Representation of Itô Integrals
by Lebesgue/Bochner Integrals

Qi Lũ; Jiongmin Yong† and Xu Zhang†

July 20, 2010

Abstract

In [22], it was proved that as long as the integrand has certain properties, the corresponding Itô integral can be written as a (parameterized) Lebesgue integral (or a Bochner integral). In this paper, we show that such a question can be answered in a more positive and refined way. To do this, we need to characterize the dual of the Banach space of some vector-valued stochastic processes having different integrability with respect to the time variable and the probability measure. The later can be regarded as a variant of the classical Riesz Representation Theorem, and therefore it will be useful in studying other problems. Some remarkable consequences are presented as well, including a reasonable definition of exact controllability for stochastic differential equations and a condition which implies a Black-Scholes market to be complete.

2010 Mathematics Subject Classification. Primary 60G05; Secondary 60H05, 60G07.

Key Words. Itô integral, Lesbegue integral, Bochner integral, range inclusion, Riesz-type Representation Theorem.

1 Introduction

Let \((\Omega, \mathcal{F}, \mathbb{F}, \mathbb{P})\) be a complete filtered probability space with \(\mathbb{F} = \{\mathcal{F}_t\}_{t \geq 0}\), on which a one-dimensional standard Brownian motion \(\{W(t)\}_{t \geq 0}\) is defined so that \(\mathbb{F}\) is its natural filtration augmented by all the \(\mathbb{P}\)-null sets. Let \(H\) be a Banach space with the norm \(|\cdot|_H\) and with the dual space \(H^*\). For any \(p \in [1, \infty]\), let \(L^p_{\mathcal{F}_T}(\Omega; H)\) be the set of all \(\mathcal{F}_T\)-measurable (\(H\)-valued) random variables \(\xi: \Omega \to H\) such that \(\mathbb{E}|\xi|^p_H < \infty\). Next, for any \(p, q \in [1, \infty]\), put
\[
L^p_{\mathbb{F}}(\Omega; L^q(0, T; H)) = \left\{ \varphi : [0, T] \times \Omega \to H \mid \varphi(\cdot) \text{ is } \mathbb{F}\text{-progressively measurable and} \right. \\
\mathbb{E}\left( \int_0^T |\varphi(t)|^q_H dt \right)^{\frac{p}{q}} < \infty \right\},
\]
(1.1)
\[
L^q(0, T; L^p(\Omega; H)) = \left\{ \varphi : [0, T] \times \Omega \to H \mid \varphi(\cdot) \text{ is } \mathbb{F}\text{-progressively measurable and} \right. \\
\int_0^T \left( \mathbb{E}|\varphi(t)|^p_H \right)^{\frac{q}{p}} dt < \infty \right\}.
\]
In an obvious way, we may also define (for \(1 \leq p, q < \infty\))
\[
\left\{ \begin{array}{ll}
L^\infty_{\mathbb{F}}(\Omega; L^q(0, T; H)), & L^p_{\mathbb{F}}(\Omega; L^\infty(0, T; H)), & L^\infty_{\mathbb{F}}(\Omega; L^\infty(0, T; H)), \\
L^q(0, T; L^p(\Omega; H)), & L^p_{\mathbb{F}}(0, T; L^\infty(\Omega; H)), & L^\infty_{\mathbb{F}}(0, T; L^\infty(\Omega; H)).
\end{array} \right.
\]
It is clear that
\[
L^p_{\mathbb{F}}(\Omega; L^p(0, T; H)) = L^p_{\mathbb{F}}(0, T; L^p(\Omega; H)) \equiv L^p_{\mathbb{F}}(0, T; H), \quad 1 \leq p \leq \infty.
\]
Also, by Minkovski’s inequality, it holds that
\[
\left\{ \begin{array}{ll}
L^p_{\mathbb{F}}(\Omega; L^q(0, T; H)) \subseteq L^q(0, T; L^p(\Omega; H)), & 1 \leq p \leq q \leq \infty, \\
L^q(0, T; L^p(\Omega; H)) \subseteq L^p_{\mathbb{F}}(\Omega; L^q(0, T; H)), & 1 \leq q \leq p \leq \infty.
\end{array} \right.
\]
(1.2)
In particular,
\[
L^1_{\mathbb{F}}(0, T; L^p(\Omega; H)) \subseteq L^p_{\mathbb{F}}(\Omega; L^1(0, T; H)), \quad 1 \leq p \leq \infty.
\]
(1.3)

We now introduce two linear operators
\[
\left\{ \begin{array}{l}
\mathbb{I} : L^2_{\mathbb{F}}(\Omega; L^2(0, T; H)) \to L^1_{\mathcal{F}_T}(\Omega; H) \quad \text{(when } H \text{ is a Hilbert space),} \\
\mathbb{I}(\zeta(\cdot)) = \int_0^T \zeta(t)dW(t), \quad \forall \zeta(\cdot) \in L^2_{\mathbb{F}}(\Omega; L^2(0, T; H)),
\end{array} \right.
\]
(1.4)
and
\[
\left\{ \begin{array}{l}
\mathbb{L} : L^1_{\mathbb{F}}(0, T; H) \to L^1_{\mathcal{F}_T}(\Omega; H), \\
\mathbb{L}(u(\cdot)) = \int_0^T u(t)dt, \quad \forall u(\cdot) \in L^1_{\mathbb{F}}(0, T; H).
\end{array} \right.
\]
(1.5)
We call \(\mathbb{I}\) and \(\mathbb{L}\) the Itô integral operator and the Lebesgue integral operator, respectively. It is clear that
\[
\left\{ \begin{array}{ll}
\mathbb{I}(L^p_{\mathbb{F}}(\Omega; L^2(0, T; H))) \subseteq L^p_{\mathcal{F}_T}(\Omega; H), & \forall p \in [1, \infty) \quad \text{(when } H \text{ is a Hilbert space),} \\
\mathbb{L}(L^p_{\mathbb{F}}(\Omega; L^1(0, T; H))) \subseteq L^p_{\mathcal{F}_T}(\Omega; H), & \forall p \in [1, \infty).
\end{array} \right.
\]
(1.6)
The first inclusion in (1.6) can be refined (when $H$ is a Hilbert space). Indeed, for any $\xi \in L^p_{\mathcal{F}_T}(\Omega; H)$ (with $p \in [1, \infty)$), $E[\xi | \mathcal{F}_t]$ is an $H$-valued continuous $L^p$-martingale. Hence, by the Martingale Representation Theorem ([11]), there is a unique $\zeta(\cdot) \in L^p_{\mathcal{F}_T}(\Omega; L^2(0, T; H))$ (called the Malliavin derivative ([17]) of $\xi$ and sometimes denoted by $D_{\cdot}\xi$) such that

$$E[\xi | \mathcal{F}_t] = E\xi + \int_0^t \zeta(s) dW(s), \quad \forall t \in [0, T].$$

(1.7)

In particular, by taking $t = T$ in the above, we see that

$$\xi = E\xi + \int_0^T \zeta(s) dW(s).$$

(1.8)

Therefore, in the case that $H$ is a Hilbert space, the first inclusion in (1.6) can be refined to the following equality:

$$L^p_{\mathcal{F}_T}(\Omega; H) = H \oplus \left[ I_{L^p_{\mathcal{F}_T}(\Omega; L^1(0, T; H))} \right],$$

(1.9)

where “$\oplus$” stands for a direct sum. Now, for the second inclusion in (1.6), we have the following simple result.

**Proposition 1.1.** Let $H$ be a Hilbert space and $p \in [1, \infty)$. Then

$$L^p_{\mathcal{F}_T}(\Omega; L^1(0, T; H)) \subseteq L^p_{\mathcal{F}_T}(\Omega; H),$$

where $G_{L^p_{\mathcal{F}_T}(\Omega; H)}$ stands for the closure of $G$ in $L^p_{\mathcal{F}_T}(\Omega; H)$.

**Proof.** For any $\zeta \in L^p_{\mathcal{F}_T}(\Omega; H)$, let

$$\xi(t) = E[\zeta | \mathcal{F}_t], \quad t \in [0, T].$$

Then $\xi(\cdot)$ is an $H$-valued $L^p$-martingale. By the martingale representation theorem and the Burkholder–Davis–Gundy’s inequality, we have

$$E|\xi(t) - \zeta|^p_H \leq C E\left( \int_t^T |D_s\zeta|^2 ds \right)^{\frac{p}{2}} \to 0, \quad \text{as } t \to T.$$

Now, for any $\delta > 0$, let

$$u_\delta(t) = \frac{\xi(T - \delta)}{\delta} I_{[T-\delta, T]}(t), \quad t \in [0, T].$$

Then $u_\delta(\cdot) \in L^p_{\mathcal{F}_T}(\Omega; L^\infty(0, T; H)) \cap L^\infty_{\mathcal{F}_T}(0, T; L^p(\Omega; H)) \subseteq L^p_{\mathcal{F}_T}(\Omega; L^1(0, T; H))$, and

$$E\left| \int_0^T u_\delta(t) dt - \zeta \right|^p = E|\xi(T - \delta) - \zeta|^p \to 0, \quad \text{as } \delta \to 0,$$

proving the proposition.

**Remark 1.2.** From the proof of Proposition 1.1, it is easy to see that we have proved the following stronger result than (1.10):

$$\overline{L^p_{\mathcal{F}_T}(\Omega; L^\infty(0, T; H))}^{L^p_{\mathcal{F}_T}(\Omega; H)} \subseteq \overline{L^p_{\mathcal{F}_T}(0, T; L^p(\Omega; H))}^{L^p_{\mathcal{F}_T}(\Omega; H)} = L^p_{\mathcal{F}_T}(\Omega; H).$$

(1.11)
From Proposition 1.1, it is seen that we do not expect to have a refinement for the Lebesgue integral operator \( L \) similar to (1.9). Instead, it is very natural for us to pose the following problem:

**Problem (E)** Whether the following is true:

\[
\mathbb{L}\left( L^p_\mathbb{F}(\Omega; L^1(0, T; H)) \right) = L^p_\mathbb{F}^\tau(\Omega; H) ?
\] (1.12)

Note that the above is equivalent to the following: When the range of the operator \( \mathbb{L} : L^p_\mathbb{F}(\Omega; L^1(0, T; H)) \to L^p_\mathbb{F}^\tau(\Omega; H) \) is closed. An interesting problem closely related to the above, taking into account (1.9), reads as follows.

**Problem (R)** Under what additional conditions on \( \zeta(\cdot) \in L^p_\mathbb{F}(\Omega; L^2(0, T; H)) \), there will be a \( u(\cdot) \in L^p_\mathbb{F}(\Omega; L^1(0, T; H)) \) such that the following holds

\[
\int_0^T \zeta(t) dW(t) = \int_0^T u(t) dt \quad \text{a.s.} \quad ?
\] (1.13)

For convenience, any \( u(\cdot) \in L^p_\mathbb{F}(\Omega; L^1(0, T; H)) \) satisfying (1.13) is called a *representor* of \( \zeta(\cdot) \). Since the Itô integral in the usual sense can only be defined on Hilbert spaces, we pose Problem (R) for the case that \( H = \mathbb{R} \) was posed and studied in [22]. Various integrability conditions were imposed on \( \zeta(\cdot) \) so that it admits a representor. Let us now briefly recall several relevant results from [22], which will give us some feelings about the representation (1.13). To this end, we define

\[
u_\alpha(s) \equiv \frac{1 - \alpha}{(T - s)^\alpha} \int_0^s \frac{\zeta(t)}{(T - t)^{1-\alpha}} dW(t), \quad s \in [0, T),
\] (1.14)

for \( \alpha \in [0, 1) \). The following is a summary of the relevant results presented in [22].

