1 Motivation and Introduction

The Gegenbauer polynomials $C_k^{(1)}(x)$ are solutions to the Gegenbauer differential equation $(1-x^2)((d^2y)/dx^2) - (2\lambda + 1)x(dy/dx) + k(k+2\lambda)y = 0$, $k = 0, 1, \ldots$. They can be written using $P_k^{(\alpha,\beta)}(x)$, Jacobi polynomials defined by Szegő [1] where $\beta = \alpha = \lambda - (1/2)$ as $C_k^{(1)}(x) = \Gamma(\lambda + (1/2))\Gamma(k+2\lambda)\Gamma(2\lambda)/(\Gamma(\lambda + (1/2))\Gamma(k+2\lambda)\Gamma(k+\lambda + (1/2)))P_k^{(\lambda,\lambda-1/2)}(x)$. Even though orthogonal polynomials are described on the interval $[-1, 1]$, it is more suitable for analytical and numerical computations to use the interval $[0, 1]$.

Finding new orthogonal systems which comprise as eigenfunctions of a differential equation is a motivating task. One of such eigenfunctions was developed by Koornwinder [2] which is the generalized Jacobi polynomials for constants $K_0, K_1 \geq 0$ with parameters $\alpha, \beta \in [0] \cup \mathbb{N}$ illustrating orthogonality on the interval $[-1, 1]$, where the corresponding differential equation of order $2(\alpha + \beta + 3)$ is given to make the corresponding operator widely suitable for applications.

Then, Koekoek and Koekoek [3] established an explicit representation of the generalized Jacobi polynomials, of higher order linear differential equations satisfied by $\{P_k^{(\alpha,\beta;K_0,K_1)}(x)\}_{k \in [0] \cup \mathbb{N}}$, $\alpha, \beta > -1$; $K_0, K_1 \geq 0$.

These systems were studied by Koornwinder [2] as orthogonal polynomials with reference to a linear combination of $W^{(\alpha,\beta;K_0,K_1)}(x)$, the Jacobi weight, and two delta functions $\delta_{-1}, \delta_1$ at the endpoints of the interval $[-1, 1]$.

On a square, inducing bivariate generalized orthogonal polynomials is straightforward [4], where tensor product can be utilized. However, the construction over triangular domains is more challenging, where some preliminary abstract was presented in ICNAAM [5].

Now, let $i,j,k$ denote a triple of non-negative integers. In this paper, a construction of orthogonal system of bivariate generalized shifted (BGS) Gegenbauer polynomials in Bézér form over a triangular domain is expressed as $\mathcal{G}_{n,r,d}^{(\lambda,K_0,K_1)}(u,v,w) = \sum_{i+j+k=n} a_{i,j,k}^{n,r,d} \mathcal{B}_{i,j,k}^n(u,v,w)$. For $d = 0, \ldots, k, r = 0, 1, \ldots, n$, and $n \in [0] \cup \mathbb{N}$, we obtain an explicit form for the coefficients $a_{i,j,k}^{n,r,d}$ and produce a recursive formula to calculate the coefficients $a_{i,j,k}^{n,r,d}$ efficiently.
1.1. Generalized Shifted Gegenbauer Polynomials (GSGP).
Generalized orthogonal polynomials were first introduced by Koornwinder [2] and developed by Koekoek and Koekoek in [3]. The univariate shifted Gegenbauer polynomial of degree $j$ in $x$ with parameter $\lambda > - (1/2)$ denoted by $C_j^{(\lambda)}(x)$ is achieved by replacing $x$ with $2x - 1$ in the definition of the classical Gegenbauer polynomial, $C_j^{(\lambda)}(x)$.

For $K_0, K_1 \geq 0$, the generalized shifted Gegenbauer polynomials (GSGP) of degree $r$ have been characterized by AlQuudah in [6] and are given by

$$G_r^{(\lambda,K_0,K_1)}(x) = \frac{r!(2\lambda-1)!}{(r+2\lambda-1)!} C_r^{(\lambda)}(x)$$

$$+ \sum_{j=0}^{r} \Lambda_j \frac{j!(2\lambda-1)!}{(j+2\lambda-1)!} C_j^{(\lambda)}(x).$$

(1)

These polynomials are orthogonal on the interval $[0,1]$ with reference to the weight [2].

$$2\Lambda_j^{(2\lambda)}(\lambda + (1/2))^{j-(1/2)}k(x \in (0,1))dx + K_0\delta_0 + K_1\delta_1,$$

(2)

where $\delta_x$ is the Dirac $\delta$–measure support at $x$.

$$\Lambda_j = (K_0 + K_1) \frac{\Gamma(2\lambda + j)\Gamma(\lambda + j + (1/2))}{\Gamma(2\lambda + (1/2))\Gamma(\lambda + j + (1/2))}$$

$$+ K_0 K_1 \frac{\Gamma(2\lambda + j)\Gamma(2\lambda + j + 1)}{(2\lambda + 1)!\Gamma(j)(2\lambda + 1)!\Gamma(j + 1)}.$$  

(3)

and $\mathbb{1}(x \in (0,1))$ denotes the indicator function, which is equal to 1 if $x \in (0,1)$, and 0 otherwise.

