Vague Implicative LI – Ideals of Lattice Implication Algebras

V. AmarendraBabu1,*, T. Anitha2

1Department of Mathematics, Acharya Nagarjuna University, India
2Department of Mathematics, K.L. University, India

Abstract We introduce the concept of vague implicative LI – ideals of lattice implication algebra and discuss some of their properties. We study the relationship between v-implicative filters, vague ILI - ideals and ILI – ideals. Extension property of a vague implicative LI – ideal is built.

Keywords Lattice Implication Algebras, ILI – ideals, Vague ILI – ideals, Implicative v- filter

1. Introduction

In order to investigate a many valued logical system whose proportional value is given in a lattice, Y. XU [9, 13] first established the lattice implication algebra by combining lattice and implication algebra, and explored many useful structures. The ideal theory serves a vital function for the development of lattice implication algebras. Y.XU, Y.B. Jun and E.H. Roh [11] introduced the notion of LI – ideals of lattice implication algebras and examined their properties. And other researchers studied several LI -ideals in lattice implication algebras. In particular Young Lin Liu, Yang Xu, Qin and Liu [7] introduced the notion of ILI – ideals of lattice implication algebras. They gave equivalent conditions of ILI – ideals and provide some equivalent conditions for a LI – ideal to be an ILI – ideal and Implicative filter in lattice implication algebras. Afterwards, Y.XU and Y.B. Jun [12] introduced the notion of fuzzy LI – ideals of lattice implication algebras. Leroy B. Beasley, Gi- Sang Cheon, Y.B. Jun and Seok Zun Song [4] introduced the fuzzy implicative LI - ideals in lattice implication algebras.

The concept of vague set [3] introduced by Gau in 1993. Vague sets as a extension of fuzzy sets, the idea of vague sets is that the membership of every element can be divided into two aspects including supporting and opposing. Since then this idea has been applied to other algebraic structures such as groups, semi groups, rings, vector spaces, topologies and on different algebras like as BM – algebras, MV – algebras and BL – algebras. At first Ya Qin and Yi Liu [6] applied the vague set theory to lattice implication algebra and introduced the notion of v- filter, and investigated some properties. In [1], we introduced the concept of Vague LI – ideals of lattice implication algebra. Also we study the various properties and equivalent characterizations of vague LI – ideals. We investigated the relation between v- filters, vague LI – ideals and Li- ideals.

The object of this paper is to make a study of vague implicative LI – ideals and its properties on lattice implication algebras L.

2. Preliminaries

In this section we collect some Definitions and important results for further sections.

Definition 2.1: [9] Let (L, ∨, ∧, →, ‘, 0, I) be a complemented lattice with the universal bounds 0, I. → is another binary operation of L. (L, ∨, ∧, →, ‘, 0, I) is called a lattice implication algebra, if the following axioms hold:

(I1) x → (y → z) = y → (x → z);
(I2) x → x = I;
(I3) x → y = y’ → x’;
(I4) x → y = y → x = I implies x = y;
(I5) (x → y) → y = (y → x) → x;
(L1) (x ∨ y) → z = (x → z) ∧ (y → z);
(L2) (x ∧ y) → z = (x → z) ∨ (y → z).

Definition 2.2:[9] A lattice implication algebra (L, ∨, ∧, →, ‘, 0, I) is said to be a lattice H implication algebra if it
satisfy the following axiom:
\[ x \lor y \lor ((x \land y) \rightarrow z) = 1; \forall \ x, y, z \]

**Theorem 2.3:** [13] Let \( L \) be a lattice implication algebra, then for any \( x, y, z \in L \), the following conclusions hold:
1. If \( I \rightarrow x = I \) then \( x = I \);
2. \( I \rightarrow x = x \) and \( x \rightarrow 0 = x \);
3. \( 0 \rightarrow x = I \) and \( x \rightarrow I = I \);
4. \( x \leq y \) if and only if \( x \rightarrow y \);
5. \( (x \rightarrow z) \rightarrow (x \rightarrow y) = ((z \land x) \rightarrow y) = (z \rightarrow x) \rightarrow (z \rightarrow y) \);
6. \( x \rightarrow y \leq (y \rightarrow z) \rightarrow (x \rightarrow z) \);
7. \( ((x \rightarrow y) \rightarrow y) \rightarrow y = x \rightarrow y \).

