \(E_k\) is a minimizer, we have nothing to prove. We now suppose that for all \(k \geq 1\), \(0 < F_\kappa(E_k \setminus B) < +\infty\). Thus \(0 < \mathcal{H}^d(E_k \setminus B) < +\infty\).

We put

\[ U = B(0, R + 1) \setminus B, \quad V_k = \{ x \in B(0, R + 1 - 2^k) \mid \text{dist}(x, B) > 2^{-k} \}. \]

By lemma 2.8, we can find polyhedral complexes \(S_k\), Lipschitz maps \(\phi_k : \mathbb{R}^n \to \mathbb{R}^n\) and a constant \(M' = M'(n, d)\) such that

1. \(V_k \subset |S_k| \subset V_{k+1}, \phi_k|_{V_{k+1}} = \text{id}_{V_{k+1}},\) and there exists a \(d\)-dimensional skeleton \(S'_k\) of \(S_k\) such that \(E''_k \cap W_k = |S'_k|\), where \(E''_k = \phi_k(E_k)\) and \(W_k = |S_k|\);
2. \(F_\kappa(E''_k \setminus B) \leq (1 + 2^{-k})F_\kappa(E_k \setminus B);\)
3. there exist complexes \(S^0_k, \ldots, S^d_k\) such that \(S^\ell_k\) is contained in the \(\ell\)-skeleton of \(S_k\) and there is a disjoint decomposition

\[ E''_k \cap \hat{W}_k = E^d_k \sqcup E^d_k \sqcup \cdots \sqcup E^d_k, \]

where for each \(0 \leq \ell \leq d\),

\[ E^\ell_k \in \text{QM}(W^\ell_k, M', \text{diam}(W^\ell_k), \mathcal{H}^\ell), \]

where

\[
\begin{align*}
W^d_k &= W_k \\
W^{\ell-1}_k &= W^\ell_k \setminus E^\ell_k
\end{align*}
\]

and \(W_k\) is the interior of \(W_k\).

We note that for each \(k\), \(E''_k\) and \(W_k\) are two compact subsets of \(\mathbb{R}^n\), thus \(E_k \cap W_k\) is a compact subset of \(\mathbb{R}^n\). We may suppose that \(E''_k \cap W_k \to E'\) in Hausdorff distance, passing to a subsequence if necessary. We put \(E = E' \cup B\). We will show that \(E\) is a minimizer.

First of all, we show that \(E\) spans \(B\) in Čech homology, so \(E \in \mathcal{F}\). Since \(\phi_k\) is Lipschitz map and \(\phi_k|_{V_{k+1}} = \text{id}_{V_{k+1}},\) in particular, \(\phi_k|_{B} = \text{id}_{B},\) thus \(E''_k = \phi_k(E_k)\) spans \(L\) in Čech homology. Since \(V_k \subset W_k \subset V_{k+1}\), we have that

\[ B \subset \phi_k(E_k) \setminus W_k \subset B(2^{-k}), \]

where we denote by \(B(\epsilon)\) denote the \(\epsilon\)-neighborhood of \(B\). Thus \(E''_k \setminus W_k \to B\) in Hausdorff distance, so

\[ E'_k = (E''_k \cap W_k) \cup (E''_k \setminus W_k) \to E' \cup B = E. \]

By proposition 2.6, we have that \(E\) spans \(L\) in Čech homology.

Next, we will show that \(F_\kappa(E \setminus B) = m(B, G, L, F, \kappa)\).

Passing to a subsequence if necessary, we may assume that

\[ E^\ell_k \to E^\ell\text{ in } U, \] for \(0 \leq \ell \leq d,\]
For any $0 \leq \ell \leq d$, we put
\[ U^\ell = U \setminus \bigcup_{\ell < \ell' \leq d} E^{\ell'}, \]
we assume that $E_k^\ell \to E^\ell$ in $U$. Then
\[ E \setminus B = \bigcup_{0 \leq \ell \leq d} E^\ell. \]

Since
\[ E_k^d \in \text{QM}(W_k^d, M', \text{diam}(W_k^d), \mathcal{H}^d), \]
we can apply the Theorem 2.5, and get that
\[ F_\kappa(E \cap W_k^d) \leq \liminf_{m \to \infty} F_\kappa(E_m \cap W_k^d) \leq \liminf_{m \to \infty} F_\kappa(E_m). \]

Since $V_k \subset W_k \subset V_{k+1}$ and $W_k^d = W_k$, we have
\[ \bigcup_k W_k^d = \bigcup_k V_k = U, \]
thus
\[ F_\kappa(E^d) \leq \liminf_{m \to \infty} F_\kappa(E_m^d). \]

For any $0 \leq \ell \leq d$, for any $\varepsilon > 0$, we put $U^\ell = B(0, R + 1 - \varepsilon) \cap U^d$ and
\[ U^\ell = \left\{ x \in B(0, R + 1 - \varepsilon) \mid \text{dist} \left( x, \bigcup_{\ell < \ell' \leq d} E^{\ell'} \right) > \varepsilon \right\}. \]
Then $U^\ell_{\varepsilon_1} \subset U^\ell_{\varepsilon_2}$ for any $0 < \varepsilon_2 < \varepsilon_1$, and
\[ \bigcup_{\varepsilon > 0} U^\ell_{\varepsilon} = U^\ell. \]

Since $E_k^\ell \to E^\ell$ in $U$, we have that $E_k^\ell \cap U_\varepsilon \to E^\ell \cap U_\varepsilon$ in $U_\varepsilon$. We will show that for any $\varepsilon > 0$, there exists $k_\varepsilon$ such that for $k \geq k_\varepsilon$,
\[ E_k^\ell \cap U_\varepsilon \in \text{QM}(U_\varepsilon^\ell, M', \text{diam}(U_\varepsilon^\ell), \mathcal{H}^\ell). \]
Indeed, for any $\varepsilon > 0$, we can find $k_\varepsilon$ such that $U^{\ell}_{\varepsilon} \subset W_k^\ell$. We prove this fact by induction on $\ell$.

