Entrepreneurship has been the fundamental topics of discussion among the politicians, economists, and academics. Business creation is especially critical in developing countries to stimulate economic growth. The present study attempts to examine entrepreneurial inclination among students who are a potential source of entrepreneurs. The findings of the present research study indicate that majority of our business students are not entrepreneurial-inclined. They do not seem to possess strong entrepreneurial characteristics and entrepreneurial skills, and they are not keen in starting a new business. The roles of higher institutes of education and the government in promoting entrepreneurship are discussed.

Keywords: Entrepreneurship, entrepreneurial characteristics, entrepreneurial inclination, Malaysia.

The importance of entrepreneurship has been well recognized by the government, the academic community, and the researchers. Business creation and the cultivation of an entrepreneurial culture within the country have been the fundamental topics of discussion among the politicians, economists, and academics. This interest is based on the argument that new businesses contribute to job creation, economic development, and political and social stability (Kuratko and Hodgetts, 2004; Postigo, Iacobucci, and Tamborini, 2003; Wennekers and Thurik, 1999).

Governments have a major interest in encouraging enterprises. They are well aware of the importance, both economic and political, of small new firms in an economy. The government understands the crucial roles played by entrepreneurial firms in contributing to the economic performance of the country. Entrepreneurial firms play a key role in innovations that lead to technological change and productivity growth. They are also the main mechanism by which many enter the economic mainstream of the society by setting up new companies in every sector of the economy. New business-
and Hanlon (1997) and Vesper and Gartner (1997) have also reported an increase in the number and importance of entrepreneurship programs over the past 25 years. Many universities have established centers for entrepreneurship and they organize annual conferences in this theme. Most of these centers provide education programs in entrepreneurship, engage in entrepreneurial research, and conduct outreach activities with entrepreneurs. They also develop programs, in conjunction with the government, to promote entrepreneurship and to serve as incubators of dynamic new entrepreneurs (Kuratko and Hodgetts, 2004; Postigo, Iacobucci, and Tamborini, 2003).

As a result, governments are willing to provide ample support to new start-ups either financially or non-financially. In addition to capital grants and tax breaks, new firms are often given a head-start through consulting services and training. Examples are the Small Business Administration in the USA, and the Training and Enterprise Councils in the UK (Kuratko and Hodgetts, 2004; Wickham, 2004). In sum, “governments aim to support entrepreneurial businesses because they have an interest in their success. Entrepreneurs bring economic prosperity, provide social stability and generate tax revenue” (Wickham, 2004, p. 193).

In academic, there has been a marked increase in entrepreneurship education. Many universities have recognized the significance of entrepreneurship and have designed curricula specifically for entrepreneurial learning. Education in entrepreneurship is a fast growing area in the United States and throughout the world (Hisrich, Peters, and Shepherd, 2005; Koh, 1996). During the 1970s, very few schools offered entrepreneurial courses in the US. But today, more than 600 schools offer such courses and they are reporting an increase in student enrollment in this area (Kuratko and Hodgetts, 2004). Other scholars such as Gorman and Hanlon (1997) and Vesper and Gartner (1997) have also reported an increase in the number and importance of entrepreneurship programs over the past 25 years.

Many universities have established centers for entrepreneurship and they organize annual conferences in this theme. Most of these centers provide education programs in entrepreneurship, engage in entrepreneurial research, and conduct outreach activities with entrepreneurs. They also develop programs, in conjunction with the government, to promote entrepreneurship and to serve as incubators of dynamic new entrepreneurs (Kuratko and Hodgetts, 2004; Postigo, Iacobucci, and Tamborini, 2003).