As the Bernstein polynomials are stable, these polynomials have been expressed in Bernstein form (see [7]). Now, next theorem provides an explicit form for GSGP of degree $r$ in $x$ symbolized by $G_r^{(\lambda,K_0,K_1)}(x)$, written in terms of Bernstein polynomials of degree $r$ in $x$ defined as

$$B_r^j(x) = \frac{r!(j-r)!}{r!j!}x^r(1-x)^{j-r}, \quad j = 0,1, \ldots, r.$$  

(4)

It is worth mentioning that the Bernstein polynomials $B_r^j(x)$ describe a basis for $\Pi_r$, the space of all polynomials of degree $\leq r$. In addition, for integers $i, j, k \geq 0$, we can define the generalized Bernstein polynomials of degree $r$ by $B_{r;k}^j(x,y,z) = ((r!)^i(i!j!k!)x^iy^jz^k)$ where $i+j+k = r$.

Theorem 1 (see [6]). For $\lambda > - (1/2), K_0, K_1 \geq 0,$ and $\Lambda_k$ defined in equation (3), the generalized shifted Gegenbauer polynomials $G_r^{(\lambda,K_0,K_1)}(x)$ of degree $r$ have the following Bernstein representation:

$$G_r^{(\lambda,K_0,K_1)}(x) = \frac{r!(2\lambda-1)!}{(r+2\lambda-1)!} \sum_{j=0}^{r} \eta_j^{\lambda,K_0,K_1} B_r^j(x)$$

$$+ \sum_{k=0}^{r} \Lambda_k \frac{k!(2\lambda-1)!}{(k+2\lambda-1)!} \sum_{j=0}^{r} \eta_j^{\lambda,K_0,K_1} B_r^j(x),$$

(5)

where

$$\eta_j^{\lambda,K_0,K_1} = (-1)^{k-j} \binom{k+\lambda-(1/2)}{j} \binom{k+\lambda-(1/2)}{k-j},$$

(6)

$j = 0,1, \ldots, k$.

In addition, Theorem 2 introduced by AlQuudah and AlMheidad [8] utilizes the geometric properties of Bernstein basis and proposes the transformation matrix of the GSGP basis into Bernstein basis of degree $n$.

Theorem 2 (see [8]). For $r, s = 0,1, \ldots, n$ and $a_k$ defined in equation (3), the entries of the transformation matrix of the GS Gegenbauer basis into Bernstein basis of degree $n$ denoted by $A_s^n_{r}$, are defined as

$$A_s^n_{r} = \mu_{s,r}^n \sum_{k=0}^{r} \Lambda_k \mu_{k,s}^{n,k},$$

(7)

where

$$\mu_{s,r}^n = \binom{k+\lambda-(1/2)}{k} \binom{k+\lambda-(1/2)}{k-j} \binom{k+\lambda-(1/2)}{k-j}$$

$$\sum_{j=0}^{\min(s,k)} (-1)^{j-s} \binom{k+\lambda-(1/2)}{s-j} \binom{k+\lambda-(1/2)}{k-j}$$

Since Bézier curves are vital to numerous applications in “approximation theory” and “numerical analysis,” with the demand of higher and/or different degree of B´ezier curve [9, 10], Corollary 1 presented by AlQuudah and AlMheidad in [11] uses Bézier degree elevation developed by Farouki and Rajan [10] to write $G_j^{(\lambda,K_0,K_1)}(x)$ of degree $j$ in terms of Bernstein basis of higher and fixed degree $n$, which helps in numerical stability and computation efficiency.

Corollary 1 (see [8]). GS Gegenbauer polynomials $G_j^{(\lambda,K_0,K_1)}(x)$ of degree $j \leq n$ are expressed using Bernstein basis of fixed degree $n$ as

$$G_j^{(\lambda,K_0,K_1)}(x) = \sum_{s=0}^{n} [A_s^n]_r B_s^n(x), \quad r = 0,1, \ldots, n,$$

(8)

where $[A_s^n]_r$ is the transpose of the matrix $[A_s^n]$, for which entries are given in equation (7).
2. Bivariate Generalized Shifted Gegenbauer Polynomials on Triangular Domains

In this section, we introduce an explicit representation of the bivariate generalized shifted (BGS) Gegenbauer polynomials, denoted by $\mathcal{G}_{n,r,d}^{*(\lambda,K_{s},K_{t})}(u,v,w)$, in terms of Bernstein basis over a triangular domain $T$. With respect to the generalized weight $W_{n,r,d}^{*(\lambda,K_{s},K_{t})}(u,v,w)$, these polynomials create an orthogonal system over $T$.