First, we take a positive integer $k_\varepsilon$ such that $2^{-k_\varepsilon} < \varepsilon$, then $U^d_\varepsilon \subset W_k^d$ for any $k \geq k_\varepsilon$.

Next, we suppose that there is an integer $k_\varepsilon$ such that $U^\ell_\varepsilon \subset W_k^\ell$ for $k \geq k_\varepsilon$. Since $E_k^\ell \to E^\ell$ in $U^\ell$ and
\[ W_k^{\ell-1} = W_k^\ell \setminus E_k^\ell, \quad U^\ell = \left\{ x \in U^\ell \mid \text{dist} \left( x, E^\ell \right) > \varepsilon \right\}, \]
we can find $k'_\varepsilon$ such that $U^{\ell-1}_{\varepsilon} \subset W_k^{\ell-1}$ for $k \geq k'_\varepsilon$.

Since $U^\ell_\varepsilon \subset W_k^\ell$ and
\[ E_k^\ell \in \text{QM}(W_k^\ell, M', \text{diam}(W_k^\ell), \mathcal{H}^\ell), \]
we get that 
\[ E^\ell_k \cap U_\epsilon^\ell \in \text{QM}(U_\epsilon^\ell, M', \text{diam}(U_\epsilon^\ell), \mathcal{H}^\ell). \]

For any \( \delta > 0 \), we put \( \Omega_\delta = \{ x \in U_\epsilon \mid \text{dist}(x, U_c^\epsilon) \geq 10\delta \} \). \( E^\ell_k \cap \Omega_\delta \) is a compact set, and \( \{ B(x, \delta) \mid x \in E^\ell_k \cap \Omega_\delta \} \) is an open covering of \( E^\ell_k \cap \Omega_\delta \), we can find a finitely many balls \( \{ B(x_i, \delta) \}_{i \in I} \) which is a covering of \( E^\ell_k \cap \Omega_\delta \), by the 5-covering lemma, see for example the Theorem 2.1 in [14], we can find a subset \( J \subset I \) such that \( B(x_{j_1}, \delta) \cap B(x_{j_2}, \delta) = \emptyset \) for \( j_1, j_2 \in J \) with \( j_1 \neq j_2 \), and
\[
\bigcup_{i \in I} B(x_i, \delta) \subset \bigcup_{j \in J} B(x_j, 5\delta).
\]
Since \( B(x_{j_1}, \delta) \cap B(x_{j_2}, \delta) = \emptyset \) for \( j_1, j_2 \in J \), we have that
\[
\mathcal{L}^n(U_\epsilon) \geq \sum_{j \in J} \mathcal{L}^n(B(x_j, \delta)),
\]
thus
\[
\# J \leq \frac{\mathcal{L}^n(U_\epsilon)}{\omega_\ell \delta^n}.
\]
By the Proposition 4.1 in [5], we have that
\[
C^{-1}(5\delta)^\ell \leq \mathcal{H}^\ell(E^\ell_k \cap B(x_j, 5\delta)) \leq C(5\delta)^\ell,
\]
so
\[
\mathcal{H}^\ell(E^\ell_k \cap \Omega_\delta) \leq \sum_{j \in J} \mathcal{H}^\ell(E^\ell_k \cap B(x_j, 5\delta)) \leq \sum_{j \in J} C(5\delta)^\ell \leq \omega^{-1}_n \mathcal{L}^n(U_\epsilon) 5^d \delta^{-n} C.
\]
Applying the theorem 3.4 in [4], we get that
\[
\mathcal{H}^\ell(E^\ell \cap \Omega_\delta) \leq \liminf_{k \to \infty} \mathcal{H}^\ell(E^\ell_k \cap \Omega_\delta) \leq \omega^{-1}_n \mathcal{L}^n(U_\epsilon) 5^d \delta^{-n} C,
\]
and \( \dim_H E^\ell \cap \Omega_\delta \leq \ell \), hence \( \dim_H E^\ell \leq \ell \), thus \( \mathcal{H}^d(E^\ell) = 0 \).

we get that
\[
\mathbb{F}_\kappa(E \setminus B) = \mathbb{F}_\kappa(E^d)
\]
\[
\leq \liminf_{k \to \infty} \mathbb{F}_\kappa(E^d_k)
\]
\[
\leq \liminf_{k \to \infty} \mathbb{F}_\kappa(E^d_k \setminus B)
\]
\[
\leq \liminf_{k \to \infty} (1 + 2^{-k})\mathbb{F}_\kappa(E_k \setminus B)
\]
\[
= \liminf_{k \to \infty} \mathbb{F}_\kappa(E_k \setminus B)
\]
\[
= m(B, G, L, F, \kappa).
\]
Since \( E \in \mathcal{F} \), we have that
\[
\mathbb{F}_\kappa(E \setminus B) \geq m(B, G, L, F, \kappa),
\]
therefore
\[
\mathbb{F}_\kappa(E \setminus B) = m(B, G, L, F, \kappa).