**LITERATURE REVIEW**

With regard to research in entrepreneurship, numerous studies have been done on entrepreneurial personality traits, entrepreneurial skills, demographic characteristics of entrepreneurs, entrepreneurial intentions, and motivating factors and obstacles for setting up new business. The personality or trait approach attempts to identify a set of psychological characteristics that would distinguish entrepreneurs from non-entrepreneurs. Within the area of research in entrepreneurship, studies involving characteristics of entrepreneurs have been conducted most frequently (Herron and Robinson, 1993; Koh, 1996). A review of the literature shows that many psychological characteristics are deemed to be associated with entrepreneurs—need for achievement, locus of control, risk taking, tolerance of ambiguity, self-confidence, innovation, personal control, self-es-
teem, problem-solving, need for independence, hard workers, work ethic (working hard), pursuit of excellence, mastery, dominance, taking ownership and accountability, ability to capture opportunities, persistence and determination, self-starting, goal-setting, resilience, receptive to new ideas and change, assertiveness, eager to learn, commitment to others, hope of success and fear of failure, energy and mobility, and effective leadership (Entrepreneur’s Handbook, 1981; Franke and Lüthje, 2004; Hisirsch, et al., 2005; Johnson, 2001; Kuratko and Hodgetts, 2004; Litturen, 2000; Robinson, Simpson, Huefner, and Hunt, 1991; Wickham, 2004). Of these characteristics, need for achievement and locus of control, have received the most attention in the studies of entrepreneurship to date (Koh, 1996).

Scholars have attempted to identify and assess the important entrepreneurial skills which enhance entrepreneurial performance. Wickham (2004) stated that entrepreneurs require two sorts of skills to run a business venture effectively—general management business skills and people management skills. General management business skills include strategy skills, planning skills, marketing skills, financial skills, project management skills, and time management skills. People management skills include skills in leadership, motivation, delegation, communication, and negotiation. Hirshirch et al. (2005) divided the skills needed by entrepreneurs into three main areas—technical skills, business management skills, and personal entrepreneurial skills. Technical skills are “know-hows” such as oral and written communication, technical know-how, ability to organize, network building, and coaching. Business management skills involve planning, goal setting, decision making, control, negotiation, and skills in the basic functional areas such as marketing and finance. Those are the skills needed to start, develop, and manage a business venture. Personal entrepreneurial skills refer to those skills that differentiate entrepreneurs from managers. They include inner control, risk taking, innovativeness, persistence, leadership and change orientation.

Galloway, Anderson, Brown, and Wilson (2005) examined students’ perceptions of the skills required for entrepreneurship. The skills students perceived to be important for starting a business or becoming self-employed are communication, organization, initiative, problem solving, creativity, finance, people management, negotiation, confidence, team-working, and perseverance.

The demographic approach to the identification of entrepreneurs assumes that people with similar backgrounds possess similar underlying stable characteristics. If this assumption holds, it will be able possible to predict entrepreneurship in unknown populations by identifying demographic characteristics of known entrepreneurs (Robinson et al., 1991). The demographic variables examined in this type of research include birth order, role models, marital status, age, education level, race, gender, occupation of parents, and the number of siblings (Crant, 1996; Hornaday and Aboud, 1971; Koh, 1996; Postigo et al., 2003; Robinson et al., 1991).
Both demographic variables and psychological characteristics have been widely linked to entrepreneurial intentions or inclination. The common way of measuring entrepreneurial intentions is one’s judgment about the likelihood of starting a new business in the future; and those who have a high probability or interest of starting a new business are classified as entrepreneurially inclined (Crant, 1996; Franke and Lüthje, 2004; Henderson and Robertson, 2000; Koh, 1996; Postigo et al., 2003; Robinson et al., 1991). Postigo et al. (2003) found that the percentage of students seriously thinking of setting up a new firm was significantly higher for those whose parents were entrepreneurs or executives, compared with those whose parents were manual or office employees. There are also some contradictory results regarding the relationships between demographics and entrepreneurial intentions. Crant (1996) found that entrepreneurial intentions were related with gender, education level, and whether a parent is an entrepreneur (entrepreneurial family). However, Koh (1999) found no relationships between entrepreneurial intentions and gender, age, marital status, the number of siblings, birth order, and family influence.