**Theorem 1.3.** (i) Let \( p \geq 1 \). For any \( \zeta(\cdot) \in L^p_\mathbb{F}(\Omega; L^2(0, T; \mathbb{R})) \),

\[
u_0(\cdot) \equiv \int_0^T \frac{\zeta(t)}{T - t} dW(t) \in \bigcup_{\varepsilon > 0} L^p_\mathbb{F}(\Omega; L^2(0, T - \varepsilon; \mathbb{R})),
\] (1.15)

and (1.13) holds with \( u(\cdot) = \nu_0(\cdot) \) in the following sense:

\[
\lim_{\varepsilon \to 0} \mathbb{E} \left| \int_0^{T-\varepsilon} \nu_0(t) dt - \int_0^T \zeta(t) dW(t) \right|^p = 0.
\] (1.16)

(ii) Suppose \( \zeta(\cdot) \in L^1_\mathbb{F}(0, T; L^2(\Omega; \mathbb{R})) \) such that

\[
\int_0^T \left[ \int_0^s \frac{\mathbb{E}|\zeta(t)|^2}{(T - t)^2} dt \right]^{\frac{1}{2}} ds < \infty.
\] (1.17)

Then

\[
u_0(\cdot) \equiv \int_0^T \frac{\zeta(t)}{T - t} dW(t) \in L^1_\mathbb{F}(0, T; \mathbb{R}),
\] (1.18)
and (1.13) holds with \( u(\cdot) = u_0(\cdot) \).

(iii) Suppose \( \zeta(\cdot) \in L^1_{\mathbb{F}}(0, T; \mathbb{R}) \) such that for some \( \delta > 0 \) the following holds:

\[
\int_0^T \mathbb{E}|\zeta(t)|^2 (T-t)^\delta dt < \infty. \tag{1.19}
\]

Then

\[
u_\alpha(\cdot) \in L^2_{\mathbb{F}}(\Omega; L^q(0, T; \mathbb{R})), \quad \forall \alpha \in \left( \frac{1-\delta}{2}, \frac{1}{q} \right) \cap [0, 1], \quad q \in \left[ \frac{2}{2-\min(\delta, 1)} \right), \tag{1.20}
\]

and

\[
u_\alpha(\cdot) \in L^q(0, T; \mathbb{R}), \quad \forall \alpha \in \left( 1 - \frac{\delta}{2} - \frac{1}{q}, \frac{1}{q} \right) \cap [0, 1], \quad q \in \left[ \frac{2}{2-\min(\delta, 1)} \right). \tag{1.21}
\]

Moreover, (1.13) holds with \( u(\cdot) = u_\alpha(\cdot) \).

(iv) Suppose \( \zeta(\cdot) \in L^p_{\mathbb{F}}(0, T; \mathbb{R}) \) for some \( p > 2 \). Then

\[
u_\alpha(\cdot) \in L^2_{\mathbb{F}}(\Omega; L^q(0, T; \mathbb{R})), \quad \forall \alpha \in \left( \frac{1}{2} + \frac{1}{p} \right) \cap [0, 1], \quad q \in \left[ \frac{2p}{2p+2} \right). \tag{1.22}
\]

Moreover, (1.13) holds with \( u(\cdot) = u_\alpha(\cdot) \).

Note that although Problem (R) is posed for the case \( H \) is a Hilbert space, Problem (E) can be posed for general Banach space since Itô’s integral is not involved here. The main purpose of this paper is to give a positive answer to Problem (E) when \( H \) is a Banach space with \( H^* \) having the Radon–Nikodým property. Our result seems to be a little surprising in some sense, and it refines the results of [22] on Problem (R). More precisely, when the answer to Problem (E) is positive, any \( \zeta(\cdot) \in L^p_{\mathbb{F}}(\Omega; L^2(0, T; H)) \) (when \( H \) is a Hilbert space) admits a representor \( u(\cdot) \in L^p_{\mathbb{F}}(\Omega; L^1(0, T; H)) \), without assuming further integrability conditions on \( \zeta(\cdot) \). This means that an Itô’s integral on a given (fixed) interval can be represented by a (parameterized) Bochner integral on that interval. We should emphasize here that any representor \( u(\cdot) \) of \( \zeta(\cdot) \in L^p_{\mathbb{F}}(\Omega; L^2(0, T; H)) \) depends on \( T \), in general. In another word, it will be more proper to write

\[
\int_0^T \zeta(t) dW(t) = \int_0^T u(t, T) dt, \quad \text{a.s.} \tag{1.23}
\]

Hence, by allowing the upper limit to change, we should have

\[
\int_0^s \zeta(t) dW(t) = \int_0^s u(t, s) dt, \quad \forall s \in [0, T], \quad \text{a.s.} \tag{1.24}
\]

According to Theorem 1.3, when \( \zeta(\cdot) \) satisfies certain (better) integrability conditions, we can find a representor of the following form:

\[
u(t, s) = \frac{1 - \alpha}{(s-t)^\alpha} \int_0^t \frac{\zeta(r)}{(s-r)^{1-\alpha}} dW(r), \quad 0 \leq t < s \leq T, \tag{1.25}
\]

for some \( \alpha \in [0, 1] \). Clearly, such an \( s \mapsto u(t, s) \) is smooth in \( s \in (t, T] \). Therefore it is natural to further ask the following question, without assuming the better integrability conditions on \( \zeta(\cdot) \).

**Problem (C)** For any \( \zeta(\cdot) \in L^p_{\mathbb{F}}(\Omega; L^2(0, T; H)) \), whether it has a representor \( u(t, s) \) which is continuous with respect to the variable \( s \)?
We will also show that the answer to Problem (C) is positive. Note that, since the Itô integral $s \mapsto \int_0^s \zeta(t)dW(t)$ is at most Hölder continuous up to order $\frac{1}{2}$, generally, one cannot expect that the differentiability of $s \mapsto u(t, s)$ (given in (1.24)). Nevertheless, it is natural to expect that $s \mapsto u(t, s)$ is Hölder continuous up to order $\frac{1}{2}$. But, we do not have a proof for this yet.

**Remark 1.4.** The fact that $u(\cdot)$ in (1.23) depends on $T$ tells us that, the positive answer to Problem (E) does not mean that Itô integrals can be completely replaced by (parameterized) Bochner integrals.

The rest of this paper is organized as follows. In Section 2, as a preliminary result, we establish a Riesz-type Representation Theorem for the dual of the Banach space $L^p_M(X_1; L^q(X_2; H))$ (see Subsection 2.1 for its definition). An interesting byproduct in this section is the characterization on the dual of $L^p_\mathcal{F}(\Omega; L^q(0,T; H))$ and $L^q_\mathcal{F}(0,T; L^p(\Omega; H))$, which will be useful in some problems appeared in stochastic distributed parameter control systems and/or stochastic partial differential equations. Section 3 is addressed to giving answers to Problems (E) and (R). Section 4 is devoted to answering Problem (C), for which the key tool we employ is the continuous selection theorem in [15]. In Section 5, we present two remarkable consequences of our positive solution to Problem (E), one of which is related to the reasonable formulation of exact controllability for stochastic differential equations, and the other a condition to guarantee a Black-Scholes market to be complete.

## 2 The Dual of $L^p_M(X_1; L^q(X_2; H))$

As a key preliminary to answer Problem (E), we need to characterize the dual of $L^p_\mathcal{F}(\Omega; L^q(0,T; H))$ and $L^q_\mathcal{F}(0,T; L^p(\Omega; H))$. We will go a little further by considering the dual of $L^p_M(X_1; L^q(X_2; H))$, which will be defined below. It seems to us that this result has its own interest.

### 2.1 Statement of the result

Let $(X_1, \mathcal{M}_1, \mu_1)$ and $(X_2, \mathcal{M}_2, \mu_2)$ be two finite measure spaces. Let $\mathcal{M}$ be a sub-$\sigma$-field of $\mathcal{M}_1 \otimes \mathcal{M}_2$ (the $\sigma$-field generated by $\mathcal{M}_1 \times \mathcal{M}_2$), and for any $1 \leq p, q < \infty$, let

$$L^p_M(X_1; L^q(X_2; H)) = \left\{ \varphi : X_1 \times X_2 \to H \mid \varphi(\cdot) \text{ is } \mathcal{M} \text{-measurable and} \int_{X_1} \left( \int_{X_2} |\varphi(x_1, x_2)|^q_H \, d\mu_2 \right)^{\frac{p}{q}} \, d\mu_1 < \infty \right\}.$$ 

Likewise, let

$$L^\infty_M(X_1; L^q(X_2; H)) = \left\{ \varphi : X_1 \times X_2 \to H \mid \varphi(\cdot) \text{ is } \mathcal{M} \text{-measurable and} \esssup_{x_1 \in X_1} \left( \int_{X_2} |\varphi(x_1, x_2)|^q_H \, d\mu_2 \right)^{\frac{1}{q}} < \infty \right\},$$

$$L^p_M(X_1; L^\infty(X_2; H)) = \left\{ \varphi : X_1 \times X_2 \to H \mid \varphi(\cdot) \text{ is } \mathcal{M} \text{-measurable and} \int_{X_1} \left( \esssup_{x_2 \in X_2} |\varphi(x_1, x_2)|^p_H \right) \, d\mu_1 < \infty \right\},$$
\[
L^\infty_M(X_1; L^\infty(X_2; H)) = \left\{ \varphi : X_1 \times X_2 \to H \mid \varphi(\cdot) \text{ is } M\text{-measurable and } \operatorname{esssup}_{(x_1, x_2) \in X_1 \times X_2} |\varphi(x_1, x_2)|_H < \infty \right\}.
\]

We denote
\[
L^p_M(X_1 \times X_2; H) = L^p_M(X_1; L^p(X_2; H)), \quad 1 \leq p \leq \infty.
\]

Also, for any \( f \in L^p_M(X_1; L^q(X_2; H)) \) \((1 \leq p, q \leq \infty)\), we denote
\[
\|f\|_{p,q,H} = \|f\|_{L^p_M(X_1; L^q(X_2; H))} \triangleq \left[ \int_{X_1} \left( \int_{X_2} |f(x_1, x_2)|^q_H \, d\mu_2 \right)^{\frac{p}{q}} \, d\mu_1 \right]^{\frac{1}{p}}.
\]

The definition of \(\|f\|_{\infty,q,H}, \|f\|_{p,\infty,H} \text{ and } \|f\|_{\infty,\infty,H}\) are obvious. Let
\[
\|f\|_{p,H} = \|f\|_{p,p,H}, \quad 1 \leq p \leq \infty.
\]

The definition of \(L^q_M(X_2; L^p(X_1; H)) \) \((1 \leq p, q \leq \infty)\) is similar. By Hölder’s inequality and Minkovski’s inequality, we have the following inclusions:
\[
L^p_M(X_1; L^q(X_2; H)) \subseteq L^r_M(X_1; L^s(X_2; H)), \quad 1 \leq r \leq p \leq \infty, \quad 1 \leq s \leq q \leq \infty,
\]

and (comparing with (2.2)–(2.3)),
\[
\left\{ \begin{array}{ll}
L^p_M(X_1; L^q(X_2; H)) \subseteq L^q_M(X_2; L^p(X_1; H)), & 1 \leq p \leq q \leq \infty, \\
L^p_M(X_1; L^q(X_2; H)) \subseteq L^q_M(X_2; L^p(X_1; H)), & 1 \leq q \leq p \leq \infty.
\end{array} \right.
\]

Next, for any \( p \in [1, \infty] \), denote
\[
p' = \left\{ \begin{array}{ll}
p, & 1 < p \leq \infty, \\
\frac{p}{p-1}, & p = \infty, \\
1, & p = 1.
\end{array} \right.
\]

The definition of \(q' \in [1, \infty] \) for \( q \in [1, \infty] \) is similar. We have the following result.

