SHAPE DERIVATIVE OF THE DIRICHLET ENERGY FOR A TRANSMISSION PROBLEM

PHILIPPE LAURENÇOT AND CHRISTOPH WALKER

Abstract. For a transmission problem in a truncated two-dimensional cylinder located beneath the graph of a function \( u \), the shape derivative of the Dirichlet energy (with respect to \( u \)) is shown to be well-defined and is computed. The main difficulties in this context arise from the weak regularity of the domain and the possible non-empty intersection of the graph of \( u \) and the transmission interface. The result is applied to establish the existence of a solution to a free boundary transmission problem for an electrostatic actuator.

1. Introduction and Main Results

Given \( f \in H^{-1}(\mathbb{R}^n) \) and an open, bounded set \( \mathcal{O} \subset \mathbb{R}^n \), let \( \varphi_\mathcal{O} \in H^1_0(\mathcal{O}) \) be the unique variational solution to the Dirichlet problem

\[
-\Delta \varphi_\mathcal{O} = f \quad \text{in} \quad \mathcal{O}, \quad \varphi_\mathcal{O} = 0 \quad \text{on} \quad \partial \mathcal{O}.
\]

Introducing the Dirichlet integral

\[
J(\mathcal{O}) := \frac{1}{2} \int_{\mathcal{O}} |\nabla \varphi_\mathcal{O}|^2 \, dx,
\]

a classical result in shape optimization states that the shape derivative of \( J(\mathcal{O}) \) is given by

\[
J'(\mathcal{O})[\theta] := \left. \frac{d}{dt} J((\text{id} + t\theta)(\mathcal{O})) \right|_{t=0} = \frac{1}{2} \int_{\mathcal{O}} \text{div}(|\nabla \varphi_\mathcal{O}|^2 \theta) \, dx
\]

for \( \theta \in W^1_\infty(\mathbb{R}^n, \mathbb{R}^n) \) \cite{[11][20]}. When the shape derivative is well-defined, it provides useful information on the Dirichlet energy itself and it is the basis for deriving first-order optimality conditions. However, the integral on the right-hand side of the shape derivative is only meaningful provided \( \varphi_\mathcal{O} \) has sufficient regularity (typically \( \varphi_\mathcal{O} \in H^2(\mathcal{O}) \)), which, in turn, requires sufficient regularity of the source term \( f \) and the open set \( \mathcal{O} \), see \cite{[11]} Corollary 5.3.8 for instance. Source terms with low Sobolev regularity or depending on the admissible shape \( \mathcal{O} \) in a non-smooth way are therefore excluded.

Amongst the simplest situations featuring such a dependence is the differentiability with respect to \( \mathcal{O} \) of the Dirichlet energy

\[
J(\mathcal{O}) := \frac{1}{2} \int_{\mathcal{O}} |\nabla \psi_\mathcal{O}|^2 \, dx,
\]

associated with Laplace’s equation subject to non-homogeneous Dirichlet boundary conditions
\[-\Delta \psi_O = 0 \quad \text{in } O, \quad \psi_O = h_O \quad \text{on } \partial O,
\]
where \(h_O\) is a given function in \(H^1(O)\), depending on \(O\) in general. In that particular case, \(\psi_O\) may be interpreted as the electrostatic potential inside \(O\) and \(h_O\) is the potential applied on \(\partial O\). Computing the shape derivative \(J'(O)\) of \(J(O)\) is then of practical importance, since \(J'(O)\) is the electrostatic force acting on \(\partial O\) \([1, 5, 9]\). Introducing \(\varphi_O := \psi_O - h_O\), we see that \(\varphi_O\) solves \([11]\) with \(f = \Delta h_O \in H^{-1}(O)\) and \(J'(O)\) obviously involves the shape derivative of \(h_O\). Summarizing, the shape differentiability of \(J(O)\) relies on the Sobolev regularity of \(\varphi_O\) which is not only governed by that of \(h_O\) but also by the smoothness of \(\partial O\).

The situation just depicted above is actually met in applications, for example, when considering electrostatic actuators consisting of a rigid electrode above which a moving electrode is suspended, both being held at different potentials \([3]\). For an idealized device with simplified geometry, the rigid electrode is the set \(D \times \{-H\}\) located at vertical height \(-H < 0\) with \(D := (-L, L), \ L > 0\), and the shape depends only on the position of the moving electrode, which is assumed to be the graph of a function \(u\) ranging in \((-H, \infty)\). The shape \(O(u)\) is then given by

\[O(u) := \{(x, z) \in D \times \mathbb{R} : -H < z < u(x)\}.
\]

The corresponding electrostatic potential \(\psi_u\) solves Laplace’s equation \(-\Delta \psi_u = 0\) in \(O(u)\) with non-homogeneous Dirichlet boundary conditions \(\psi_u = h_u \neq \text{const} \text{ on } \partial O(u)\), reflecting the potential difference. A possible choice for \(h_u\) is

\[h_u(x, z) = \frac{H + z}{H + u(x)}, \quad (x, z) \in O(u),
\]

which corresponds to both electrodes being held at constant potentials and features an explicit dependence on \(u\). Incorporating the boundary values into the electrostatic potential by setting \(\varphi_u := \psi_u - h_u\), one obtains that \(\varphi_u \in H^1_0(O(u))\) solves the Dirichlet problem

\[-\Delta \varphi_u = f_u \quad \text{in } O(u), \quad \varphi_u = 0 \quad \text{on } \partial O(u),
\]

where the regularity of the source term \(f_u := \Delta h_u\) turns out to be two order less than that of \(u\) \([15]\): that is, \(f_u \in H^{k-2}(O(u))\) only if \(u \in H^k(D)\), a property obviously satisfied for the choice \([13]\). Consequently, application of the above mentioned result to compute the derivative of \(J(O(u))\) with respect to \(u\) requires \textit{a priori} a sufficiently high regularity of \(u\) and hence of the shape \(O(u)\), which may not be available for the problem under consideration. Indeed, the regularity of the solution \(\varphi_u\) to \([14]\) is not only controlled by that of \(u\), but also limited by the fact that \(O(u)\) is only a Lipschitz domain, so that one may only expect \(\varphi_u \in H^{\min(k,3/2)}(O(u))\) for \(u \in H^k(D)\) in general. This restricted regularity does not seem to be sufficient to give a meaning to the shape derivative of \(J(O(u))\). Nevertheless, for this particular case (and under suitable assumptions) we show in \([12, 13]\) that \(\varphi_u \in H^2(O(u))\) for \(u \in H^3_0(D) \cap H^\alpha(D)\) with \(\alpha > 3/2\) and that \(J(O(u))\) has a shape derivative, which is well-defined and given by

\[J'(O(u))(x) = \frac{1}{2} |\nabla \psi_u(x, u(x))|^2, \quad x \in D,
\]
as expected.
Another instance, where a similar difficulty arises, is when the solution to the Dirichlet problem \((1.4)\) is replaced by the solution to a transmission problem, where the boundary of the domain may contact the transmission interface. Such a situation is also encountered in the modeling of microelectromechanical systems (MEMS) \([2, 3, 16]\), see Section 5 below. In that case, the geometry of the admissible shapes looks similar to the class \(O(u)\) described above and is defined as follows: Let \(H, L, d > 0\) be three positive parameters and set \(D := (-L, L)\). Given a real-valued function \(u\) defined on the interval \(D\) and ranging in \([-H, \infty)\), the admissible shape \(\Omega(u)\) consists of two subregions

\[
\Omega_1 := D \times (-H - d, -H)
\]

and

\[
\Omega_2(u) := \{(x, z) \in D \times \mathbb{R} : -H < z < u(x)\}
\]

which are separated by the interface

\[
\Sigma(u) := \{(x, -H) : x \in D, u(x) > -H\},
\]

see Figure \ref{fig:1.1}; that is,

\[
\Omega(u) := \{(x, z) \in D \times \mathbb{R} : -H - d < z < u(x)\} = \Omega_1 \cup \Omega_2(u) \cup \Sigma(u).
\]

Let us emphasize that we explicitly allow the graph \(G(u)\) of \(u\), defined by

\[
G(u) := \{(x, u(x)) : x \in D\},
\]

(1.5)

to intersect the interface \(\Sigma := D \times \{-H\};\) that is, the coincidence set

\[
\mathcal{C}(u) := \{x \in D : u(x) = -H\}
\]

(1.6)

of \(u\) may be non-empty, resulting in a disconnected top part \(\Omega_2(u)\) with connected components \((O_i(u))_i\) – see the blue curve in Figure \ref{fig:1.1}. If \(\mathcal{C}(u)\) is empty – see the green curve in Figure \ref{fig:1.1} – then

\[
\Sigma(u) = \Sigma = D \times \{-H\}.
\]
The dielectric properties of $\Omega_1$ and $\Omega_2(u)$ being different with a jump discontinuity at the interface $\Sigma(u)$, the potential $\psi_u \in H^1(\Omega(u))$ under consideration in this paper is defined as the variational solution to the transmission problem

$$\begin{align*}
\text{div}(\sigma \nabla \psi_u) &= 0 \quad \text{in } \Omega(u), \\
[\psi_u] = [\sigma \partial_z \psi_u] &= 0 \quad \text{on } \Sigma(u), \\
\psi_u &= h_u \quad \text{on } \partial \Omega(u),
\end{align*}$$

(1.7a, 1.7b, 1.7c)

where $[\cdot]$ denotes the jump across $\Sigma(u)$. Here and in the following, $\sigma_1 \in C^2(\Omega_1)$ with $\sigma_1(x,z) > 0$, $\sigma_2 > 0$ is a positive constant (with $\sigma_1(-H) \neq \sigma_2$), and $h_u \in H^1(\Omega(u))$ is a given function defining the boundary values of $\psi_u$ on $\partial \Omega(u)$. The associated Dirichlet energy is

$$\mathcal{J}(u) := \frac{1}{2} \int_{\Omega(u)} \sigma |\nabla \psi_u|^2 \, d(x,z).$$

(1.8)

The main contribution of the present research is the computation of the shape derivative of $\mathcal{J}(u)$ with respect to $u$ in an appropriate functional setting. Several steps are needed to achieve this goal. According to the discussion above, the first step is to derive sufficient regularity on $\psi_u$, keeping in mind that $\psi_u$ depends on $u$ not only through $\Omega_2(u)$, but also through $h_u$. An appropriate functional setting for $u$ turns out to be the set

$$\tilde{S} := \{ u \in H^2(D) \cap H^1_0(D) : u \geq -H \text{ in } D \}.$$

Let us already point out that $C(u) = \emptyset$ if and only if

$$u \in S := \{ u \in H^2(D) \cap H^1_0(D) : u > -H \text{ in } D \}.$$

The variational setting for the potential $\psi_u$ is then

$$\mathcal{A}(u) := h_u + H^1_0(\Omega(u)),$$

where the boundary values $h_u$ are defined by

$$h_u(x,z) := h(x,z,u(x)) = \begin{cases} 
h_1(x,z,u(x)), & (x,z) \in \Omega_1, \\
h_2(x,z,u(x)), & (x,z) \in \Omega_2(u),
\end{cases}$$

the given function $h$ satisfying (2.2) below. The well-posedness of (1.7) is provided by the following result.

**Theorem 1.1.** Let the function $h$ satisfy (2.2) below.

(a) For each $u \in \tilde{S}$, there is a unique variational solution $\psi_u \in \mathcal{A}(u)$ to (1.7). Moreover, $\psi_{u,1} := \psi_u|_{\Omega_1} \in H^2(\Omega_1)$ and $\psi_{u,2} := \psi_u|_{\Omega_2(u)} \in H^2(\Omega_2(u))$, and $\psi_u$ is a strong solution to the transmission problem (1.7).

(b) Given $\kappa > 0$, there is $c(\kappa) > 0$ such that, for all $u \in \tilde{S}$ satisfying $\|u\|_{H^2(D)} \leq \kappa$,

$$\|\psi_u\|_{H^1(\Omega(u))} + \|\psi_{u,1}\|_{H^2(\Omega_1)} + \|\psi_{u,2}\|_{H^2(\Omega_2(u))} \leq c(\kappa).$$

**Proof.** This follows from Proposition 3.1 and Corollary 3.14 \[ \square \]

While the existence and uniqueness of $\psi_u \in \mathcal{A}(u)$ as a variational solution of (1.7) are straightforward consequences of Lax-Milgram’s theorem, the $H^2$-regularity is more involved, in particular when the coincidence set $C(u)$ is non-empty so that $\Omega_2(u)$ is not connected. Indeed, in such a case, $\psi_u$ still satisfies the transmission conditions (1.7b) on $\Sigma(u) \neq \Sigma$ but is subject to the Dirichlet boundary conditions $\psi_u = h_u$ on $\Sigma \setminus \Sigma(u)$. We
shall thus begin with the simplest situation, where the coincidence set \( C(u) \) is empty – see the green curve in Figure 1.1. For smooth functions \( u \in S \cap W^2_\infty(D) \), the piecewise \( H^2 \)-regularity of solutions to the transmission problem (1.7) is known [17]. The strategy to extend it to arbitrary functions in \( \tilde{S} \) is known [14]. The strategy includes two steps: on the one hand, we derive quantitative estimates on \( \psi_u \) in \( H^2(\Omega_1) \) and \( H^2(\Omega_2(u)) \) for \( u \in S \cap W^2_\infty(D) \), which depend neither on the \( W^2_\infty \)-norm of \( u \) nor on the positivity of \( u + H \), as stated in Theorem 1.1(b). On the other hand, we show that \( u \mapsto \psi_u - h_u \) is a continuous map from \( \tilde{S} \) to \( H^1(\mathbb{R}^2) \) when \( S \) is endowed with the topology of \( \mathcal{H}_0^1(D) \), the proof relying on the \( \Gamma \)-convergence of the functionals associated with the variational formulation defining \( \psi_u \). Combining these two results leads us to Theorem 1.1.

Next, due to the regularity properties of \( \psi_u \) provided by Theorem 1.1 we can compute the shape derivative of the Dirichlet energy \( \mathcal{J}(u) \) with respect to \( u \in S \) in a classical way [11, 20].

**Theorem 1.2.** Let the function \( h \) satisfy (2.2) below and consider \( u \in S \). Introducing
\[
g(u)(x) := \frac{\sigma_2}{2} (1 + (\partial_x u(x))^2) \left[ \partial_x \psi_{u,2} - (\partial_z h_2)_u - (\partial_w h_2)_u \right]^2 (x, u(x)), \quad x \in D,
\]
and endowing \( S \) with the \( H^2(D) \)-topology, the Dirichlet energy \( \mathcal{J} : S \to \mathbb{R} \) defined in (1.8) is continuously Fréchet differentiable with
\[
\partial_u \mathcal{J}(u)(x) = -g(u)(x) + \frac{\sigma_2}{2} \left[ (\partial_z h_2)_u + (\partial_w h_2)_u \right]^2 (x, u(x))
\]
for \( u \in S \) and \( x \in D \), where \( \psi_{u,1}, \psi_{u,2} \) is defined in Theorem 1.1.

\[
(\partial_w h_1)_u(x,z) := \partial_w h_1(x,z,u(x)), \quad (x,z) \in \Omega_1,
\]
and
\[
((\partial_x h_2)_u, (\partial_z h_2)_u, (\partial_w h_2)_u)(x,z) := (\partial_x h_2, \partial_z h_2, \partial_w h_2)(x,z,u(x))
\]
for \( (x,z) \in \overline{\Omega_2(u)} \).

**Proof.** This follows from Proposition 3.17 and Proposition 4.2.

The proof of Theorem 1.2 is performed along the lines of the proof of [11, Theorem 5.3.2] and relies on the following observation: for \( u \in S \), there is a neighborhood \( V \) of \( u \) in \( S \) such that, for any \( v \in V \), there is a bi-Lipschitz transformation mapping \( \Omega(v) \) onto \( \Omega(u) \). Such a transformation then allows us to convert \( \mathcal{J}(v) \) for each \( v \in V \) to an integral over \( \Omega(u) \) and investigate the behavior of the difference \( \mathcal{J}(v) - \mathcal{J}(u) \) as \( v \to u \).

The just outlined approach obviously fails for \( u \in \tilde{S} \setminus S \), since the coincidence set \( C(u) \) is non-empty. Indeed, in that case, it does not seem to be possible to find a bi-Lipschitz transformation mapping \( \Omega(v) \) onto \( \Omega(u) \), unless their coincidence sets are equal, \( C(v) = C(u) \), an assumption which is far too restrictive. We instead use an approximation argument and show that the Dirichlet energy \( \mathcal{J} \) admits directional derivatives in the directions \( -u + S \), as stated in the next result.
Theorem 1.3. Let the function $h$ satisfy (2.2) below and consider $u \in \bar{S}$. Introducing
\begin{equation*}
\mathbb{g}(u)(x) := \left\{ \begin{array}{ll}
\frac{\sigma_2}{2} \left( 1 + (\partial_x u(x))^2 \right) \left[ \partial_x \psi_{u,2} - (\partial_x h_2)u - (\partial_x h_2)_u \right]^2(x, u(x)), & x \in D \setminus C(u), \\
\frac{\sigma_2}{2} \left[ \frac{\sigma_1}{\sigma_2} \partial_x \psi_{u,1} - (\partial_x h_2)_u - (\partial_x h_2)_u \right]^2(x, -H), & x \in C(u),
\end{array} \right.
\end{equation*}
then, for $w \in S$,
\begin{equation*}
\lim_{t \to 0^+} \frac{1}{t} \left( \mathbb{g}(u + t(w - u)) - \mathbb{g}(u) \right) = -\int_D \mathbb{g}(u)(x)(w - u)(x) \, dx \\
+ \frac{\sigma_2}{2} \int_D \left[ \left( (\partial_x h_2)_u \right)^2 + \left( (\partial_x h_2)_u + (\partial_x h_2)_u \right)^2 \right] (x, u(x)) (w - u)(x) \, dx \\
- \int_D \left[ \sigma_1 (\partial_x h_1)_u \partial_x \psi_{u,1} \right] (x, -H - d) (w - u)(x) \, dx,
\end{equation*}
the notation being the same as in Theorem 1.2. Moreover, the function $\mathbb{g} : \bar{S} \to L_p(D)$ is continuous for each $p \in [1, \infty)$, the set $\bar{S}$ being endowed with the topology of $H^2(D)$.

Proof. This follows from Proposition 3.17 and Corollary 4.3.

Observe that, for $u \in S$, the formula for $\mathbb{g}(u)$ in Theorem 1.3 matches that of $\mathbb{g}(u)$ in Theorem 1.2, since $\mathcal{C}(u)$ is empty in that case. The proof of Theorem 1.3 relies on Theorem 1.2 using the fact that $u + t(w - u) \in S$ for $t \in (0, 1)$ when $u \in S$ and $w \in S$. The main step is actually the computation of $\mathbb{g}(u)$ for $u \in \bar{S} \setminus S$. To this end, we consider a bounded sequence $(u_n)_{n \geq 1}$ in $S$ converging to $u$ in $H^1_0(D)$ and identify the limit of $\mathbb{g}(u_n)$ as $n \to \infty$. Of importance here are the uniform $H^2$-estimates proved in Theorem 1.1 (b).

We end this section with the description of the contents of the subsequent sections.

In Section 2 we provide the precise assumptions on the function $h$ defining the boundary conditions (1.7c) of the potential $\psi$, see (2.2) and (2.3).

The derivation of the $H^2$-estimates stated in Theorem 1.1 (b) is next performed in Section 3. We begin Section 3 by recalling the well-posedness of the variational formulation associated with the transmission problem (1.7) and $H^2$-regularity properties of $\psi$ when $u \in S \cap W^2_\infty(D)$. For such $u$ we derivate in Section 3.2 quantitative estimates on $\psi$ in $H^2(\Omega_1)$ and $H^2(\Omega_2(u))$. To this end, we further develop the approach from [13] and heavily use the property that $\Omega_2(u)$ can be mapped in a bi-Lipschitz way onto the rectangle $D \times (0, 1)$ when $u \in S$. To extend the validity of the $H^2$-estimates to all $u \in \bar{S}$, special attention is paid to the dependence of the various constants arising in the estimates derived for $u \in S \cap W^2_\infty(D)$, including that involved in Sobolev embeddings. We show in particular that the estimates depend neither on the $W^2_\infty$-regularity of $u$ nor on the positivity of $u + H$. For the extension to $u \in \bar{S}$, we employ then an approximation argument, relying on the density of $S \cap W^2_\infty(D)$ in $\bar{S}$. Specifically, given $u \in \bar{S}$, we consider a sequence $(u_n)_{n \geq 1}$ in $S \cap W^2_\infty(D)$, which is bounded in $H^2(D)$ and converges to $u$ in $H^1_0(D)$. A Γ-convergence argument provided in Section 3.2 then implies that $(\psi_{u_n} - h_{u_n})_{n \geq 1}$ converges to $\psi_u - h_u$ in $H^1(\mathbb{R}^2)$. Combining the outcome of Sections 3.1 and 3.2 allows us to complete the proof of Theorem 1.3 in Section 3.3. Finally, in preparation of the proof of Theorem 1.3...
we identify in Section 3.4 the behavior of the vertical derivative \( x \mapsto \partial_z \psi_{u_n,2}(x, u_n(x)) \), \( x \in D \), as \( n \to \infty \) for a sequence \((u_n)_{n \geq 1} \) in \( S \) converging to \( u \in \bar{S} \) in the norm of \( H^1(D) \). Since the coincidence set \( C(u) \) of \( u \) may be non-empty and possibly includes countably many connected components, this step requires some care for the analysis in \( C(u) \), while a different argument is needed in \( D \setminus C(u) \).