**Definition 2.4:** [7] Let \( A \) be a subset of a lattice implication algebra \( L \). \( A \) is said to be an ILI - ideal of \( L \) if it satisfies the following conditions:
1. \( 0 \in A \);
2. \( \forall x, y, z \in L, ((x \rightarrow y) ^ \prime \rightarrow y ^ \prime \rightarrow z ^ \prime) \in A \) and \( z \in A \) implies \( (x \rightarrow y ^ \prime) \in A \).

**Definition 2.5:** [13] Let \( F \) be a subset of a lattice implication algebra \( L \). \( F \) is said to be a implicative filter of \( L \) if it satisfies the following conditions:
1. \( I \in F \);
2. \( \forall x, y, z \in L, (x \rightarrow y) \in F \) implies \( (y \rightarrow z) \in F \).

**Definition 2.6:** [3] A vague set \( A \) in the universal of discourse \( X \) is characterized by two membership functions given by:
1. A truth membership function \( t_A : X \rightarrow [0,1] \) and
2. A false membership function \( f_A : X \rightarrow [0,1], \)
   
   Where \( t_A(x) \) is a lower bound of the grade of membership of \( x \) derived from the “evidence for \( x \)”, and \( f_A(x) \) is a lower bound on the negation of \( x \) derived from the “evidence against \( x \)” and \( t_A(x) + f_A(x) \leq 1 \). Thus the grade of membership of \( x \) in the vague set \( A \) is bounded by subinterval \([t_A(x), 1 - f_A(x)]\) of \([0,1]\). The vague set \( A \) is written as
   
   \[ A = \{ (x, [t_A(x), f_A(x)]) \} / x \in X \}
   
   Where the interval \([t_A(x), 1 - f_A(x)]\) is called the value of \( x \) in the vague set \( A \) and denoted by \( V_A(x) \).

**Definition 2.7:** [3] Let \( A \) be a vague set of a universe \( X \) with the truth membership function \( t_A \) and the false membership function \( f_A \). For any \( x, y \in \mathbb{R} \) with \( \alpha \leq \beta \), the \((\alpha, \beta)\) cut or vague cut of a vague set \( A \) is a crisp subset \( A(\alpha, \beta) \) of the set
\[ X \text{ given by } A(\alpha, \beta) = \{ x \in X / V_A(x) \geq [\alpha, \beta] \}. \]

**Definition 2.8:** [3] The \( (\alpha, \alpha) \) cut of the vague set \( A \) is the \((\alpha, \alpha)\) cut of \( A \) and hence given by \( A_\alpha = \{ x \in X / t_A(x) \geq \alpha \} \).

**Notation:** Let \( I \{0, 1\} \) denote the family of all closed subintervals of \([0,1]\). If \( I_1 = [a_1, b_1], I_2 = [a_2, b_2] \) are two elements of \( I \{0, 1\} \), we call \( I_1 \geq I_2 \) if \( a_1 \geq a_2 \) and \( b_1 \geq b_2 \). We define the term \( \text{imax} \) to mean the maximum of two interval as \( \text{imax} [I_1, I_2] = \text{max} \{a_1, a_2\} \text{max} \{b_1, b_2\} \).

Similarly, we can define the term \( \text{imin} \) of any two intervals.

**Definition 2.9:** [1] Let \( A \) be a vague set of a lattice implication algebra \( L \). \( A \) is said to be a vague LI – ideal (briefly VLI – ideal) of \( L \) if it satisfies the following conditions:
1. \( \forall x \in L, V_A(0) \geq V_A(x), \)
2. \( \forall x, y \in L, V_A(x) \geq \text{imin} \{V_A((x \rightarrow y) ^ \prime), V_A(y)\}. \)

**Definition 2.10:** [1] Let \( A \) be a vague set of a lattice implication algebra \( L \). \( A \) is said to be a vague lattice ideal of \( L \) if it satisfies the following conditions:
1. \( \forall y \leq x \text{ then } V_A(y) \geq V_A(x) \),
2. \( V_A(x \lor y) \geq \text{imin} \{V_A(x), V_A(y)\} \) for \( x, y \in L \).