2.1. The Triangular Domain $T$. Let $p_{1}, p_{2}, p_{3}$ be noncollinear vertices for a triangle $T$. Then, any point $p$ inside the triangle can be written uniquely in terms of the vertices $p_i, i = 1, 2, 3$ utilizing a triple of non-negative coordinates, called “barycentric coordinates,” defined as $u = (\text{area}(p_{1}, p_{2}, p)) / (\text{area}(p_{1}, p_{2}, p_{3}))$, $v = (\text{area}(p_{1}, p, p_{3})) / (\text{area}(p_{1}, p_{2}, p_{3}))$, $w = (\text{area}(p_{1}, p_{2}, p)) / (\text{area}(p_{1}, p_{2}, p_{3}))$, such that $u + v + w = 1$ and $p = up_{1} + vp_{2} + wp_{3}$. We only have two degrees of freedom, despite the fact that we have three “barycentric coordinates.”

Thus, any point is exclusively defined by any two of the barycentric coordinates, and thus the triangular domain is defined as $T = \{(u, v, w): u, v, w \geq 0; w = 1 - (u + v)\}$.

For linearly independent and mutually orthogonal polynomials of some degree $n$, employing the barycentric coordinates $(u, v, w)$, we can illustrate the basis in a triangular structure where the $i$th row contains $i + 1$ basis totaling $\binom{n + 2}{2}$.

It is worthwhile to mention that generalized Bernstein polynomials, $B_{i,j}^{n}(u,v,w)$, are non-negative and form a partition of unity, $\sum_{0\leq i,j \leq n} (n!/(i! j! k!))u^{i}v^{j}w^{k} = 1$, and are equally weighted as basis functions with equal integrals over the domain $T$.

Lemma 1 (see [12]). The generalized Bernstein polynomials $B_{i,j}^{n}(u,v,w)$ such that $i + j + k = n$ on the triangular domain $T$ satisfy $\int_{T} B_{i,j}^{n}(u,v,w) dA = \Delta(i + j + k + 1)n + 2 = 2 \cdot \text{area}(T)$.

2.2. Construction. For $\gamma > -1$, $n \in \{0\} \cup \mathbb{N}$; $k = 0, \ldots, n$; $r = 0, 1, \ldots, n$; $d = 0, 1, \ldots, k$; $\lambda_{n}$ defined by equation (3), $\frac{n_{r}}{r}_{n}$ defined by equation (6), where $2 \lambda + \gamma = 1$ and analogues to the construction in [13] using barycentric coordinates $u,v,w$, the explicit representation of degree-ordered system of $C_{n,r,d}^{*(\lambda,K_{s},K_{t})}(u,v,w)$, BGS Gegenbauer polynomials in Bernstein form over the triangular domain $T$ is written as

$$G_{n,r,d}^{*(\lambda,K_{s},K_{t})}(u,v,w) = \sum_{i=0}^{r} \frac{\lambda_{i}}{r!} B_{i,j}^{n}(u,v) \sum_{j=0}^{n-r} (-1)^{j} \binom{n+r+1}{j} B_{j}^{n-r}(w,u+v) + \sum_{k=0}^{n} \Lambda_{k} \frac{d_{k}}{d!} B_{d}^{k}(u,v) \sum_{j=0}^{k-d} (-1)^{j} \binom{k+d+1}{j} B_{j}^{k-d}(w,u+v),$$

(9)

these polynomials create an orthogonal system with respect to the weight function $W_{n,r,d}^{*(\lambda,K_{s},K_{t})}(u,v,w)$ given as

$$\frac{\Gamma(2\lambda+1)}{(2\lambda+1)!} \frac{(1-\nu)^{(\lambda/2)}}{\Gamma(\lambda+(1/2)^{2})} 1 \leq 1 - (1 - \nu)^{(\lambda/2)} 1 - 1 \leq 1 \leq (\nu, 1, 1)dw + K_{o}z_{o}(u) + K_{1}z_{1}(u).$$

(10)

The idea of the construction of this system is to let the bivariate $G_{n,r,d}^{*(\lambda,K_{s},K_{t})}(u,v,w)$ concur with the univariate shifted Gegenbauer polynomial $C_{n}^{(3)}(x)$, along one side of $T$, and to make its variation along each chord parallel to that edge a scaled version of $G_{n,r,d}^{*(\lambda,K_{s},K_{t})}(u,v,w)$.

The variation of $G_{n,r,d}^{*(\lambda,K_{s},K_{t})}(u,v,w)$ with $\nu$ can be placed in a way that on the triangular domain, these polynomials are orthogonal with every polynomial of degree $n_{i}$ and with other $n_{j}$ degree polynomials $G_{n,r,d}^{*(\lambda,K_{s},K_{t})}(u,v,w)$ for $r \neq s$.

For $i = 0, \ldots, k$, $k \in \{0\} \cup \mathbb{N}$, employ the polynomial $q_{k,i}(w)$ introduced by Farouki et al. [12] defined as

$$q_{k,i}(w) = \sum_{j=0}^{k-i} (-1)^{j} \binom{k+i+1}{j} B_{j}^{k-i}(w).$$

(11)

Then, any polynomial $p(w)$ of degree $\leq k - i - 1$, $q_{k,i}(w)$ is orthogonal to $(1 - w)^{2i+k+1}$ on $[0,1]$ for $l = 0, \ldots, k - i - 1$. Thus,

$$\int_{0}^{1} q_{k,i}(w) (1 - w)^{2i+k+1} p(w) dw = 0.$$  (12)

By choosing $G_{0,0}^{*(\lambda,K_{s},K_{t})} = 1$, for $0 \leq r \leq n$ and $n = 0, 1, 2, \ldots$, the bivariate polynomials $G_{n,r,d}^{*(\lambda,K_{s},K_{t})}(u,v,w)$ form a degree-ordered orthogonal system over the triangular domain $T$.