In Section 4 we turn to the study of the differentiability of the Dirichlet energy \( J(u) \), see (1.8), with respect to \( u \in \bar{S} \). In this regard, we first establish the Fréchet differentiability of \( J \) on \( S \), the proof following closely [11]. We thus obtain the Fréchet derivative \( \partial_u J \) for \( u \in S \) in the form given in Theorem 1.2. We then consider \( u \in S \setminus S \) and combine the outcome of Theorem 1.2 and Section 3.4 to prove Theorem 1.3.

Finally, Section 5 is devoted to an application of Theorems 1.2 and 1.3 to identify the Euler-Lagrange equation satisfied by the minimizers of a functional arising in the modeling of microelectromechanical systems.

2. Notations and Conventions

Given a subset \( R \) of \( \mathbb{R}^n \) with Lipschitz boundary, we let \( H^1_0(R) \) denote the space of functions in \( H^1(R) \) vanishing on the boundary \( \partial R \) (in the sense of traces) and denote its dual space by \( H^{-1}(R) \).

Recall that
\[
S = \{ v \in H^2(D) \cap H^1_0(D) : v > -H \text{ in } D \}
\]
so that its \( H^2 \)-closure is \( \bar{S} \) introduced above. Given \( v \in \bar{S} \) and a pair of real-valued functions \( (\vartheta_1, \vartheta_2) \) with \( \vartheta_1 \) defined on \( \Omega_1 \) and \( \vartheta_2 \) defined on \( \Omega_2(v) \), we put
\[
\vartheta := \begin{cases} 
\vartheta_1 & \text{in } \Omega_1, \\
\vartheta_2 & \text{in } \Omega_2(v),
\end{cases}
\]
and let
\[
\lbrack \vartheta \rbrack(x, -H) := \vartheta_1(x, -H) - \vartheta_2(x, -H), \quad x \in D \setminus C(v),
\]

denote the jump across the interface \( \Sigma(v) \) (if meaningful). Recall that the coincidence set \( C(v) \) is defined in (1.6). In particular, we set
\[
\sigma := \begin{cases} 
\sigma_1 & \text{in } \Omega_1, \\
\sigma_2 & \text{in } \Omega_2(v).
\end{cases}
\]

Conversely, if \( \vartheta \) is defined in \( \Omega(v) \), then we denote the corresponding restrictions by \( \vartheta_1 := \vartheta|_{\Omega_1} \) and \( \vartheta_2 := \vartheta|_{\Omega_2(v)} \).

For further use we set
\[
\sigma_{\min} := \min_{\Omega_1} \left\{ \sigma_{2, \min \sigma_1} \right\} > 0, \quad \sigma_{\max} := \max_{\Omega_1} \left\{ \sigma_{2, \max \sigma_1} \right\} < \infty. \tag{2.1}
\]

As described in the introduction, for \( v \in \bar{S} \), the values of the potential \( \psi_v \) on the boundary \( \partial \Omega(v) \) are given by a function \( h_v \). For technical reasons we assume that \( h_v \) is not only defined on \( \partial \Omega(v) \) but also has an extension to \( \bar{\Omega}(v) \). More precisely, we fix \( C^2 \)-functions
\[
h_1 : \bar{D} \times [-H - d, -H] \times [-H, \infty) \to [0, \infty) \tag{2.2a}
\]
and
\[
h_2 : \bar{D} \times [-H, \infty) \times [-H, \infty) \to [0, \infty) \tag{2.2b}
\]
satisfying
\[
\begin{align*}
\sigma_1(x, -H) \partial_z h_1(x, -H, w) &= \sigma_2 \partial_z h_2(x, -H, w), \quad (x, w) \in D \times [-H, \infty), \\
(h_1(x, -H, w), (x, w) \in D \times [-H, \infty), \quad (2.2d)
\end{align*}
\]

For a given function \( v \in \bar{S} \) we then define
\[
\psi_v(x, z) := \begin{cases} 
    h_{v,1}(x, z) := h_1(x, z, v(x)), & (x, z) \in \Omega_1, \\
    h_{v,2}(x, z) := h_2(x, z, v(x)), & (x, z) \in D \times [-H, \infty). 
\end{cases}
\] (2.3)

Note that (2.2c)-(2.2d) imply
\[
[h_v] = [\sigma \partial_z h_v] = 0 \quad \text{on} \quad \Sigma(v). \quad (2.4)
\]

Consequently, by (2.4),
\[
\psi_v \in H^1(\Omega(v)) \quad \text{with} \quad (h_{v,1}, h_{v,2}) \in H^2(\Omega_1) \times H^2(\Omega_2(v)). \quad (2.5)
\]

3. The Potential

Given \( v \in \bar{S} \) we recall the set of admissible potentials
\[
A(v) = h_v + H^1_0(\Omega(v))
\]
and define the functional
\[
J(v)[\vartheta] := \frac{1}{2} \int_{\Omega(v)} \sigma|\nabla \vartheta|^2 \, d(x, z), \quad \vartheta \in A(v). \quad (3.1)
\]

The potential \( \psi_v \) corresponding to \( v \in \bar{S} \) and solving the transmission problem (1.7) is then the minimizer of the functional \( J(v) \) on the set \( A(v) \); that is,
\[
J(v)[\psi_v] = \min_{\vartheta \in A(v)} \{ J(v)[\vartheta] \}.
\]

We first prove Theorem 1.1 for \( v \in \bar{S} \cap W^2_\infty(D) \), i.e. for smooth \( v \) with empty coincidence set \( \mathcal{C}(v) \).

**Proposition 3.1.** (a) For each \( v \in \bar{S} \) there is a unique minimizer \( \psi_v \in A(v) \) of \( J(v) \) on \( A(v) \).

(b) If \( v \in S \cap W^2_\infty(D) \), then \( \psi_v = (\psi_{v,1}, \psi_{v,2}) \in H^2(\Omega_1) \times H^2(\Omega_2(v)) \) satisfies the transmission problem
\[
\begin{align*}
\div(\sigma \nabla \psi_v) &= 0 \quad \text{in} \quad \Omega(v), \\
[\psi_v] &= [\sigma \partial_z \psi_v] = 0 \quad \text{on} \quad \Sigma, \\
\psi_v &= h_v \quad \text{on} \quad \partial \Omega(v). 
\end{align*}
\] (3.2a)

(c) If \( v \in S \cap W^2_\infty(D) \), then \( \sigma \partial_z \psi_v \in H^1(\Omega(v)) \).

**Proof.** (a) Let \( v \in \bar{S} \). The existence and uniqueness of a minimizer \( \psi_v \) of \( J(v) \) on the set \( A(v) \) follow at once from the Lax-Milgram theorem, the positive lower bound (2.1) on \( \sigma \), Poincaré’s inequality, the convexity of \( J(v) \), and the property \( \div(\sigma \nabla h_v) \in H^{-1}(\Omega(v)) \) due to (2.5).
(b) Next, the minimizing property of $\psi_v$ entails that $J(v)[\psi_v] \leq J(v)[\psi_v + t\theta]$ for each $t \in \mathbb{R}$ and $\theta \in H_0^1(\Omega(v))$. By definition of $J(v)$, this readily gives

$$\int_{\Omega(v)} \sigma \nabla \psi_v \cdot \nabla \vartheta \, d(x, z) = 0, \quad \vartheta \in H_0^1(\Omega(v)).$$

(3.3)

Now, if $v \in S \cap W_\infty^2(D)$, then [17, Theorem III.4.6] ensures the existence of a unique solution $\tilde{\psi} = (\tilde{\psi}_1, \tilde{\psi}_2) \in H^2(\Omega_1) \times H^2(\Omega_2(v))$ to the transmission problem (3.2). Clearly, $\tilde{\psi} \in \mathcal{A}(v)$ satisfies (3.3), thus $\psi_v = \tilde{\psi}$.

(c) It follows from the regularity of $\sigma_1$, Proposition 3.1(b), and (3.2b) that

$$\sigma \partial_z \psi_v \in H^1(\Omega_1) \cup H^1(\Omega_2(v))$$

with zero jump across the interface, i.e. $[\sigma \partial_z \psi_v] = 0$ on $\Sigma$. This implies $\sigma \partial_z \psi_v \in H^1(\Omega(v))$. □

We shall later prove that Proposition 3.1(b) extends to all $v \in \bar{S}$, see Corollary 3.14. We also note the following $H^1$-estimate for $\psi_v$.

**Lemma 3.2.** Given $v \in \bar{S}$,

$$\int_{\Omega(v)} |\nabla \psi_v|^2 \, d(x, z) \leq \int_{\Omega(v)} |\nabla h_v|^2 \, d(x, z).$$

**Proof.** This follows from $h_v \in \mathcal{A}(v)$ and the minimizing property of $\psi_v$ stated in Proposition 3.1(a). □

For our purpose we need, besides the extension of Proposition 3.1(b) to all $v \in \bar{S}$, precise information on the dependence of $\psi_v$ on $v$. Such information is, unfortunately, not included in the approach of [17].

### 3.1. Uniform Estimates on the Potential $\psi_v$

For $v \in S \cap W_\infty^2(D)$ we denote the unique minimizer of $J(v)$ on $\mathcal{A}(v)$ by $\psi_v \in \mathcal{A}(v)$, with

$$\psi_v = (\psi_{v,1}, \psi_{v,2}) \in H^2(\Omega_1) \times H^2(\Omega_2(v)),$$

as provided by Proposition 3.1. In that case, the coincidence $\mathcal{C}(v)$ of $v$, defined in (1.6), is empty, so that $\Sigma(v) = \Sigma$, see Figure 3.1. We next define

$$\chi = \chi_v := \psi_v - h_v \in H_0^1(\Omega(v)), \quad (\chi_1, \chi_2) := (\chi_{v,1}, \chi_{v,2}) \in H^2(\Omega_1) \times H^2(\Omega_2(v)), \quad (3.4)$$

suppressing in the following the dependence of $\chi$ on the fixed $v$ for ease of notation. Recalling (2.4), we obtain from Proposition 3.1 that $\chi$ satisfies the transmission problem

$$\text{div}(\sigma \nabla \chi) = -\text{div}(\sigma \nabla h_v) \quad \text{in} \ \Omega(v),$$

$$[\chi] = [\sigma \partial_z \chi] = 0 \quad \text{on} \ \Sigma,$$

$$\chi = 0 \quad \text{on} \ \partial \Omega(v). \quad (3.5a), (3.5b), (3.5c)$$

Our aim is now to derive an estimate for $\chi = \chi_v = (\chi_{v,1}, \chi_{v,2})$ in the norm of $H^2(\Omega_1) \times H^2(\Omega_2(v))$, which only depends on $\|v\|_{H^2(D)}$ but neither on the norm of $v$ in $W_\infty^2(D)$ nor on the value of $\min_D\{v + H\}$. This then allows us to extend Proposition 3.1(b) to all $v \in \bar{S}$. Before going on, let us recall that

$$\sigma_1 \geq \sigma_{\text{min}} > 0, \quad \|\sigma_2\|_{C^2(\bar{\Omega}_1)} < \infty, \quad (3.6)$$

properties which will be used frequently in the following.
Analogously to Proposition 3.1 (c), an immediate consequence of (3.4) and (3.5b) is the $H^1$-regularity of $\sigma \partial_z \chi$.

**Lemma 3.3.** Let $v \in S \cap W^{2,\infty}_\infty(D)$ and $\chi = \psi - h_v$. Then $\sigma \partial_z \chi \in H^1(\Omega(v))$ and

$$\| \sigma \partial_z \chi \|_{H^1(\Omega(v))} \leq c \left( \| \partial_z \chi_1 \|_{H^1(\Omega_1)} + \| \partial_z \chi_2 \|_{H^1(\Omega_2(v))} \right)$$

for some constant $c > 0$ independent of $v$.

To derive an $H^2$-estimate on $\chi$ (more precisely, on $\chi_1$ and on $\chi_2$) we transform (3.5) to a transmission problem on a rectangle. To keep a flat interface between the two subregions, we transform $\Omega_1$ to the rectangle $D \times (-d, 0)$ and $\Omega_2(v)$ to the rectangle $D \times (0, 1)$. More precisely, we introduce the transformation

$$T_1(x, z) := (x, H + z) \ , \ (x, z) \in \Omega_1 \ , \quad (3.7)$$

mapping $\Omega_1$ onto the rectangle $\mathcal{R}_1 := D \times (-d, 0)$, and the transformation

$$T_2(x, z) := \left( x, \frac{H + z}{H + v(x)} \right) \ , \ (x, z) \in \Omega_2(v) \ , \quad (3.8)$$

mapping $\Omega_2(v)$ onto the fixed rectangle $\mathcal{R}_2 := D \times (0, 1)$. Then

$$\Sigma_0 := D \times \{ 0 \}$$

is the interface separating $\mathcal{R}_1$ and $\mathcal{R}_2$. We set

$$\mathcal{R} := D \times (-d, 1) = \mathcal{R}_1 \cup \mathcal{R}_2 \cup \Sigma_0$$

and let $(x, \eta)$ denote the new variables in $\mathcal{R}$, i.e. $(x, \eta) = T_1(x, z)$ in $\mathcal{R}_1$ and $(x, \eta) = T_2(x, z)$ in $\mathcal{R}_2$. We also introduce

$$\tilde{\sigma} := \begin{cases} \sigma_1 \circ (T_1)^{-1} & \text{in } \mathcal{R}_1, \\ \frac{\sigma_2}{H + v} & \text{in } \mathcal{R}_2. \end{cases}$$
Then, by (3.4) and (3.5b),
\[ \Phi = (\Phi_1, \Phi_2) \in H^1_0(\mathcal{R}), \quad \Phi_j := \chi_j \circ (T_j)^{-1} \in H^2(\mathcal{R}_j), \quad j = 1, 2, \quad (3.9) \]
and
\[ [\Phi] = [\hat{\sigma} \partial_\eta \Phi] = 0 \quad \text{on} \quad \Sigma_0. \quad (3.10) \]
We will make use of this regularity often in the following without mention. In particular, as \( \Phi \) vanishes on \( \partial \mathcal{R} \) (and is smooth enough),
\[ \partial_x \Phi(x, -d) = \partial_x \Phi(x, 1) = \partial_\eta \Phi(\pm L, \eta) = 0, \quad x \in D, \quad \eta \in (-d, 1). \quad (3.11) \]
We begin with an identity for \( \Phi \), which is based on [10, Lemma 4.3.1.2] and fundamental for the forthcoming analysis.

**Lemma 3.4.** Given \( v \in S \cap W^{2, \infty}_\infty(D) \) and with the above notation,
\[ \int_{\mathcal{R}} \partial^2_x \Phi \partial_\eta (\hat{\sigma} \partial_\eta \Phi) \, d(x, \eta) = \int_{\mathcal{R}} \partial_x \partial_\eta \Phi \partial_x (\hat{\sigma} \partial_\eta \Phi) \, d(x, \eta). \]

**Proof.** We adapt the proof of [17, Lemma II.2.2]. Since \([\Phi] = 0 \) on \( \Sigma_0 \) by (3.10), we get
\[ [\partial_x \Phi] = 0 \quad \text{on} \quad \Sigma_0. \quad (3.12) \]
Then (3.12) along with (3.9) imply that
\[ F := \partial_x \Phi = (\partial_x \Phi_1, \partial_x \Phi_2) \in H^1(\mathcal{R}), \]
while (3.10) along with (3.9) imply that
\[ G := \hat{\sigma} \partial_\eta \Phi = (\hat{\sigma}_1 \partial_\eta \Phi_1, \hat{\sigma}_2 \partial_\eta \Phi_2) \in H^1(\mathcal{R}). \]
Consequently, the regularity of \((F, G)\) together with (3.10), (3.11), and (3.12) allow us to apply [10, Lemma 4.3.1.2, Lemma 4.3.1.3] from which we deduce that
\[ \int_{\mathcal{R}} \partial_x F \partial_\eta G \, d(x, \eta) = \int_{\mathcal{R}} \partial_\eta F \partial_x G \, d(x, \eta) \]
as claimed. \( \square \)

Based on the previous lemma we derive the following identity, which subsequently leads to the desired \( H^2 \)-estimates on \( \psi = \psi_v \).

**Lemma 3.5.** Let \( v \in S \cap W^{2, \infty}_\infty(D) \). Then, for \( \chi = \psi_v - h_v \),
\[ \int_{\Omega_1 \cup \Omega_2(v)} \div (\sigma \nabla \chi) \, \partial^2_z \chi \, d(x, z) \]
\[ = \int_{\Omega_1 \cup \Omega_2(v)} \partial_z (\sigma \partial_x \chi) \, \partial_x \partial_z \chi \, d(x, z) + \int_{\Omega_1 \cup \Omega_2(v)} \partial_z (\sigma \partial_z \chi) \, \partial^2_x \chi \, d(x, z) \]
\[ + \int_D (\partial_x \sigma_1 \partial_x \chi \partial_z \chi_1) (x, -H) \, dx - \frac{\alpha_2}{2} \int_D \partial^2_x v(x) (\partial_z \chi_2(x, v(x)))^2 \, dx. \]
proof. Let us first emphasize that the regularity of \( \Phi \) stated in (3.9) ensures the validity of the subsequent computations. Using the transformations \( T_1 \) and \( T_2 \) introduced above (and the fact that \( \sigma_2 \) is constant) we get

\[
J := \int_{\Omega_1 \cup \Omega_2(v)} \partial_x (\sigma \partial_x \chi) \, \partial_x^2 \chi \, d(x, z) \\
= \int_{\mathcal{R}_1} \partial_x (\hat{\sigma}_1 \partial_x \Phi_1) \, \partial_{\eta}^2 \Phi_1 \, d(x, \eta) \\
+ \int_{\mathcal{R}_2} \hat{\sigma}_2 \partial_{\eta}^2 \Phi_2 \left[ \partial_x^2 \Phi_2 - \eta \frac{\partial_x v}{H + v} \partial_x \partial_\eta \Phi_2 + \eta^2 \left( \frac{\partial_x v}{H + v} \right)^2 \partial_{\eta}^2 \Phi_2 \\
+ 2\eta \left( \frac{\partial_x v}{H + v} \right)^2 \partial_\eta \Phi_2 - \eta \frac{\partial_{\eta}^2 v}{H + v} \partial_\eta \Phi_2 \right] \, d(x, \eta).
\]

We next combine the integral on \( \mathcal{R}_1 \) and the integral on \( \mathcal{R}_2 \) stemming from the first term in the square brackets to get

\[
\int_{\mathcal{R}_1} \partial_x (\hat{\sigma}_1 \partial_x \Phi_1) \, \partial_{\eta}^2 \Phi_1 \, d(x, \eta) + \int_{\mathcal{R}_2} \hat{\sigma}_2 \partial_{\eta}^2 \Phi_2 \, \partial_x^2 \Phi_2 \, d(x, \eta) \\
= \int_{\mathcal{R}} \partial_x^2 \Phi \, \partial_\eta (\hat{\sigma} \partial_\eta \Phi) \, d(x, \eta) + \int_{\mathcal{R}_1} \left[ \partial_x \hat{\sigma}_1 \partial_x \Phi_1 \partial_{\eta}^2 \Phi_1 - \partial_\eta \hat{\sigma}_1 \partial_x^2 \Phi_1 \partial_\eta \Phi_1 \right] \, d(x, \eta) \\
= \int_{\mathcal{R}} \partial_x \partial_\eta \Phi \, \partial_x (\hat{\sigma} \partial_\eta \Phi) \, d(x, \eta) + \int_{\mathcal{R}_1} \left[ \partial_x \hat{\sigma}_1 \partial_x \Phi_1 \partial_{\eta}^2 \Phi_1 - \partial_\eta \hat{\sigma}_1 \partial_x^2 \Phi_1 \partial_\eta \Phi_1 \right] \, d(x, \eta),
\]

where we have used Lemma 3.3 to obtain the second identity. Splitting again the integral on \( \mathcal{R} \) into integrals on \( \mathcal{R}_1 \) and \( \mathcal{R}_2 \) and gathering the above computations give

\[
J = \int_{\mathcal{R}_1} \hat{\sigma}_1 (\partial_x \partial_\eta \Phi_1)^2 \, d(x, \eta) + \int_{\mathcal{R}_1} \partial_x \hat{\sigma}_1 \partial_\eta \Phi_1 \partial_x \partial_\eta \Phi_1 \, d(x, \eta) \\
+ \int_{\mathcal{R}_1} \left[ \partial_x \hat{\sigma}_1 \partial_x \Phi_1 \partial_{\eta}^2 \Phi_1 - \partial_\eta \hat{\sigma}_1 \partial_x^2 \Phi_1 \partial_\eta \Phi_1 \right] \, d(x, \eta) \\
+ \int_{\mathcal{R}_2} \hat{\sigma}_2 (\partial_x \partial_\eta \Phi_2)^2 \, d(x, \eta) - \int_{\mathcal{R}_2} \frac{\hat{\sigma}_2 \partial_x v}{H + v} \partial_\eta \Phi_2 \partial_x \partial_\eta \Phi_2 \, d(x, \eta) \\
+ \int_{\mathcal{R}_2} \hat{\sigma}_2 \partial_{\eta}^2 \Phi_2 \left[ -2\eta \frac{\partial_x v}{H + v} \partial_x \partial_\eta \Phi_2 + \eta^2 \left( \frac{\partial_x v}{H + v} \right)^2 \partial_{\eta}^2 \Phi_2 \\
+ 2\eta \left( \frac{\partial_x v}{H + v} \right)^2 \partial_\eta \Phi_2 - \eta \frac{\partial_{\eta}^2 v}{H + v} \partial_\eta \Phi_2 \right] \, d(x, \eta) \tag{3.13}
\]