In making the decision of becoming entrepreneurs, individuals are influenced by various factors such as work experience, motivation, personality, family environment, and societal norms (Watson, Hogarth-Scott, and Wilson, 1998). These influencing factors include individual or psychological components, social, and economic features (Henderson and Robertson, 2000). Several studies have examined empirically the motivating factors and barriers for business start-ups. For example, Watson et al. (1998) identified four types of factors in motivations for start-up—entrepreneurial factors, personal-opportunistic factors, market-opportunistic factors, and financial needs factors. Specific factors under each of these four types are listed in Table 1.

In their study of young adults’ attitudes to entrepreneurship as a career, Henderson and Robertson (2000) found that the primary reasons for considering a business start-up were “being one’s own boss” and “to make money.” For those respondents who were not contemplating the option of starting up a new business, the reasons cited were “do not have the qualities,” “not a risk-taker,” “want a family life,” “no capital to invest,” and “it involves too much work.” However, the study by Postigo et al. (2003) indicated that earning money was not the major reason for becoming an entrepreneur. The
student respondents in the study indicated personal (non-economic) reasons as the most important for setting up their own firms. The top three reasons given by the respondents were “to put into practice own ideas,” “personal independence,” “to create something of one’s own.” As for the difficulties in starting up their own firms, the top three reasons given by the respondents were “too much risk,” “lack of initial funding,” and “too much competition.”

Given the importance of entrepreneurship in an economy of the country and the students as the potential source of entrepreneurs, much research is needed on student entrepreneurship. However, how entrepreneurially inclined are our students, the future labor force of our society? The purpose of the present study is to address this issue. Specifically, the study attempts to answer the following questions:

1. Do business students possess entrepreneurial characteristics? Is there a difference in entrepreneurial characteristics between genders, majors of study, and entrepreneurial inclinations?

2. What is the proportion of the business students in study that indicates a high probability of starting a business in relation than those indicating a low probability of starting a business? Can entrepreneurial inclination be associated with gender, majors of study, birth order, and family influence?

3. How competent are the business students in terms of entrepreneurial skills? Is there any difference in the level of competency between genders, majors of study and entrepreneurial inclinations?

4. What are the perceived motivating factors and barriers of the business students for starting up a business?

The present study adopts the definition of entrepreneur by Mamat and Raya (1990). Entrepreneur is “a person who undertakes a venture, organizes it, raises capital to finance it, and assumes all or a major portion of the risk” (p. 1).

**RESEARCH METHOD**

The present study aims to (1) describe the entrepreneurial characteristics and skills of university business students, and their motivating factors and barriers for starting up a business; (2) examine group differences in their entrepreneurial characteristics and skills based on gender, major of study, and entrepreneurial inclination; and (3) determine whether there is an association between entrepreneurial inclination and gender, major of study, birth order, and family influence. Hence, this is a descriptive study in conjunction with T-test as the test of difference and chi-square test as the test of association.

**Sample**

The data for this study were collected from 200 final-year students pursuing a bachelor degree in business. Convenience sampling, a non-probability sampling technique was used. A total of 200 survey questionnaires were distributed. Survey questionnaires were personally distributed and collected from 100 students majoring in Business Administration and another 100 students majoring in Accounting in a private university, yielding a response rate of 100%. Gaining data access is a major concern in any primary data
research study. Hence, this private university was chosen as the target population due to the ability of the present researchers to gain physical access or entry to the data source. The sample consisted of more females (80%) than males (20%) with an average age of 22 years. Almost all of the respondents are of Chinese ethic origin (95%).

**Measurement**

**Entrepreneurial Characteristics**

Nine commonly cited entrepreneurial characteristics were included in this study to assess whether the students possessed entrepreneurial traits. They are innovation (4 items), confidence (4 items), internal locus of control (5 items), need for achievement (4 items), opportunity seeking (5 items), risk taking and faith (4 items), persistence (4 items), diligence (4 items), and initiative (4 items). The items used to measure each of these psychological characteristics were taken from the Entrepreneur Self Diagnosis Questionnaire by Mike McLoughlin. Two sample items for each characteristic were given in the table below. Respondents were asked how often they behave, feel, or believe with respect to each item using the scale ranged from 1 = never to 4 = always.