**Lemma 2.1.** Let \( H \) be a Banach space, \((X_1, M_1, \mu_1) \) and \((X_2, M_2, \mu_2) \) be two finite measure spaces, \( M \) be a sub-\(\sigma\)-field of \( M_1 \otimes M_2 \), and let \( 1 \leq p, q < \infty \). Then, \( H^* \) has the Radon–Nikodým property with respect to \((X_1 \times X_2, M, \mu_1 \times \mu_2) \) if and only if for any \( F \in L^p_M(X_1; L^q(X_2; H))^* \), there exists a unique \( g \in L^p_M(X_1; L^{q'}(X_2; H^*)) \) such that
\[
F(f) = \int_{X_1 \times X_2} (f(x_1, x_2), g(x_1, x_2))_{H,H^*} d\mu_1 d\mu_2, \quad \forall f \in L^p_M(X_1; L^q(X_2; H)),
\]

and
\[
\|F\|_{L^p_M(X_1; L^q(X_2; H))^*} = \|g\|_{p',q',H^*}.
\]

Due to the above result, we make the following identification (for the case that \( H^* \) has the Radon–Nikodým property with respect to \((X_1 \times X_2, M, \mu_1 \times \mu_2) \)):
\[
L^p_M(X_1; L^q(X_2; H))^* = L^{p'}_M(X_1; L^{q'}(X_2; H^*)), \quad 1 \leq p, q < \infty.
\]
The above is a Riesz-type Representation Theorem for the dual of space $L^p_M(X_1; L^q(X_2; H))$. It seems to us that Lemma 2.1 should be a known result but we have not found an exact reference. Therefore, for reader’s convenience, we provide a detailed proof in the next three subsections. As a corollary of Lemma 2.1, we will characterize the dual of $L^p_2(\Omega; L^q(0, T; H))$ and $L^p_{T}(0, T; L^p(\Omega; H))$ in the last subsection.

The main idea for the proof of Lemma 2.1 is similar to that of the relevant result in [4, Appendix B, pp. 375–376] (see also [7, Theorem 1, Chapter IV, pp. 98–99]). However, Lemma 2.1 does not follow from the main result in [4, Appendix B] because the later considered only the special case that $p = q$ and $H = \mathbb{R}$, for which, by Fubini’s Theorem, one can reduce the problem to the case with one measure on the product space. Also, Lemma 2.1 does not seem to be a corollary of [7, Theorem 1, Chapter IV, pp. 98–99] because of the very fact that our $\mathcal{M}$ is an “interconnecting” sub-$\sigma$-field of the $\sigma$-field generated by $\mathcal{M}_1 \times \mathcal{M}_2$.

### 2.2 Proof of the necessity in Lemma 2.1 for the case $H = \mathbb{R}$

As a key step to prove Lemma 2.1, in this subsection we show first the “only if” part of this lemma for the special case $H = \mathbb{R}$.

For any $g \in L^p_M(X_1; L^q(X_2; \mathbb{R}))$, define $F_g : L^p_M(X_1; L^q(X_2; \mathbb{R})) \mapsto \mathbb{R}$ by

$$F_g(f) = \int_{X_1 \times X_2} f(x_1, x_2)g(x_1, x_2)d\mu_1d\mu_2, \quad \forall f \in L^p_M(X_1; L^q(X_2; \mathbb{R})).$$

By the linearity of the integral, $g \mapsto F_g$ is a linear map. It follows from Hölder’s inequality that

$$|F_g(f)| \leq \|f\|_{p,q,\mathbb{R}}\|g\|_{p',q',\mathbb{R}}, \quad \forall f \in L^p_M(X_1; L^q(X_2; \mathbb{R})).$$

Hence $F_g \in L^p_M(X_1; L^q(X_2; \mathbb{R}))^*$ and

$$\|F_g\|_{L^p_M(X_1; L^q(X_2; \mathbb{R}))^*} \leq \|g\|_{p',q',\mathbb{R}}. \tag{2.8}$$

Therefore, $g \mapsto F_g$ is a linear non-expanding map. Now, we show that this map is surjective and is an isometry.

To show the surjectivity of $g \mapsto F_g$, take any $F \in L^p_M(X_1; L^q(X_2; \mathbb{R}))^*$. Since for any $A \in \mathcal{M}$, $I_A \in L^p_M(X_1; L^q(X_2; \mathbb{R}))$, we may define

$$\nu(A) = F(I_A), \quad \forall A \in \mathcal{M}.$$ 

Then $\nu$ is a totally finite signed measure on $(X_1 \times X_2, \mathcal{M})$, and $\nu \ll \mu_1 \times \mu_2$. By the Radon-Nikodym Theorem, there is an $\mathcal{M}$-measurable map $g \in L^1_M(X_1 \times X_2; \mathbb{R})$ such that

$$\nu(A) = \int_A gd\mu_1d\mu_2, \quad \forall A \in \mathcal{M},$$

i.e.,

$$F(I_A) = \int_{X_1 \times X_2} gI_Ad\mu_1d\mu_2, \quad \forall A \in \mathcal{M}.$$ 

Consequently, for any $\mathcal{M}$-measurable simple functions $f$,

$$F(f) = \int_{X_1 \times X_2} f(x_1, x_2)g(x_1, x_2)d\mu_1d\mu_2.$$
Select a sequence \( \{a_n\}_{n=1}^{\infty} \subset M \) such that

\[
A_n \subset A_{n+1}, \quad n = 1, 2, \cdots, \quad (\mu_1 \times \mu_2) \left( (X_1 \times X_2) \setminus \bigcup_{n=1}^{\infty} A_n \right) = 0, \tag{2.9}
\]

and \( g \) is bounded on each \( A_n \). For any \( n \geq 1 \), note that

\[
 f \mapsto \int_{X_1 \times X_2} f(x_1, x_2) g(x_1, x_2) I_{A_n}(x_1, x_2) d\mu_1 d\mu_2
\]
is a bounded linear functional on \( L^p_M(X_1; L^q(X_2; \mathbb{R})) \) which agrees with \( F \) on all \( M \)-measurable simple functions which vanishes off \( A_n \). It follows that

\[
F(f I_{A_n}) = \int_{X_1 \times X_2} f g I_{A_n} d\mu_1 d\mu_2, \quad \forall f \in L^p_M(X_1; L^q(X_2; \mathbb{R})). \tag{2.10}
\]

Since \( g I_{A_n} \) is bounded, one has \( g I_{A_n} \in L^q_M(X_1; L^q(X_2; \mathbb{R})) \). We claim that \( g \in L^q_M(X_1; L^q(X_2; \mathbb{R})) \), and

\[
\|g\|_{L^q_M(X_1; L^q(X_2; \mathbb{R}))} \leq \|F\|_{L^p_M(X_1; L^q(X_2; \mathbb{R}))^*}. \tag{2.11}
\]

To show this, we distinguish four cases.

**Case 1:** \( p, q \in (1, \infty) \). Choose

\[
f = \begin{cases} 
 a \left( \int_{X_2} |g|^q I_{A_n} d\mu_2 \right)^{\frac{p'}{q'}} |g|^{q-1} (\text{sgn} g) I_{A_n}, & \text{if } \int_{X_2} |g|^q I_{A_n} d\mu_2 \neq 0, \\
 0, & \text{if } \int_{X_2} |g|^q I_{A_n} d\mu_2 = 0,
\end{cases}
\]

where

\[
a = \left[ \int_{X_1} \left( \int_{X_2} |g|^q I_{A_n} d\mu_2 \right)^{\frac{p'}{q'}} d\mu_1 \right]^{\frac{1}{p'}}.
\]

Then

\[
\|f\|_{L^p} = \left[ \int_{X_1} \left( \int_{X_2} |f|^q d\mu_2 \right)^{\frac{p'}{q}} d\mu_1 \right]^{\frac{1}{p'}}
\]

\[
= \left\{ \int_{X_1} \left[ \int_{X_2} a^q \left( \int_{X_2} |g|^q I_{A_n} d\mu_2 \right)^{\left(\frac{p'}{q'}-1\right)q} |g|^{(q'-1)q} I_{A_n} d\mu_2 \right]^{\frac{p}{q}} d\mu_1 \right\}^{\frac{1}{p'}}
\]

\[
= a \left\{ \int_{X_1} \left( \int_{X_2} |g|^q I_{A_n} d\mu_2 \right)^{\frac{p'}{q'}} d\mu_1 \right\}^{\frac{1}{p'}} = 1.
\]
Taking the above $f$ in (2.10), we find that

$$F(f) = \int_{X_1} \int_{X_2} f g I_{A_n} d\mu_2 d\mu_1 = a \int_{X_1} \left( \int_{X_2} |g| q I_{A_n} d\mu_2 \right)^{\frac{q}{q'}} d\mu_1$$

$$= a \int_{X_1} \left( \int_{X_2} |g| q I_{A_n} d\mu_2 \right)^{\frac{q}{q'}} d\mu_1 = \left[ \int_{X_1} \left( \int_{X_2} |g| q I_{A_n} d\mu_2 \right)^{\frac{q}{q'}} d\mu_1 \right]^{\frac{1}{p'}}$$

$$= \|g I_{A_n}\|_{p',q';\mathbb{R}},$$

which gives

$$\|g I_{A_n}\|_{p',q';\mathbb{R}} \leq \|F\|_{L_{M}(X_1;L^q(X_2;\mathbb{R}))^*}.$$

Letting $n \to \infty$, by making use of Fatou’s Lemma, one concludes (2.11).

**Case 2:** $p = 1$, $1 < q < \infty$. In this case, we first take $p \in (1, \infty)$, and take $f$ as in Case 1. Then

$$\|f\|_{1,q} = \int_{X_1} \left( \int_{X_2} |f| q d\mu_2 \right)^{\frac{1}{q'}} d\mu_1 \leq \left[ \int_{X_1} \left( \int_{X_2} |f| q d\mu_2 \right)^{\frac{q}{q'}} d\mu_1 \right]^{\frac{1}{p'}} \mu_1(X_1)^{\frac{1}{p'}} = \mu_1(X_1)^{\frac{1}{p'}}.$$

Consequently,

$$\|g I_{A_n}\|_{p',q';\mathbb{R}} = F(f) \leq \|F\|_{L_{M}(X_1;L^q(X_2;\mathbb{R}))^*} \|f\|_{1,q} \leq \|F\|_{L_{M}(X_1;L^q(X_2;\mathbb{R}))^*} \mu_1(X_1)^{\frac{1}{p'}}.$$

Letting $n \to \infty$ and then letting $p \to 1$ (which means $p' \to \infty$), we obtain

$$\|g\|_{\infty,q';\mathbb{R}} \leq \|F\|_{L_{M}(X_1;L^q(X_2;\mathbb{R}))^*},$$

which is (2.11) for the case $p = 1$.

**Case 3:** $1 < p < \infty$, $q = 1$. In this case, we first take $q \in (1, \infty)$, and take $f$ as in Case 1. Then

$$\|f\|_{p,1;\mathbb{R}} = \left[ \int_{X_1} \left( \int_{X_2} |f| q d\mu_2 \right)^{p} d\mu_1 \right]^{\frac{1}{p'}} \leq \left[ \int_{X_1} \left( \int_{X_2} |f| q d\mu_2 \right)^{\frac{q}{q'}} d\mu_1 \right]^{\frac{1}{p'}} \mu_2(X_2)^{\frac{1}{p'}} = \mu_2(X_2)^{\frac{1}{p'}}.$$

Hence,

$$\|g I_{A_n}\|_{p',q';\mathbb{R}} = F(f) \leq \|F\|_{L_{M}(X_1;L^q(X_2;\mathbb{R}))^*} \|f\|_{p,1;\mathbb{R}} \leq \|F\|_{L_{M}(X_1;L^q(X_2;\mathbb{R}))^*} \mu_2(X_2)^{\frac{1}{p'}}.$$

Letting $n \to \infty$ and then letting $q \to 1$ (which means $q' \to \infty$), we obtain

$$\|g\|_{p',\infty;\mathbb{R}} \leq \|F\|_{L_{M}(X_1;L^q(X_2;\mathbb{R}))^*},$$

which is the case of (2.11) for $q = 1$.