(3.13)

To handle \( I(\mathcal{R}_1) \) we first consider the third integral involving the square brackets. We integrate by parts its first term with respect to \( \eta \) and its second term with respect to \( x \). Using (3.11) to get rid of the corresponding boundary terms and noticing that the
resulting terms involving $\partial x_1 \hat{\sigma}_1$ cancel, this yields
\[
\int_{R_1} \left[ \partial x_1 \hat{\sigma}_1 \partial x_1 \Phi_1 \partial^2_\eta \Phi_1 - \partial x_1 \hat{\sigma}_1 \partial^2_\eta \Phi_1 \partial x_1 \Phi_1 \right] \, d(x, \eta)
\]
\[
= \int_D \int_{-d}^0 \partial x_1 \hat{\sigma}_1 \partial x_1 \Phi_1 \partial^2_\eta \Phi_1 \, d\eta \, dx - \int_{-d}^0 \partial x_1 \hat{\sigma}_1 \partial^2_\eta \Phi_1 \partial x_1 \Phi_1 \, dx \, d\eta
\]
\[
= \int_D (\partial x_1 \hat{\sigma}_1 \partial x_1 \Phi_1 \partial x_1 \Phi_1) (x, 0) \, dx - \int_{R_1} \partial x_1 \Phi_1 \partial x_1 \Phi_1 \, d(x, \eta)
\]
\[
+ \int_{R_1} \partial x_1 \hat{\sigma}_1 \partial x_1 \Phi_1 \partial x_1 \Phi_1 \, d(x, \eta).
\]
Consequently,
\[
I(R_1) = \int_{R_1} \hat{\sigma}_1 (\partial x_1 \partial x_1 \Phi_1)^2 \, d(x, \eta) + \int_{R_1} \partial x_1 \partial x_1 \Phi_1 \partial x_1 \Phi_1 \, d(x, \eta)
\]
\[
+ \int_D (\partial x_1 \hat{\sigma}_1 \partial x_1 \Phi_1 \partial x_1 \Phi_1) (x, 0) \, dx ;
\]
that is, using the transformation $T_1$ to write the integral in terms of $\chi_1$,
\[
I(R_1) = \int_{\Omega_1} \partial x_1 (\sigma_1 \partial x_1 \chi_1) \partial x_2 \chi_1 \, d(x, z) + \int_D (\partial x_1 \sigma_1 \partial x_1 \chi_1 \partial x_1 \chi_1) (x, -H) \, dx . \quad (3.14)
\]
We next turn to $I(R_2)$ and gather some of the terms to get
\[
I(R_2) = \int_{R_2} \sigma_2 \left[ \frac{\partial x_1 \partial x_2 \Phi_2}{H + v} - \frac{\partial x_1 v}{(H + v)^2} \partial x_2 \Phi_2 - \eta \frac{\partial x_1 v}{(H + v)^2} \partial^2_\eta \Phi_2 \right]^2 (H + v) \, d(x, \eta)
\]
\[
+ \int_{R_2} \sigma_2 \frac{\partial x_1 v}{H + v} \partial x_2 \Phi_2 \left[ \partial x_2 \partial x_2 \Phi_2 - \frac{\partial x_1 v}{H + v} \partial x_2 \Phi_2 \right] \, d(x, \eta)
\]
\[
- \int_{R_2} \sigma_2 \eta \frac{\partial x_1^2 v}{H + v} \partial x_2 \Phi_2 \partial^2_\eta \Phi_2 \, d(x, \eta).
\]
We then focus on the last term of this identity. Integrating first in $\eta$ and then by parts in $x$, using again (3.11) to cancel the corresponding boundary terms, yields
\[
- \int_{R_2} \sigma_2 \eta \frac{\partial x_1^2 v}{H + v} \partial x_2 \Phi_2 \partial^2_\eta \Phi_2 \, d(x, \eta)
\]
\[
= - \frac{\sigma_2}{2} \int_D \frac{\partial x_1^2 v(x)}{H + v(x)} \left( \frac{\partial x_2 \Phi_2(x, 1)}{H + v(x)} \right) (\partial x_2 \Phi_2(x, 1))^2 \, dx
\]
\[
+ \frac{\sigma_2}{2} \int_{R_2} \frac{\partial x_1^2 v}{(H + v)^2} (\partial x_2 \Phi_2)^2 \, d(x, \eta)
\]
\[
= - \frac{\sigma_2}{2} \int_D \frac{\partial x_1^2 v(x)}{H + v(x)} \left( \frac{\partial x_2 \Phi_2(x, 1)}{H + v(x)} \right)^2 \, dx
\]
\[
+ \int_{R_2} \sigma_2 \left[ \frac{\partial x_1^2 v}{(H + v)^2} (\partial x_2 \Phi_2)^2 - \frac{\partial x_1 v}{H + v} \partial x_2 \Phi_2 \partial x_2 \Phi_2 \right] \, d(x, \eta).
\]
Hence, gathering the previous two identities and noticing the cancellation of terms entail
\[
I(\mathcal{R}_2) = \int_{\mathcal{R}_2} \sigma_2 \left[ \frac{\partial_x \partial_x \Phi_2}{H + v} - \frac{\partial_x v}{(H + v)^2} \partial_x \Phi_2 - \eta \frac{\partial_x v}{(H + v)^2} \partial^2_x \Phi_2 \right]^2 (H + v) \, d(x, \eta)
- \frac{\sigma_2}{2} \int_D \partial^2_x v(x) \left( \frac{\partial_x \Phi_2(x, 1)}{H + v(x)} \right)^2 \, dx.
\]
Since
\[
\partial_x \partial_x \chi_2(x, z) = \frac{1}{H + v(x)} \partial_x \partial_x \Phi_2 \left( x, \frac{H + z}{H + v(x)} \right) - \frac{\partial_x v(x)}{(H + v(x))^2} \partial_x \Phi_2 \left( x, \frac{H + z}{H + v(x)} \right)
- \frac{\partial_x v(x)(H + z)}{(H + v(x))^3} \partial^2_x \Phi_2 \left( x, \frac{H + z}{H + v(x)} \right),
\]
we use $T_2$ to transform $I(\mathcal{R}_2)$ back to $\chi_2$ and find
\[
I(\mathcal{R}_2) = \int_{\Omega(v)} \sigma_2 (\partial_x \partial_x \chi_2)^2 \, d(x, z) - \frac{1}{2} \int_D \sigma_2 \partial^2_x v(x) (\partial_x \chi_2(x, v(x)))^2 \, dx. \tag{3.15}
\]
Plugging (3.14)-(3.15) into (3.13) and recalling that $\sigma_2$ is constant, the assertion readily follows. \qed

The right-hand side of the identity of Lemma 3.5 involves “bulk” terms in $\Omega_1 \cup \Omega_2(v)$ and a contribution on the interface $\Sigma$ and the top part $\Theta(v)$, see (1.5), which all require to be handled differently. We begin with the first interface integral on $\Sigma$ and observe:

**Lemma 3.6.** Given $\alpha \in (1/2, 1)$ there is $c_2(\alpha) > 0$ such that, for $v \in S \cap W^2_{\infty}(D)$ and $\chi = \psi_v - h_v$,
\[
\left| \int_D \left( \partial_x \sigma_1 \partial_x \chi_1 \partial_x \chi_1(x, -H) \right) \, dx \right| \leq c_2(\alpha) \| \chi_1 \|_{H^1(\Omega_1)}^{2(1-\alpha)} \| \chi_1 \|_{H^2(\Omega_1)}^{2\alpha}.
\]

**Proof.** By complex interpolation, $H^\alpha(\Omega_1) \equiv [L^2(\Omega_1), H^1(\Omega_1)]_{\alpha}$, which guarantees
\[
\| w \|_{H^\alpha(\Omega_1)} \leq c(\alpha) \| w \|_{L^2(\Omega_1)}^{1-\alpha} \| w \|_{H^1(\Omega_1)}^\alpha, \quad w \in H^1(\Omega_1).
\]
Since the trace operator is continuous from $H^\alpha(\Omega_1)$ to $L^2(D \times \{-H\})$, see [10] Theorem 1.5.1.2], we deduce from (3.6) that
\[
\left| \int_D \left( \partial_x \sigma_1 \partial_x \chi_1 \partial_x \chi_1(x, -H) \right) \, dx \right| \leq \| \partial_x \sigma_1 \|_{\infty} \| \partial_x \chi_1 \|_{L^2(D \times \{-H\})} \| \partial_x \chi_1 \|_{L^2(D \times \{-H\})}
\leq c(\alpha) \| \partial_x \chi_1 \|_{H^\alpha(\Omega_1)} \| \partial_x \chi_1 \|_{H^\alpha(\Omega_1)}
\leq c(\alpha) \| \chi_1 \|_{H^1(\Omega_1)}^{2(1-\alpha)} \| \chi_1 \|_{H^2(\Omega_1)}^{2\alpha}
\]
as claimed. \qed

Let us point out that the transformation $(T_1, T_2)$ introduced in (3.7)-(3.8) and used in the proof of Lemma 3.5 features a singularity as $v$ approaches $-H$, a property which prevents its use for $v \in S$. To circumvent this drawback, we shall introduce a different transformation which maps $\Omega(v)$ as a whole onto a fixed rectangle, but does not preserve the flatness of the interface between the two subregions $\Omega_1$ and $\Omega_2(v)$ (see (3.18) below). As we shall see, such a transformation allows us to derive functional inequalities for all
\( v \in \bar{S} \) depending only on the \( H^2 \)-norm of \( v \). This mild dependence turns out to be of utmost importance for the forthcoming analysis.

**Lemma 3.7.** Given \( \kappa > 0 \) and \( q \in [1, \infty) \), there is \( c(q, \kappa) > 0 \) such that, for \( v \in \bar{S} \) with \( \|v\|_{H^2(D)} \leq \kappa \),

\[
\|\theta\|_{L_q(\Omega(v))} \leq c(q, \kappa)\|\theta\|_{H^1(\Omega(v))}, \quad \theta \in H^1(\Omega(v)).
\]  
Moreover, given \( \alpha \in (0, 1/2) \), there is \( c(\alpha, \kappa) > 0 \) such that, for \( v \in \bar{S} \) with \( \|v\|_{H^2(D)} \leq \kappa \),

\[
\|\theta(\cdot, v)\|_{H^\alpha(D)} \leq c(\alpha, \kappa)\|\theta\|^{(1-2\alpha)/2}_{L_2(\Omega(v))}\|\theta\|^{(2\alpha+1)/2}_{H^1(\Omega(v))}, \quad \theta \in H^1(\Omega(v)).
\]

**Proof.** We use the transformation

\[
\Xi(x, z) := T(x, z) := \left( x, \frac{H + d + z}{H + d + v(x)} \right), \quad (x, z) \in \Omega(v),
\]
to map \( \Omega(v) \) onto the rectangle \( \mathcal{R}_2 = D \times (0, 1) \). Given \( \theta \in H^1(\Omega(v)) \), we define \( \phi := \theta \circ \Xi^{-1} \) so that

\[
\phi(x, \eta) = \theta(x, -H - d + (H + d + v(x))\eta),
\]

\[
\partial_x \phi(x, \eta) = \partial_x \theta(x, -H - d + (H + d + v(x))\eta) + \eta \partial_x v(x) \partial_x \theta(x, -H - d + (H + d + v(x))\eta),
\]

\[
\partial_\eta \phi(x, \eta) = (H + d + v(x)) \partial_\eta \theta(x, -H - d + (H + d + v(x))\eta)
\]
for \( (x, \eta) \in \mathcal{R}_2 \). It easily follows from the previous formulas, the continuous embedding of \( H^2(D) \) in \( W^1_\infty(D) \), and the assumed bound on \( v \) that

\[
\|\phi\|_{H^1(\mathcal{R}_2)} \leq c(\kappa)\|\theta\|_{H^1(\Omega(v))} ,
\]

\[
\|\phi\|_{L_q(\mathcal{R}_2)} \leq \frac{1}{d^{1/q}}\|\theta\|_{L_q(\Omega(v))} ,
\]

\[
\|\theta\|_{L_q(\Omega(v))} \leq c(q, \kappa)\|\phi\|_{L_q(\mathcal{R}_2)} .
\]

On the one hand, \( (3.16) \) now readily follows from \( (3.19) \), \( (3.21) \) and the continuous embedding of \( H^1(\mathcal{R}_2) \) in \( L_q(\mathcal{R}_2) \) for all \( q \in [1, \infty) \). On the other hand, the continuity of the trace as a mapping from \( H^1(\mathcal{R}_2) \) to \( H^{1/2}(D \times \{1\}) \), see \[10\] Theorem 1.5.1.2, and \( (3.19) \) ensure that

\[
\|\theta(\cdot, v)\|_{H^{1/2}(D)} = \|\phi(\cdot, 1)\|_{H^{1/2}(D)} \leq c\|\phi\|_{H^1(\mathcal{R}_2)} \leq c(\kappa)\|\theta\|_{H^1(\Omega(v))} .
\]

Finally, let \( \alpha \in (0, 1/2) \). By complex interpolation,

\[
[L_2(\mathcal{R}_2), H^1(\mathcal{R}_2)]_{\alpha+1/2} = H^{\alpha+1/2}(\mathcal{R}_2)
\]
so that

\[
\|\phi\|_{H^{\alpha+1/2}(\mathcal{R}_2)} \leq c(\alpha)\|\phi\|^{(1-2\alpha)/2}_{L_2(\mathcal{R}_2)}\|\phi\|^{(2\alpha+1)/2}_{H^1(\mathcal{R}_2)} .
\]

Since \( \alpha > 0 \), the trace maps \( H^{\alpha+1/2}(\mathcal{R}_2) \) continuously to \( H^\alpha(D \times \{1\}) \) and we thus deduce that

\[
\|\theta(\cdot, v)\|_{H^\alpha(D)} = \|\phi(\cdot, 1)\|_{H^\alpha(D)} \leq c(\alpha)\|\phi\|^{(1-2\alpha)/2}_{L_2(\mathcal{R}_2)}\|\phi\|^{(2\alpha+1)/2}_{H^1(\mathcal{R}_2)}
\]

\[
\leq c(\alpha, \kappa)\|\theta\|^{(1-2\alpha)/2}_{L_2(\Omega(v))}\|\theta\|^{(2\alpha+1)/2}_{H^1(\Omega(v))} ,
\]
the last inequality stemming from \( (3.19) \) and \( (3.20) \). \( \square \)
As for the boundary integral over $\mathcal{G}(v)$ on the right-hand side of the identity of Lemma 3.5 we note:

**Lemma 3.8.** Given $\zeta \in (3/4, 1)$ and $\kappa > 0$, there is $\zeta(\zeta, \kappa) > 0$ such that, for $v \in S \cap W^2_\infty(D)$ with $\|v\|_{H^2(D)} \leq \kappa$ and $\chi = \psi_v - h_v$,

$$\left| \frac{\sigma^2}{2} \int_D \partial_x^2 v(x) \left( \partial_x \chi_2(x, v(x)) \right)^2 \, dx \right| \leq \zeta(\zeta, \kappa) \|\partial_x \chi\|_{L^2(\Omega(v))}^2 \|\sigma \partial_x \chi\|_{H^1(\Omega(v))}^2.$$

**Proof.** By the Cauchy-Schwarz inequality,

$$\left| \frac{\sigma^2}{2} \int_D \partial_x^2 v(x) \left( \partial_x \chi_2(x, v(x)) \right)^2 \, dx \right| \leq (\sigma^2)^{-1} \|\partial_x^2 v\|_{L^2(D)} \|\sigma \partial_x \chi_2(\cdot, v)\|_{L^4(D)}^2$$

and it remains to estimate the term involving $\chi_2$. To this end we use the functional inequality (3.17) (with $\alpha = \zeta - 1/2$), and the continuous embedding of $H^{\zeta-1/2}(D)$ in $L^4(D)$ to obtain

$$\|\sigma \partial_x \chi_2(\cdot, v)\|_{L^4(D)}^2 \leq \|\sigma \partial_x \chi_2(\cdot, v)\|_{H^{2(\zeta-1/2)}(D)} \leq c(\zeta, \kappa) \|\theta\|_{L^2(\Omega(v))}^2 \|\theta\|_{H^1(\Omega(v))}^2$$

as claimed. \hfill \Box

We are now in a position to derive the desired estimate on $\psi_v$.

**Proposition 3.9.** Given $\kappa > 0$, there is a constant $\psi(\kappa) > 0$ such that

$$\|\chi_v\|_{H^1(\Omega(v))} + \|\chi_{v,1}\|_{H^2(\Omega_1)} + \|\chi_{v,2}\|_{H^2(\Omega_2(v))} \leq \psi(\kappa)$$

(3.22a)

and

$$\|\psi_v\|_{H^1(\Omega(v))} + \|\psi_{v,1}\|_{H^2(\Omega_1)} + \|\psi_{v,2}\|_{H^2(\Omega_2(v))} + \|\sigma \partial_x \psi_v\|_{H^1(\Omega(v))} \leq \psi(\kappa),$$

(3.22b)

whenever $v \in S \cap W^2_\infty(D)$ with $\|v\|_{H^2(D)} \leq \kappa$.