Using the fact that $(u + v)^{r} B_{r}^{n}(u/(1 - w)) = B_{r}^{n}(u,v)$, we rephrase polynomials (9) as
\[
\mathcal{G}^{\star,(K_0,K_1)}_{n,r,d}(u,v,w) = \sum_{i=0}^{n} (-1)^{r-i} \begin{pmatrix} r + \lambda - (1/2) \\ i \end{pmatrix} \begin{pmatrix} r - i \\ r \end{pmatrix} B^r_i \left( \frac{u}{1-w} \right) (1-w)^{r} q_{n,r}(w)
\]
\[
+ \sum_{k=0}^{n} \Lambda_k \sum_{i=0}^{d} (-1)^{d-i} \begin{pmatrix} d + \lambda - (1/2) \\ j \end{pmatrix} \begin{pmatrix} d - i \\ d \end{pmatrix} B^d_i \left( \frac{u}{1-w} \right) (1-w)^{d} q_{k,d}(w).
\]

Using Theorem 1, for \( d = 0, \ldots, k \), \( r = 0, \ldots, n \), we get
\[
\mathcal{G}^{\star,(K_0,K_1)}_{n,r,d}(u,v,w) = C_{r}^{\star,(K_0,K_1)} \left( \frac{u}{1-w} \right) (1-w)^{r} q_{n,r}(w)
\]
\[
+ C_{d}^{\star,(K_0,K_1)} \left( \frac{u}{1-w} \right) (1-w)^{d} \sum_{k=0}^{n} \Lambda_k q_{k,d}(w),
\]

where \( q_{k,d}(w) \) is defined in equation (11) and \( C_{r}^{\star,(K_0,K_1)}(t) \) denotes the univariate shifted Gegenbauer polynomial of degree \( r \).

Two steps are needed to prove that the polynomials \( \mathcal{G}^{\star,(K_0,K_1)}_{n,r,d}(u,v,w) \) form an orthogonal system over the triangular domain with respect to the generalized Gegenbauer weight function.

(1) Step 1: we need to show that \( \mathcal{G}^{\star,(K_0,K_1)}_{n,r,d}(u,v,w) \) is orthogonal to all polynomials of degree less than \( n \) as in the following theorem.

**Theorem 3.** For \( r = 0, 1, \ldots, n \); \( n \in \mathbb{N} \); \( K_0, K_1 \geq 0 \); and \( \lambda > (1/2), \gamma > 1 \), such that \( 2\lambda + \gamma = 1 \), we have
\[
\mathcal{G}^{\star,(K_0,K_1)}_{n,r,d}(u,v,w) \text{ with respect to the weight function } W^{(K_0,K_1)}(u,v,w) \text{ written as}
\]
\[
\frac{\Gamma(2\lambda+1)}{\Gamma(\lambda+1)^2} (1-w)^{-1} (1-u)^{-11} (w \in (0,1)) dudw + K_0 \delta_0(u) + K_1 \delta_{w=1}(u).
\]

**Proof.** For \( l = 0, \ldots, m; m = 0, \ldots, n-1 \), construct a set of bivariate polynomials:
\[
H^{(l)}_{n,m}(u,v,w) = C^{\star,(K_0,K_1)}_{l} \left( \frac{u}{1-w} \right) (1-w)^{m} w^{n-m-1},
\]
where \( C^{\star,(K_0,K_1)}_{l}(t) \) denotes the univariate shifted Gegenbauer polynomial of degree \( l \). Employ equation (6); then, \( H^{(l)}_{n,m}(u,v,w) \) can be expressed as
\[
H^{(l)}_{n,m}(u,v,w) = (1-w)^{m} w^{n-m-1} \sum_{j=0}^{l} (-1)^{l-j} \begin{pmatrix} l + \lambda - (1/2) \\ j \end{pmatrix} \begin{pmatrix} l - j \\ l \end{pmatrix} B^{l}_j \left( \frac{u}{1-w} \right) (1-w)^{l}. \]

Note that span of \( H^{(l)}_{n,m}(u,v,w) \) comprises the set of Bernstein polynomials
\[
\mathcal{B}^{m}_j(w) \left( \frac{u}{1-w} \right) (1-w)^{m} w^{n-m-1} = \mathcal{B}^{m}_j(u,v) w^{n-m-1}, \; j = 0, \ldots, m; \; m = 0, \ldots, n-1 \; \text{spanning } \Pi_{n-1}. \; \text{Accordingly, it is sufficient to show that}
\]
\[
I = \int_{T} \mathcal{G}^{\star,(K_0,K_1)}_{n,r,d}(u,v,w) H^{(l)}_{n,m}(u,v,w) W^{(K_0,K_1)} \left( u,v \right) dA = 0, \; l = 0, \ldots, m; m = 0, \ldots, n-1.
\]
Now, by substituting $C^*(λ,r,K_1)(u,v,w)$, $H_j^{(1)}(u,v,w)$, and $W^{(λ,r,K_1)}(u,v,w)$ into the integral