**Case 4:** $p = q = 1$. In this case, we still first let $p,q \in (1, \infty)$, and take $f$ as in Case 1 with $q = r$. Then

$$\|f\|_{1,1} = \int_{X_1} \int_{X_2} |f| q d\mu_2 d\mu_1$$

$$\leq \left[ \int_{X_1} \left( \int_{X_2} |f| q d\mu_2 \right)^{\frac{q}{q'}} d\mu_1 \right]^{\frac{1}{p'}} \mu_1(X_1)^{\frac{1}{p'}} \mu_2(X_2)^{\frac{1}{p'}} = \mu_1(X_1)^{\frac{1}{p'}} \mu_2(X_2)^{\frac{1}{p'}}.$$
Consequently,

\[ \|gI_{A_n}\|_{p',q';R} = F(f) \leq \|F\|_{L^\infty_\mathcal{M}(X_1;L^1(\mathbb{R}^2))} \|f\|_{1,1} \leq \|F\|_{L^3_\mathcal{M}(X_1;L^1(\mathbb{R}^2))} \mu_1(X_1)^{\frac{1}{p'}} \mu_2(X_1)^{\frac{1}{p}}. \]

Letting \( n \to \infty \) and then letting \( p, q \to 1 \) (which means \( p', q' \to \infty \)), we obtain

\[ \|g\|_{\infty;R} \leq \|F\|_{L^3_\mathcal{M}(X_1;L^1(\mathbb{R}^2))}^{*}, \] (2.14)

which is the case of (2.11) for \( p, q = 1 \).

Finally, (2.8) means that \( F_g \in (L^p_\mathcal{M}(X_1;L^q(\mathbb{R}^2)))^* \) and since \( F \) and \( F_g \) coincides on a dense subset of \( L^p_\mathcal{M}(X_1;L^q(\mathbb{R}^2)) \), one has \( F = F_g \). Also, (2.6) follows easily from (2.8) and (2.11).

2.3 Proof of the necessity in Lemma 2.1 for the general case

We are now in a position to prove the “only if” part of Lemma 2.1 for the general case. The proof is divided into two steps.

**Step 1.** We show that \( L^p_\mathcal{M}(X_1;L^q(\mathbb{R}^2);H^*) \) is isometrically isomorphic to a subspace \( H \) of \( L^p_\mathcal{M}(X_1;L^q(\mathbb{R}^2);H^*)^* \).

For any given \( g \in L^p_\mathcal{M}(X_1;L^q(\mathbb{R}^2);H^*) \), define a linear functional \( F_g \) on \( L^p_\mathcal{M}(X_1;L^q(\mathbb{R}^2);H) \) as follows:

\[ F_g(f) = \int_{X_1 \times X_2} (f(x_1, x_2), g(x_1, x_2))_{H,H} * d\mu_1 d\mu_2, \quad \forall f \in L^p_\mathcal{M}(X_1;L^q(\mathbb{R}^2);H). \] (2.15)

Then, by means of the Hölder inequality and similar to (2.8), we conclude that \( F_g \) belongs to \( L^p_\mathcal{M}(X_1;L^q(\mathbb{R}^2);H^*) \), and

\[ \|F_g\|_{L^p_\mathcal{M}(X_1;L^q(\mathbb{R}^2);H)^*} \leq \|g\|_{p',q',H^*}. \] (2.16)

Therefore the norm of \( F_g \) is not greater than \( \|g\|_{p',q',H^*} \). Define

\[ H \equiv \{ F_g \mid g \in L^p_\mathcal{M}(X_1;L^q(\mathbb{R}^2);H^*) \}. \]

It remains to prove the reverse of inequality (2.16). Clearly, without loss of generality, we may assume that \( g \neq 0 \).

Suppose first that \( g = \sum_{i=1}^{\infty} h_i^* I_{E_i} \), where \( h_i^* \) is a sequence in \( H^* \) and \( \{E_i\}_{i=1}^{\infty} \) is a countable partition of \( X_1 \times X_2 \) by members of \( \mathcal{M} \) with \( (\mu_1 \times \mu_2)(E_i) > 0 \) for all \( i \). Since we have shown that \( L^p_\mathcal{M}(X_1;L^q(\mathbb{R}^2)) = L^p_\mathcal{M}(X_1;L^q(\mathbb{R}^2);H) \) (in Subsection 2.2) and noting that \( 0 < |\varphi|_{H^*} \in L^p_\mathcal{M}(X_1;L^q(\mathbb{R}^2)) \), for any \( \varepsilon > 0 \), there exists a nonnegative function \( \varphi \in L^p_\mathcal{M}(X_1;L^q(\mathbb{R}^2)) \) such that

\[ 0 < \|\varphi\|_{p,q} \leq 1, \quad \|g\|_{p',q',H^*} - \varepsilon \leq \int_{X_1 \times X_2} |g|_{H^*} \varphi d\mu_1 d\mu_2. \]

Further, choose \( h_i \in H \) with \( |h_i|_H = 1 \) such that

\[ |h_i^*|_{H^*} - \frac{\varepsilon}{\|\varphi\|_{1,1}} \leq h_i^*(h_i), \]

and define

\[ f = \sum_{i=1}^{\infty} \varphi h_i I_{E_i} \in L^p_\mathcal{M}(X_1;L^q(\mathbb{R}^2);H). \]
Then we have that \( \|f\|_{p,q,H} = \|\varphi\|_{p,q} \leq 1 \), and we have that
\[
\int_{X_1 \times X_2} \langle f(x_1, x_2), g(x_1, x_2) \rangle_{H, H^*} d\mu_1 d\mu_2 = \int_{X_1 \times X_2} \varphi \sum_{i=1}^{\infty} \langle h_i, h_i^* \rangle_{H, H^*} \chi_{E_i} d\mu_1 d\mu_2
\]
\[
\geq \int_{X_1 \times X_2} \varphi \sum_{i=1}^{\infty} \left( |h_i^*|_{H^*} - \frac{\varepsilon}{\|\varphi\|_{1,1}} \right) \chi_{E_i} d\mu_1 d\mu_2
\]
\[
\geq \int_{X_1 \times X_2} |g|_{H^*} \varphi d\mu_1 d\mu_2 - \frac{\varepsilon}{\|\varphi\|_{1,1}} \int_{X_1 \times X_2} \varphi d\mu_1 d\mu_2 \geq \|g\|_{p', q', H^*} - 2\varepsilon.
\]
This gives
\[
\|F_g\|_{L^p_M(X_1; L^q(X_2; H^*))} \geq \|g\|_{p', q', H^*},
\]
and therefore
\[
\|F_g\|_{L^p_M(X_1; L^q(X_2; H^*))} = \|g\|_{p', q', H^*},
\]
whenever \( g \in L^p'_M(X_1; L^q'(X_2; H^*)) \) is countably valued.

For the general case, we choose a sequence \( \{g_n\}_{n=1}^{\infty} \subset L^p'_M(X_1; L^q(X_2; H^*)) \) such that each \( g_n \) is countably valued and
\[
\lim_{n \to \infty} \|g_n - g\|_{p', q', H^*} = 0.
\]  
(2.17)
We have obtained that
\[
\|F_{g_n}\|_{L^p_M(X_1; L^q(X_2; H^*))} = \|g_n\|_{p', q', H^*},
\]
and by virtue of (2.16),
\[
\|F_{g_n} - F_g\|_{L^p_M(X_1; L^q(X_2; H^*))} = \|F_{g_n} - g\|_{L^p_M(X_1; L^q(X_2; H^*))} \leq \|g_n - g\|_{p', q', H^*}.
\]
Therefore, noting (2.17), we end up with
\[
\|F_g\|_{L^p_M(X_1; L^q(X_2; H^*))} = \lim_{n \to \infty} \|F_{g_n}\|_{L^p_M(X_1; L^q(X_2; H^*))} = \lim_{n \to \infty} \|g_n\|_{p', q', H^*} = \|g\|_{p', q', H^*}.
\]
Hence we get that \( L^p'_M(X_1; L^q'(X_2; H^*)) \) is isometrically isomorphic to \( \mathcal{H} \).

Step 2. We show that the subspace \( \mathcal{H} \) is equal to \( L^p'_M(X_1; L^q(X_2; H)) \).

To this end, for \( F \in L^p_M(X_1; L^q(X_2; H))^* \), we define
\[
G(E)(h) = F(h I_E), \quad \forall E \in \mathcal{M}, \ h \in H.
\]  
(2.18)
By
\[
|F(h I_E)| \leq \|F\|_{L^p_M(X_1; L^q(X_2; H^*))} \|h I_E\|_{p,q,H} \leq \|F\|_{L^p_M(X_1; L^q(X_2; H^*))} \|h\|_{H^*} \|I_E\|_{p,q},
\]
we see that \( G : \mathcal{M} \to H^* \) and it is countably additive. Let \( E_1, \cdots, E_n \) (\( n \in \mathbb{N} \)) be a partition of \( X_1 \times X_2 \) by members of \( \mathcal{M} \) with \( (\mu_1 \times \mu_2)(E_i) > 0 \) for all \( 1 \leq i \leq n \). Then \( G(E_i) \in H^* \). Define
\[
G^1_{E_i}(h) = \text{Re} G(E_i)(h), \quad G^2_{E_i}(h) = \text{Im} G(E_i)(h), \quad \forall h \in H.
\]
Clearly, \( |G(E_i)|_{H^*} \leq |G^1_{E_i}|_{H^*} + |G^2_{E_i}|_{H^*} \). Noting that both \( G^1_{E_i} \) and \( G^2_{E_i} \) are real functionals, we see that, for any \( \varepsilon > 0 \), one can find \( h_1^i \) and \( h_2^i \) in the closed unit ball of \( H \) such that
\[
|G^1_{E_i}|_{H^*} - \frac{\varepsilon}{2n} < \text{Re} G(E_i)(h_1^i), \quad |G^2_{E_i}|_{H^*} - \frac{\varepsilon}{2n} < \text{Im} G(E_i)(h_2^i).
\]
It follows that
\[
\sum_{i=1}^{n} |G(E_i)|_H^* - \varepsilon < \text{Re} \sum_{i=1}^{n} G(E_i)(h_i^1) + \text{Im} \sum_{i=1}^{n} G(E_i)(h_i^2)
\]
\[
= \text{Re} F\left(\sum_{i=1}^{n} h_i^1 I_{E_i}\right) + \text{Im} F\left(\sum_{i=1}^{n} h_i^2 I_{E_i}\right)
\]
\[
\leq \|F\|_p^p (X_1; L^q(X_2; H))^* \left( \left\| \sum_{i=1}^{n} h_i^1 I_{E_i} \right\|_{p,q,H} + \left\| \sum_{i=1}^{n} h_i^2 I_{E_i} \right\|_{p,q,H} \right)
\]
\[
\leq 2\|F\|_p^p (X_1; L^q(X_2; H))^* \|I_{E_i}\|_{p,q} \leq 2\|F\|_p^p (X_1; L^q(X_2; H))^* \mu_1(X_1)^{\frac{2}{p}} \mu_2(X_2)^{\frac{1}{q}}.
\]
Hence \(|G(X_1 \times X_2)|_H^* < \infty\) and \(G\) is a \((\mu_1 \times \mu_2)\)-continuous \(\sigma\)-additive measure of bounded variation. Since \(H^*\) has the Radon-Nikodym property with respect to \((X_1 \times X_2, \mathcal{M}, \mu_1 \times \mu_2)\), there exists a Bochner integrable \(g : X_1 \times X_2 \rightarrow H^*\) such that
\[
G(E) = \int_E gd\mu_1 d\mu_2, \quad \forall E \in \mathcal{M}.
\] (2.19)