**Entrepreneurial Inclination**

To measure entrepreneurial inclination, respondents were asked to indicate their probability of starting a business upon the completion of their study (either after their undergraduate or graduate study). Following the approach by Koh (1996), respondents who indicated a high or very high probability of starting a business were classified as entrepreneurially inclined; and those indicated a low or very low probability were classified as non-entrepreneurially inclined.

**Birth Order and Family Influence**

The respondents were asked whether they are the first born (yes/no); whether any of their family members or close relatives owned a business when they were growing up (yes/no); and whether any of their family members or close relatives owns a business now (yes/no). The last two questions were used to determine family influence or family entrepreneurial inclination. This method of measuring family entrepreneurial inclination was adapted from Koh (1996).

**Entrepreneurial Skills**

The competency of entrepreneurial skills among the respondents was measured using the three categories of skills by Hisrich et al. (2005). They are technical skills, personal entrepreneurial skills, and business management skills as described above. Respondents were asked to indicate their level of competency in each specific skill under the respective skill areas, using a scale ranging from 1 = very incompetent to 6 = very competent.

**Motivating Factors and Barriers for Business Start-ups**

Twenty-five items used to measure motivating factors and barriers for starting a business were taken from Postigo et al.’s (2003) study. Sample perceived factors for starting own business are “personal independence,” “to accumulate a personal fortune,” “to earn more than an employee,” and “to be the head of an organization.” Sample perceived factors for not start-
ing own business are “too much risk,” “lack of initial funding,” “fear of being unsuccessful,” and “I doubt my entrepreneurial abilities.” Respondents were asked to pick five items for reasons starting and five for reasons not starting a new business and ranked the items according to the degree of importance.

Table 2. Sample Items of the Nine Entrepreneurial Characteristics

| Entrepreneurial Characteristics | Sample Items                                                                 |
|--------------------------------|------------------------------------------------------------------------------|
| Confidence                     | 1. I believe I can overcome obstacles.                                       |
|                                | 2. I know I can do what I set out to do.                                     |
| Diligence                      | 1. I treat my own convenience as less important than getting the job done.   |
|                                | 2. I will do almost anything to finish a task on time.                       |
| Initiative                     | 1. I can see for myself what action needs to be taken, I do not depend upon others to tell me. |
|                                | 2. I do not like to wait till I have to take action, I act before I am forced to. |
| Innovation                     | 1. I develop new ideas.                                                      |
|                                | 2. I believe there are always new and better ways of doing things.           |
| Internal locus of control       | 1. It is I, not luck nor fate, which influence the outcome of doing things in my life. |
|                                | 2. I cannot wait and watch things happen; I prefer to make things happen.   |
| Need for achievement           | 1. I take pleasure in responding to challenges, so competition makes me work harder. |
|                                | 2. I will work with anybody as long as I get things done and achieve my goal.|
| Opportunity seeking            | 1. I try to see my problems as opportunities.                               |
|                                | 2. If an opportunity arises I act on it immediately.                         |
| Persistence                    | 1. If I am faced with a problem I try again and again to solve it.           |
|                                | 2. If one solution does not work, I try to find another.                    |
| Risk taking and faith          | 1. I am not afraid to take risk if I have a good chance of succeeding.       |
|                                | 2. I am willing to risk the loss of money to do something I know to be right.|

Table 3. Means and Standard Deviations of the Entrepreneurial Characteristics

| Entrepreneurial Characteristics | Mean* | Standard Deviation |
|--------------------------------|-------|--------------------|
| Diligence                      | 2.68  | 0.50               |
| Confidence                     | 2.61  | 0.48               |
| Risk taking and faith          | 2.58  | 0.50               |
| Need for achievement           | 2.57  | 0.44               |
| Opportunity seeking            | 2.57  | 0.54               |
| Initiative                     | 2.56  | 0.50               |
| Persistence                    | 2.54  | 0.52               |
| Innovation                     | 2.52  | 0.53               |
| Internal locus of control      | 2.51  | 0.45               |