$$I = \Delta \int_0^1 \int_0^1 w^{−1−r} C^*(λ,r,K_1)(u,v,w) \cdot (u,v,w)W^{(λ,r,K_1)}(u,v,w) \, du \, dw,$$

and by collecting, reordering the terms, and applying $t = (w/(1−w))$, we get

$$I = \frac{\Gamma(2λ+1)}{(1−w)^{r+λ+1/2}} \int_0^1 w^{n−m−1} (1−w)^{r+m+1} q_{n,r}(w) \, dw$$

and by the orthogonality property of the shifted Gegenbauer polynomials, we can write

$$I = \frac{\Gamma(2λ+1)}{(1−w)^{r+λ+1/2}} \int_0^1 w^{n−m−1} (1−w)^{r+m+1} q_{n,r}(w) \, dw$$

Note that $I < d < r$, when $m < d < r$, and so the orthogonality property of the shifted Gegenbauer polynomials can be used, and when $r ≤ d ≤ m ≤ n−1$, use the orthogonality property given in equation (12). Hence, $I = 0$, which completes the proof.

Now we introduce Theorem 4 which will be proved to finalize the construction of the BGS Gegenbauer polynomials orthogonal system over $T = \left\{C^*(λ,r,K_1)(u,v,w)\right\}_{n,r,d}$. □

**Theorem 4.** Let $K_0, K_1 ≥ 0$, $λ > (1/2)$, $γ > 1$, and $W^{(λ,r,K_1)}(u,v,w)$ be the generalized weight function defined as $(\Gamma(2λ+1)/\Gamma(λ+(1/2)^2))w^{λ−1/2}(1−w)^{γ−1}(u ∈ (0,1−w))|w ∈ (0,1)| \, du \, dw + K_0δ_0(u) + K_1δ_{n−1}(u)$ enables us to separate the integrand, and taking the constrained $2λ + γ = 1$ facilitates the usage of the orthogonality property given in equation (12).

Now we introduce Theorem 4 which will be proved to finalize the construction of the BGS Gegenbauer polynomials orthogonal system over $T = \left\{C^*(λ,r,K_1)(u,v,w)\right\}_{n,r,d}$. □

Proof. Let $T = \left\{(u,v,w): u, v, w ≥ 0; u + v + w = 1\right\}$ be a triangular domain, and for $r, s = 0, . . . , n; m = 0, . . . , s$; and $d = 0, . . . , r$, where $r ≠ s$ and $d ≠ m$, let

$$I = \int_T \int_0^1 w^{−1−r} C^*(λ,r,K_1)(u,v,w) \, C^*(λ,s,m) \cdot (u,v,w)W^{(λ,r,K_1)}(u,v,w) \, du \, dw,$$

which can be written as

$$I = \int_0^1 \int_0^1 w^{−1−r} C^*(λ,r,K_1)(u,v,w) \, C^*(λ,s,m) \cdot (u,v,w)W^{(λ,r,K_1)}(u,v,w) \, du \, dw,$$

Note that for $n ∈ \mathbb{N}_0$, $r, k = 0, . . . , n$; and $d = 0, . . . , k$, the BGS GP defined in equation (14) can be expressed in terms of $q_{n,r}(w)$ as

$$C^*(λ,r,K_1)(u,v,w) = (1+λ)C^*(λ,r,K_1)(u,v,w) + C^*(λ,r,K_1)(u,v,w) \, C^*(λ,s,m)$$

and by the orthogonality property of the shifted Gegenbauer polynomials, we can write

$$I = \frac{\Gamma(2λ+1)}{(1−w)^{r+λ+1/2}} \int_0^1 w^{n−m−1} (1−w)^{r+m+1} q_{n,r}(w) \, dw$$
By substituting the terms into the integral \( I \), making the change of variables \( u = t(1 - w) \), separating the integrand, and reordering the integrals, the value of \( (I/\Delta) \) equals

\[
\frac{\Gamma(2\lambda + 1)}{\Gamma(\lambda + (1/2))}\left(1 + \Lambda_n\right)^2 \sum_{i=0}^{\lambda - (1/2)} (-1)^i \binom{\lambda - (1/2)}{i} \int_0^1 C_r^{(3)}(t)C_s^{(3)}(t)(1 - t)^{\lambda - (1/2)} dt
\]

\[
\cdot \int_0^1 q_{n,r}(w)q_{n,s}(w)(1 - w)^{i+r-s+y\lambda - (1/2)} dw
\]

\[
+ \frac{\Gamma(2\lambda + 1)}{\Gamma(\lambda + (1/2))}\left(1 + \Lambda_n\right) \sum_{j=0}^{n-1} \Lambda_j \sum_{i=0}^{\lambda - (1/2)} (-1)^i \binom{\lambda - (1/2)}{i} \int_0^1 C_r^{(3)}(t)C_m^{(3)}(t)(1 - t)^{\lambda - (1/2)} dr
\]