Clearly, if \(f \in L^p_\mathcal{M}(X_1; L^q(X_2; H))\) is a simple function, then
\[
F(f) = \int_{X_1 \times X_2} \langle f(x_1, x_2), g(x_1, x_2) \rangle_{H,H^*} d\mu_1 d\mu_2.
\]
Select an expanding sequence \(\{E_n\}_{n=1}^\infty\) in \(\mathcal{M}\) such that \(\bigcup_{n=1}^\infty E_n = X_1 \times X_2\) and such that \(g\) is bounded on each \(E_n\). Fixing arbitrarily an \(n_0 \in \mathbb{N}\) and noting that \(\int_{E_{n_0}} \langle \cdot, g(x_1, x_2) \rangle_{H,H^*} d\mu_1 d\mu_2\) is a bounded linear functional on \(L^p_\mathcal{M}(X_1; L^q(X_2; H))\) which agrees with \(F\) on all simple functions supported on \(E_{n_0}\), it follows that
\[
F(f_{E_{n_0}}) = \int_{X_1 \times X_2} \langle f(x_1, x_2), g(x_1, x_2) I_{E_{n_0}} \rangle_{H,H^*} d\mu_1 d\mu_2, \quad \forall f \in L^p_\mathcal{M}(X_1; L^q(X_2; H)).
\] (2.20)

Further, since \(g I_{E_{n_0}}\) is bounded, one has \(g I_{E_{n_0}} \in L^{p'}_\mathcal{M}(X_1; L^{q'}(X_2; H^*))\) and
\[
\|g I_{E_{n_0}}\|_{p',q',H^*} \leq \|F\|_{L^{p'}_\mathcal{M}(X_1; L^{q'}(X_2; H^*))}.
\] (2.21)

Since inequality (2.21) holds for each \(n_0\), by the Monotone Convergence Theorem, we conclude that \(g \in L^{p'}_\mathcal{M}(X_1; L^{q'}(X_2; H^*))\).

Finally, for any \(f \in L^p_\mathcal{M}(X_1; L^q(X_2; H))\), it follows from (2.20) that
\[
F(f) = \lim_{n \to \infty} \int_{X_1 \times X_2} \langle f(x_1, x_2), g(x_1, x_2) I_{E_n} \rangle_{H,H^*} d\mu_1 d\mu_2
\]
\[
= \int_{X_1 \times X_2} \langle f(x_1, x_2), g(x_1, x_2) \rangle_{H,H^*} d\mu_1 d\mu_2 = F_g(f).
\]
This means that \(F = F_g\). Hence \(L^{p'}_\mathcal{M}(X_1; L^{q'}(X_2; H))\) coincides with \(L^{p'}_\mathcal{M}(X_1; L^{q'}(X_2; H^*))\).
2.4 Proof of the sufficiency in Lemma 2.1

In order to complete the proof of Lemma 2.1, it remains to prove its “if” part, which is the main concern in this subsection.

Let \( G : \mathcal{M} \to H^* \) be a \((\mu_1 \times \mu_2)\)-continuous vector measure of bounded variation. We want to show that there exists a \( \tilde{g} \in L^1_M(X_1; L^1(X_2; H^*)) \) such that

\[
G(E) = \int_E \tilde{g}d\mu_1d\mu_2, \quad \forall E \in \mathcal{M}.
\]  

(2.22)

Firstly, we show that if \( E_0 \in \mathcal{M} \) has a positive \((\mu_1 \times \mu_2)\)-measure, then \( G \) has a Bochner integrable Radon–Nikodým derivative on an \( \mathcal{M} \)-measurable set \( B \) satisfying \( B \subset E_0 \) and \((\mu_1 \times \mu_2)(B) > 0\).

Denote by \(|G|\) the variation of \( G \), which is a scalar measure (see [7, Definition 4 and Proposition 9 of Chapter 1, pp.2–3]). It is easy to see that \(|G|\) is a \((\mu_1 \times \mu_2)\)-continuous \( \mathbb{R}^+ \)-valued measure. Applying the Radon–Nikodým Theorem (to \(|G|\) and \( \mu_1 \times \mu_2 \)), one can find an \( \mathcal{M} \)-measurable subset \( B \) of \( E_0 \) and a positive integer \( k \) such that \(|G|(A) \leq k(\mu_1 \times \mu_2)(A)\) for all \( A \in \mathcal{M} \) with \( A \subset B \).

Define a linear functional \( \ell \) on the subspace \( S \) of simple functions in \( L^p_M(X_1, L^q(X_2, H)) \) as follows:

\[
\ell(f) = \sum_{i=1}^n G(E_i \cap B)(x_i),
\]

where

\[
f = \sum_{i=1}^n x_i I_{E_i}, \quad x_i \in H, \quad 1 \leq i \leq n,
\]

with \( \{E_i, 1 \leq i \leq n\} \) being a partition of \( X_1 \times X_2 \). It follows that

\[
|\ell(f)| = \left| \sum_{i=1}^n G(E_i \cap B)(x_i) \right| = \left| \sum_{i=1}^n \frac{G(E_i \cap B)}{(\mu_1 \times \mu_2)(E_i \cap B)}(\mu_1 \times \mu_2)(E_i \cap B)x_i \right|
\]

\[
\leq \sum_{i=1}^n k(\mu_1 \times \mu_2)(E_i \cap B)x_i \leq k\|f\|_{L^1(X_1 \times X_2; H)} \leq k\mu_1(X_1)^{\frac{1}{p}}\mu_2(X_2)^{\frac{1}{q}}\|f\|_{L^p_M(X_1; L^q(X_2; H))}.
\]

Therefore \( \ell \) is a bounded linear functional on \( S \). By the Hahn-Banach Theorem, it has a bounded linear extension to \( L^p_M(X_1, L^q(X_2, H)) \) (The extension is still denoted by \( \ell \)). Hence there exists a \( g \in L^p_M(X_1, L^q(X_2, H^*)) \) such that

\[
\ell(f) = \int_{X_1 \times X_2} \langle f, g \rangle_{H,H^*}d\mu_1d\mu_2, \quad \forall f \in L^p_M(X_1, L^q(X_2, H)).
\]

We have

\[
G(E \cap B)(x) = \ell(xI_E) = \int_E \langle x, g \rangle_{H,H^*}d\mu_1d\mu_2, \quad \forall x \in H, \ E \in \mathcal{M}.
\]

Since \( g \in L^p_M(X_1, L^q(X_2, H^*)) \) is Bochner integrable, we see that

\[
G(E \cap B)(x) = \left( \int_E gd\mu_1d\mu_2 \right)(x), \quad \forall x \in H, \ E \in \mathcal{M}.
\]

Consequently,

\[
G(E \cap B) = \int_E gd\mu_1d\mu_2, \quad \forall \ E \in \mathcal{M}.
\]  

(2.23)
Noting that \( B \in \mathcal{M} \), and therefore replacing \( E \) in (2.23) by \( E \cap B \), we see that
\[
G(E \cap B) = \int_{E \cap B} g d\mu_1 d\mu_2, \quad \forall E \in \mathcal{M}.
\]

Now by the Exhaustion Lemma ([7, page 70]), there exist a sequence \( \{A_n\}_{n=1}^\infty \) of disjoint members of \( \mathcal{M} \) such that \( \bigcup_{n=1}^\infty A_n = X_1 \times X_2 \) and a sequence \( \{g_n\}_{n=1}^\infty \) of Bochner integrable functions on \( X_1 \times X_2 \) such that
\[
G(E \cap A_n) = \int_{E \cap A_n} g_n d\mu_1 d\mu_2, \quad \forall E \in \mathcal{M}, \quad n \in \mathbb{N}.
\]
Define \( \tilde{g} : X_1 \times X_2 \to H^* \) by \( \tilde{g}(x_1, x_2) = g_n(x_1, x_2) \) if \( (x_1, x_2) \in A_n \). It is obvious that \( \tilde{g} \) is \((\mu_1 \times \mu_2)\)-measurable. Moreover, for each \( E \in \mathcal{M} \) and all \( m \in \mathbb{N} \), it holds
\[
G(E \cap \bigcup_{n=1}^m A_n) = \int_E \tilde{g} I_{\bigcup_{n=1}^m A_n} d\mu_1 d\mu_2.
\]
Consequently,
\[
G(E) = \lim_{m \to \infty} \int_E \tilde{g} I_{\bigcup_{n=1}^m A_n} d\mu_1 d\mu_2, \quad \forall E \in \mathcal{M}.
\]
For \( h \in H^{**} \), the variation
\[
|G(h)|(X_1 \times X_2) \geq \lim_{m \to \infty} \int_{X_1 \times X_2} |\langle h, \tilde{g} \rangle_{H^{**}, H^*} I_{\bigcup_{n=1}^m A_n} d\mu_1 d\mu_2.
\]
Hence by the Monotone Convergence Theorem, \( \langle h, \tilde{g} \rangle_{H^{**}, H^*} \in L^1_M(X_1; L^1(X_2; \mathbb{R})) \) for each \( h \in H^{**} \).

If \( E \in \mathcal{M} \) and \( h \in H^{**} \), from the Dominate Convergence Theorem, we have
\[
\langle h, G(E) \rangle_{H^{**}, H^*} = \lim_{m \to \infty} \int_{X_1 \times X_2} \langle h, \tilde{g} \rangle_{H^{**}, H^*} I_{\bigcup_{n=1}^m A_n} d\mu_1 d\mu_2
\]
\[
= \int_{X_1 \times X_2} \langle h, \tilde{g} \rangle_{H^{**}, H^*} d\mu_1 d\mu_2.
\]
Therefore \( \tilde{g} \) is Pettis integrable and its Pettis integration \( \mathcal{P} \int_{X_1 \times X_2} \tilde{g} d\mu_1 d\mu_2 = G(E) \) for each \( E \in \mathcal{M} \). Since \( |G|(X_1 \times X_2) \) is finite, \( \int_{X_1 \times X_2} |\tilde{g}|_{H^*} I_{\bigcup_{n=1}^m A_n} d\mu_1 d\mu_2 \leq |G|(X_1 \times X_2) \) for all \( m \in \mathbb{N} \). By the Monotone Convergence Theorem, \( |\tilde{g}|_{H^*} \in L^1_M(X_1; L^1(X_2; \mathbb{R})) \). Hence \( \tilde{g} \) is Bochner integrable. Since the Pettis and Bochner integrals coincide whenever they coexist, we obtain (2.22), proving the Radon-Nikodým property of \( H^* \) with respect to \((X_1 \times X_2, \mathcal{M}, \mu_1 \times \mu_2)\).

### 2.5 A corollary of Lemma 2.1

We now look an interesting corollary of Lemma 2.1. We first state the following.

**Lemma 2.2.** Let
\[
\mathcal{M} = \left\{ A \in \mathcal{B}[0, T] \otimes \mathcal{F}_T \mid t \mapsto I_A(t, \cdot) \text{ is } \mathcal{F}\text{-progressively measurable} \right\}.
\]

Then $\mathcal{M}$ is a sub-$\sigma$-field of $\mathcal{B}[0, T] \otimes \mathcal{F}_T$. Moreover, a process $\varphi : [0, T] \times \Omega \to H$ is $\mathcal{F}$-progressively measurable if and only if it is $\mathcal{M}$-measurable.

