1. General information

Reactions with compounds sensitive to air or moisture were conducted in oven-dried glassware under an atmosphere of argon using standard Schlenk-technique. Anhydrous tetrahydrofuran (THF) was refluxed over sodium and freshly distilled from potassium prior to use. Anhydrous diethyl ether (Et₂O) was freshly distilled from Na/K-alloy. Anhydrous dichloromethane (CH₂Cl₂) was dried over P₄O₁₀ and also freshly distilled prior to use. Anhydrous methanol (MeOH) and dimethyl sulfoxide (DMSO) were purchased in extra-dry grade from Acros Organics and stored over molecular sieves. Unless stated otherwise, all reagents were purchased at Sigma Aldrich, Acros Organics, Alfa Aesar, ABCR, TCI, Fluorochem and BLDPharm and were used without further purification. Flash column chromatography (FC) was carried out on Merck silica gel (40-63 µm) with an excess compressed air pressure up to 0.5 bar. Solvents for chromatography and liquid-liquid extractions were purchased in technical grade and purified by distillation. For analytical thin layer chromatography (TLC) Merck silica gel 60 F254-plates were used and detection was carried out using UV-light (254 nm) or KMNO₄-stain (1.5 g in 250 mL water, 5 g NaHCO₃). Automatic flash-systems by Reveleris IES and Büchi C-850 Flashprep were used for medium pressure liquid chromatography (MPLC) using commercially available 4 g, 12 g or 40 g Reveleris-C₁₈-flash cartridges as the stationary phase. Preparative HPLC was conducted on a Büchi C-850 Flashprep device using an Agilent Zorbax XDB-C₁₈ column (21.2 x 150 mm, 5 µm particle size) as the stationary phase. As the mobile phase, water (Milli-Q grade) and acetonitrile (HPLC grade) were used. Detection was performed by UV-absorption (λ = 210 nm, 230, 254, 320 nm) and electronic light scattering detection (ELSD) with isopropanol as carrier. Melting points were measured using a Büchi Melting Point M-560 device and are uncorrected. Infrared spectra were recorded on a Digilab 3100 FT-IR Excalibur Series and a Jasco FT/IR-4600 spectrometer. Absorption bands are given in wave numbers ν (cm⁻¹). HRMS spectra (ESI-MS) were recorded on a Thermo Fisher Scientific Orbitrap Velos Pro and Thermo Fisher Scientific LTQ Orbitrap XL spectrometer. ¹H NMR (300 MHz, 400 MHz, 500 MHz and 600 MHz), ¹³C NMR (75 MHz, 101 MHz, 126 MHz and 151 MHz) and ¹⁹F NMR (282 MHz) spectra were measured on a Bruker Avance II 300, Bruker NEO 400, Agilent DD2 500 and Agilent DD2 600 spectrometer. Chemical shifts (δ in ppm) were referenced to the solvent residual peak (CDCl₃: δ_H = 7.26 ppm and δ_C = 77.0 ppm; DMSO-d₆: δ_H = 2.50 ppm and δ_C = 39.5 ppm). The multiplicities of the observed signals were given as s (singlet), bs (broad signal), d (doublet), t (triplet), q (quartet), hept (heptet), m (multiplet) and combination of the above.

2. General procedures

General Procedure (GP1) for the preparation of N-monosubstituted anilines (1g-ah):

\[
\begin{align*}
\text{Iodobenzene (1.0 equiv., 10.0 mmol), primary amine (1.5 equiv.), CuI (0.1 equiv.), L-proline (0.2 equiv.), and potassium bicarbonate (2.0 equiv.) were dissolved in anhydrous DMSO (0.5 M) and heated to 60 °C for 18 hours. After cooling to room temperature, water and EtOAc were added and the phases were separated. The aqueous layer was extracted with EtOAc (3 x), the combined organic phases were dried over MgSO}_4\text{ and concentrated in vacuo. Purification by flash column chromatography (EtOAc/pentane) led to isolation of the desired N-monosubstituted anilines.}
\end{align*}
\]