**Proof.** Since $\text{div}(\sigma \nabla \chi) = -\text{div}(\sigma \nabla h_v)$ in $\Omega(v)$ by (3.5a), it follows from Lemma 3.5 that

$$\int_{\Omega_1 \cup \Omega_2(v)} \sigma \left( \partial_x \chi_2 \right)^2 \, d(x, z) + \int_{\Omega_1 \cup \Omega_2(v)} \sigma \left( \partial_x^2 \chi \right)^2 \, d(x, z)$$

$$= -\int_{\Omega_1 \cup \Omega_2(v)} \text{div}(\sigma \nabla h_v) \left( \partial_x \chi_2 \right) \, d(x, z) - \int_{\Omega_1} \partial_x \sigma_1 \left\{ \partial_x \chi_2 \partial_x \partial_x \chi_2 + \partial_x \partial_x \chi_2 \right\} \, d(x, z)$$

$$- \int_D \left( \partial_x \partial_x \chi_2 \partial_x \chi_2 \right) (x, -h) \, dx + \frac{\sigma_2}{2} \int_D \left( \partial_x^2 v(x) \left( \partial_x \chi_2(x, v(x)) \right)^2 \right) \, dx.$$

We next use (3.6) and the Cauchy-Schwarz inequality for the integrals on $\Omega_1 \cup \Omega_2(v)$ on the right-hand side. Incorporating the resulting terms involving second order derivatives of $\chi$ on the left-hand side and recalling Lemma 3.6 and Lemma 3.8, we deduce

$$\int_{\Omega_1 \cup \Omega_2(v)} \sigma \left( \partial_x \chi_2 \right)^2 \, d(x, z) + \int_{\Omega_1 \cup \Omega_2(v)} \sigma \left( \partial_x^2 \chi \right)^2 \, d(x, z)$$

$$\leq c \int_{\Omega_1 \cup \Omega_2(v)} |\text{div}(\sigma \nabla h_v)|^2 \, d(x, z) + c \int_{\Omega_1} \sigma_1 |\nabla \chi_2|^2 \, d(x, z)$$

$$+ \zeta(\zeta, \kappa) \chi_1 \|H^{2(\zeta-1/2)}(\Omega_1) \chi_1\|_{H^2(\Omega_1)} + \psi(\kappa) \|\partial_x \chi\|_{H^1(\Omega_1)}^2 \|\sigma \partial_x \chi\|_{H^1(\Omega_1)}^2$$

(3.23)
for some fixed $\alpha \in (3/4, 1)$. We now aim at controlling the last two terms of the right-hand side by the term on the left-hand side. For the first term we obtain from (3.5a) and (3.6)

$$
\|\chi\|_{H^1(\Omega)}^{2\alpha} \leq \left( \|\partial_x^2 \chi_1\|_{L^2(\Omega)}^2 + \|\partial_x \partial_z \chi_1\|_{L^2(\Omega)}^2 + \|\partial_z^2 \chi_1\|_{L^2(\Omega)}^2 \right)^{\alpha} + \|\chi\|_{H^1(\Omega)}^{2\alpha} 
$$

By Young’s inequality and (3.6), we obtain for $\epsilon \in (0, 1)$

$$
\|\chi\|_{H^1(\Omega)}^{2(1-\alpha)} \|\chi\|_{H^2(\Omega)}^{2\alpha} \leq \epsilon \|\text{div}(\sigma_1 \nabla h_{\epsilon,1})\|_{L^2(\Omega)}^2 + \epsilon \|\partial_x \partial_z \chi_1\|_{L^2(\Omega)}^2 + (1 + \frac{c}{\epsilon}) \|\chi\|_{H^1(\Omega)}^{2} 
$$

We use once more (3.6) and choose

$$
\epsilon := \min \left\{ \frac{1}{16\|\sigma_1\|_{L^\infty(\Omega)}}, \frac{\sigma_{\min}}{8}, \frac{1}{2} \right\} 
$$

to obtain

$$
\|\chi\|_{H^1(\Omega)}^{2(1-\alpha)} \|\chi\|_{H^2(\Omega)}^{2\alpha} \leq \frac{1}{4} \int_{\Omega} \sigma_1 \left\{ (\partial_x \partial_z \chi_1)^2 + (\partial_z^2 \chi_1)^2 \right\} \, d(x, z) + \epsilon \int_{\Omega} \left( |\chi_1|^2 + \sigma_1 |\nabla \chi_1|^2 \right) \, d(x, z) + \epsilon \int_{\Omega} |\text{div}(\sigma_1 \nabla h_{\epsilon,1})|^2 \, d(x, z). 
$$

Finally, since $\chi_1(x, -H - d) = 0$ for $x \in D$, a generalized Poincaré’s inequality (see II.Section 1.4)) and (3.6) entail that

$$
\int_{\Omega} |\chi_1|^2 \, d(x, z) \leq c \int_{\Omega} |\nabla \chi_1|^2 \, d(x, z) \leq c \int_{\Omega} \sigma_1 |\nabla \chi_1|^2 \, d(x, z), 
$$

so that

$$
\|\chi\|_{H^1(\Omega)}^{2(1-\alpha)} \|\chi\|_{H^2(\Omega)}^{2\alpha} \leq \frac{1}{4} \int_{\Omega} \sigma_1 \left\{ (\partial_x \partial_z \chi_1)^2 + (\partial_z^2 \chi_1)^2 \right\} \, d(x, z) + c \int_{\Omega} \sigma_1 |\nabla \chi_1|^2 \, d(x, z) + c \int_{\Omega} |\text{div}(\sigma_1 \nabla h_{\epsilon,1})|^2 \, d(x, z). 
$$
Similarly, for \( \epsilon \in (0, 1) \), it follows from (3.6) and Young’s inequality that
\[
\| \partial_z \chi \|_{L^2(\Omega(v))}^{2(1-\alpha)} \| \sigma \partial_z \chi \|_{H^1(\Omega(v))}^{2a} \\
\leq \| \partial_z \chi \|_{L^2(\Omega(v))}^{2(1-\alpha)} \| \sigma \partial_z \chi \|_{L^2(\Omega(v))}^{2a} \\
+ \| \partial_z \chi \|_{L^2(\Omega(v))}^{2(1-\alpha)} \left( \| \partial_x (\sigma \partial_z \chi) \|_{L^2(\Omega(v))}^2 + \| \partial_z (\sigma \partial_z \chi) \|_{L^2(\Omega(v))}^2 \right) \\
\leq \frac{\| \sigma \|_{L^\infty(\Omega(v))}^2}{\sigma_{\min}} \int_{\Omega(v)} \sigma |\nabla \chi|^2 \, dx, \, dz + \frac{1}{\epsilon} \int_{\Omega(v)} |\partial_z \chi|^2 \, dx, \, dz \\
+ \epsilon \| \partial_x (\sigma \partial_z \chi) \|_{L^2(\Omega(v))} + \| \partial_z (\sigma \partial_z \chi) \|_{L^2(\Omega(v))} \\
\leq c \left( 1 + \frac{1}{\epsilon} \right) \int_{\Omega(v)} \sigma |\partial_z \chi|^2 \, dx, \, dz + 2c \int_{\Omega(v)} (|\partial_x \sigma_1|^2 + |\partial_z \sigma_1|^2) |\partial_z \chi|^2 \, dx, \, dz \\
+ 2c \| \sigma \|_{L^\infty(D)} \left( \int_{\Omega(v)} \sigma |\partial_x \partial_z \chi|^2 \, dx, \, dz + \int_{\Omega(v)} \sigma |\partial_z^2 \chi|^2 \, dx, \, dz \right).
\] (3.25)

Choosing \( \epsilon = 1/(8 \| \sigma \|_{L^\infty(D)}) \) and using once more (3.6), we end up with
\[
\| \partial_z \chi \|_{L^2(\Omega(v))}^{2(1-\alpha)} \| \sigma \partial_z \chi \|_{H^1(\Omega(v))}^{2a} \leq c \int_{\Omega(v)} \sigma |\nabla \chi|^2 \, dx, \, dz \\
+ \frac{1}{4} \int_{\Omega(v)} \sigma \left\{ (\partial_x \partial_z \chi)^2 + (\partial_z^2 \chi)^2 \right\} \, dx, \, dz.
\] (3.26)

Taking (3.24)–(3.25) into account, we derive from (3.23) that
\[
\int_{\Omega_1 \cup \Omega_2(v)} \sigma (\partial_x \partial_z \chi)^2 \, dx, \, dz + \int_{\Omega_1 \cup \Omega_2(v)} \sigma (\partial_z^2 \chi)^2 \, dx, \, dz \\
\leq c \int_{\Omega_1 \cup \Omega_2(v)} \text{div} (\sigma \nabla h_v) |^2 \, dx, \, dz + c \int_{\Omega(v)} \sigma |\nabla \chi|^2 \, dx, \, dz.
\]

We then use again the identity
\[
\sigma \partial_z^2 \chi = -\partial_x \sigma \partial_x \chi - \partial_z \sigma \partial_z \chi - \sigma \partial_z^2 \chi - \text{div} (\sigma \nabla h_v) \quad \text{in} \quad \Omega_1 \cup \Omega_2(v),
\]
stemming from (3.5a) along with Lemma 3.2 (recalling \( \psi_v = \chi + h_v \)) and (3.6) to derive
\[
\| \chi_1 \|_{H^2(\Omega_1)}^2 + \| \chi_2 \|_{H^2(\Omega_2(v))}^2 \leq c \int_{\Omega_1 \cup \Omega_2(v)} |\text{div} (\sigma \nabla h_v)|^2 \, dx, \, dz \\
+ \int_{\Omega(v)} \sigma |\nabla h_v|^2 \, dx, \, dz.
\] (3.26)

Finally, since \( h_{v,j}(x, z) = h_j(x, z, v(x)) \) for \( (x, z) \in \Omega(v) \) and \( j = 1, 2 \), it follows from the assumed bound on \( v \) and the continuous embedding of \( H^2(D) \) in \( C(D) \) that
\[
\| h_{v,1} \|_{H^2(\Omega_1)} \leq c \left( 1 + \| v \|_{H^1(D)}^2 + \| v \|_{H^2(D)} \right) \| h_1 \|_{C^2(\bar{\Omega} \times [-d,-d] \times [-h,\kappa])} \\
\leq c(\kappa)
\] (3.27a)
\[ \Omega(v) = \int_{\Omega(v)} \sigma |\nabla (\theta + h_v)|^2 \, d(x, z), \quad \theta \in H^1_0(\Omega(v)), \quad \theta \in L^2(\Omega(M)) \setminus H^1_0(\Omega(v)). \]

Consider now \( v \in \bar{S} \) and a sequence \( (v_n)_{n \geq 1} \) in \( \bar{S} \) such that
\[ v_n \to v \quad \text{in} \quad H^1_0(D), \quad -H \leq v, v_n \leq M. \]
Owing to the continuous embedding of $H^1_0(D)$ in $C(\bar{D})$, a direct consequence of (3.28) is that

$$v_n \to v \quad \text{in} \quad C(\bar{D}).$$

Let us first observe that, according to (2.3) and (2.4), both $h v_n$ and $h v$ belong to $H^1(\Omega(M))$.

**Lemma 3.10.** Suppose (3.28). Then $h v_n \to h v$ in $H^1(\Omega(M))$ and

$$\lim_{n \to \infty} \int_{\Omega(v_n)} \sigma |\nabla h v_n|^2 \, d(x, z) = \int_{\Omega(v)} \sigma |\nabla h v|^2 \, d(x, z).$$

**Proof.** Recall that $h v(x, z) = h(x, z, v(x))$ for $(x, z) \in \Omega(M)$, so that

$$\nabla h v(x, z) = (\partial_x h(x, z, v(x)) + \partial_x v(x) \partial_x h(x, z, v(x)), \partial_z h(x, z, v(x))),$$

hence $h v_n, h v \in H^1(\Omega(M))$. Owing to (3.29) and the regularity of $h$ we obtain

$$\lim_{n \to \infty} \sup_{(x, z) \in \Omega(M)} |(\partial_x h, \partial_z h, \partial_x v_n \partial_w h)(x, z, v_n(x)) - (\partial_x h, \partial_z h, \partial_x v \partial_w h)(x, z, v(x))| = 0.$$ (3.32)

Together with (3.28), this implies $h v_n \to h v$ in $H^1(\Omega(M))$. In particular, $|\nabla h v_n|^2 \to |\nabla h v|^2$ in $L^1(\Omega(M))$. Since $\sigma$ is bounded and $\sigma 1_{\Omega(v_n)} \to \sigma 1_{\Omega(v)}$ pointwise, the last property stated in Lemma 3.10 now follows from [8, Proposition 2.61].

Next, we show that the functional $G(v)$ is the $\Gamma$-limit of the sequence $(G(v_n))_{n \geq 1}$.

**Proposition 3.11.** Suppose (3.28). Then

$$\Gamma - \lim_{n \to \infty} G(v_n) = G(v) \quad \text{in} \quad L^2(\Omega(M)).$$

**Proof.** Step 1. We begin with the asymptotic lower semicontinuity. Considering an arbitrary sequence $(\theta_n)_{n \geq 1}$ in $L^2(\Omega(M))$ and $\theta \in L^2(\Omega(M))$ such that

$$\theta_n \to \theta \quad \text{in} \quad L^2(\Omega(M)),$$ (3.30)

we have to show that

$$G(v)[\theta] \leq \liminf_{n \to \infty} G(v_n)[\theta_n].$$ (3.31)

We may assume that $\theta_n \in H^1_0(\Omega(v_n))$ for all $n \geq 1$ and that $(G(v_n)[\theta_n])_{n \geq 1}$ is bounded, since (3.31) is clearly satisfied otherwise. In that case, if $\tilde{\theta}_n$ denotes the extension of $\theta_n$ by zero in $\Omega(M) \setminus \Omega(v_n)$, then it follows from (2.1) and Lemma 3.10 that $(\tilde{\theta}_n)_{n \geq 1}$ is bounded in $H^1_0(\Omega(M))$ and thus

$$(\tilde{\theta}_n)_{n \geq 1} \quad \text{is weakly relatively compact in} \quad H^1_0(\Omega(M)).$$ (3.32)
Introducing $\tilde{\theta} := \theta 1_{\Omega(v)}$ and noticing that

$$
\int_{\Omega(M)} |\tilde{\theta}_n - \tilde{\theta}|^2 d(x, z) = \int_{\Omega(v) \cap \Omega(M)} |\theta_n - \theta|^2 d(x, z) + \int_{\Omega(v) \cap \partial (\Omega(M) \setminus \Omega(v))} |\theta_n|^2 d(x, z) 
+ \int_{\Omega(M) \setminus (\Omega(v) \cap \partial \Omega(M))} |\theta|^2 d(x, z)
$$

$$
\leq \int_{\Omega(v) \cap \Omega(M)} |\theta_n - \theta|^2 d(x, z) + 2 \int_{\Omega(v) \cap \partial (\Omega(M) \setminus \Omega(v))} |\theta_n - \theta|^2 d(x, z)
+ 2 \int_{\Omega(M) \setminus (\Omega(v) \cap \partial \Omega(M))} |\theta|^2 d(x, z),
$$

we infer from (3.29), (3.30), and Lebesgue’s theorem that the right-hand side of the above inequality converges to zero as $n \to \infty$. Consequently, $(\tilde{\theta}_n)_{n \geq 1}$ converges to $\tilde{\theta}$ in $L^2(\Omega(M))$, which implies, together with (3.32), that $\tilde{\theta} \in H^1(\Omega(M))$ and

$$
\tilde{\theta}_n \to \tilde{\theta} \quad \text{in} \quad H^1(\Omega(M)), \quad \tilde{\theta}_n \to \theta \quad \text{in} \quad H^{3/4}(\Omega(v)).
$$

In particular, using Lemma 3.10 and the continuity of the trace,

$$
\tilde{\theta}_n + h_{v_n} \to \theta + h_v \quad \text{in} \quad L^2(\partial \Omega(v)).
$$

It remains to check that $\theta \in H^1_0(\Omega(v))$ for which we only have to show that $\theta$ vanishes (in the sense of traces) on the upper part $\Theta v$ of the boundary $\partial \Omega(v)$, since $\theta = \tilde{\theta}$ vanishes on the other boundary parts of $\Omega(v)$. Since $\tilde{\theta}_n \in H^1_0(\Omega(v_n))$, it follows from Hölder’s inequality that

$$
|h_{v_n,2}(x, v_n(x)) - (\tilde{\theta}_n + h_{v_n,2})(x, v(x))| = \left| (\tilde{\theta}_n + h_{v_n,2})(x, v_n(x)) - (\tilde{\theta}_n + h_{v_n,2})(x, v(x)) \right|
$$

$$
= \left| \int_{v(x)}^{v_n(x)} \partial_z (\tilde{\theta}_n + h_{v_n,2})(x, z) \, dz \right|
$$

$$
\leq |v_n(x) - v(x)|^{1/2} \left( \int_{-H}^{M} |\partial_z (\tilde{\theta}_n + h_{v_n,2})(x, z)|^2 \, dz \right)^{1/2}
$$

for a.e. $x \in D$, and thus, by (2.1),

$$
\int_D |h_{v_n,2}(x, v_n(x)) - (\tilde{\theta}_n + h_{v_n,2})(x, v(x))|^2 \, dx
$$

$$
\leq \int_D |v_n(x) - v(x)| \int_{-H}^{M} |\partial_z (\tilde{\theta}_n + h_{v_n,2})(x, z)|^2 \, dz \, dx
$$

$$
\leq \frac{||v_n - v||_{L^\infty(D)}}{\sigma_{\text{min}}} \int_{\Omega(M)} |\nabla (\tilde{\theta}_n + h_{v_n})(x, z)|^2 \, d(x, z)
$$

$$
= 2 \frac{||v_n - v||_{L^\infty(D)}}{\sigma_{\text{min}}} G(v_n)[\theta_n].
$$

Since $(G(v_n)[\theta_n])_{n \geq 1}$ is bounded and $v_n \to v$ in $C(D)$ by (3.29), the right-hand side of the above inequality converges to zero. Hence, due to (3.34) and $h_{v_n,2}(\cdot, v_n) \to h_{v,2}(\cdot, v)$ in
Since the Hausdorff distance $d$ by (3.29) and since $H \in G$, we prove the existence of a recovery sequence. By definition of the functional

$$\theta_n + h_{v_n} \rightharpoonup \tilde{\theta} + h_{v} \quad \text{in} \quad H^1_0(\Omega(M)),$$

so that

$$\int_{\Omega(M)} \sigma |\nabla (\tilde{\theta} + h_{v})|^2 \, d(x, z) \leq \liminf_{n \to \infty} \int_{\Omega(M)} \sigma |\nabla (\tilde{\theta}_n + h_{v_n})|^2 \, d(x, z). \quad (3.35)$$

Since $\tilde{\theta}_n \in H^1_0(\Omega(v_n))$,

$$\int_{\Omega(M) \setminus \Omega(v_n)} \sigma |\nabla (\tilde{\theta}_n + h_{v_n})|^2 \, d(x, z) = \int_{\Omega(M) \setminus \Omega(v_n)} \sigma |\nabla h_{v_n}|^2 \, d(x, z)$$

and we thus deduce from Lemma 3.10

$$\lim_{n \to \infty} \int_{\Omega(M) \setminus \Omega(v_n)} \sigma |\nabla (\tilde{\theta}_n + h_{v_n})|^2 \, d(x, z) = \int_{\Omega(M) \setminus \Omega(v)} \sigma |\nabla h_{v}|^2 \, d(x, z)$$

$$= \int_{\Omega(M)} \sigma |\nabla (\tilde{\theta} + h_{v})|^2 \, d(x, z), \quad (3.36)$$

the last equality being due to $\tilde{\theta} \in H^1_0(\Omega(v))$. Combining (3.35) and (3.36) implies (3.31).

**Step 2.** We prove the existence of a recovery sequence. By definition of the functional $G(v)$ we only need to consider $\theta \in H^1_0(\Omega(v))$. Then $\theta \in H^1_0(\Omega(M))$ and $f := -\Delta \theta \in H^{-1}(\Omega(M))$ can be considered also as an element of $H^{-1}(\Omega(v_n))$ by restriction. Let now $\theta_n \in H^1_0(\Omega(v_n))$ denote the unique weak solution to

$$-\Delta \theta_n = f \quad \text{in} \quad \Omega(v_n), \quad \theta_n = 0 \quad \text{on} \quad \partial \Omega(v_n).$$

Since the Hausdorff distance $d_H$ in $\Omega(M)$ (see [11 Section 2.2.3]) satisfies

$$d_H(\Omega(v_n), \Omega(v)) \leq \|v_n - v\|_{L^\infty(D)} \to 0$$

by (3.29) and since $\Omega(M) \setminus \Omega(v_n)$ has a single connected component for all $n \geq 1$ as $v_n > -H$, it follows from [22 Theorem 4.1] and [11 Theorem 3.2.5] that $\theta_n \to \tilde{\theta}$ in $H^1_0(\Omega(M))$, where $\tilde{\theta} \in H^1_0(\Omega(M))$ is the unique weak solution to

$$-\Delta \tilde{\theta} = f \quad \text{in} \quad \Omega(M), \quad \tilde{\theta} = 0 \quad \text{on} \quad \partial \Omega(M).$$

Clearly, $\tilde{\theta} = \theta$ by uniqueness, so that $\theta_n \to \theta$ in $H^1_0(\Omega(M))$. Since $\theta_n \in H^1_0(\Omega(v_n))$ and $\theta \in H^1_0(\Omega(v))$, this convergence yields, with the help of Lemma 3.10

$$\int_{\Omega(v)} \sigma |\nabla (\theta + h_{v})|^2 \, d(x, z) = \int_{\Omega(v)} \sigma (|\nabla \theta|^2 + 2 \nabla \theta \cdot \nabla h_{v} + |\nabla h_{v}|^2) \, d(x, z)$$

$$= \lim_{n \to \infty} \int_{\Omega(M)} \sigma (|\nabla \theta_n|^2 + 2 \nabla \theta_n \cdot \nabla h_{v_n}) \, d(x, z)$$

$$+ \lim_{n \to \infty} \int_{\Omega(v_n)} \sigma |\nabla h_{v_n}|^2 \, d(x, z)$$

$$= \lim_{n \to \infty} \int_{\Omega(v_n)} \sigma |\nabla (\theta_n + h_{v_n})|^2 \, d(x, z);$$

that is,

$$G(v)[\theta] = \lim_{n \to \infty} G(v_n)[\theta_n].$$
Combining the outcome of Step 1 and Step 2 implies the $\Gamma$-convergence of $(G(v_n))_{n \geq 1}$ to $G(v)$ in $L_2(\Omega(M))$. \hfill $\square$

For the Dirichlet energy \eqref{eq:dirichlet}, which is given by
\[
\mathfrak{J}(v) = \mathcal{J}(v)[\psi_v] = \frac{1}{2} \int_{\Omega(v)} \sigma |\nabla \psi_v|^2 \, d(x,z), \quad v \in \mathcal{S},
\]
with $\psi_v$ denoting the potential from Proposition \ref{prop:potential}, we then obtain:

**Corollary 3.12.** Suppose \eqref{eq:estimate}. Then
\[
\lim_{n \to \infty} \| (\psi_{v_n} - h_{v_n}) - (\psi_v - h_v) \|_{H^1_0(\Omega(M))} = 0
\]
and
\[
\lim_{n \to \infty} \mathfrak{J}(v_n) = \mathfrak{J}(v).
\]

**Proof.** For $n \geq 1$, set
\[
\chi_n := \psi_{v_n} - h_{v_n} \in H^1_0(\Omega(v_n)) \subset H^1_0(\Omega(M)),
\]
and recall that $\chi_n$ is a minimizer of $G(v_n)$ in $H^1_0(\Omega(v_n))$ by Proposition \ref{prop:potential} (a). Since $(v_n)_{n \geq 1}$ is bounded in $H^1(D)$, it follows from \eqref{eq:weak}, Lemma \ref{lem:weak} and Lemma \ref{lem:compact} that $(\chi_n)_{n \geq 1}$ is bounded in $H^1_0(\Omega(M))$. Hence, there are a subsequence $(n_j)_{j \geq 1}$ and $\chi \in H^1_0(\Omega(M))$ such that $\chi_{n_j} \to \chi$ in $L^2(\Omega(M))$ and $\chi_{n_j} \rightharpoonup \chi$ in $H^1_0(\Omega(M))$. By Proposition \ref{prop:gamma} and the fundamental theorem of $\Gamma$-convergence, see \cite[Corollary 7.20]{G}, $\chi$ is a minimizer of the functional $G(v)$ on $L_2(\Omega(M))$. Clearly, from the definition of $G(v)$ we see that $\chi + h_v \in \mathcal{A}(v)$ minimizes the functional $\mathcal{J}(v)$ on $\mathcal{A}(v)$, hence $\psi_v = \chi + h_v$ owing to Proposition \ref{prop:potential} (a). The sequence $(\chi_n)_{n \geq 1}$ then has a unique cluster point in $L_2(\Omega(M))$ and is compact in that space and weakly compact in $H^1_0(\Omega(M))$. From this, we deduce that $\chi_n \to \chi$ in $L^2(\Omega(M))$ and $\chi_{n_j} \to \chi$ in $H^1_0(\Omega(M))$. Moreover, the fundamental theorem of $\Gamma$-convergence \cite[Corollary 7.20]{G} also ensures $G(v_n)[\chi_{n_j}] \to G(v)[\chi]$; that is, $\mathfrak{J}(v_n) \to \mathfrak{J}(v)$ as $n \to \infty$.