**Remark 2.3.** It is easy to see that the same conclusion in Lemma 2.2 holds for any given filtration $\mathcal{F}$ (i.e., it is not necessarily the natural filtration generated by the Brownian motion $\{W(t)\}_{t \geq 0}$, and also if one replaces the $\mathcal{F}$-progressive measurability by any other measurability requirement, for examples, adapted, optional or predictable, etc.

According to Lemmas 2.1 and 2.2, we have the following interesting corollary, whose proof is straightforward.

**Corollary 2.4.** Let $0 < s \leq T$ and $H^*$ have the Radon–Nikodým property with respect to $([0, T] \times \Omega, \mathcal{M}, m \times \mathbb{P})$ (where $m$ is the Lebesgue measure). Then the following identities hold:

\[
\begin{align*}
L_p^q(\Omega; L^q(0, s; H))^* &= L_p^q(\Omega; L^q(0, s; H^*)), \\
L_p^q(0, s; L^p(\Omega; H))^* &= L_p^q(0, s; L^p(\Omega; H^*)).
\end{align*}
\]

The above is a Riesz-type Representation Theorem for the dual of spaces $L_p^q(\Omega; L^q(0, s; H))$ and $L_p^q(0, s; L^p(\Omega; H))$, which will be very useful below.

We refer to [14] for an application of Corollary 2.4 in the study of null controllability of forward stochastic heat equations with one control. We will give more application of this result in our forthcoming papers;

### 3 Answers to Problems (E) and (R)

In this section, we return to our complete filtered probability space $(\Omega, \mathcal{F}, \mathcal{F}, \mathbb{P})$ and give answers to Problems (E) and (R).

For any $p \in [1, \infty)$ and $0 < s \leq T$, define an operator $L_s : L_p^1(\Omega; L^1(0, s; H)) \to L_p^1(\Omega; H)$ by

\[ L_s(u(\cdot)) = \int_0^s u(t)dt, \quad \forall u(\cdot) \in L_p^1(\Omega; L^1(0, s; H)). \]

Concerning Problem (E), noting that $L_p^1(0, s; L^p(\Omega; H)) \subseteq L_p^1(\Omega; L^1(0, s; H))$, we give the following positive answer (which is a little stronger than the desired (1.12)):

**Theorem 3.1.** If $H^*$ has the Radon-Nikodým property, then

\[ L_s\left(L_p^1(0, s; L^p(\Omega; H))\right) = L_p^1(\Omega; H). \]

Moreover, for each $\phi(\cdot, s) \in L_p^1(\Omega; H)$, there is a $\varsigma(\cdot, s) \in L_p^1(0, s; L^p(\Omega; H))$ such that

\[
\begin{align*}
\|\varsigma(\cdot, s)\|_{L_p^1(0, s; L^p(\Omega; H))} &\leq \|\phi(\cdot, s)\|_{L_p^1(0, s; L^p(\Omega; H))}. \\
\|\varsigma(\cdot, s)\|_{L_p^1(0, s; L^p(\Omega; H))} &\leq \|\phi(\cdot, s)\|_{L_p^1(0, s; L^p(\Omega; H))}.
\end{align*}
\]

(In general, the above $\varsigma(\cdot, s)$ is NOT unique.)

The result in Theorem 3.1 turns out to be sharp for $p \in (1, \infty)$. Indeed, we have the following result of negative nature.
Theorem 3.2. For any $p \in (1, \infty)$ and any $r \in (1, \infty]$, it holds that

$$\mathbb{L}_s \left( L^r_p(0, s; \Omega) \right) \subseteq L^r_p(\Omega; H).$$

(3.3)

Remark 3.3. 1) In [6, VI, 68, pp. 130–131] and [8], some Radon-Nikodým type theorems were established for real-valued or vector-valued processes with finite variation. However, it seems that none of these results could be applied to prove Theorem 3.1.

2) Thanks to Remark 2.3, the conclusion in Theorem 3.1 holds for any given filtration $\mathbb{F}$; and one may replace the $\mathbb{F}$-progressive measurability by any other measurability requirement.

3) We believe that (3.1) is sharp in the sense that, for any $r \in (1, \infty]$ and any $p \in [1, \infty]$,

$$\mathbb{L}_s \left( L^p(0; \Omega) \right) \subseteq L^p(\Omega; H),$$

(3.4)

Theorem 3.2 shows that the first conclusion in (3.4) is true for $p \in (1, \infty)$, and that, noting (1.2), the second conclusion in (3.4) is true for $p \in [1, r] \cap (1, \infty)$. The general case is under our investigation. Note that the above can also be written as

$$\mathbb{L}_s \left( \bigcup_{q>1} L^p(0; \Omega) \right) \subseteq L^p(\Omega; H).$$

(3.5)

As a consequence of Theorem 3.1 and the Martingale Representation Theorem, our answer to Problem (R) is as follows:

**Corollary 3.4.** If $H$ is a Hilbert space, then for any $p \in [1, \infty)$, one can find a constant $C > 0$ such that for any $\zeta(\cdot) \in L^p(\Omega; L^2(0, T; H))$, there is a $u(\cdot) \in L^{1/p}_p(0, T; L^p(\Omega; H))$ so that equality (1.13) holds and

$$\|u(\cdot)\|_{L^{1/p}_p(0, T; L^p(\Omega; H))} \leq C \|\zeta(\cdot)\|_{L^p(\Omega; L^2(0, T; H))}. $$

(3.6)

**Remark 3.5.** By point 2) in Remark 3.3, it is easy to see that the conclusion in Corollary 3.4 holds also for adapted or optional or predictable stochastic processes.

Corollary 3.4 shows the existence for the representation of Itô integrals by Lebesgue/Bochner integrals. The proof of Corollary 3.4 follows easily from Theorem 3.1 by noting the well-known result that any Hilbert space has the Radon-Nikodým property (e.g., [7]) and using also the Burkholder-Davis-Gundy inequality for vector-valued stochastic processes (see [5, Theorem 5.4] and [16, Corollary 3.11]). The rest of this section is devoted to proving Theorems 3.1–3.2.

In order to prove Theorems 3.1–3.2, besides Corollary 2.4, we need the following result concerning range inclusion for operators, which can be found in [19, Lemma 4.13, pp. 94–95 and Theorem 4.15, p. 97], for example.

**Lemma 3.6.** Suppose $B_X$ and $B_Z$ are the open unit balls in Banach spaces $X$ and $Z$, respectively. Let $L : X \to Z$ be a linear bounded operator whose range is denoted by $R(L)$, and whose adjoint operator is denoted by $L^* : Z^* \to X^*$. Then, the following two conclusions hold

(i) If $R(L) = Z$, then there is a constant $C > 0$ such that

$$\|z^*\|_{Z^*} \leq C \|L^* z^*\|_{X^*}, \quad \forall z^* \in Z^*. $$

(3.7)
(ii) If (3.7) holds for some constant $C > 0$, then

$$B_Z \subset CL(B_X) \equiv \{CLx \mid x \in B_X\}. \quad (3.8)$$

**Remark 3.7.** 1) Clearly, by Lemma 3.6, we see that $\mathcal{R}(L) = Z$ if and only if (3.7) holds for some constant $C > 0$. But this lemma goes a little further than this. Indeed, the second conclusion of this lemma provides a “quantitative” characterization $B_Z \subset CL(B_X)$, which is more delicate than $\mathcal{R}(L) = Z$. We shall use this result essentially when we answer Problem (C) in the next section;

2) One should compare Lemma 3.6 with the following general range inclusion result (e.g., [13, Lemma 2.4 in Chap. 7]): Let $X, Y$ and $Z$ be Banach spaces with $X$ being reflexive, and both $F : Y \to Z$ and $G : X \to Z$ be linear bounded operators. Then,

$$|F^* z^*|_{Y^*} \leq C|G^* z^*|_{X^*}, \quad \forall z^* \in Z^*, \text{ for some constant } C > 0$$

$$\iff \mathcal{R}(F) \subseteq \mathcal{R}(G). \quad (3.9)$$

As shown in [1], the equivalence (3.9) may fail whenever $X$ is not reflexive. Nevertheless, when $F$ is surjective (in particular when $Y = Z$ and $F = I$, the identity operator, the case considered in Lemma 3.6), this equivalence remains to be true (even without the reflexivity assumption for $X$) (see [20, Theorem 1.2 and Remark 1.3]). We refer to [21] for further range inclusion results.

Further, we need the following property for Wiener integrals, a special case of Itô integrals with deterministic integrands (e.g., [12, Theorem 2.3.4 in Chapter 2, p. 11]).

**Lemma 3.8.** For each $0 \leq a < b \leq T$ and $f \in L^2(a, b)$ (for which $f$ is a deterministic function, i.e., it does not depend on $\omega \in \Omega$), the Wiener integral $\int_a^b f(t) dW(t)$ is a Gaussian random variable with mean 0 and variance $\int_a^b |f(t)|^2 dt$.

We are now in a position to prove Theorems 3.1–3.2.

**Proof of Theorem 3.1.** It suffices to show (3.2). Since $L^1_p(0, s; L^p(\Omega; H)) \subseteq L^p_p(\Omega; L^1(0, s; H))$ (algebraically and topologically), the restriction of operator $L^p_s : L^p_p(\Omega; L^1(0, s; H)) \to L^p_p(\Omega; H)$ to $L^1_p(0, s; L^p(\Omega; H))$ is a bounded linear operator from $L^1_p(0, s; L^p(\Omega; H))$ to $L^1_p(0, s; L^p(\Omega; H))$ (For simplicity, we still denote it by $L^p_s$). By Concluding (ii) in Lemma 3.6 and Corollary 2.4, by a simple scaling, we see that the desired result (3.2) is implied by the following:

$$\|L^p_s \eta\|_{L^p_p(0, s; L^p(\Omega; H))} \geq \|\eta\|_{L^p_p(\Omega; H^*)}, \quad \forall \eta \in L^p_p(\Omega; H^*). \quad (3.10)$$

In order to prove (3.10), let us first find the adjoint operator $L^p_s$ of $L_s$. For any $u(\cdot) \in L^1_p(0, s; L^p(\Omega; H))$, and $\eta \in L^p_p(\Omega; H)^* = L^p_p(\Omega; H^*)$, we have

$$\langle L^p_s u, \eta \rangle = \mathbb{E} \left( \int_0^s u(t) dt, \eta \right)_{H, H^*} = \int_0^s \mathbb{E}(u(t), \eta)_{H, H^*} dt \quad (3.11)$$

which leads to

$$\begin{cases} L^p_s : L^p_p(\Omega; H^*) \to L^1_p(0, s; L^p(\Omega; H))^* = L^\infty_p(0, s; L^p(\Omega; H^*)), \\ \langle L^p_s \eta \rangle(t) = \mathbb{E}[\eta | \mathcal{F}_t], \quad t \in [0, s], \forall \eta \in L^p_p(\Omega; H^*). \quad (3.12) \end{cases}$$
This gives a representation of the adjoint operator $\mathbb{L}_s^*$ of $\mathbb{L}_s$.

Now, we let $p > 1$. Making use of (3.12), we find that

$$
\|\mathbb{L}_s^* \eta\|_{L^p_0(0, s; L^p(\Omega; H^*))} \geq \left[ \mathbb{E}[|\eta|^{p'}] \right]^{\frac{1}{p'}} = \|\mathbb{L}_s^* \eta\|_{L^p_0(0, s; L^p(\Omega; H^*))}^{\frac{1}{p'}}
$$

Therefore, (3.10) holds for $p > 1$.