*On a 4-point scale: 1 = never, 2 = sometimes, 3 = usually, 4 = always.
Table 4. Test of Difference in Entrepreneurial Characteristics Based on Gender

| Entrepreneurial Characteristics | Mean of Male Group (n = 37) | Mean of Female Group (n = 163) | Significance Level |
|--------------------------------|----------------------------|-------------------------------|-------------------|
| Confidence                     | 2.71                       | 2.59                          | p < .173          |
| Diligence                      | 2.75                       | 2.66                          | p < .426          |
| Initiative                     | 2.59                       | 2.56                          | p < .675          |
| Innovation                     | 2.57                       | 2.51                          | p < .492          |
| Internal locus of control      | 2.60                       | 2.49                          | p < .663          |
| Need for achievement           | 2.54                       | 2.58                          | p < .492          |
| Opportunity seeking            | 2.62                       | 2.56                          | p < .555          |
| Persistence                    | 2.61                       | 2.52                          | p < .314          |
| Risk taking and faith          | 2.72                       | 2.54                          | p < .047*         |

*Significant at p < .05.

Table 5. Test of Difference in Entrepreneurial Characteristics Based on Major of Study

| Entrepreneurial Characteristics | Mean of BBA Group (n = 100) | Mean of BAC Group (n = 100) | Significance Level |
|--------------------------------|-----------------------------|-----------------------------|-------------------|
| Confidence                     | 2.64                        | 2.59                        | p < .462          |
| Diligence                      | 2.71                        | 2.64                        | p < .311          |

| Innovation                     | 2.52                        | 2.52                        | p < .947          |
| Internal locus of control      | 2.48                        | 2.54                        | p < .348          |
| Need for achievement           | 2.59                        | 2.55                        | p < .519          |
| Opportunity seeking            | 2.60                        | 2.54                        | p < .479          |
| Persistence                    | 2.52                        | 2.56                        | p < .633          |
| Risk taking and faith          | 2.60                        | 2.56                        | p < .575          |

RESULT AND DISCUSSION

Research Question 1

Do our students exhibit entrepreneurial characteristics? Is there a difference in entrepreneurial characteristics between types of gender, majors of study, and entrepreneurial inclinations?

Table 2 presents the means and standard deviations of the nine entrepreneurial characteristics included in the study. The means ranged from 2.51 to 2.68 on a 4-point scale. Diligence is the variable that achieved the highest mean among all of the entrepreneurial characteristics. This is in consistent with the general perception of the Chinese people that they are the hard-working group. Overall, the results show that the respondents were rather weak in the qualities of an entrepreneur.

T-tests were performed to test the difference in each of the nine entrepreneurial characteristics with respect to gender, majors of study, and entrepreneurial inclinations. The test results were presented in Tables 4, 5, 6. The results show that:

1. Male students were significantly higher in risk taking and faith than the female students.
2. There is no significant difference in all of the nine entrepreneurial characteristics between Business Administration students (BBA group) and Accounting students (BAC group).
3. The entrepreneurial-inclined group was found to be more confident and
Results show that entrepreneurial inclination is associated with gender—male students are more entrepreneurial inclined than female students. However, the test result may be interpreted with caution due to the relatively small sample size of males (n = 40) in relation to the number of females (n = 160) in this study. Nevertheless, the result is in line with Chen, Greene, and Crick’s (1998) that male students expressed a higher intention to become entrepreneurs than did female students. As for the major of study, there is no significant difference between BBA and BAC students in entrepreneurial inclination. Similarly, entrepreneurial inclination was found not to be associated with birth order and whether any family members or close relatives own a business before and now (family influence).

**Research Question 2**

What is the proportion of the students indicating a high probability of starting a business (entrepreneurial inclined) in relation to those indicating a low probability of starting a business (non-entrepreneurial inclined)? Is entrepreneurial inclination associated with gender, major of study, birth order, and family influence?

Seventy-nine of the 200 respondents (40%) indicated that they have a high or very high probability of starting a business upon completing of their studies. One hundred and twenty-one respondents (60%) indicated a low likelihood of starting a new business upon graduation. These results show that majority of the students (60%) are not keen in setting up a new venture or to be self-employed (based on their indication of a low probability of starting a new business upon graduation.)