It remains to show the strong convergence of $(\chi_n)_{n \geq 1}$ in $H^1_0(\Omega(M))$. To this end, we infer from the convergence of $(\mathfrak{J}(v_n))_{n \geq 1}$ to $\mathfrak{J}(v)$ and Lemma \ref{lem:compact} that
\[
\lim_{n \to \infty} \| \chi_n \|_{H^1_0(\Omega(M))} = \| \chi \|_{H^1_0(\Omega(M))}.
\]
Together with the already established weak convergence of $(\chi_n)_{n \geq 1}$ to $\chi$ in $H^1_0(\Omega(M))$, this gives the strong convergence. \hfill $\square$

### 3.3. $H^2$-Estimate for the Potential $\psi_v$. Owing to the $H^2$-estimates on $\Omega_1 \cup \Omega_2(v)$ derived in Proposition \ref{prop:estimate}, we are able to improve Corollary \ref{cor:potential} to stronger topologies.

**Proposition 3.13.** Consider $\kappa > 0$, $v \in \mathcal{S}$, and a sequence $(v_n)_{n \geq 1}$ satisfying
\[
v_n \in S \cap W^2_\infty(D) \quad \text{with} \quad \|v_n\|_{H^2(D)} \leq \kappa, \quad (3.37)
\]
and
\[
\lim_{n \to \infty} \| v_n - v \|_{H^1_0(D)} = 0. \quad (3.38)
\]
Then $\psi_v = (\psi_{v,1}, \psi_{v,2}) \in H^2(\Omega_1) \times H^2(\Omega_2(v))$ satisfies
\[
\| \psi_v \|_{H^1(\Omega(v))} + \| \psi_{v,1} \|_{H^2(\Omega_1)} + \| \psi_{v,2} \|_{H^2(\Omega_2(v))} + \| \sigma \partial_z \psi_v \|_{H^1(\Omega(v))} \leq c_4(\kappa) \quad (3.39)
\]
and
\[ \psi_{v_n,1} \to \psi_{v,1} \text{ in } H^{2}(\Omega_1), \quad \psi_{v_n,2} \to \psi_{v,2} \text{ in } H^{2}(U) \] (3.40)
for any open set \( U \) such that \( \bar{U} \) is a compact subset of \( \Omega_2(v) \).

**Proof.** It first follows from (3.37), (3.38), and the continuous embedding of \( H^2(D) \) in \( C(\bar{D}) \) that there is \( M > 0 \) such that (3.28) is satisfied. Thus, by Corollary 3.12
\[ \psi_{v_n} - h_{v_n} \to \psi_{v} - h_{v} \text{ in } H^{1}_0(\Omega(M)) \] (3.41)
Next, owing to (3.37), we infer from (3.22b) that
\[ \|\psi_{v_n,1}\|_{H^2(\Omega_1)} + \|\psi_{v_n,2}\|_{H^2(\Omega_2(v_n))} + \|\sigma \partial_z \psi_{v_n}\|_{H^1(\Omega(\psi_n))} \leq q(\kappa), \quad n \geq 1. \] (3.42)
Now, (3.41), (3.42), and Lemma 3.10 ensure that \( \psi_{v,1} \in H^2(\Omega_1) \) and \( \psi_{v_n,1} \to \psi_{v,1} \) in \( H^2(\Omega_1) \). Similarly, for any open set \( U \) such that \( \bar{U} \) is a compact subset of \( \Omega_2(v) \), we infer from (3.38) and the continuous embedding of \( H^1_0(D) \) in \( C(\bar{D}) \) that \( U \subset \Omega_2(v_n) \) for \( n \) large enough. Thus, (3.41), (3.42), and Lemma 3.10 imply that \( \psi_{v,2} \in H^2(U) \) and \( \psi_{v_n,2} \to \psi_{v,2} \) in \( H^2(U) \). In particular, the latter along with (3.42) gives
\[ \int_{U} |\partial_{z}^{j} \partial_{\bar{z}}^{k} \psi_{v,2}|^2 \, d(x,z) \leq \liminf_{n \to \infty} \int_{U} |\partial_{z}^{j} \partial_{\bar{z}}^{k} \psi_{v_n,2}|^2 \, d(x,z) \leq q(\kappa), \quad j + k \leq 2. \]
We then use Fatou’s lemma to conclude that \( \partial_{z}^{j} \partial_{\bar{z}}^{k} \psi_{v,2} \) belongs to \( L^2(\Omega_2(v)) \) for \( j + k \leq 2 \), that is, \( \psi_{v,2} \in H^2(\Omega_2(v)) \). Finally, we deduce the estimate (3.39) from (3.40) and (3.42) by a weak lower semicontinuity argument.

Combining Corollary 3.12 and Proposition 3.13 allows us now to extend the validity of Proposition 3.1 (b) to all \( v \in \tilde{S} \). Recall that \( \Omega_2(v) \) is a well-defined open, but possibly disconnected, set in \( \mathbb{R}^2 \) for \( v \in \tilde{S} \), see Figures 3.1 and 3.2.

**Corollary 3.14.** Let \( v \in \tilde{S} \) and let \( \psi_{v} \in A(v) \) be the unique minimizer of \( J(v) \) on \( A(v) \) provided by Proposition 3.7. Then \( \psi_{v} = (\psi_{v,1},\psi_{v,2}) \in H^2(\Omega_1) \times H^2(\Omega_2(v)) \) with \( \sigma \partial_z \psi_{v} \in H^1(\Omega(v)) \) satisfies the transmission problem
\[ \begin{align*}
\text{div}(\sigma \nabla \psi_{v}) &= 0 \quad \text{in } \Omega(v), \\
[\psi_{v}] &= [\sigma \partial_z \psi_{v}] = 0 \quad \text{on } \Sigma(v), \\
\psi_{v} &= h_{v} \quad \text{on } \partial \Omega(v).
\end{align*} \] (3.43a-3.43c)
Moreover,
\[ \|\psi_{v}\|_{H^1(\Omega(v))} + \|\psi_{v,1}\|_{H^2(\Omega_1)} + \|\psi_{v,2}\|_{H^2(\Omega_2(v))} + \|\sigma \partial_z \psi_{v}\|_{H^1(\Omega(v))} \leq c(\kappa), \] (3.44)
provided \( \|v\|_{H^2(D)} \leq \kappa \).

**Proof.** Let \( v \in \tilde{S} \) be fixed and \( \kappa > 0 \) such that \( \|v\|_{H^2(D)} \leq \kappa/2 \). We may choose a sequence \( (v_n)_{n \geq 1} \) in \( S \cap W^{2}_{\infty}(D) \) satisfying
\[ v_n \to v \text{ in } H^{2}(D), \quad \sup_{n \geq 1} \|v_n\|_{H^2(D)} \leq \kappa. \]
In particular, (3.37)–(3.38) are satisfied, so that Proposition 3.13 implies that \( (\psi_{v,1},\psi_{v,2}) \) belongs to \( H^2(\Omega_1) \times H^2(\Omega_2(v)) \) and satisfies the estimate (3.44).

Regarding the transmission problem (3.43), recall first that \( \psi_{v} \) satisfies (3.3). Since \( v \in C(\bar{D}) \), we can write the open set \( \{x \in D : v(x) > -H\} \) as a countable union of open intervals \((a_i,b_i)_{i \in I}\), see [1] IX.Proposition 1.8.
Let \( i \in I \) and set
\[
O_i(v) := \{(x, z) \in (a_i, b_i) \times \mathbb{R} : -H - d < z < v(x)\} \subset \Omega(v)
\]
and \( O_i'(v) := \Omega_2(v) \cap O_i(v) \). It readily follows from (3.43) and the fact that \((\psi_{v,1}, \psi_{v,2})\) belongs to \( H^2(\Omega_1) \times H^2(\Omega_2(v)) \) that \( \text{div}(\sigma \nabla \psi_v) = 0 \) in \( \Omega_1 \) and in each \( O_i'(v) \), hence (3.43b). Moreover, for all \( \theta \in \mathcal{D}(O_i'(v)) \) it follows from (3.33) and Gauß’ theorem that
\[
0 = \int_{O_i'(v)} \sigma \nabla \psi_v \cdot \nabla \theta \, dx,
\]
hence \( [\sigma \partial_z \psi_v](\cdot, -H) = 0 \) a.e. in \((a_i, b_i)\). Therefore, (3.43b) holds, which in particular implies, together with the piecewise \( H^2 \)-regularity of \( \psi_v \), that \( \sigma \partial_z \psi_v \in H^1(\Omega(v)) \). Finally, since \( \psi_v \in H^1(\Omega(v)) \) we have \( \|\psi_v\|_0 = 0 \) on \( \Sigma(v) \), while (3.43c) is due to \( \psi_v \in \mathcal{A}(v) \).

Thanks to Corollary 3.14 we can extend the convergence established in Proposition 3.13 to an arbitrary sequence \((v_n)_{n \geq 1}\) in \( \bar{S} \).

**Corollary 3.15.** Consider \( \kappa > 0 \), \( v \in \bar{S} \), and a sequence \((v_n)_{n \geq 1}\) satisfying
\[
v_n \in \bar{S} \quad \text{with} \quad \|v_n\|_{H^2(D)} \leq \kappa,
\]
and (3.38). Then the convergence (3.40) holds true.

**Proof.** The additional assumption \( v_n \in S \cap W^2_\infty(D) \) is only used in the proof of Proposition 3.13 to obtain the bound (3.42). Since such an estimate is now guaranteed by Corollary 3.14 as \( \|v_n\|_{H^2(D)} \leq \kappa \) for all \( n \geq 1 \), the proof of Corollary 3.15 follows the same lines as that of Proposition 3.13.

The next step is to identify the limit of \( \partial_z \psi_{v_n,2}(\cdot, v_n) \) as \( n \to \infty \) within the framework of Proposition 3.13, which requires the following preparatory lemma.

**Lemma 3.16.** Let \( p \in [1, \infty) \), \( \kappa > 0 \), and \( v \in \bar{S} \) such that \( \|v\|_{H^2(D)} \leq \kappa \). Then there exists \( q(p, \kappa) > 0 \) such that
\[
\|\partial_z \psi_{v,2}(\cdot, v)\|_{L^p(D \setminus \mathcal{C}(v))} \leq q(p, \kappa),
\]
the coincidence set \( \mathcal{C}(v) \) of \( v \) being defined in (1.6).

**Proof.** As in Corollary 3.14, since \( v \in C(\bar{D}) \), we can write the open set \( \{x \in D : v(x) > -H\} \) as a countable union of open intervals \((a_i, b_i)_{i \in I}\) and set, for \( i \in I \),
\[
O_i(v) := \{(x, z) \in (a_i, b_i) \times \mathbb{R} : -H - d < z < v(x)\} \subset \Omega(v)
\]
and \( O_i'(v) := \Omega_2(v) \cap O_i(v) \). As \( D \setminus \mathcal{C}(v) \) has finite measure, we may assume that \( p \in [3/2, \infty) \). Let \( i \in I \). Since \( \psi_{v,2} \in H^2(O_i'(v)) \) by Corollary 3.14 it follows from (3.43b) and Young’s inequality that, for \( x \in (a_i, b_i) \),
\[
\sigma_2^p |\partial_z \psi_{v,2}(x, v(x))| \leq |\sigma_2 \partial_z \psi_{v,2}(x, -H)|^p + p \sigma_2^p \int_{-H}^{v(x)} |\partial_z \psi_{v,2}(x, z)|^{p-1} |\partial_z^2 \psi_{v,2}(x, z)| \, dz \\
\leq |\sigma_1(x, -H) \partial_z \psi_{v,1}(x, -H)|^p + \frac{P}{2} \sigma_2^{2(p-1)} \int_{-H}^{v(x)} |\partial_z \psi_{v,2}(x, z)|^{2(p-1)} \, dz \\
+ \frac{P}{2} \sigma_2^{2(p-1)} \int_{-H}^{v(x)} |\partial_z^2 \psi_{v,2}(x, z)|^2 \, dz.
\]
Integrating with respect to \(x \in (a_i, b_i)\), we find
\[
\sigma_2^p \int_{a_i}^{b_i} |\partial_z \psi_{v,2}(x, v(x))|^p \, dx \leq \int_{a_i}^{b_i} |\sigma_1(x, -H)\partial_z \psi_{v,1}(x, -H)|^p \, dx \\
+ \frac{p}{2} \sigma_2^{2(p-1)} \int_{\Omega(v)} |\partial_z \psi_{v,2}(x, z)|^{2(p-1)} \, d(x, z) \\
+ \frac{p}{2} \sigma_2^{2} \int_{\Omega(v)} |\partial_z^2 \psi_{v,2}(x, z)|^{2} \, d(x, z).
\]

Summing over all \(i \in I\) we obtain
\[
\sigma_2^p \int_{D \setminus C(v)} |\partial_z \psi_{v,2}(x, v(x))|^p \, dx \leq \int_{D \setminus C(v)} |\sigma_1(x, -H)\partial_z \psi_{v,1}(x, -H)|^p \, dx \\
+ \frac{p}{2} \int_{\Omega_2(v)} |\sigma_2 \partial_z \psi_{v,2}(x, z)|^{2(p-1)} \, d(x, z) \\
+ \frac{p}{2} \sigma_2^{2} \int_{\Omega_2(v)} |\partial_z^2 \psi_{v,2}(x, z)|^{2} \, d(x, z)
\]
and then infer from (3.6) and (3.44) that
\[
\sigma_2^p \int_{D \setminus C(v)} |\partial_z \psi_{v,2}(x, v(x))|^p \, dx \leq \|\sigma_1\|_{L^\infty(D)} \int_{D} |\partial_z \psi_{v,1}(x, -H)|^p \, dx \\
+ \frac{p}{2} \|\sigma \partial_z \psi_v\|_{L^2(p-1)(\Omega(v))}^{2(p-1)} + \frac{p}{2} \sigma_2^{2} c(\kappa)^2.
\] (3.45)

On the one hand, \(\partial_z \psi_{v,1}\) belongs to \(H^1(\Omega_1)\) and the continuity of the trace from \(H^1(\Omega_1)\) to \(H^{1/2}(D \times (-H))\) combined with the continuous embedding of \(H^{1/2}(D)\) in \(L_p(D)\) and (3.44) imply that
\[
\|\partial_z \psi_{v,1}(\cdot, -H)\|_{L^p(D)} \leq c(p) \|\psi_{v,1}(\cdot, -H)\|_{H^{1/2}(\Omega_1)} \\
\leq c(p) \|\psi_{v,1}\|_{H^1(\Omega_1)} \leq c(p, \kappa).
\] (3.46)

On the other hand, \(\sigma \partial_z \psi_v\) belongs to \(H^1(\Omega(v))\) and it follows from Lemma 3.7 (with \(q = 2(p-1)\)) and (3.44) that
\[
\|\sigma \partial_z \psi_v\|_{L^{2(p-1)}(\Omega(v))} \leq \|\sigma \partial_z \psi_v\|_{H^1(\Omega(v))} \leq c(p, \kappa).
\] (3.47)

Combining (3.45)-(3.47) completes the proof. \(\square\)

3.4. Limit Behavior of the Trace of the Vertical Derivative. To derive the continuity property of the function \(g\) stated in Theorem 1.3 we shall next investigate the continuity with respect to \(v \in S\) of the potential’s vertical derivative \(\partial_z \psi_v\) traced along the graph \(\mathcal{G}(v)\). Recall that \(\partial_z \psi_v\) along \(\mathcal{G}(v)\) consists of the two parts
\[
D \setminus C(v) \to \mathbb{R}, \quad x \mapsto \partial_z \psi_{v,2}(x, v(x))
\]
and
\[
C(v) \to \mathbb{R}, \quad x \mapsto \partial_z \psi_{v,1}(x, -H)
\]
and that the transition between \(\partial_z \psi_{v,2}\) and \(\partial_z \psi_{v,1}\) across the interface is prescribed by the transmission condition (3.43b) involving \(\sigma\).
Proposition 3.17. Consider $\kappa > 0$, $v \in \bar{S}$, and a sequence $(v_n)_{n \geq 1}$ in $\bar{S}$ satisfying
\[ \|v_n\|_{H^2(D)} \leq \kappa \quad \text{and} \quad \lim_{n \to \infty} \|v_n - v\|_{H^1(D)} = 0. \] (3.48)
Then
\[ \ell(v_n) \to \ell(v) \quad \text{in} \quad L_p(D) \] (3.49)
for $p \in [1, \infty)$, where $\ell(v) \in L_p(D)$ is given by
\[ \ell(v)(x) := \begin{cases} \partial_z \psi_{v,2}(x, v(x)), & x \in D \setminus C(v), \\ \frac{\sigma_1(x, -H)}{\sigma_2} \partial_z \psi_{v,1}(x, -H), & x \in C(v). \end{cases} \]

Proof. We first observe that the trace theorem, (3.6), and the $H^2$-regularity of $\psi_{v,1}$ provided by Corollary 3.11 imply that $x \mapsto \partial_z \psi_{v,1}(x, -H)$ belongs to $L_p(D)$ for any $p \in [1, \infty)$. We deduce from this fact and Lemma 3.16 that $\ell(v) \in L_p(D)$ for $p \in [1, \infty)$. Also, it follows from (3.48) that $\|v\|_{H^2(D)} \leq \kappa$.