Next, for $p = 1$, we have that

$$
\|\mathbb{L}_s^* \eta\|_{L^\infty_0(0, s; \mathbb{L}_s(\Omega; H^*))} = \text{esssup}_{\omega \in \Omega} \left[ \sup_{t \in [0, s]} \mathbb{E}[|\eta| \mathcal{F}_t] \right] \Rightarrow \text{esssup}_{\omega \in \Omega} \mathbb{E}[|\eta|] = \|\mathbb{L}_s^* \eta\|_{L^\infty_0(0, s; \mathbb{L}_s(\Omega; H^*))}.
$$

This implies that our conclusion also holds for $p = 1$.

\textbf{Proof of Theorem 3.2.} Noting (2.3), it suffices to prove Theorem 3.2 for $r \in (1, \infty)$. We use the contradiction argument. Assume that

$$
\mathbb{L}_s \left( L^p_0(0, s; L^p(\Omega; H)) \right) = L^p_0(\Omega; H), \quad \text{for some } p, r \in (1, \infty).
$$

Since $L^p_0(0, s; L^p(\Omega; H)) \subseteq L^p_0(0, s; L^1(\Omega; H)) \subseteq L^p_0(\Omega; L^1(0, s; H))$ (algebraically and topologically), the restriction of operator $\mathbb{L}_s : L^p_0(\Omega; L^1(0, s; H)) \to L^p_0(\Omega; H)$ to $L^p_0(0, s; L^p(\Omega; H))$ is again a bounded linear operator from $L^p_0(0, s; L^p(\Omega; H))$ to $L^p_0(\Omega; H)$ (For simplicity, we still denote it by $\mathbb{L}_s$). Similar to (3.12), the representation of the adjoint operator $\mathbb{L}_s^*$ of $\mathbb{L}_s$ is given as follows:

$$
\begin{cases}
\mathbb{L}_s^* : L^p_0(\Omega; H^*) \to L^{p'}_0(0, s; L^{p'}(\Omega; H^*)), \\
(\mathbb{L}_s^* \eta)(t) = \mathbb{E}[\eta | \mathcal{F}_t], \quad t \in [0, s], \forall \eta \in L^p_0(\Omega; H^*).
\end{cases}
$$

By (3.15), using the first conclusion in Lemma 3.6 and noting Corollary 2.4, we conclude that there exists a constant $C > 0$ such that for any $\eta \in L^p_0(\Omega; H^*)$, it holds that

$$
\|\eta\|_{L^p_0(\Omega; H^*)} \leq C \|\mathbb{L}_s^* \eta\|_{L^p_0(0, s; L^{p'}(\Omega; H^*))},
$$

where $r' = r/(r - 1)$.

Fix any $x_0 \in H^*$ satisfying $|x_0|_{H^*} = 1$ (which is independent of the time variable $t$ and the sample point $\omega$). Consider a sequence of random variables $\{\eta_n\}_{n=1}^{\infty}$ defined by

$$
\eta_n = \int_0^s e^{nt}dW(t)x_0, \quad n \in \mathbb{N}.
$$
It is obvious that \( \eta_n \in L^p_{\mathcal{F}_s}(\Omega; H^*) \) for any \( n \in \mathbb{N} \). By Lemma 3.8, the integral \( \int_0^s e^{nt} dW(t) \) is a Gaussian random variable with mean 0 and variance \( e^{2ns - 1}/2n \). Hence,

\[
\left[ \mathbb{E} \left| \int_0^s e^{nt} dW(t) \right|^p \right]^{1/p} = \left[ \int_{-\infty}^{\infty} \frac{\sqrt{n|x|^p}}{\sqrt{(e^{2ns} - 1)\pi}} e^{-\frac{e^{2ns} - 1}{2n} dx} \right]^{1/p} = \left[ \int_{-\infty}^{\infty} \left( \frac{e^{2ns} - 1}{n} \right)^{p/2} \frac{|x|^p}{\sqrt{\pi}} e^{-x^2} dx \right]^{1/p} = \left( \frac{1}{\sqrt{\pi}} \int_{-\infty}^{\infty} |x|^p e^{-x^2} dx \right)^{1/p} \sqrt{\frac{e^{2ns} - 1}{n}}.
\]

(3.18)

Now, by (3.18), it is easy to see that

\[
\|\eta_n\|_{L^p_{\mathcal{F}_s}(\Omega; H^*)} = \left[ \mathbb{E} \left| \int_0^s e^{nt} dW(t) x_0 \right|^p \right]^{1/p} = \left[ \mathbb{E} \left| \int_0^s e^{nt} dW(t) \right|^p \right]^{1/p} \left( \int_{-\infty}^{\infty} |x|^p e^{-x^2} dx \right)^{1/p} \sqrt{\frac{e^{2ns} - 1}{n}}.
\]

(3.19)

Using (3.18) again, we have

\[
\left\{ \left[ \mathbb{E} \left| \int_0^s e^{nt} dW(t) x_0 \right|^p \right]^{1/p} \right\}^{1/p} = \left\{ \left[ \mathbb{E} \left| \int_0^s e^{nt} dW(t) \right|^p \right] \right\}^{1/p} \left( \int_{-\infty}^{\infty} |x|^p e^{-x^2} dx \right)^{1/p} \sqrt{\frac{e^{2ns} - 1}{n}} dt \}
\]

(3.20)

\[
\leq \frac{1}{\sqrt{\pi}} \left( \int_{-\infty}^{\infty} |x|^p e^{-x^2} dx \right)^{1/p} \left( \int_0^s e^{nt} dt \right)^{1/p} \leq \frac{1}{\sqrt{\pi}} \left( \int_{-\infty}^{\infty} |x|^p e^{-x^2} dx \right)^{1/p} \frac{e^{ns}}{(nr')^{1/p}}.
\]

From (3.19) and (3.20), it follows that

\[
\lim_{n \to \infty} \frac{\|\mathbb{E}[\eta_n | \mathcal{F}_t]\|_{L^p_{\mathcal{F}_t}(0, s; L^p(\Omega; H^*))}}{\|\eta_n\|_{L^p_{\mathcal{F}_s}(\Omega; H^*)}} \leq \lim_{n \to \infty} \frac{e^{ns}}{(nr')^{1/p}} \sqrt{e^{2ns} - 1} = 0.
\]

This, combined with (3.16), gives

\[
\lim_{n \to \infty} \frac{\|L^*_s \eta_n\|_{L^p_{\mathcal{F}_s}(0, s; L^p(\Omega; H^*))}}{\|\eta_n\|_{L^p_{\mathcal{F}_s}(\Omega; H^*)}} = 0,
\]

which contradicts inequality (3.17). This completes the proof of Theorem 3.2.
4 Answer to Problem (C)

This section is addressed to give a positive answer to Problem (C).

Theorem 3.1 tells us that any Itô integral \( \int_0^s \zeta(t) dW(t) \) with \( \zeta(\cdot) \in L^p_\mathcal{F}(\Omega; L^2(0, T; H)) \) admits a (parameterized) Bochner integral representation, i.e., we can find a representor \( u(\cdot, s) \in L^1_\mathcal{F}(0, s; L^p(\Omega; H)) \) (which is of course NOT unique) such that

\[
\int_0^s \zeta(t) dW(t) = \int_0^s u(t, s) dt, \quad \forall \, s \in [0, T]. \tag{4.1}
\]

Put \( Z \equiv L^1_\mathcal{F}(0, T; L^p(\Omega; H)) \). We now show that one can choose a \( u(\cdot, s) \), which is continuous in \( Z \) with respect to \( s \), such that (4.1) holds. More precisely, we have the following result:

**Theorem 4.1.** For any given \( \zeta(\cdot) \in L^p_\mathcal{F}(\Omega; L^2(0, T; H)) \), define a (set-valued) mapping \( F : [0, T] \to 2^Z \) by

\[
F(s) = \left\{ \eta(\cdot, s) \in Z \mid \int_0^s \eta(t, s) dt = \int_0^s \zeta(t) dW(t), \quad \text{and} \ \eta(t, s) = 0, \ \forall \ t > s \right\}, \quad \forall \, s \in [0, T]. \tag{4.2}
\]

Then \( F \) has a continuous selection \( f \).

**Remark 4.2.** If we choose \( u(\cdot, s) \) to be the above \( f(s) \), then \( u(\cdot, s) \) is the desired process (for (4.1)), which is continuous in \( Z \) with respect to \( s \).

Before proving Theorem 4.1, we recall the following useful preliminary results.

**Lemma 4.3.** Let \( X \) and \( Y \) be two topological spaces. Then, for any set-valued mapping \( \phi : X \to 2^Y \), the following two statements are equivalent:

(i) The map \( \phi \) is lower semi-continuous, i.e., for any open subset \( V \) of \( Y \), the set \( \left\{ x \in X \mid \phi(x) \cap V \neq \emptyset \right\} \) is open in \( X \);

(ii) If \( x \in X \), \( y \in \phi(x) \), and \( V \) is a neighborhood of \( y \) in \( Y \), then there exists a neighborhood of \( x \) in \( X \) such that for every \( x' \in U \), there exists a \( y' \in \phi(x') \cap V \).

**Lemma 4.4.** ([15, Theorem 3.2”]) The following properties of a \( T_1 \)-space are equivalent:

(i) \( X \) is paracompact (i.e., any open cover of \( X \) admits a locally finite open refinement, which is the case if \( X \) is compact or is a metric space);

(ii) If \( Y \) is a Banach space, then every lower semi-continuous mapping \( F : X \to 2^Y \) such that \( F(x) \) is a non-empty, closed, convex subset of \( Y \) for any \( x \in X \), admits a continuous selection, i.e., there exists a continuous mapping \( f : X \to Y \) such that \( f(x) \in F(x) \) for any \( x \in X \).

We can now give a proof of Theorem 4.1.

**Proof of Theorem 4.1.** The main idea is to use Lemma 4.4. It is obviously that \([0, T] \) is a \( T_1 \)-space and is paracompact. Hence we need only to prove that \( F(s) \) is a non-empty, closed, convex subset of \( Z \) for any \( s \in [0, T] \) and \( F \) is lower semi-continuous. By Theorem 3.1, we see that \( F(s) \) is non-empty. Also, it is very easy to check that \( F(s) \) is a convex subset of \( Z \) and is closed in \( Z \).