\[
\cdot \int_0^1 q_{n,r}(w)q_{j,m}(w)(1 - w)^{i+r+s+y\lambda - (1/2)} dw
\]

\[
+ \frac{\Gamma(2\lambda + 1)}{\Gamma(\lambda + (1/2))}\left(1 + \Lambda_n\right) \sum_{k=0}^{n-1} \Lambda_k \sum_{j=0}^{n-1} \Lambda_j \sum_{i=0}^{\lambda - (1/2)} (-1)^i \binom{\lambda - (1/2)}{i} \int_0^1 C_s^{(3)}(t)C_m^{(3)}(t)(1 - t)^{\lambda - (1/2)} dt
\]

\[
\cdot \int_0^1 q_{n,s}(w)q_{j,m}(w)(1 - w)^{i+r+s+y\lambda - (1/2)} dw
\]

\[
+ \frac{\Gamma(2\lambda + 1)}{\Gamma(\lambda + (1/2))}\left(1 + \Lambda_n\right)^2 \sum_{k=0}^{n-1} \Lambda_k \sum_{j=0}^{n-1} \Lambda_j \sum_{i=0}^{\lambda - (1/2)} (-1)^i \binom{\lambda - (1/2)}{i} \int_0^1 C_d^{(3)}(t)C_m^{(3)}(t)(1 - t)^{\lambda - (1/2)} dt
\]

\[
\cdot \int_0^1 q_{k,d}(w)q_{j,m}(w)(1 - w)^{i+r+s+y\lambda - (1/2)} dw
\]

\[
+ K_0\left(1 + \Lambda_n\right)^2 \int_0^1 C_r^{(3)}(t)C_s^{(3)}(t)\delta_0(t) dt \int_0^1 q_{n,r}(w)q_{n,s}(w)(1 - w)^{i+r+s+1} dw
\]

\[
+ K_0\left(1 + \Lambda_n\right) \sum_{j=0}^{n-1} \Lambda_j \int_0^1 C_r^{(3)}(t)C_m^{(3)}(t)\delta_0(t) dt \int_0^1 q_{n,r}(w)q_{j,m}(w)(1 - w)^{i+r+s+1} dw
\]

\[
+ K_0\left(1 + \Lambda_n\right) \sum_{k=0}^{n-1} \Lambda_k \int_0^1 C_s^{(3)}(t)C_m^{(3)}(t)\delta_0(t) dt \int_0^1 q_{n,s}(w)q_{k,d}(w)(1 - w)^{i+r+s+1} dw
\]

\[
+ K_0\left(1 + \Lambda_n\right) \sum_{k=0}^{n-1} \Lambda_k \sum_{j=0}^{n-1} \Lambda_j \int_0^1 C_d^{(3)}(t)C_m^{(3)}(t)\delta_0(t) dt \int_0^1 q_{k,d}(w)q_{j,m}(w)(1 - w)^{i+r+s+1} dw
\]

\[
+ K_1\left(1 + \Lambda_n\right)^2 \int_0^1 C_r^{(3)}(t)C_s^{(3)}(t)\delta_1(t) dt \int_0^1 q_{n,r}(w)q_{n,s}(w)(1 - w)^{i+r+s+1} dw
\]

\[
+ K_1\left(1 + \Lambda_n\right) \sum_{j=0}^{n-1} \Lambda_j \int_0^1 C_r^{(3)}(t)C_m^{(3)}(t)\delta_1(t) dt \int_0^1 q_{n,r}(w)q_{j,m}(w)(1 - w)^{i+r+s+1} dw
\]

\[
+ K_1\left(1 + \Lambda_n\right) \sum_{k=0}^{n-1} \Lambda_k \int_0^1 C_s^{(3)}(t)C_d^{(3)}(t)\delta_1(t) dt \int_0^1 q_{n,s}(w)q_{k,d}(w)(1 - w)^{i+r+s+1} dw
\]

\[
+ K_1\left(1 + \Lambda_n\right) \sum_{k=0}^{n-1} \Lambda_k \sum_{j=0}^{n-1} \Lambda_j \int_0^1 C_d^{(3)}(t)C_m^{(3)}(t)\delta_1(t) dt \int_0^1 q_{k,d}(w)q_{j,m}(w)(1 - w)^{i+r+s+1} dw.
\]
Since \( d \neq r \) and \( m \neq s \), then \( r \neq s \) and \( d \neq m \), and so the orthogonality property of the shifted Gegenbauer polynomials is utilized. Then, \( I = 0 \), and thus \( \mathbf{C}_{n,r,d}^{(l,K_{n},K_{r})} (u, v, w) \) \( \perp \mathbf{C}_{n,r,d}^{(l,K_{s},K_{r})} (u, v, w) \).

Hence, for \( \lambda > - (1 / 2) \), \( \gamma > - 1 \), \( \{ \mathbf{C}_{n,r,d}^{(l,K_{n},K_{r})} (u, v, w) \}_{n;r,d=0}^{n} \) form an orthogonal system over the triangular domain \( T \), with respect to the generalized weight \( W_{\lambda}^{(l,K_{n},K_{r})} \).