Let $\epsilon \in (0, H)$ be arbitrarily fixed. Due to $v_n \to v$ in $H^1_0(D)$ and the embedding of $H^1_0(D)$ in $C(\bar{D})$, there is $n_\epsilon \geq 1$ such that
\[ v(x) - \epsilon \leq v_n(x) \leq v(x) + \epsilon, \quad x \in \bar{D}, \quad n \geq n_\epsilon. \] (3.50)
Moreover, since $v \in C(\bar{D})$ with $v(\pm L) = 0$, the set
\[ \Lambda(\epsilon) := \{ x \in D : v(x) > -H + \epsilon \} \]
is non-empty and open, and we can thus write it as a countable union of open intervals $(\Lambda_i(\epsilon))_{i \in I}$, see [1] IX. Proposition 1.8. For any fixed index $i \in I$ define the open set
\[ U_i(\epsilon) := \{(x, z) \in \Lambda_i(\epsilon) \times (-H, \infty) : z < v(x) - \epsilon \} \]
and note, by (3.50), that $U_i(\epsilon) \subset \Omega_2(v_n)$ for $n \geq n_\epsilon$. Thanks to (3.32), $(\psi_{v_n,2})_{n \geq 1}$ is relatively compact in $H^s(U_i(\epsilon))$ for any $s \in (3/2, 2)$ so that (3.40) implies $\psi_{v_n,2} \to \psi_{v,2}$ in $H^s(U_i(\epsilon))$. Using the continuity of the trace operator from $H^{s-1}(U_i(\epsilon))$ to $L_2(\partial U_i(\epsilon))$ and noticing the inclusion $\{(x, v(x) - \epsilon) : x \in \Lambda_i(\epsilon)\} \subset \partial U_i(\epsilon)$, we deduce
\[ \partial_z \psi_{vn,2}(\cdot, v - \epsilon) \to \partial_z \psi_{v,2}(\cdot, v - \epsilon) \quad \text{in} \quad L_2(\Lambda_i(\epsilon)). \] (3.51)
Next, we put
\[ \Psi_n(x) := \partial_z \psi_{v,2}(x, v(x)) - \partial_z \psi_{vn,2}(x, v_n(x)), \quad x \in \Lambda(\epsilon), \quad n \geq 1, \]
and observe that, for $i \in I$ and $n \geq n_\epsilon$,
\[
\|\Psi_n\|_{L_2(\Lambda_i(\epsilon))} \leq \left\| \partial_z \psi_{v,2}(\cdot, v - \epsilon) - \partial_z \psi_{vn,2}(\cdot, v - \epsilon) \right\|_{L_2(\Lambda_i(\epsilon))}
+ \left\| \int_{v-\epsilon}^{v} \partial^2_z \psi_{v,2}(\cdot, z) \, dz - \int_{v-\epsilon}^{v_n} \partial^2_z \psi_{vn,2}(\cdot, z) \, dz \right\|_{L_2(\Lambda_i(\epsilon))}
\leq \left\| \partial_z \psi_{v,2}(\cdot, v - \epsilon) - \partial_z \psi_{vn,2}(\cdot, v - \epsilon) \right\|_{L_2(\Lambda_i(\epsilon))}
+ \left( \int_{\Lambda_i(\epsilon)} (v_n - v + \epsilon) \int_{v-\epsilon}^{v_n} |\partial^2_z \psi_{vn,2}|^2 \, dz \, dx \right)^{1/2}
+ \left( \int_{\Lambda_i(\epsilon)} (v_n - v + \epsilon) \int_{v-\epsilon}^{v_n} |\partial^2_z \psi_{vn,2}|^2 \, dz \, dx \right)^{1/2}.\]
Using (3.50) and the inequality \((a + b + c)^2 \leq 3(a^2 + b^2 + c^2)\), we infer that, for \(n \geq n_\epsilon\),
\[
\|\Psi_n\|^2_{L^2(\Lambda_i(\epsilon))} \leq 3\|\partial_z \psi_{v,2}(\cdot, v - \epsilon) - \partial_z \psi_{v_n,2}(\cdot, v - \epsilon)\|^2_{L^2(\Lambda_i(\epsilon))} \\
+ 3\epsilon \int_{\Lambda_i(\epsilon)} \int_{v-H}^v |\partial_z^2 \psi_{v,2}|^2 \, dx \, dz + 6\epsilon \int_{\Lambda_i(\epsilon)} \int_{v-H}^v |\partial_z^2 \psi_{v_n,2}|^2 \, dx \, dz \\
\leq 3\|\partial_z \psi_{v,2}(\cdot, v - \epsilon) - \partial_z \psi_{v_n,2}(\cdot, v - \epsilon)\|^2_{L^2(\Lambda_i(\epsilon))} \\
+ 3\epsilon \int_{\Lambda_i(\epsilon)} \int_{v-H}^v |\partial_z^2 \psi_{v,2}|^2 \, dx \, dz + 6\epsilon \int_{\Lambda_i(\epsilon)} \int_{v-H}^v |\partial_z^2 \psi_{v_n,2}|^2 \, dx \, dz .
\]

Now, if \(J\) is any finite subset of \(I\), it follows from (3.44) (applied to \(v\) and \(v_n\)) and the previous inequality that, for \(n \geq n_\epsilon\),
\[
\sum_{i \in J} \|\Psi_n\|^2_{L^2(\Lambda_i(\epsilon))} \leq 3 \sum_{i \in J} \|\partial_z \psi_{v,2}(\cdot, v - \epsilon) - \partial_z \psi_{v_n,2}(\cdot, v - \epsilon)\|^2_{L^2(\Lambda_i(\epsilon))} \\
+ 3\epsilon \int_{\Lambda_i(\epsilon)} \int_{v-H}^v |\partial_z^2 \psi_{v,2}|^2 \, dx \, dz + 6\epsilon \int_{\Lambda_i(\epsilon)} \int_{v-H}^v |\partial_z^2 \psi_{v_n,2}|^2 \, dx \, dz \\
\leq 3 \sum_{i \in J} \|\partial_z \psi_{v,2}(\cdot, v - \epsilon) - \partial_z \psi_{v_n,2}(\cdot, v - \epsilon)\|^2_{L^2(\Lambda_i(\epsilon))} \\
+ 3\epsilon \int_{\Omega_i(v)} |\partial_z^2 \psi_{v,2}|^2 \, dx \, dz + 6\epsilon \int_{\Omega_i(v_n)} |\partial_z^2 \psi_{v_n,2}|^2 \, dx \, dz \\
\leq 3 \sum_{i \in J} \|\partial_z \psi_{v,2}(\cdot, v - \epsilon) - \partial_z \psi_{v_n,2}(\cdot, v - \epsilon)\|^2_{L^2(\Lambda_i(\epsilon))} + c(\kappa)\epsilon .
\]

Letting \(n \to \infty\) and recalling (3.51) and the finiteness of \(J\) we get
\[
\limsup_{n \to \infty} \sum_{i \in J} \|\Psi_n\|^2_{L^2(\Lambda_i(\epsilon))} \leq c(\kappa)\epsilon .
\]

Next, let \(\delta \in (0, 1)\). Since
\[
\sum_{i \in I} |\Lambda_i(\epsilon)| = |\Lambda(\epsilon)| \leq |D| ,
\]
there is a finite subset \(J_\delta \subset I\) such that
\[
|\Lambda(\epsilon)| - \delta \leq \sum_{i \in J_\delta} |\Lambda_i(\epsilon)| \leq |\Lambda(\epsilon)| .
\]

Hence, setting \(\Lambda^\delta(\epsilon) := \bigcup_{i \in J_\delta} \Lambda_i(\epsilon)\), we get
\[
\|\Psi_n\|^2_{L^2(\Lambda(\epsilon))} \leq \sum_{i \in J_\delta} \|\Psi_n\|^2_{L^2(\Lambda_i(\epsilon))} + 2 \int_{\Lambda(\epsilon) \setminus \Lambda^\delta(\epsilon)} \left(|\partial_z \psi_{v,2}(\cdot, v)| + |\partial_z \psi_{v_n,2}(\cdot, v_n)|\right)^2 \, dx \, dz \\
\leq \sum_{i \in J_\delta} \|\Psi_n\|^2_{L^2(\Lambda_i(\epsilon))} + 2|\Lambda(\epsilon) \setminus \Lambda^\delta(\epsilon)|^{1/2} \|\partial_z \psi_{v,2}(\cdot, v)|\)^2_{L^2(\Lambda_i(\epsilon) \setminus \Lambda^\delta(\epsilon))} \\
+ 2\|\Lambda(\epsilon) \setminus \Lambda^\delta(\epsilon)|^{1/2} \|\partial_z \psi_{v_n,2}(\cdot, v_n)|\)^2_{L^2(\Lambda_i(\epsilon) \setminus \Lambda^\delta(\epsilon))} .
\]

Since \(\Lambda(\epsilon) \subset D \setminus C(v)\) and \(\Lambda(\epsilon) \subset D \setminus C(v_n)\), \(n \geq n_\epsilon\),
\[
\Lambda(\epsilon) \subset D \setminus C(v)\) and \(\Lambda(\epsilon) \subset D \setminus C(v_n)\), \(n \geq n_\epsilon\),
\]

\[
(3.54)
\]
by (3.50), we deduce from (3.53), Lemma 3.16 (with \( p = 4 \)), and the previous inequality that
\[
\| \Psi_n \|_{L^2(\Lambda(\epsilon))}^2 \leq \sum_{i \in J_\delta} \| \Psi_n \|_{L^2(\Lambda_i(\epsilon))}^2 + c(\kappa) \delta^{1/2}, \quad n \geq n_\epsilon.
\]
Owing to the finiteness of \( J_\delta \), we may let \( n \to \infty \) in the previous inequality with the help of (3.52) and obtain that
\[
\limsup_{n \to \infty} \| \Psi_n \|_{L^2(\Lambda(\epsilon))}^2 \leq c(\kappa) (\epsilon + \delta^{1/2}).
\]
Now, for \( \epsilon_0 \in (0, H) \) and \( \delta \in (0, \epsilon_0) \), we have \( \Lambda(\epsilon_0) \subset \Lambda(\delta) \), so that the previous estimate (with \( \epsilon = \delta \)) gives
\[
\limsup_{n \to \infty} \| \Psi_n \|_{L^2(\Lambda(\epsilon_0))}^2 \leq \limsup_{n \to \infty} \| \Psi_n \|_{L^2(\Lambda(\delta))}^2 \leq c(\kappa) (\delta + \delta^{1/2}).
\]
Letting \( \delta \to 0 \) and recalling the definition of \( \Psi_n \), we yield
\[
\lim_{n \to \infty} \| \partial_z \psi_{v,2}(\cdot, v) - \partial_z \psi_{v_n,2}(\cdot, v_n) \|_{L^2(\Lambda(\epsilon_0))}^2 = 0, \quad \epsilon_0 \in (0, H).
\] (3.55)
Next, let \( \epsilon \in (0, H) \). The transmission condition (3.43) ensures
\[
\partial_z \psi_{v_n,2}(x, v_n(x)) = \frac{\sigma_1(x, -H)}{\sigma_2} \partial_z \psi_{v_n,1}(x, -H) + \int_{-H}^{v_n(x)} \partial_z^2 \psi_{v_n,2}(x, z) \, dz
\]
for \( x \in D \setminus C(v_n) \) and \( n \geq 1 \), from which we derive
\[
\int_{D \setminus (\Lambda(\epsilon) \cup C(v_n))} \left| \partial_z \psi_{v_n,2}(x, v_n(x)) - \frac{\sigma_1(x, -H)}{\sigma_2} \partial_z \psi_{v_n,1}(x, -H) \right|^2 \, dx \\
\leq \int_{D \setminus (\Lambda(\epsilon) \cup C(v_n))} (v_n(x) + H) \int_{-H}^{v_n(x)} |\partial_z^2 \psi_{v_n,2}(x, z)|^2 \, dz \, dx.
\]
Thanks to (3.50),
\[
v_n(x) + H \leq v(x) + \epsilon + H \leq 2\epsilon, \quad x \in D \setminus \Lambda(\epsilon), \quad n \geq n_\epsilon,
\]
so that, using (3.44),
\[
\int_{D \setminus (\Lambda(\epsilon) \cup C(v_n))} \left| \partial_z \psi_{v_n,2}(x, v_n(x)) - \frac{\sigma_1(x, -H)}{\sigma_2} \partial_z \psi_{v_n,1}(x, -H) \right|^2 \, dx \leq c(\kappa) \epsilon \quad (3.56)
\]
for \( n \geq n_\epsilon \). Furthermore, (3.6), Corollary 3.15 and the continuity of the trace ensure that
\[
\lim_{n \to \infty} \int_D \left| \frac{\sigma_1(x, -H)}{\sigma_2} \partial_z \psi_{v_n,1}(x, -H) - \frac{\sigma_1(x, -H)}{\sigma_2} \partial_z \psi_{v,1}(x, -H) \right|^2 \, dx = 0. \quad (3.57)
\]
Now, recalling the definition of $\ell(v)$ on $C(v)$,
\[
\int_{(D \setminus \Lambda(\epsilon)) \cap C(v_n)} \left| \frac{\sigma_1(x, -H)}{\sigma_2} \partial_2 \psi_{v_n, 1}(x, -H) - \ell(v)(x) \right|^2 \, dx \\
\leq 2 \int_{(D \setminus \Lambda(\epsilon)) \cap C(v_n)} \left| \frac{\sigma_1(x, -H)}{\sigma_2} \left[ \partial_2 \psi_{v_n, 1}(x, -H) - \partial_2 \psi_{v, 1}(x, -H) \right] \right|^2 \, dx \\
+ 2 \int_{(D \setminus \Lambda(\epsilon)) \cap C(v_n)} \left| \frac{\sigma_1(x, -H)}{\sigma_2} \partial_2 \psi_{v, 1}(x, -H) - \ell(v)(x) \right|^2 \, dx \\
\leq 2 \int_{(D \setminus \Lambda(\epsilon)) \cap C(v_n)} \left| \frac{\sigma_1(x, -H)}{\sigma_2} \left[ \partial_2 \psi_{v_n, 1}(x, -H) - \partial_2 \psi_{v, 1}(x, -H) \right] \right|^2 \, dx + 2Q_\epsilon,
\]
with
\[
Q_\epsilon := \int_{D \setminus \Lambda(\epsilon) \cup C(v)} \left| \frac{\sigma_1(x, -H)}{\sigma_2} \partial_2 \psi_{v, 1}(x, -H) - \ell(v)(x) \right|^2 \, dx.
\]
Hence, owing to (3.57),
\[
\limsup_{n \to \infty} \int_{(D \setminus \Lambda(\epsilon)) \cap C(v_n)} \left| \frac{\sigma_1(x, -H)}{\sigma_2} \partial_2 \psi_{v_n, 1}(x, -H) - \ell(v)(x) \right|^2 \, dx \leq 2Q_\epsilon. \tag{3.58}
\]
In addition,
\[
\int_{D \setminus \Lambda(\epsilon) \cup C(v_n)} \left| \frac{\sigma_1(x, -H)}{\sigma_2} \partial_2 \psi_{v_n, 1}(x, -H) - \ell(v)(x) \right|^2 \, dx \leq Q_\epsilon. \tag{3.59}
\]
Using the disjoint union
\[
D = \Lambda(\epsilon) \cup [(D \setminus \Lambda(\epsilon)) \cap C(v_n)] \cup [D \setminus (\Lambda(\epsilon) \cup C(v_n))]
\]
and recalling (3.50) and the definition of $\ell$, we obtain that, for $n \geq n_\epsilon$,
\[
\|\ell(v_n) - \ell(v)\|_{L^2(D)}^2 \\
\leq 3 \int_{D \setminus \Lambda(\epsilon) \cup C(v_n)} \left| \partial_2 \psi_{v_n, 2}(x, v_n(x)) - \frac{\sigma_1(x, -H)}{\sigma_2} \partial_2 \psi_{v_n, 1}(x, -H) \right|^2 \, dx \\
+ 3 \int_{D \setminus \Lambda(\epsilon) \cup C(v_n)} \left| \frac{\sigma_1(x, -H)}{\sigma_2} \partial_2 \psi_{v_n, 1}(x, -H) - \frac{\sigma_1(x, -H)}{\sigma_2} \partial_2 \psi_{v, 1}(x, -H) \right|^2 \, dx \\
+ 3 \int_{D \setminus \Lambda(\epsilon) \cup C(v_n)} \left| \frac{\sigma_1(x, -H)}{\sigma_2} \partial_2 \psi_{v, 1}(x, -H) - \ell(v)(x) \right|^2 \, dx \\
+ \int_{\Lambda(\epsilon)} \left| \partial_2 \psi_{v_n, 2}(x, v_n(x)) - \partial_2 \psi_{v, 2}(x, v(x)) \right|^2 \, dx.
\]
It then follows from (3.55)-(3.59) that
\[
\limsup_{n \to \infty} \|\ell(v_n) - \ell(v)\|_{L^2(D)}^2 \leq c(\kappa)\epsilon + 5Q_\epsilon. \tag{3.60}
\]
At this point, we observe that
\[ \lim_{\epsilon \to 0} |D (\Lambda(\epsilon) \cup C(v))| = \lim_{\epsilon \to 0} |\{x \in D : -H < v(x) < -H + \epsilon\}| = 0 , \]
so that, since both \( x \mapsto \sigma_1(x, -H) \partial_z \psi_{v,1}(x, -H) \) and \( \ell(v) \) belong to \( L_2(D) \),
\[ \lim_{\epsilon \to 0} Q_{\epsilon} = 0 . \]
We then take the limit \( \epsilon \to 0 \) in (3.60) to conclude that
\[ \lim_{n \to \infty} \| \ell(v_n) - \ell(v) \|_{L_2(D)}^2 = 0 . \]
Finally, \( (\ell(v_n))_{n \geq 1} \) is bounded in \( L^p(D) \) for any \( p \in [1, \infty) \) by the trace theorem, (3.6), the \( H^2 \)-estimate (3.44) on \( (\psi_{v,n})_{n \geq 1} \), and Lemma 3.16. Combining this bound with the previous convergence implies the convergence in \( L^p(D) \) for \( p \in [1, \infty) \) as stated in (3.49). \( \square \)

Remark 3.18. The proofs of Proposition 3.12 and Proposition 3.17 greatly simplify when the sequence \( (v_n)_{n \geq 1} \) decreases monotically to \( v \). Indeed, in that case, \( \Omega(v) \subset \Omega(v_n) \) for all \( n \geq 1 \) and, for instance, it is possible to use \( \partial_z \psi_{v,n,2}(x, v(x)) \) in the computations, since it is well-defined.

4. Shape Derivative of the Dirichlet Energy

In order to compute the shape derivative of the Dirichlet energy defined in (1.8), the first step is to investigate the differentiability properties of \( \psi_v \) with respect to \( v \in S \).

Lemma 4.1. Let \( u \in S \) be fixed and define, for \( v \in S \), the transformation
\[ \Theta_v = (\Theta_{v,1}, \Theta_{v,2}) : \Omega(u) \to \Omega(v) \]
by
\[
\Theta_{v,1}(x, z) := (x, z), \quad (x, z) \in \Omega_1, \tag{4.1a}
\]
\[
\Theta_{v,2}(x, z) := \left( x, z + \frac{v(x) - u(x)}{H + u(x)}(z + H) \right), \quad (x, z) \in \Omega_2(u). \tag{4.1b}
\]
Then there exists a neighborhood \( U \) of \( u \) in \( S \) such that
\[ U \to H^1_0(\Omega(u)), \quad v \mapsto \xi_v := \chi_v \circ \Theta_v \]
is continuously differentiable, where \( \chi_v = \psi_v - h_v \in H^1_0(\Omega(v)) \) and \( S \) is endowed with the \( H^2(D) \)-topology.

Proof. We follow the lines of the proof of [11, Theorem 5.3.2]. Recall that \( \chi_v \in H^1_0(\Omega(v)) \) satisfies the integral identity
\[ \int_{\Omega(v)} \sigma \nabla \chi_v \cdot \nabla \theta d(\bar{x}, \bar{z}) = - \int_{\Omega(v)} \sigma \nabla h_v \cdot \nabla \theta d(\bar{x}, \bar{z}), \quad \theta \in H^1_0(\Omega(v)), \tag{4.2} \]
which we next shall write as integrals over \( \Omega(u) \). To this end, we first note that
\[ \xi_u = \chi_u, \quad \nabla \xi_v = D \Theta_v^T \nabla \chi_v \circ \Theta_v, \]
where $D\Theta_{v,1} = \text{id}$ and

$$
D\Theta_{v,2}(x, z) = 
\begin{pmatrix}
1 & 0 \\
(z + H)\partial_x \left( \frac{v - u}{H + u} \right)(x) & \frac{H + v(x)}{H + u(x)}
\end{pmatrix}, \quad (x, z) \in \Omega_2(u).
$$

For $\phi \in H^1_0(\Omega(u))$ we have

$$
\phi_v := \phi \circ \Theta_v^{-1} \in H^1_0(\Omega(v))
$$

with

$$
\nabla \phi_v = \left( (D\Theta_v^T)^{-1} \nabla \phi \right) \circ \Theta_v^{-1}.
$$

Performing the change of variables $(\tilde{x}, \tilde{z}) = \Theta_v(x, z)$ in (4.2) with $\theta = \phi_v$ gives

$$
\int_{\Omega(u)} J_v \sigma (D\Theta_v)^{-1}(D\Theta_v^T)^{-1} \nabla \xi_v \cdot \nabla \phi \, d(x, z)
\quad = - \int_{\Omega(u)} J_v (D\Theta_v)^{-1}(\sigma \nabla h_v) \circ \Theta_v \cdot \nabla \phi \, d(x, z),
$$

where we used $\sigma \circ \Theta_v = \sigma$ due to $\Theta_v \equiv \text{id}_D$ and $\sigma_2 = \text{const}$, and where $J_v := \text{det}(D\Theta_v)$ is

$$
J_{v,1} = 1, \quad J_{v,2} = \frac{H + v}{H + u}.
$$

Introducing the notations

$$
A(v) := J_v \sigma (D\Theta_v)^{-1}(D\Theta_v^T)^{-1}
$$

and

$$
B(v) := \text{div}(J_v (D\Theta_v)^{-1}(\sigma \nabla h_v) \circ \Theta_v),
$$

we define the function

$$
F : S \times H^1_0(\Omega(u)) \to H^{-1}(\Omega(u)), \quad (v, \xi) \mapsto -\text{div}(A(v)\nabla \xi) - B(v)
$$

and observe that (4.3) is equivalent to

$$
F(v, \xi_v) = 0, \quad v \in S.
$$

We then shall use the implicit function theorem to derive that $\xi_v$ depends smoothly on $v$. For that purpose, let us first show that $F$ is Fréchet differentiable in $S \times H^1_0(\Omega(u))$. Indeed, define $P, Q \in C(D \times \mathbb{R}, \mathbb{R}^3)$ by

$$
P(x, z) := \left( x, z - \frac{u(x)}{H + u(x)}(z + H), 0 \right), \quad Q(x, z) := \left( 0, \frac{H + z}{H + u(x)}, 1 \right),
$$

for $(x, z) \in \bar{D} \times \mathbb{R}$, and note that

$$
\nabla h_{v,2} \circ \Theta_{v,2} = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} (\partial_x h_2, \partial_z h_2, \partial_w h_2) \circ (P + vQ).
$$