It remains to show that \( F \) is lower semi-continuous. Fix any \( s \in [0, T] \), any \( \eta(\cdot, s) \in F(s) \), and any neighborhood \( V \) of \( \eta(\cdot, s) \) in \( Z \). Clearly, there exists a \( \delta > 0 \) such that

\[
V_1 = \left\{ z(\cdot) \in Z \mid \|z(\cdot) - \eta(\cdot, s)\|_Z < \delta \right\} \subset V.
\]

21
We claim that there exists an \( \varepsilon > 0 \) such that for any \( r \) satisfying \( |r - s| < \varepsilon \), it holds that
\[
F(r) \cap V_1 \neq \emptyset.
\] (4.3)
This claim will yield the lower semi-continuity of \( F(\cdot) \). To prove out claim, we first make use of the Burkholder-Davis-Gundy inequality for vector-valued stochastic process (see [5, Theorem 5.4] and [16, Corollary 3.11]) to get the following:
\[
E \left[ \int_r^s |\zeta(t)|^2 dt \right]_H^\beta \leq E \left[ \sup_{r \leq t \leq s} \left( \int_r^h |\zeta(t)|^2 dt \right)^\frac{\beta}{2} \right] \leq C E \left[ \int_r^s |\zeta(t)|^2_H dt \right]^\frac{\beta}{2}. \tag{4.4}
\]
Choose an increasing sequence \( \{\rho_k\}_{k=1}^\infty \) such that \( 0 \leq \rho_1 \leq \rho_2 \leq \cdots \leq \rho_k \leq \rho_{k+1} \leq \cdots \rightarrow s \). Since \( \zeta(\cdot) \in L^\beta_p(\Omega; L^2(0, T; H)) \), by the Dominated Convergence Theorem, we have
\[
\lim_{k \rightarrow \infty} E \left[ \int_{\rho_k}^s |\zeta(t)|^2_H dt \right]^\frac{\beta}{2} = \lim_{k \rightarrow \infty} E \left[ \int_0^T \chi_{[\rho_k, s]} |\zeta(t)|^2_H dt \right]^\frac{\beta}{2} = 0.
\]
Hence,
\[
\lim_{r \rightarrow \infty} E \left[ \int_r^s |\zeta(t)|^2_H dt \right]^\frac{\beta}{2} \leq \lim_{k \rightarrow \infty} E \left[ \int_{\rho_k}^s |\zeta(t)|^2_H dt \right]^\frac{\beta}{2} = 0. \tag{4.5}
\]
Therefore, it follows from (4.4) that there exists an \( \varepsilon_1 > 0 \) such that for any \( 0 \leq s - r < \varepsilon_1 \), the following holds
\[
\left\| \int_r^s \zeta(t)dW(t) \right\|_{L^\beta_p(\Omega; H)} < \frac{\delta}{3}. \tag{4.6}
\]
On the other hand, by the Hölder inequality and using the Dominated Convergence Theorem, similar to the proof of (4.5), we see that there exists an \( \varepsilon_2 > 0 \) (may depend on \( s \)) such that for any \( 0 \leq s - r < \varepsilon_2 \), it holds
\[
\left\| \int_r^s \eta(t, s) dt \right\|_{L^\beta_p(\Omega; H)} \leq \int_r^s \left\| \eta(t, s) \right\|_{L^\beta_p(\Omega; H)} dt = \int_r^s \left[ E \left| \eta(t, s) \right|^p_H \right]^\frac{\beta}{p} dt < \frac{\delta}{3}. \tag{4.7}
\]
Put \( \varepsilon_3 = \min\{\varepsilon_1, \varepsilon_2\} \). From (4.6)–(4.7) and noting that \( \int_0^s \eta(t, s) dt = \int_0^s \zeta(t)dW(t) \), we conclude that for any \( r \) satisfies \( 0 \leq s - r < \varepsilon_3 \), it holds that
\[
\left\| \int_0^r \eta(t, s) dt - \int_0^s \zeta(t)dW(t) \right\|_{L^\beta_p(\Omega; H)} \\
\leq \left\| \int_0^r \eta(t, s) dt - \int_0^s \eta(t, s) dt \right\|_{L^\beta_p(\Omega; H)} + \left\| \int_0^r \zeta(t)dW(t) - \int_0^s \zeta(t)dW(t) \right\|_{L^\beta_p(\Omega; H)} < \frac{2\delta}{3}. \tag{4.8}
\]
By the second conclusion in Theorem 3.1 and noting (4.8), we see that there is a \( \phi(\cdot, r) \in L^\frac{1}{p}_p(0, r; L^p(\Omega; H)) \) such that \( \left\| \phi(\cdot, r) \right\|_{L^\frac{1}{p}(0, r; L^p(\Omega; H))} < \frac{2\delta}{3} \), and
\[
\int_0^r \phi(t, r) dt = \int_0^r \zeta(t)dW(t) - \int_0^r \eta(t, s) dt.
\]
Put \( g(\cdot, r) = \chi_{[0, r]} \phi(\cdot, r) + \chi_{[0, r]} \eta(\cdot, s) \). It is obvious that \( g(\cdot, r) \in F(r) \), and
\[
\left\| \eta(\cdot, s) - g(\cdot, r) \right\|_{L^\frac{1}{p}(0, s; L^p(\Omega; H))} \leq \int_r^s \left[ E \left| \eta(t, s) \right|^p_H \right]^\frac{\beta}{p} dt + \left\| \phi(\cdot, r) \right\|_{L^\frac{1}{p}(0, r; L^p(\Omega; H))} < \delta.
\]
Therefore, for any \( 0 \leq s - r < \varepsilon_3 \), it holds that \( g(\cdot, r) \in V_1 \), which gives (4.3). By a similar argument, one can show that there exists an \( \varepsilon_4 > 0 \) such that (4.3) holds for any \( 0 \leq r - s < \varepsilon_4 \). Choosing \( \varepsilon = \min\{\varepsilon_3, \varepsilon_4\} \), we see that (4.3) holds for any \( |r - s| < \varepsilon \). By Lemma 4.3, we know that \( F : [0, T] \rightarrow Z \) is lower semi-continuous.

Finally, thanks to Lemma 4.4, we conclude that there exists a continuous selection \( f \) of \( F \). \(\square\)
Two Illustrative Applications

In this section, we give two simple applications of our Theorems 3.1–3.2. More interesting and sophisticated applications will be presented in our forthcoming publications.

5.1 Application to the controllability problem

Consider a one-dimensional controlled stochastic differential equation:

\[
\begin{align*}
\text{dx(t)} & = [bx(t) + u(t)]dt + \sigma dW(t), \\
\text{with } b \text{ and } \sigma \text{ being given constants.}
\end{align*}
\]

We say that system (5.1) is exactly controllable if for any \(x_0 \in \mathbb{R}\) and \(x_T \in L^p_{F_T}(\Omega; \mathbb{R})\), there exists a control \(u(\cdot) \in L^p(\Omega; L^1(0, T; \mathbb{R}))\) such that the corresponding solution \(x(\cdot)\) satisfies 

\[
x(0) = x_0 \quad \text{and} \quad x(T) = x_T.
\]

By variation of constant formula, we have

\[
x(T) = e^{bT}x_0 + \int_0^T e^{b(T-t)}u(t)dt + \int_0^T e^{b(T-t)}\sigma dW(t).
\]

Thus, exact controllability is equivalent to the following:

\[
x_T = e^{bT}x_0 + \int_0^T e^{b(T-t)}u(t)dt + \int_0^T e^{b(T-t)}\sigma dW(t).
\]

Since \(x_T \in L^p_{F_T}(\Omega; \mathbb{R})\), there exists a unique \(\zeta(\cdot) \in L^p(\Omega; L^2(0, T; \mathbb{R}))\) such that

\[
x_T = \mathbb{E}x_T + \int_0^T \zeta(t)dW(t).
\]

Hence, to ensure (5.2), it suffices to have

\[
\mathbb{E}x_T = e^{bT}x_0 + \int_0^T \left[\zeta(t) - e^{b(T-t)}\sigma\right]dW(t) = \int_0^T e^{b(T-t)}u(t)dt,
\]

which is guaranteed by Theorem 3.1. This means that (5.1) is exactly controllable.

On the other hand, surprisingly, in virtue of [18, Theorem 3.1], it is clear that system (5.1) is NOT exactly controllable if one restricts to use admissible controls \(u(\cdot) \in L^2(\Omega; L^2(0, T; \mathbb{R}))\)!

Moreover, by Theorem 3.2, we see that system (5.1) is NOT exactly controllable, either provided that one uses admissible controls \(u(\cdot) \in L^2(\Omega; L^q(0, T; \mathbb{R}))\) for any \(q \in (1, \infty]\). This leads to a corrected formulation for the exact controllability of stochastic differential equations, as presented below.

We consider the following linear stochastic differential equation:

\[
\begin{align*}
\begin{cases}
\text{dy(t)} & = [Ay(t) + Bu(t)]dt + [Cy(t) + Du(t)]dW(t), \\
y(0) & = y_0 \in \mathbb{R}^n.
\end{cases}
\end{align*}
\]

where \(A, C \in \mathbb{R}^{n \times n}\) and \(B, D \in \mathbb{R}^{n \times m}\) are matrices. Various controllability issues for system (5.3) were studied, say, in [2, 3, 10, 18] and the references cited therein. Note however that, unlike the classical deterministic case, as far as we know, there exist no universally accepted notions for controllability in the stochastic setting so far.

Motivated by the above observation, we introduce the following:
Definition 5.1. System (5.3) is said to be exactly controllable if for any \( y_0 \in \mathbb{R}^n \) and \( y_T \in L^p_{\mathcal{F}_T}(\Omega; \mathbb{R}^n) \), there exists a control \( u(\cdot) \in L^2_{\mathcal{F}}(\Omega; L^1(0, T; \mathbb{R}^m)) \) such that \( D_y(\cdot) \in L^2_{\mathcal{F}}(\Omega; L^2(0, T; \mathbb{R}^n)) \) and the corresponding solution \( y(\cdot) \) of (5.3) satisfies \( y(T) = y_T \).

We need \( D_y(\cdot) \in L^2_{\mathcal{F}}(\Omega; L^2(0, T; \mathbb{R}^n)) \) in the above definition because it appears in the Itô integral \( \int_0^T \left[ C_y(t) + D_y(t) \right] dW(t) \). It is clear that, for the controllability of deterministic linear (time-invariant) ordinal differential equations, there is no difference between the controllability by using \( L^1 \) (in time) control and that by using \( L^2 \) (or even analytic in time) control. However, our analysis above indicates that things are completely different in the stochastic setting. A detailed study of the controllability for system (5.3) (in the sense of Definition 5.1) seems to deviate the theme of this paper, and therefore we shall address this topic in our forthcoming works.

5.2 Application to a Black-Scholes model

Consider a Black-Scholes market model

\[
\begin{align*}
    dX_0(t) &= rX_0(t)dt, \\
    dX(t)(t) &= bX(t)dt + \sigma X(t)dW(t),
\end{align*}
\]

with \( r, b, \sigma \) being constants. Under conditions of self-financing, and no transaction costs, the investor’s wealth process \( Y(\cdot) \) satisfies the following equation:

\[
dY(t) = \left[ rY(t) + (b - r)Z(t) \right] dt + \sigma Z(t)dW(t),
\]

where \( Z(t) \) is the amount invested in the stock. For convenience, a European contingent claim with payoff at the maturity \( T \) being \( \xi \in L^2_{\mathcal{F}_T}(\Omega; \mathbb{R}) \) is identified with \( \xi \). Any such a \( \xi \) is said to be replicable if there exists a trading strategy \( Z(\cdot) \) such that for some \( Y_0 \) (the price of the contingent claim at \( t = 0 \)), one has

\[
Y(0) = Y_0, \quad Y(T) = \xi.
\]

In another word, contingent claim \( \xi \) is replicable if and only if the following backward stochastic differential equation (BSDE, for short) admits an adapted solution \((Y(\cdot), Z(\cdot)):\)

\[
\begin{align*}
    dY(t) &= \left[ rY(t) + (b - r)Z(t) \right] dt + \sigma Z(t)dW(t), \quad t \in [0, T], \\
    Y(T) &= \xi.
\end{align*}
\]

In this case, \( Y(t) \) is a price of the contingent claim at time \( t \). See [9] and [23] for some relevant presentations. Now, let us look at an extreme case,

\[
b - r > 0, \quad \sigma = 0.
\]

In this case, \( \xi \) is replicable if and only if the following BSDE admits an adapted solution \((Y(\cdot), Z(\cdot)):\)

\[
\begin{align*}
    dY(t) &= \left[ rY(t) + (b - r)Z(t) \right] dt, \quad t \in [0, T], \\
    Y(T) &= \xi.
\end{align*}
\]

Similar to the above subsection, we see that the above admits an adapted solution \((Y(\cdot), Z(\cdot))\), which means that \( \xi \) is replicable. Further, since \( \xi \) is arbitrary, this also means that the market with conditions (5.7) is complete! This is a little surprising since \( \sigma = 0 \) in the market model. Some further careful study along this line will be carried out in our future investigations.