Chi-square tests were used to examine whether there is an association between entrepreneurial inclination and gender, major of study, birth order, and family influence. Results show that entrepreneurial inclination is associated with gender—male students are more entrepreneurial inclined than female students. However, the test result may be interpreted with caution due to the relatively small sample size of males (n = 40) in relation to the number of females (n = 160) in this study. Nevertheless, the result is in line with Chen, Greene, and Crick’s (1998) that male students expressed a higher intention to become entrepreneurs than did female students. As for the major of study, there is no significant difference between BBA and BAC students in entrepreneurial inclination. Similarly, entrepreneurial inclination was found not to be associated with birth order and whether any family members or close relatives own a business before and now (family influence).

**Research Question 3**

How competent are our students in terms of entrepreneurial skills? Is there a difference in the level of competency between types of gender, majors of study, and entrepreneurial inclinations?

### Table 6. Test of Difference in Characteristics Based on Entrepreneurial Inclination

| Entrepreneurial Characteristics | Mean of Entrepreneurial-Inclined Group (n = 79) | Mean of Non-entrepreneurial Inclined Group (n = 121) | Significance Level |
|---------------------------------|-----------------------------------------------|--------------------------------------------------|-------------------|
| Confidence                      | 2.71                                          | 2.55                                             | p < .021*         |
| Diligence                       | 2.77                                          | 2.62                                             | p < .069          |
| Initiative                      | 2.61                                          | 2.53                                             | p < .247          |
| Innovation                      | 2.60                                          | 2.47                                             | p < .080          |
| Internal locus of control       | 2.58                                          | 2.46                                             | p < .071          |
| Need for achievement            | 2.61                                          | 2.55                                             | p < .361          |
| Opportunity seeking             | 2.67                                          | 2.50                                             | p < .030*         |
| Persistence                     | 2.60                                          | 2.50                                             | p < .180          |
| Risk taking and faith           | 2.62                                          | 2.55                                             | p < .305          |

*Significant at p < .05.
T-tests of difference were used to examine the difference in competency of the overall technical skills, business management skills, and personal entrepreneurial skills. As seen in Tables 8-10, it has been found that:

1. Male students are more competent than the female students in the overall technical skills.

2. There is no significant difference in the competency of entrepreneurial skills between Business Adminis-

table shows the means and standard deviations of the entrepreneurial skills under the respective categories—technical skills, business management skills, and personal entrepreneurial skills. The means of individual entrepreneurial skills range from 3.70 to 4.07. By looking at the individual means and the overall means of the three skill categories, we can conclude that the respondents were only somewhat competent in entrepreneurial skills.

| Table 7: Means and Standard Deviations of Entrepreneurial Skills |
|---------------------------------------------------------------|
| **Entrepreneurial Skills**                                    | **Mean** | **Standard Deviation** |
| **Technical Skills**                                          |          |                       |

3. Those who are entrepreneurial-inclined indicated a higher level of competency in the personal entrepreneurial skills.

**Research Question 4**

*What are the perceived motivating factors and barriers for starting up a business?*
main reasons. They are afraid of risks and competition and cast doubts about their competency in entrepreneurship. These findings are similar to those by Postigo, et al. (2003). The Argentinean and Italian students in their study cited non-economic reasons as the most important for setting a business; and they are also fear of risk, getting fund, competition, and own entrepreneurial abilities.

CONCLUSION
The findings of the present research study show that majority of our business students in the sample are not entrepreneurial-inclined. They do not seem to possess strong entrepreneurial characteristics and entrepreneurial skills, and they are not keen in starting a new business. They concern about the risks associated with new business creation and initial funding. In addition, they lack of confidence in their abilities to compete. These findings are consistent with those reported by Franke and Lüthje (2004)—“Unlike entrepreneurship programs, general business management education seems to have no significant influence on entrepreneurial intentions” (p.6).