Since $h_2$ is $C^2$-smooth, we clearly have

$$
[v \mapsto (\partial_x h_2, \partial_z h_2, \partial_w h_2) \circ (P + vQ)] \in C^1(S, L^2(\Omega_2(u), \mathbb{R}^3))
$$

so that, thanks to the continuous embedding of $H^2(D)$ in $W^1_\infty(D)$, we readily obtain that

$$
[v \mapsto \nabla h_{v,2} \circ \Theta_{v,2}] \in C^1(S, L^2(\Omega_2(u), \mathbb{R}^2)).
$$
Since $\Theta_{v,1} \equiv \text{id}$, a similar argument ensures that
\[
[v \mapsto \nabla h_{v,1} \circ \Theta_{v,1}] \in C^1(S, L_2(\Omega_1, \mathbb{R}^2)),
\]
and therefore
\[
[v \mapsto \nabla h_v \circ \Theta_v] \in C^1(S, L_2(\Omega(u), \mathbb{R}^2)).
\]
Moreover, $v \mapsto J_v$ and $v \mapsto (D\Theta_v)^{-1}$ are continuously differentiable from $S$ to $L_\infty(\Omega(u))$ and $L_\infty(\Omega(u), \mathbb{R}^{2 \times 2})$, respectively, and we conclude that
\[
v \mapsto J_v (D\Theta_v)^{-1}(\sigma \nabla h_v) \circ \Theta_v
\]
is continuously differentiable from $S$ to $L_2(\Omega(u), \mathbb{R}^2)$, hence $B \in C^1(S, H^{-1}(\Omega(u)))$. The $C^1$-smoothness of $(v, \xi) \mapsto \text{div}(A(v)\nabla \xi)$ is proved as in [11, Theorem 5.3.2] and we have indeed established
\[
F \in C^1(S \times H_0^1(\Omega(u)), H^{-1}(\Omega(u))).
\]
By the Lax-Milgram theorem, the mapping $\zeta \mapsto \partial \xi F(u, \chi_u)\zeta = -\text{div}(\sigma \nabla \zeta)$ is bijective from $H_0^1(\Omega(u))$ to $H^{-1}(\Omega(u))$ and thus an isomorphism due to the open mapping theorem. Consequently, the implicit function theorem ensures the existence of a neighborhood $U$ of $v$ in $S$ and a function $\Xi \in C^1(U, H_0^1(\Omega(u)))$ such that $\Xi(u) = \xi_u$ and $F(v, \Xi(v)) = 0$ for $v \in U$. By Corollary 3.12, $\xi_v \in \Xi(U)$ for $\|v - u\|_{H^2(D)}$ sufficiently small and consequently $\xi_v = \Xi(v)$ for $v \in U$ by the uniqueness provided by the implicit function theorem. \(\square\)

As a consequence of Lemma 4.1, we are now in a position to investigate differentiability properties of the Dirichlet energy
\[
\mathfrak{J}(u) = \frac{1}{2} \int_{\Omega(u)} |\sigma \nabla \psi_u|^2 \, d(x, z)
\]
with respect to $u$. We begin with the case $u \in S$. At such functions, the Dirichlet energy $\mathfrak{J}$ is Fréchet differentiable as shown next.

**Proposition 4.2.** Let $S$ be endowed with the $H^2(D)$-topology. Then the Dirichlet energy $\mathfrak{J} : S \to \mathbb{R}$ is continuously Fréchet differentiable with
\[
\partial u \mathfrak{J}(u)[\vartheta] = -\frac{1}{2} \int_D \sigma_2 (1 + |\partial_x u(x)|^2) \left[ \partial_x \psi_{u,2} - (\partial_x h_2)_u - (\partial_w h_2)_u \right]^2(x, u(x)) \vartheta(x) \, dx
\]
\[
+ \frac{1}{2} \int_D \sigma_2 \left[ (\partial_x h_2)_u \right]^2(x, u(x)) \vartheta(x) \, dx
\]
\[
- \int_D [\sigma_1 (\partial_w h_1)_u \partial_x \psi_{u,1}] (x, -H - d) \vartheta(x) \, dx
\]
for $u \in S$ and $\vartheta \in H^2(D) \cap H_0^1(D)$.

**Proof.** We use the notation from Lemma 4.1. Let $u \in S$ be fixed and recall that, with the transformation $\Theta_v : \Omega(u) \to \Omega(v)$ as in [4.1], the mapping $v \mapsto \xi_v = \chi_v \circ \Theta_v$ is differentiable with respect to $v$ in a neighborhood $U$ of $u$ in $S$ and takes values in $H_0^1(\Omega(u))$. Now, using $\psi_v = \chi_v + h_v$ and the change of variable $(\tilde{x}, \tilde{z}) = \Theta_v(x, z)$ in the integral defining $\mathfrak{J}(v)$, we
have

\[
\mathcal{J}(v) = \frac{1}{2} \int_{\Omega(v)} \sigma |\nabla \psi_u|^2 \, d(x, z) = \frac{1}{2} \int_{\Omega(u)} \sigma \left[(D \Theta_v^T)^{-1} \nabla \xi_v + \nabla h_v \circ \Theta_v\right]^2 J_v \, d(x, z)
\]

for \( v \in U \). Therefore, introducing

\[
j(v) := (D \Theta_v^T)^{-1} \nabla \xi_v + \nabla h_v \circ \Theta_v
\]

and recalling that \( h_i, i = 1, 2, \) is \( C^2 \) in all its arguments, we deduce that the Fréchet derivative of \( \mathcal{J} \) at \( u \) applied to \( \vartheta \in H^2(D) \cap H_0^1(D) \) is

\[
\partial_u \mathcal{J}(u)[\vartheta] = \partial_v \mathcal{J}(v)[\vartheta] \big|_{v=u} = \int_{\Omega(u)} \sigma j(u) \cdot (\partial_v j(v)[\vartheta]) \big|_{v=u} \, J_u \, d(x, z)
\]

\[
+ \frac{1}{2} \int_{\Omega(u)} \sigma |j(u)|^2 (\partial_v J_v)[\vartheta] \big|_{v=u} \, d(x, z).
\]

Taking the identity \( j(u) = \nabla \psi_u \) into account, we infer from (4.14) that

\[
\partial_u \mathcal{J}(u)[\vartheta] = \int_{\Omega(u)} \sigma \nabla \psi_u \cdot (\partial_v j(v)[\vartheta]) \big|_{v=u} \, d(x, z)
\]

\[
+ \frac{1}{2} \int_{\Omega(u)} \sigma_2 |\nabla \psi_u|^2 \frac{\vartheta}{H + u} \, d(x, z). \tag{4.6}
\]

We next use that \( \Theta_u \) is the identity on \( \Omega(u) \) and that \( \xi_u = \chi_u \) to compute from the definition of \( j(v) \) that

\[
\partial_v j(v)[\vartheta] \big|_{v=u} = -\partial_v (D \Theta_v^T)[\vartheta] \big|_{v=u} \nabla \chi_u + \partial_v (\nabla \xi_v)[\vartheta] \big|_{v=u}
\]

\[
+ \partial_v (\nabla h_v \circ \Theta_v)[\vartheta] \big|_{v=u}. \tag{4.7}
\]

On the one hand, since \( \Theta_{v,1} \) is independent of \( v \) and \( \xi_{v,1} = \chi_{v,1} \), we readily obtain in \( \Omega_1 \) that

\[
\partial_v j(v)[\vartheta] \big|_{v=u} = \nabla (\partial_v \chi_v[\vartheta]) \big|_{v=u} + \nabla ((\partial_w h) u \vartheta) \quad \text{in} \ \Omega_1, \tag{4.8}
\]

where \( (\partial_w h)_u = \partial_w h(\cdot, \cdot, u) \). On the other hand, in \( \Omega_2(u) \) we have

\[
-\partial_v (D \Theta_v^T)[\vartheta] \big|_{v=u} \nabla \chi_u = -\partial_z \chi_u \nabla \left( \frac{\vartheta(z + H)}{H + u} \right) \quad \text{in} \ \Omega_2(u). \tag{4.9}
\]

and

\[
\partial_v (\nabla \xi_v)[\vartheta] \big|_{v=u} = \nabla (\partial_v \xi_v[\vartheta]) \big|_{v=u} \quad \text{in} \ \Omega_2(u). \tag{4.10}
\]

Moreover,

\[
\partial_v (\nabla h_v \circ \Theta_v)[\vartheta] \big|_{v=u} = \nabla ((\partial_w h) u \vartheta) + \frac{\vartheta(z + H)}{H + u} \nabla ((\partial_z h) u) \quad \text{in} \ \Omega_2(u). \tag{4.11}
\]
Consequently, gathering (4.6)-(4.11), we derive
\[
\frac{\partial u}{\partial \Omega}(u)[\partial] = \int_{\Omega(u)} \sigma \nabla \psi_u \cdot \nabla \left( \partial_i \xi_v[\partial] \big|_{v=u} + (\partial_v h)_u \theta \right) \, d(x, z)
\]
\[
- \int_{\Omega_2(u)} \sigma_2 \partial_z \chi_{u,2} \nabla \psi_{u,2} \cdot \nabla \left( \frac{\partial(z + H)}{H + u} \right) \, d(x, z)
\]
\[
+ \int_{\Omega_2(u)} \sigma_2 \nabla \psi_{u,2} \cdot \nabla \left( (\partial_z h)_u \right) \, d(x, z)
\]
\[
+ \frac{1}{2} \int_{\Omega_2(u)} \sigma_2 |\nabla \psi_{u,2}|^2 \frac{\partial}{H + u} \, d(x, z),
\]
(4.12)
and it remains to simplify the four integrals. As for the first one we use (3.43a), (3.43b), and Gauß’ theorem to get
\[
\int_{\Omega(u)} \sigma \nabla \psi_u \cdot \nabla \left( \partial_i \xi_v[\partial] \big|_{v=u} + (\partial_v h)_u \theta \right) \, d(x, z)
\]
\[
= \int_{\partial \Omega(u)} \left( \partial_i \xi_v[\partial] \big|_{v=u} + (\partial_v h)_u \theta \right) \sigma \nabla \psi_u \cdot n_{\partial \Omega(u)} \, dS
\]
\[
+ \int_{\Sigma} \left[ \partial_i \xi_v[\partial] \big|_{v=u} + (\partial_v h)_u \theta \right] \sigma_1 \partial_z \psi_{u,1} \, dS.
\]
First note that the integral on \( \Sigma \) vanishes. Indeed, since \( \xi_{v,i}(x, -H) = \chi_{v,i}(x, -H) \) for \( x \in D \) and \( i = 1, 2 \), we have \( \left[ \xi_v \right] = 0 \) on \( \Sigma \) by (2.4) and (3.43b), hence \( \left[ \partial_v \xi_v[\partial] \right] = 0 \) on \( \Sigma \). Similarly \( \left[ (\partial_v h)_u \right] = 0 \) on \( \Sigma \) owing to (2.2c). Next, since \( \partial_i \xi_v[\partial] \big|_{v=u} \) belongs to \( H^1_0(\Omega(u)) \) according to Proposition 4.1, it vanishes on the boundary \( \partial \Omega(u) \). Moreover, since \( \theta \in H^1_0(D) \), the term \( (\partial_v h)_u \theta \) vanishes on the lateral parts of \( \partial \Omega(u) \), hence
\[
\int_{\Omega(u)} \sigma \nabla \psi_u \cdot \nabla \left( \partial_i \xi_v[\partial] \big|_{v=u} + (\partial_v h)_u \theta \right) \, d(x, z)
\]
\[
= \int_D \sigma_2 \partial_v h_2(x, u(x), u(x)) \theta(x) \left( - \partial_x u(x) \partial_x \psi_{u,2}(x, u(x)) + \partial_z \psi_{u,2}(x, u(x)) \right) \, dx
\]
\[
- \int_D \sigma_1(x, -H - d) \partial_u h_1(x, -H - d, u(x)) \theta(x) \partial_z \psi_{u,1}(x, -H - d) \, dx.
\]
Moreover, since
\( (\partial_z h)_u = \partial_z \psi_u (\cdot, u) - \partial_z \chi_u (\cdot, u) \),
(4.13)
we can write the second and the third integral in (4.12) as
\[
- \int_{\Omega_2(u)} \sigma_2 \nabla \psi_{u,2} \cdot \left[ \partial_z \chi_{u,2} \nabla \left( \frac{\partial(z + H)}{H + u} \right) - \frac{\partial(z + H)}{H + u} \nabla \left( (\partial_z h)_u \right) \right] \, d(x, z)
\]
\[
= - \int_{\Omega_2(u)} \sigma_2 \nabla \psi_{u,2} \cdot \nabla \left( \partial_z \chi_{u,2} \frac{\partial(z + H)}{H + u} \right) \, d(x, z)
\]
\[
+ \int_{\Omega_2(u)} \sigma_2 \nabla \psi_{u,2} \cdot \nabla \left( \partial_z \psi_{u,2} \right) \frac{\partial(z + H)}{H + u} \, d(x, z),
\]
(4.14)
For the first integral on the right-hand side of (4.14) we use (3.43a) and Gauß’ theorem and readily obtain, noticing that \( (x, z) \mapsto (z + H) \theta(x) \) vanishes on all parts of the boundary
\[ \partial \Omega_2(u) \] except on \( \Phi(u) \) and using (4.13), that
\[
- \int_{\Omega_2(u)} \sigma_2 \nabla \psi_{u,2} \cdot \nabla \left( \partial_z \chi_{u,2} \frac{\partial (z + H)}{H + u} \right) \, d(x, z) \\
= - \int_D \sigma_2 \partial(x) \left( \partial_z \psi_{u,2}(x, u(x)) - (\partial_z h)_u(x, u(x)) \right) \times \left( - \partial_x u(x) \partial_x \psi_{u,2}(x, u(x)) + \partial_z \psi_{u,2}(x, u(x)) \right) \, dx.
\]

The second integral on the right-hand side of (4.14) is written in the alternative form
\[
\int_{\Omega_2(u)} \sigma_2 \nabla \psi_{u,2} \cdot \nabla (\partial_z \psi_{u,2}) \frac{\partial (z + H)}{H + u} \, d(x, z) = \frac{1}{2} \int_{\Omega_2(u)} \sigma_2 \partial \nabla \psi_{u,2} \left( \frac{\partial (z + H)}{H + u} \right) \, d(x, z).
\]
We then integrate with respect to \( z \) to obtain
\[
\int_{\Omega_2(u)} \sigma_2 \nabla \psi_{u,2} \cdot \nabla (\partial_z \psi_{u,2}) \frac{\partial (z + H)}{H + u} \, d(x, z) = - \frac{1}{2} \int_{\Omega_2(u)} \sigma_2 \nabla \psi_{u,2} \left( \frac{\partial (z + H)}{H + u} \right) \, d(x, z) + \frac{1}{2} \int_D \sigma_2 \nabla \psi_{u,2}(x, u(x)) \partial(x) \, dx.
\]

Consequently, substituting (4.14)-(4.16) in (4.12), we conclude that
\[
\partial_u \tilde{\mathcal{J}}(u)[\vartheta] = - \int_D \sigma_2 \left[ \partial_z \psi_{u,2} - (\partial_z h_2)_u - (\partial_u h_2)_u \right](x, u(x)) \times \left[ - \partial_x u \partial_x \psi_{u,2} + \partial_z \psi_{u,2} \right](x, u(x)) \vartheta(x) \, dx \\
+ \frac{1}{2} \int_D \sigma_2 \nabla \psi_{u,2}(x, u(x)) \left( \frac{\partial (z + H)}{H + u} \right) \vartheta(x) \, dx \\
- \int_D \left[ \sigma_1 (\partial_u h_1)_u \partial_z \psi_{u,1} \right](x, -H - d) \vartheta(x) \, dx.
\]

It remains to rewrite the first two integrals on \( \Phi(u) \). For that purpose, it follows from (3.33c) that
\[
\psi_{u,2}(x, u(x)) = h_{u,2}(x, u(x)) = h(x, u(x), u(x)), \quad x \in D,
\]
from which we deduce that
\[
\partial_x \psi_{u,2}(x, u(x)) = - \partial_x u(x) \left[ \partial_z \psi_{u,2} - (\partial_z h_2)_u - (\partial_u h_2)_u \right](x, u(x)) \\
+ (\partial_z h_2)_u(x, u(x)).
\]

Using the above identity, it is easy to check that
\[
\frac{1}{2} \nabla \psi_{u,2}(x, u(x))^2 = \left[ \partial_z \psi_{u,2} - (\partial_z h_2)_u - (\partial_u h_2)_u \right] \left[ - \partial_x u \partial_x \psi_{u,2} + \partial_z \psi_{u,2} \right](x, u(x)) \\
- \frac{1}{2} \left( 1 + |\partial_x u(x)|^2 \right) \left[ \partial_z \psi_{u,2} - (\partial_z h_2)_u - (\partial_u h_2)_u \right]^2(x, u(x)) \\
+ \frac{1}{2} \left[ (\partial_z h_2)_u \right]^2 + (\partial_z h_2)_u (\partial_u h_2)_u \right]^2(x, u(x))
\]
so that we end up with
\[
\partial_u \mathcal{J}(u)[\vartheta] = -\frac{1}{2} \int_D \sigma_2 \left[ (\partial_x u(x))^2 \right] \left[ \partial_z \psi_{u,2} - (\partial_z h_2)_u - (\partial_w h_2)_u \right]^2 (x, u(x)) \vartheta(x) \, dx
\]
\[
+ \frac{1}{2} \int_D \sigma_2 \left[ \left( (\partial_x h_2)_u \right)^2 + \left( (\partial_z h_2)_u + (\partial_w h_2)_u \right)^2 \right] (x, u(x)) \vartheta(x) \, dx
\]
\[
- \int_D \left[ \sigma_1 (\partial_w h_1)_u \partial_z \psi_{u,1} \right] (x, -H - d) \vartheta(x) \, dx
\]
as claimed. It finally follows Proposition 3.13, Corollary 3.15, Proposition 3.17, the continuity of the trace from $H^{1/2}(\Omega_1)$ to $L_2(D \times \{ -H \})$, and the $C^2$-regularity on $h_1$ and $h_2$ that $\partial_u \mathcal{J} : \tilde{S} \to \mathcal{L}(H^2(D) \cap H^1_0(D), \mathbb{R})$ is continuous.

We finish off this section by considering the differentiability properties of the Dirichlet energy \( \mathcal{J} \) at a function $u \in \tilde{S}$. As pointed out in Theorem 1.3, allowing also for non-empty coincidence sets restricts to directional derivatives in the directions $-u + S$. Given $u \in \tilde{S}$, let us recall that the function $g(u) : D \to [0, \infty)$ is given by
\[
g(u)(x) = \frac{\sigma_2}{2} \left( 1 + (\partial_x u(x))^2 \right) \left[ \partial_z \psi_{u,2} - (\partial_z h_2)_u - (\partial_w h_2)_u \right]^2 (x, u(x))
\]
for $x \in D \setminus C(u)$ and
\[
g(u)(x) = \frac{\sigma_2}{2} \left[ \frac{\sigma_1}{\sigma_2} \partial_z \psi_{u,1} - (\partial_z h_2)_u - (\partial_w h_2)_u \right]^2 (x, -H)
\]
for $x \in C(u)$.

**Corollary 4.3.** Let $u \in \tilde{S}$ and $w \in S$. Then
\[
\lim_{t \to 0^+} \frac{1}{t} \left( \mathcal{J}(u + t(w - u)) - \mathcal{J}(u) \right) = -\int_D g(u)(w - u) \, dx
\]
\[
+ \frac{1}{2} \int_D \sigma_2 \left[ \left( (\partial_x h_2)_u \right)^2 + \left( (\partial_z h_2)_u + (\partial_w h_2)_u \right)^2 \right] (\cdot, u) (w - u) \, dx
\]
\[
- \int_D \left[ \sigma_1 (\partial_w h_1)_u \partial_z \psi_{u,1} \right] (\cdot, -H - d) (w - u) \, dx.
\]
Moreover, the function $g : \tilde{S} \to L_p(D)$ is continuous for each $p \in [1, \infty)$.