## 3. Recurrence Relation

Bernstein–Bézier basis has remarkable geometric properties, so they can be used in surfaces and curves which will facilitate numerical computations (see [9, 14]). For \( n, i, j, k \in \{ 0 \} \cup \mathbb{N} \), such that \( i + j + k = n \), let the BGS Gegenbauer orthogonal polynomials \( \mathbf{C}_{n,r,d}^{(l,K_{n},K_{r})} (u, v, w) \), \( r = 0, 1, \ldots, n \), \( d = 0, \ldots, k \) be written in terms of Bernstein–Bézier form as follows:

\[
\mathbf{C}_{n,r,d}^{(l,K_{n},K_{r})} (u, v, w) = \sum_{i+j+k=n} a_{i,j,k}^{n,r,d} B_{i,j,k}^{n} (u, v, w). 
\]

(25)

Our goal is to obtain a closed formula for coefficients \( a_{i,j,k}^{n,r,d} \) and produce a recurrence relation equation to calculate coefficients efficiently.

**Theorem 5.** For \( n \in \{ 0 \} \cup \mathbb{N} \), \( r = 0, 1, \ldots, n \), and \( d = 0, \ldots, k \) and non-negative integers \( i, j, k \) such that \( i + j + k = n \), Bernstein–Bézier coefficients \( a_{i,j,k}^{n,r,d} \) of BGS Gegenbauer polynomials \( \mathbf{C}_{n,r,d}^{(l,K_{n},K_{r})} (u, v, w) \) are expressed by

\[
a_{i,j,k}^{n,r,d} = \begin{cases} (-1)^{i} \binom{n + r + 1}{k} \binom{n - r}{k} A_{n,r}^{\lambda} + \Lambda_{k} (-1)^{i} \binom{k + d + 1}{j} \binom{k - d}{j} A_{n,d}^{\lambda}, & 0 \leq k \leq n - r, \\ 0, & k > n - r. \end{cases}
\]

(26)

**Case 2.** \( 0 \leq k \leq n - r \). Equate equation (25) with equation (9), and then we obtain the following:

\[
\sum_{i+j=k-n} a_{i,j,k}^{n,r,d} B_{i,j,k}^{n} (u, v, w) = (-1)^{i} \binom{n + r + 1}{k} B_{k}^{n-r} (u, v, w) \sum_{i=0}^{r} \eta_{i}^{\lambda} B_{i}^{1} (u, v)
\]

\[
+ \Lambda_{k} \sum_{j=0}^{k-d} (-1)^{j} \binom{k + d + 1}{j} B_{j}^{k-d} (u, v, w) \sum_{i=0}^{d} \eta_{i,d}^{\lambda} B_{i,d}^{1} (u, v),
\]

(27)

where \( \Lambda_{k} \) is defined in equation (3) and \( \eta_{i}^{\lambda} \) is defined in equation (6). In the last equation, we compare similar powers of \( w \) to obtain

\[
\sum_{i=0}^{n-k} a_{i,j,k}^{n,r} \binom{n}{k} B_{i}^{n-k} (u, v) = \sum_{i=0}^{n-k} a_{i,j,k}^{n,r} \binom{n}{k} B_{i}^{n-k} (u, v) = \sum_{i=0}^{n-k} a_{i,j,k}^{n,r} \binom{n}{k} B_{i}^{n-k} (u, v)
\]

\[
(-1)^{i} \binom{n + r + 1}{k} \binom{n - r}{k} (u + v)^{n-r-k} \sum_{i=0}^{r} \eta_{i}^{\lambda} B_{i}^{d} (u, v)
\]

\[
+ \Lambda_{k} \sum_{j=0}^{k-d} (-1)^{j} \binom{k + d + 1}{j} \binom{k - d}{j} (u + v)^{k-d-j} \sum_{i=0}^{d} \eta_{i,d}^{\lambda} B_{i,d}^{1} (u, v).
\]

(28)
Then, we utilize Corollary 1 and some combinatorial identities to write \( \sum_{i=0}^{n} a_{i,j,k}^{n,r} n_{k}^{r} B_{i}^{n-k} (u, v) \) in above equation as

\[
(-1)^{k} \binom{n+r+1}{k} \binom{n-r}{k} \sum_{i=0}^{r} A_{i}^{n-k} B_{i}^{n-k} (u, v) + \Lambda_{k} \sum_{j=0}^{k-d} (-1)^{j} \binom{k+d+1}{j} (k-d)^{i} A_{i}^{n-k} B_{i}^{d-k-j} (u, v).
\]

(29)

Therefore, we obtain a closed form for Bernstein–Bézier coefficients.

We will incorporate a result of Farouki et al. [12] to find the recursive formula for \( a_{i,j,k}^{n,r} \), which will be used in the process of obtaining the recurrence equation.