According to Chen et al.’s (1998) study, the number of management courses taken by the students has no effect on entrepreneurial decision. Furthermore, students taking entrepreneurship classes scored significantly higher in entrepreneurial self-efficacy than those taking non-entrepreneurship classes. Rae (1999) also claims that (as cited in Galloway, et al., 2005) the skills traditionally taught in business schools are not enough to make students successful entrepreneurs. These arguments imply that the traditional curricular content and teaching method in business schools are not adequate in promoting entrepreneurial spirit among the students.

As stated by Postigo et al. (2003), business creation by university graduates is especially important in developing countries “because the industrial
may be given to aid fresh graduates who intend to start a new business. Financial assistance could be in the form of government grants to launch an innovative idea or product; or in the form of cheap loans and credit. Government scientists and engineers may help businesses solve difficult technical problems. And government agencies may offer free consulting and training services with respect to managing a business (Dollinger, 2003).

However, the findings of the present study could not be generalized to all Malaysian universities. The generalization of the findings of the present study is limited to business students of Chinese in origin. More studies are needed to examine entrepreneurial inclination of business students of other races (as in Malaysian population) from both private and public institutes of higher education. Future research may also examine entrepreneurial inclination of students with non-business majors. More data are needed to provide evidence to support the present research findings and for comparison purpose within the student population. Research on the implementation of more entrepreneurial-specific programs in universities and their effectiveness may also be needed in the future.

Instructions to Contributors

Aim and Scope

The South East Asian Journal of Management (SEAM) aims to present the latest thinking and research that tests, extends, or builds management theory and contributes to management practice. Contents of the Journal will be of interest to management teachers, students and researchers as well as to practicing managers. Journal materials should be analytical rather than descriptive.

Whilst a major focus of the journal is on management issues related to South East Asia, increasingly global concerns and conceptual topics will be covered also. The journal does not take a narrow view of business and management. Manuscripts from other disciplines might be published if considered to offer significant contributions to solve existing managerial problems.

In order to be published in SEAM, a manuscript must make strong empirical and theoretical contributions to the field of management. Thus, preference is given to submissions that test, extend, or build strong theoretical frameworks while empirically examining issues with high importance for management theory and practice.

Accreditation

The South East Asian Journal of Management (ISSN: 1978-1989) has received an “A” Accreditation from The Indonesian Directorate of Higher Education (DIKTI) SK No. 64a/DIKTI/Kep/2010, November 1st, 2010.

Instruction to Authors

Manuscripts must be double-spaced on 8 1/2 x 11” paper. Body text should be in Times New Roman, font size 12. Manuscript length should be reasonable for the contribution offered. Soft copy of the article should be submitted online through our Open Journal System (OJS) site at http://www.journal.ui.ac.id/tseajm, if possible. If not, manuscripts may also be sent via email to:

Sari Wahyuni, Ph.D
Editor in Chief
The South East Asian Journal of Management
Departement of Management Faculty of Economics Universitas Indonesia
Departement of Management Building, Kampus Baru UI,
West Java, Indonesia
Phone : +62-21-7272425 ext 503
Fax : +62-21-7863556
Email: seam@ui.ac.id; seam.mrc@gmail.com

Manuscripts are reviewed by the editor, members of the SEAM Editorial Review Board, and occasional reviewers. The author’s name and affiliation are removed before reviewing in order to ensure objectivity. Please do not identify the author(s) in the body of the paper either directly or by citation. Manuscripts with poor English will be directed to an appointed Language Editing partners before further reviewing process can be done. With the submission of a manuscript, the following three items should be included in a separate page:
1. Cover page showing title, each author’s name, affiliation, complete office address, personal and institution email address, and the category of the article. Select one category from the following: Finance, Marketing, Human Resource, Innovation, Knowledge Management, Strategic, and Organization.
2. Abstract of up to 150 words.
3. Keywords, approximately five to seven words.
**Heading**

Manuscript should be divided into five heading, i.e. Introduction, Literature Review, Research Method, Result and Discussion and Conclusion. Each heading should be in Times New Roman, bold, font size 14. Sub-heading should be in Times New Roman, bold-italic, font size 12.