**Proof.** Given $u \in \tilde{S}$ and $w \in S$, note that $u_s := u + s(w - u) = (1 - s)u + sw \in S$, $s \in (0, 1)$.

Let $\psi_{u_s}$ denote the solution to (3.43) associated with $u_s$ and set $\vartheta := w - u$. Since $u_s \in S$ for $s \in (0, 1)$, we obtain from Proposition 4.2 that
\[
\frac{d}{ds} \mathcal{J}(u_s) = -\frac{1}{2} \int_D \sigma_2 \left( 1 + |\partial_x u_s|^2 \right) \left[ \partial_z \psi_{u_s,2} - (\partial_z h_2)_{u_s} - (\partial_w h_2)_{u_s} \right]^2 (\cdot, u_s) \vartheta \, dx
\]
\[
+ \frac{1}{2} \int_D \sigma_2 \left[ \left( (\partial_x h_2)_{u_s} \right)^2 + \left( (\partial_z h_2)_{u_s} + (\partial_w h_2)_{u_s} \right)^2 \right] (\cdot, u_s) \vartheta \, dx
\]
\[
- \int_D \left[ \sigma_1 (\partial_w h_1)_{u_s} \partial_z \psi_{u_s,1} \right] (\cdot, -H - d) \vartheta \, dx.
\]
for $s \in (0, 1)$. Therefore, letting $s \to 0$ we derive with the help of Proposition \ref{reg} the $C^2$-regularity of $h_1$ and $h_2$, and \ref{int} that

$$
\lim_{s \to 0^+} \frac{d}{ds} \mathcal{J}(u_s) = - \int_D g(u) \vartheta \, dx \\
+ \frac{1}{2} \int_D \sigma_2 \left[ \left( \partial_x h_2 \right)^2 + \left( \partial_z h_2 + \partial_w h_2 \right)^2 \right] (\cdot, u) \vartheta \, dx \\
- \int_D \left[ \sigma_1 (\partial_w h_1)_u \partial_z \psi_{u,1} \right] (\cdot, -H - d) \vartheta \, dx.
$$

(4.18)

Now, Corollary \ref{convergence} guarantees that $\mathcal{J}(u_s) \to \mathcal{J}(u)$ as $s \to 0$, so that

$$
\mathcal{J}(u_t) - \mathcal{J}(u) = \int_0^t \frac{d}{ds} \mathcal{J}(u_s) \, ds, \quad t \in (0, 1),
$$

and we conclude from (4.18) that

$$
\lim_{t \to 0^+} \frac{1}{t} (\mathcal{J}(u_t) - \mathcal{J}(u)) = \lim_{t \to 0^+} \frac{1}{t} \int_0^t \frac{d}{ds} \mathcal{J}(u_s) \, ds \\
= - \int_D g(u) \vartheta \, dx \\
+ \frac{\sigma_2}{2} \int_D \left[ \left( \partial_x h_2 \right)^2 + \left( \partial_z h_2 + \partial_w h_2 \right)^2 \right] (\cdot, u) \vartheta \, dx \\
- \int_D \left[ \sigma_1 (\partial_w h_1)_u \partial_z \psi_{u,1} \right] (\cdot, -H - d) \vartheta \, dx.
$$

Recalling that $\vartheta = w - u$, the proof of Corollary \ref{cor} is complete, except for the continuity of the function $g : \bar{S} \to L_p(D)$ for $p \in [1, \infty)$. However, this follows from Corollary \ref{continuity} Proposition \ref{reg}, the continuity of the trace from $H^s(\Omega_1)$ to $L_p(D \times \{-H\})$ for $s \in (1 - 1/p, 1)$, and the $C^2$-regularity of $h_1$ and $h_2$. \hfill $\Box$

5. Least Energy Solution for a Stationary MEMS Model

We illustrate our findings on the shape derivative of the Dirichlet energy \ref{energy} with the existence of solutions to an elliptic variational inequality arising in the modeling of micromechanical systems (MEMS) \cite{18, 19}. Specifically, we consider an idealized MEMS device consisting of two plates held at different electrostatic potentials: a thin elastic plate is suspended above a rigid ground plate, the latter being covered by a non-penetrable dielectric layer of thickness $d > 0$ \cite{3}. Due to the potential difference between the two plates, a Coulomb force is created across the device, inducing a deformation of the elastic plate, thereby converting electrostatic energy to mechanical energy while changing the geometry of the device. Considering a cross section of the device, the rigid plate and the dielectric layer are given by $D \times \{-H - d\}$ with $D = (-L, L)$ and

$$
\Omega_1 = D \times (-H - d, -H),
$$

respectively. Denoting the deflection of the elastic plate by $u : \bar{D} \to [-H, \infty)$, the elastic plate is the graph

$$
\mathcal{G}(u) = \{(x, u(x)) : x \in D\}$
We finally set
\[ E \]
and that is, 
\[ \Omega(u) = \{(x, z) \in D \times \mathbb{R} : -H - d < z < u(x)\} = \Omega_1 \cup \Omega_2(u) \cup \Sigma(u), \]
so that the geometry of the MEMS device is exactly that considered in the previous sections. The dielectric properties of the device are given by the permittivity of the dielectric layer \( \Omega_1 \), which is assumed to be a positive function \( \sigma_1 \in C^2(\Omega_1) \), and the permittivity of \( \Omega_2(u) \), which is taken to be a positive constant \( \sigma_2 \). Moreover, the two plates are held at constant potentials, being respectively taken to be zero on the rigid plate \( D \times \{-H - d\} \) and equal to a positive constant \( V \) on the elastic plate \( \Omega(u) \). The electrostatic potential \( \psi_u \) in the device then solves the transmission problem (1.7); that is,
\[
\begin{align*}
\text{div}(\sigma \nabla \psi_u) &= 0 \quad \text{in} \; \Omega(u), \\
\lbrack \psi_u \rbrack &= 0 \quad \text{on} \; \Sigma(u), \\
\psi_u &= h_u \quad \text{on} \; \partial\Omega(u),
\end{align*}
\]
the corresponding boundary conditions being prescribed by a function \( h \) satisfying (2.2), as well as
\[
h_1(x, -H - d, w) = h_2(x, w, w) - V = 0, \quad (x, w) \in \bar{D} \times [-H, \infty). \quad (5.1a)
\]
Finally, the total energy
\[ E(u) := E_m(u) + E_e(u) \]
of the MEMS device is the sum of the mechanical energy \( E_m(u) \) and the electrostatic energy \( E_e(u) \). The former is given by
\[
E_m(u) := \frac{\beta}{2} \| \partial^2_x u \|_{L_2(D)}^2 + \left( \frac{\tau}{2} + \frac{a}{4} \| \partial_x u \|_{L_2(D)}^2 \right) \| \partial_x u \|_{L_2(D)}^2
\]
with \( \beta > 0 \) and \( \tau \geq 0 \), taking into account bending and external stretching effects of the elastic plate. The electrostatic energy is
\[
E_e(u) := -\frac{1}{2} \int_{\Omega(u)} \sigma |\nabla \psi_u|^2 \, d(x, z);
\]
that is, \( E_e(u) := -J(u) \), see (1.8). Recalling that
\[ \tilde{S} = \{ u \in H^2(D) \cap H^1_0(D) : u \geq -H \text{ in } D \}, \]
it is readily seen that \( E_m(u) \) is well-defined for \( u \in \tilde{S} \), as are \( \psi_u \) and \( E_e(u) \) due to Theorem 1.1.

Equilibrium configurations of the MEMS device, if any, are then provided by critical points of the total energy \( E \) in \( \tilde{S} \), and in particular by minimizers when they exist. A minimal requirement in that direction is the boundedness from below of \( E \) on \( \tilde{S} \), for which the following additional assumptions on \( h \) are sufficient: there are constants \( m_i > 0 \), \( i = 1, 2, 3 \), such that
\[
|\partial_x h_1(x, z, w)| + |\partial_z h_1(x, z, w)| \leq \sqrt{m_1 + m_2 w^2}, \quad |\partial_w h_1(x, z, w)| \leq \sqrt{m_3}, \quad (5.1b)
\]
for \((x, z, w) \in \bar{D} \times [-H - d, -H] \times [-H, \infty)\) and
\[
|\partial_x h_2(x, z, w)| + |\partial_z h_2(x, z, w)| \leq \sqrt{\frac{m_1 + m_2 w^2}{H + w}},
|\partial_w h_2(x, z, w)| \leq \sqrt{\frac{m_3}{H + w}},
\]
(5.1c)
for \((x, z, w) \in \bar{D} \times [-H, \infty) \times [-H, \infty)\).

Within this framework, Theorem 5.1 allows us to prove the existence of at least one minimal energy solution.

**Theorem 5.1.** Assume that \(h\) satisfies (2.2)-(2.3) and (5.1) and set
\[
\mathcal{R} := \beta - 4L^2 [(d + 1)\sigma_{\text{max}} (12m_2L^2 + 2m_3) - \tau]_+.
\]
If
\[
\max\{a, \mathcal{R}\} > 0,
\]
(5.2)
then the total energy \(E\) has at least one minimizer \(u_* \in \bar{S}\) in \(\bar{S}\); that is,
\[
E(u_*) = \min_{\bar{S}} E.
\]
(5.3)

It is yet unknown whether there is more than one equilibrium configuration or whether
the minimizer provided by Theorem 5.1 has empty or non-empty coincidence set \(C(u_*)\)
(defined in (5.1)). Even in much simpler situations as considered in [14], where the electrostatic potential is an explicitly computable function depending in a local way on \(u\), the answer is rather complex. Indeed, minimizers may have empty or non-empty coincidence sets and may coexist with other critical points of \(E\), depending on the boundary values of the electrostatic potential. We expect the same complexity in the model considered herein.

**Remark 5.2.** Condition (5.2) is obviously satisfied if \(\mathcal{R} > 0\), which amounts to assuming
that the applied voltage \(V\) is sufficiently small compared to the dimensions of the device, see Example 5.4 below.

Next, thanks to the analysis carried out in the previous sections, we can characterize
any solution to (5.3) by means of a variational inequality. To this end, for \(u \in \bar{S}\), we define
the function \(g(u)\) by
\[
g(u)(x) := \begin{cases} 
\frac{\sigma_2}{2} (1 + (\partial_x u(x))^2) \left(\partial_z \psi_{u,2}(x, u(x))\right)^2, & x \in D \setminus C(u), \\
\frac{\sigma_1(x, -H)^2}{2\sigma_2} \left(\partial_z \psi_{u,1}(x, -H)\right)^2, & x \in C(u) .
\end{cases}
\]
(5.4)
Actually, \(g\) is nothing but the function \(g\) defined in Theorems 1.2 and 1.3 taking into
account the property
\[
\partial_w h_1(x, -H - d, w) = \partial_x h_2(x, w, w) + \partial_w h_2(x, w, w) = 0
\]
(5.5)
for \((x, w) \in D \times [-H, \infty)\), which is easily derived from (5.1a). In particular, \(g : \bar{S} \to L_2(D)\)
is continuous and represents the electrostatic force acting on the elastic plate \(\mathcal{G}(u)\).

**Theorem 5.3.** Assume that \(h\) satisfies (2.2)-(2.3), (5.1), and (5.2). Let \(u \in \bar{S}\) be a
solution to the minimization problem (5.3). Then \(g(u) \in L_2(D)\) and \(u\) is an \(H^2\)-weak
solution to the variational inequality
\[
\beta \partial_x^2 u - (\tau + a \|\partial_x u\|_{L_2(D)}) \partial_x^2 u + \partial_S g(u) \geq -g(u) \quad \text{in} \quad D,
\]
(5.6)
where $\partial I_S$ is the subdifferential of the indicator function $I_S$ of the closed convex subset $\bar{S}$ of $H^2(D)$; that is,

$$\int_D \left\{ \beta \partial_x^2 u \partial_x^2 (w - u) + \left[ \tau + a \| \partial_x u \|_{L^2(D)}^2 \right] \partial_x^2 (w - u) \right\} \, dx \geq - \int_D g(u)(w - u) \, dx$$

for all $w \in \bar{S}$.

A minimizer $u$ of $E$ in $\bar{S}$ being a critical point of $E$ and satisfying the convex constraint $u \in \bar{S}$, the variational inequality (5.6) is simply the corresponding Euler-Lagrange equation: it involves the derivative $\beta \partial_x^4 u - \left( \tau + a \| \partial_x u \|_{L^2(D)}^2 \right) \partial_x^2 u$ of the mechanical energy $E_m$ with respect to $u$, the subdifferential $\partial I_S(u)$ of the convex constraint, and the “differential” $g(u)$ of the electrostatic energy $E_e$ with respect to $u$, in the sense of Theorems 1.2 and 1.3.

Before providing the proofs of Theorem 5.1 and Theorem 5.3, let us give an example of a function $h$ prescribing the boundary conditions (1.7) for the electrostatic potential. **Example 5.4.** Let us consider the situation where $\sigma_1$ does not depend on the vertical variable $z$; that is, $\sigma_1 = \sigma_1(x)$. In that case, we set

$$h_1(x, z, w) := V \frac{\sigma_2(H + z + d)}{\sigma_2 d + \sigma_1(x)(H + w)}, \quad (x, z, w) \in \bar{D} \times [-H - d, -H] \times [-H, \infty),$$

and

$$h_2(x, z, w) := V \frac{\sigma_2 d + \sigma_1(x)(H + z)}{\sigma_2 d + \sigma_1(x)(H + w)}, \quad (x, z, w) \in \bar{D} \times [-H, \infty) \times [-H, \infty).$$

Then assumptions (2.2), (2.3) and (5.1) are easily checked. Moreover, if $V$ is sufficiently small, then $\mathcal{R}$ defined in Theorem 5.1 is positive, hence (5.2) holds in that case.

5.1. **Existence of a Minimizer.** Given $u \in \bar{S}$ we recall that $\psi_u$ is the unique solution to the transmission problem (1.7) provided by Theorem 1.1.

**Proof of Theorem 5.1.** We first note that the total energy $E$ is bounded from below and coercive. To this end, we recall the Poincaré and Poincaré-Wirtinger inequalities

$$\|u\|_{L^2(D)} \leq |D| \|\partial_x u\|_{L^2(D)}, \quad \|\partial_x u\|_{L^2(D)} \leq |D| \|\partial_x^2 u\|_{L^2(D)},$$

which are valid for all $u \in \bar{S}$. Let $u \in \bar{S}$. It follows from (5.11), (1.14), Lemma 3.2 and Young’s inequality that

$$-E_e(u) = \frac{1}{2} \int_{\Omega(u)} \sigma |\nabla \psi_u|^2 \, d(x, z) \leq \frac{1}{2} \int_{\Omega(u)} \sigma |\nabla h_u|^2 \, d(x, z)$$

$$\leq \int_{\Omega(u)} \sigma \left[ (\partial_z h(x, z, u(x)))^2 + (\partial_u h(x, z, u(x)))^2 (\partial_x u(x))^2 \right] \, d(x, z)$$

$$\leq \frac{1}{2} \int_{\Omega(u)} \sigma (\partial_z h(x, z, u(x)))^2 \, d(x, z)$$

$$\leq \int_{\Omega} \left[ \frac{3}{2} (m_1 + m_2 u(x)^2) + m_3 (\partial_x u(x))^2 \right] \, dx.$$
Using (5.7) we get
\[ -E_e(u) \leq \frac{d+1}{2} \sigma_{max} \left[ 3m_1 |D| + (3m_2 |D|^2 + 2m_2) \|\partial_x u\|_{L^2(D)}^2 \right]. \]

Therefore,
\[ E(u) \geq \frac{\beta}{2} \|\partial_x^2 u\|_{L^2(D)}^2 + \frac{a}{4} \|\partial_x u\|_{L^2(D)}^4 - \frac{3(d+1)}{2} \sigma_{max} m_1 |D| \]
\[ - \left[ \frac{d+1}{2} \sigma_{max} (3m_2 |D|^2 + 2m_2) - \frac{\tau}{2} \right] \|\partial_x u\|_{L^2(D)}^2 \]
\[ \geq \frac{\beta}{2} \|\partial_x^2 u\|_{L^2(D)}^2 + \frac{a}{4} \|\partial_x u\|_{L^2(D)}^4 - \frac{3(d+1)}{2} \sigma_{max} m_1 |D| \]
\[ - \left[ \frac{d+1}{2} \sigma_{max} (3m_2 |D|^2 + 2m_2) - \frac{\tau}{2} \right] + \|\partial_x u\|_{L^2(D)}^2. \] (5.8)

Now, if \( a > 0 \), then Young’s inequality and (5.8) give
\[ E(u) \geq \frac{\beta}{2} \|\partial_x^2 u\|_{L^2(D)}^2 - C_1 \]
for some constant \( C_1 > 0 \) independent of \( u \in \tilde{S} \). If \( a = 0 \), then we infer from (5.2) with \( |D| = 2L, \) (5.7), and (5.8) that \( \tilde{R} > 0 \) and
\[ E(u) \geq \frac{\tilde{R}}{2} \|\partial_x^2 u\|_{L^2(D)}^2 - \frac{3(d+1)}{2} \sigma_{max} m_1 |D|. \]

Consequently, \( E \) is coercive when (5.2) is satisfied.

Now, take a minimizing sequence \((u_j)_{j \geq 1}\) of \( E \) in \( \tilde{S} \). Then
\[ \lim_{j \to \infty} E(u_j) = \inf_{\tilde{S}} E, \]
and the just established coercivity of \( E \) guarantees that \((u_j)_{j \geq 1}\) is bounded in \( H^2(D) \). We thus may assume that \((u_j)_{j \geq 1}\) converges weakly towards some \( u_* \) in \( H^2(D) \) and strongly in \( H^1_0(D) \). Obviously \( u_* \in \tilde{S} \) and
\[ E_m(u_*) \leq \liminf_{j \to \infty} E_m(u_j). \]

Moreover, since \( H^2(D) \) is continuously embedded in \( L_\infty(D) \), we may invoke Corollary 3.12 to obtain that
\[ E_e(u_*) = \lim_{j \to \infty} E_e(u_j). \]
Consequently, \( u_* \) minimizes \( E \) on \( \tilde{S} \) and the proof of Theorem 5.1 is complete. \( \square \)

5.2. Euler-Lagrange Equation. We finally prove Theorem 5.3 which requires deriving the Euler-Lagrange equation satisfied by any minimizer of \( E \) on \( \tilde{S} \). We first observe that the additional assumption (5.1a) simplifies the directional derivative with respect to \( u \in \tilde{S} \) of the electrostatic energy \( E_e \), which is given in Theorems 1.2 and 1.3.

**Proposition 5.5.** Let \( u \in \tilde{S} \) and \( w \in \tilde{S} \). Then
\[ \lim_{s \to 0^+} \frac{1}{s} (E_e(u + s(w - u)) - E_e(u)) = \int_D g(u)(w - u) \, dx. \]
identity of (5.1a) yields so that the last integral on the right-hand side of (5.9) vanishes. Moreover, the second identity of (5.1a) implies

\[
\lim_{s \to 0^+} \frac{1}{s} (E_e(u + s(w - u)) - E_e(u)) = \int_D g(u)(x)(w - u)(x) \, dx - \frac{1}{2} \int_D \sigma_2 \left( (\partial_x h_2)_u + (\partial_w h_2)_u \right)^2 (x, u(x)) (w - u)(x) \, dx + \int_D \left[ \sigma_1 (\partial_w h_1)_u \partial_x \psi_u \right] (x, -H - d) (w - u)(x) \, dx.
\]

Now observe that the first identity of (5.1a) implies

\[(\partial_w h_1)_u (x, -H - d) = 0, \quad x \in D,
\]

so that the last integral on the right-hand side of (5.9) vanishes. Moreover, the second identity of (5.1a) yields

\[(\partial_x h_2)_u (x, u(x)) = 0, \quad x \in D,
\]

which, together with (5.5), implies that the second integral on the right-hand side of (5.9) also vanishes. 

**Proof of Theorem 5.3.** Consider a minimizer \( u \in \tilde{S} \) of \( E \) on \( \tilde{S} \) and fix \( w \in S \). Owing to the convexity of \( S \), the function \( u + s(w - u) = (1 - s)u + sw \) belongs to \( S \) for all \( s \in (0, 1] \) and the minimizing property of \( u \) guarantees that

\[0 \leq \liminf_{s \to 0^+} \frac{1}{s} (E(u + s(w - u)) - E(u)).\]

Proposition 5.5 then implies that

\[0 \leq \int_D \left\{ \beta \partial_x^2 u \partial_x^2 (w - u) + \left( \tau + a \| \partial_x u \|_{L_2(D)}^2 \right) \partial_x u \partial_x (w - u) \right\} \, dx + \int_D g(u)(w - u) \, dx
\]

for all \( w \in S \). Since \( S \) is dense in \( \tilde{S} \), this inequality also holds for any \( w \in \tilde{S} \), which completes the proof of Theorem 5.3. 

**Remark 5.6.** In Theorem 5.3, a salient feature of \( g(u) \), which is given by (5.4) and coincides with the directional derivative of \( E_e = -\bar{F} \), is that it is non-negative, a property which is due to the uniform potentials applied on both the rigid plate \( D \times \{ -H - d \} \) and the elastic plate \( \bar{G}(u) \). When the applied potential on the elastic plate \( \bar{G}(u) \) is non-constant, the formula for the directional derivative of \( E_e = -\bar{F} \) provided by Theorems 1.2 and 1.3 involves a positive term and a negative term, and its sign is not determined a priori. A similar observation is made in [7] for a related model. In fact, if \( d = 0 \) (i.e. there is no dielectric layer) and if, instead of assuming (5.1a), the function \( h \) is taken to be

\[h(x, z, w) = \frac{H + z}{H + w} p(x, w), \quad (x, z, w) \in \bar{D} \times [-H, \infty) \times [-H, \infty),
\]

for a suitable function \( p \), then one easily recovers the model considered in [7] from Theorem 1.2.