**Lemma 2.** Let \( g(x) = \sum_{i+j+k=m} d_{i,j,k} B_{i,j,k} (x) \in \Pi_{m} \). Then, the following holds:

\[
g(x) \in \mathcal{P}_{m} \iff \sum_{i+j+k=m} d_{i,j,k} c_{i,j,k} = 0,
\]

\[
\forall h(x) = \sum_{i+j+k=m} c_{i,j,k} B_{i,j,k} (x) \in \Pi_{m-1}.
\]

(30)

Now, use \( B_{i+1,j,k}^{n} (u, v, w) = (u + v + w) B_{i+1,j,k}^{n-1} (u, v, w) \) to express the generalized \((n-1)\)th degree Bernstein polynomial \( B_{i+1,j,k}^{n-1} (u, v, w) \) as

\[
\frac{1}{n} ((i+1) B_{i+1,j,k}^{n} (u, v, w) + (j+1) B_{i+1,j+1,k}^{n} (u, v, w) + (k+1) B_{i,j,k+1}^{n} (u, v, w)).
\]

(31)

For \( i + j + k = n - 1 \), using the construction of the BGS Gegenbauer polynomials \( G_{s}^{(n,k,s)} (u, v, w) \), we get \( \langle B_{i,j,k}^{n-1} (u, v, w), G_{s}^{(n,k,s)} (u, v, w) \rangle = 0 \). Finally, use Lemma 2 to attain the desired recurrence relation to generate the coefficients \( a_{i,j,k}^{n,r} \) recursively on \( k, a_{i,j,k+1}^{n,r} = (-1/(k+1)) [(i+1) a_{i+1,j+1,k}^{n,r} + (j+1) a_{i,j+1,k+1}^{n,r}] \), such that \( a_{i,j,k}^{n,r} \) for \( i \in \{0\} \cup \mathbb{N} \) where \( A_{i}^{n} \) is given in equation (7).

**4. Applications and Conclusion**

Orthogonal polynomials provide a natural approach to the extension, implementation, and study of solutions to multiple differential equations. They are vital to stability and efficiency of numerical methods, the characteristics of which are useful for solving engineering and physical problems. So, discovering novel types of orthogonal polynomials serve in the advancement of applications in diverse disciplines.

Therefore, orthogonal polynomials have gained notable attention. They are key to numerous problems in mathematical analysis and approximation theory. They play a significant role in splines, Fredholm theory, fractional calculus, integrodifferential equations, stochastic differential equations (SDEs), spectral element method (SEM), and data integration.

It is therefore more practical to construct orthogonal polynomial systems recursively in lieu of absolute forms. The recursive relation makes it possible to establish any polynomial of a given degree directly.

In this paper, we investigated the GS Gegenbauer orthogonal polynomials \( G_{s}^{(n,k,s)} (x) \) using Bernstein representation on the interval \([0, 1]\) with regard to the measure \([\lambda/2]((2\lambda)^{2})/\Gamma(\lambda + (1/2)^{2})) (x - \lambda x)^{1/2} (1/2) \) \((x \in (0, 1), dx + K_{0} \delta_{0} + K_{1} \delta_{1} \).

Then, for \( \lambda > (1/2) \), we constructed \( G_{s}^{(n,k,s)} (u, v, w) = \sum_{i+j+k=m} a_{i,j,k}^{n,r} B_{i,j,k} (u, v, w) \), the BGS Gegenbauer orthogonal polynomials, on the triangular domain \( T \) in terms of generalized Bernstein coefficients \( a_{i,j,k}^{n,r} \), with respect to the weight \((\Gamma(2\lambda + 1))/\Gamma(\lambda + (1/2)^{2})) (u - v)^{1/2} (1/2) (1 - u)^{1/2} (1 - w)^{1/2} \) \((u \in (0, 1), \lambda \neq (1/2)) \).

We have also shown that for \( r \neq s \) and \( d \neq m \), \( G_{s}^{(n,k,s)} (u, v, w) \perp G_{s}^{(n,k,s)} (u, v, w) \) to conclude that these bivariate polynomials form an orthogonal system over \( T \). The coefficients \( a_{i,j,k}^{n,r} \) were given in a closed and explicit form, and then a recurrence relationship was defined to allow us to calculate the polynomials effectively and efficiently.

The construction in this paper can be extended to \( i \)-variate polynomials over an \( i \)-dimensional simplex where

\[
T_{i} = \left\{ u = (u_{0}, \ldots, u_{i}) \mid u_{j} \geq 0, \sum_{j=0}^{i} u_{j} = 1 \right\}
\]

denotes the \( i \)-dimensional unit simplex in barycentric coordinates. Moreover,

\[
B_{i}^{n} (u) = \binom{n}{i} u^{i} \prod_{k=0}^{n} \frac{\zeta_{k}}{\zeta_{k}^{i}} = \prod_{j=0}^{n} \frac{\zeta_{j}}{\zeta_{k}^{i}} \prod_{j=1}^{i} \zeta_{j}, \quad |\zeta| = n,
\]

(33)

where \( \zeta = (\zeta_{0}, \ldots, \zeta_{d}) \in [0, 1]^{n} \) and \( \zeta = (\zeta_{0}, \ldots, \zeta_{d}) = n \) denotes the Bernstein basis for \( n \)th degree polynomial over the simplex \( T_{i} \).