**Math Notation**

Notations should be clearly explained within the text. Equations should be centered on the page. If equations are numbered, type the number in parentheses flush with the right margin. Unusual symbols and Greek letters should be identified. For equations that may be too wide to fit in a single column, indicate appropriate breaks.

**Table and Figures**

Indicate table placements within text. Camera-ready tables should be typed flush with the left-hand margin and have proper labeling of sources, column headings, and other notations. Once the manuscript has been accepted for publication, complex tables and figures (diagrams, charts, graphs, etc.) should be prepared professionally for camera-ready reproduction.

**References**

Reference citations within the text should consist of the author’s last name and date of publication, without punctuation, enclosed within parentheses, and should be inserted before punctuation and/or at a logical break in the sentence. If several citations are needed, separate them with semicolons, and list alphabetically. If two or more works by an author have the same year, distinguish them by placing a, b, etc. after the year.

References should be double-spaced and attached on a separate page. Works by single author, list chronologically; two authors, alphabetically and then chronologically; three authors, the same; four or more, list chronologically. References should be in the following:

**Books:**
Bagozzy, R.P. (1980), *Causal Models in Marketing*, New York: Wiley.

**Journals:**
Singh, J. (1991), Understanding the Structure of Consumers’ Satisfaction Evaluations of Service Delivery, *Journal of the Academy of Marketing Science*, 19 (Summer), 223-244.

**Three or More Authors:**
Zeithaml, V.A., Berry, L.L., & Parasuraman, A. (1993), The Nature and Determinants of Customers Experiences of Service, *Journal of the Academy of Marketing Science*, 21 (Winter), 1-12.

**Article in a Book Edited by another Author:**
Levitt, T. (1988), The Globalization of Markets, in *Multinational Marketing Management*, Robert, D.B., & Quelch, J.A. (Eds.), Reading, MA, Addison Weley, 186-205.

**Unpublished Dissertations:**
Paterson, K.S. (1985), The Effects of Bilingual Labels in Buyer Behaviour, *Dissertation*, University of California at Irvine.

About MRC

The Management Research Center (MRC) laboratory was created in March 2006 due to the particular reason of relative weakness on management research in Indonesia. MRC is national research center dedicated to contribute the theoretical, empirical, and practical research in recent management issues.

The intention is not only to stimulate research and discussion within scholarly circles, but also to enhance business community and public awareness to stimulate thinking on and exploring solutions in management issues.

The MRC is placed to assist local, regional and international scholar and other researcher that provides a congenial and stimulating intellectual environment, encouraging the fullest interaction and exchange ideas.

To achieve these aims, the MRC conducts a range of research programs; holds public lecturers, seminars, workshops, and conferences; publishes research journals and books, support research facilities, including data, financial subsidy and library collections.

Research

Research within MRC covers the fields of interest in:
- Business Policy & Strategy
- Entrepreneurship
- Finance and Banking
- Gender and Diversity in Organizations
- International Management
- Management Education & Development
- Operations Management
- Organization Development & Change
- Organization & Management Theory
- Organizational Behavior
- Research Methods in Management
- Social Issues in Management
- Technology & Innovation Management

Activities

MRC has a program of public lecturers, seminars, workshops, and conferences, organized independently or in collaboration with other research organization and also with private sectors. The scope of these ranges activities from informal discussion group to major international events.

Especially for the public lecturer, MRC invites and opens the opportunity for distinguish professor, leaders and CEO of the companies to share their knowledges and their experiences.

Publications

To facilitate timely dissemination of research and commentaries on recent and current developments, MRC produce monographs under the Working Paper Series.

MRC also publishes academic journals which is called The South East Asian Journal of Management (SEAM), Indonesia Capital Market Review (ICMR) and Asean Marketing Journal (AMJ).

Library

The MRC library collaborates with the Graduate School of Management, Faculty of Economics, University of Indonesia. This library has many excellent collections of management studies in Bahasa Indonesia and English, in print and multimedia formats.