According to a procedure by Ma et al.\textsuperscript{1}, iodobenzene (1.0 equiv., 10.0 mmol), a primary amine (1.5 equiv.), copper iodide (0.1 equiv.), L-proline (0.2 equiv.) and potassium bicarbonate (2.0 equiv.) were dissolved in anhydrous DMSO (0.5 M) and heated to 60 °C for 18 hours. After cooling to room temperature, water and EtOAc were added and the phases were separated. The aqueous layer was extracted with EtOAc (3 x), the combined organic phases were dried over MgSO\textsubscript{4} and concentrated in vacuo. Purification by flash column chromatography (EtOAc/pentane) led to isolation of the desired N-monosubstituted anilines.

General Procedure (GP2) for the preparation of N-Methylanilines (Il-n and 1p-q):

\[
\begin{align*}
\text{Aniline (1.0 equiv., 5.00 mmol), NaOMe (3.0 equiv.), paraformaldehyde (3.0 equiv.) were dissolved in anhydrous MeOH (0.4 M) and refluxed overnight. After cooling to room temperature, sodium borohydride (3.0 equiv.) was added in three portions over 15 minutes. The reaction mixture was refluxed for two hours, cooled to room temperature and quenched with NH}_4\text{Cl-solution (sat. aq.) and EtOAc. The phases were separated and the aqueous phase was extracted with EtOAc (3 x). The combined organic phases were dried over MgSO}_4\text{ and concentrated in vacuo. Purification by flash column chromatography (EtOAc/pentane) led to isolation of the desired N-methylanilines.}
\end{align*}
\]

According to a procedure by Barluenga et al.\textsuperscript{2}, an aniline (1.0 equiv., 5.00 mmol), NaOMe (3.0 equiv.) and paraformaldehyde (3.0 equiv.) were dissolved in anhydrous MeOH (0.4 M) and refluxed overnight. After cooling to room temperature, sodium borohydride (3.0 equiv.) was added in three portions over 15 minutes. The reaction mixture was refluxed for two hours, cooled to room temperature and quenched with NH\textsubscript{4}Cl-solution (sat. aq.) and EtOAc. The phases were separated and the aqueous phase was extracted with EtOAc (3 x). The combined organic phases were dried over MgSO\textsubscript{4} and concentrated in vacuo. Purification by flash column chromatography (EtOAc/pentane) led to isolation of the desired N-methylanilines.
2. General procedures

General Procedure (GP3) for the preparation of Ketenes (2a-h):

Following a representative procedure from the literature, a carboxylic acid (1.0 equiv., between 10.0 mmol and 20.0 mmol) was dissolved in anhydrous CH$_2$Cl$_2$ (approx. 0.1 M). Oxalyl chloride (1.5 equiv.) and catalytic amounts of anhydrous DMF were added at room temperature. When gas formation ceased (approx. 3 h), the volatiles were removed in vacuo and the residue was dissolved in anhydrous ethereal solvent (THF or Et$_2$O, depending on the boiling point of the ketene). Triethylamine (4.0 equiv.) was added slowly at room temperature and the reaction mixture was stirred for 3 – 64 hours. Filtration under Argon atmosphere, concentration in vacuo and short-path distillation gave the desired ketenes as yellow oils.

General Procedure (GP4) for the preparation of Oxindoles (3aa-ha):

To a solution of a N-monosubstituted aniline (1.0 equiv., 0.20 mmol) in anhydrous THF (0.01 M) ethyl magnesium bromide (3.0 M solution in Et$_2$O, 1.1 equiv.) was added at room temperature and the reaction mixture was stirred for 30 minutes. Subsequently, the ketene (1.5 equiv.) was added dropwise and stirring was continued. After further 30 minutes, iodine (2.2 equiv.) was added and the reaction was stirred overnight at room temperature. Sodium sulfite (sat. aq. solution) was added until the brown colour disappeared and the phases were separated. The aqueous phase was extracted with EtOAc (3 x), the combined organic phases dried over MgSO$_4$ and concentrated in vacuo. Purification by reversed-phase MPLC (MeOH/H$_2$O or MeCN/H$_2$O) led to isolation of the desired oxindoles.