### 3. Vague Implicative LI – ideal

**Definition 3.1:** Let \( A \) be a vague set of a lattice implication algebra \( L \). \( A \) is said to be a vague implicative LI – ideal (brieﬂy VILI – ideal) of \( L \) if it satisfies the following conditions:
1. \( \forall x \in L, V_A(0) \geq V_A(x), \)
2. \( \forall x, y \in L, V_A((x \rightarrow y) ^ \prime) \geq \text{imin} \{V_A((x \rightarrow y) ^ \prime), V_A(y)\}. \)

**Example 3.2:** Let \( L = \{0, a, b, c, d, I\} \) be a set with Cayley table as follows:
\[
\begin{array}{cccccc}
& 0 & a & b & c & d \\
0 & 0 & 1 & 1 & 1 & 1 \\
ad & a & c & b & c & b \\
b & d & a & 1 & b & a \\
c & a & a & 1 & b & 1 \\
d & b & 1 & b & 1 & 1 \\
I & 0 & a & b & c & d \\
\end{array}
\]

Define \( \rightarrow, \lor \text{ and } \land \) operations on \( L \) as follows:
\[ x \rightarrow 0, \ x \lor y = (x \rightarrow y) \rightarrow y, x \land y = ((x \rightarrow y) ^ \prime \rightarrow y) ^ \prime \text{ for all } x, y \in L. \]

Then \( (L, \lor, \land, \rightarrow, 0, I) \) is a lattice implication algebra.

[13] Define a vague set \( A \) of \( L \) by
Theorem 3.3: Any VILI – ideal of a lattice implication algebra L is a VILI – ideal of L.

Proof: Let A be a VILI – ideal of a lattice implication algebra L. Then obviously, \( V_A(0) \geq V_A(x) \) for all \( x \in L \).

Let \( x, y, z \in L \), then we have \( V_A((x \rightarrow y)' \rightarrow y' \rightarrow z) \), \( V_A(z) \).

Taking \( y = 0 \) in the above equation, we obtain \( V_A((x \rightarrow 0)' \rightarrow 0 \rightarrow z) \), \( V_A(z) \).

\( A((x' \rightarrow y) \rightarrow (y' \rightarrow z)) \), \( V_A(z) \)

\( A(x) = \text{imin}\{V_A((x \rightarrow 0)' \rightarrow z'), V_A(z)\} \)

\( \text{imin}\{V_A((x \rightarrow z)'), V_A(z)\} \).

Hence A is a VILI – ideal of L.

The converse of theorem 3.3 may not be true as seen in the following example:

Example 3.4: The vague set
\( B = \{0, [0.7, 0.2] \} \),
\( (a, [0.5, 0.3]), (b, [0.5, 0.3]), (c, [0.7, 0.2]), (d, [0.5, 0.3]), (l, [0.5, 0.3]) \)
of L (in example 3.2) is a VILI – ideal of L. But it is not a VILI – ideal of L because
\( V_A((a \rightarrow b)') \geq \text{imin}\{V_A((a \rightarrow b)' \rightarrow b)' \rightarrow 0)', V_A(0)\} \).

Theorem 3.5: In a lattice H implication algebra L, every VILI - ideal is a VILI – ideal.

Proof: Let A be any VILI - ideal of a lattice H implication algebra L.

Then obviously, \( V_A(0) \geq V_A(x) \) for all \( x \in L \).

We have, \( V_A((x \rightarrow y)'') = V_A((y' \rightarrow x')) \) (since L is a lattice H implication algebra)

\( = V_A((y' \rightarrow (x \rightarrow y)')'') \) (since L is a lattice H implication algebra)

\( = V_A((x \rightarrow y)' y') \)

\( \geq \text{imin}\{V_A((x \rightarrow y)' \rightarrow y' \rightarrow z), V_A(z)\} \). (by 2.9 (2))

Hence A is a VILI – ideal of L.

Corollary 3.6: Every VILI- ideal A of a lattice implication algebra L is order reversing.

Corollary 3.7: Every VILI – ideal of a lattice implication algebra L is a vague lattice ideal of L. Conversely need not to be true.

Remark 3.8: In a lattice H implication algebra L, every vague lattice ideal is a VILI -ideal.

Example 3.9: Let \( L = \{0, a, b, I\} \) be a set with Cayley table as follows:

\[
\begin{array}{cccc}
  & 0 & a & b & I \\
 0 & 0 & I & I & I \\
a & a & b & I & 0 \\
b & b & a & a & I \\
I & I & 0 & a & b \\
\end{array}
\]

Define \( ' \), \( \lor \) and \( \land \) – operations on L as follows:

\( x' = x \rightarrow 0, x \lor y = (x \rightarrow y) \rightarrow y, x \land y = ((x' \rightarrow y') \rightarrow y')' \)

for all \( x, y \in L \).

Then \((L, \lor, A, \rightarrow, ' , 0, I)\) is a lattice H implication algebra [13]. Let C be a vague set in L defined by

\( C = \{0, [0.7, 0.2], (a, [0.5, 0.3]), (b, [0.5, 0.3]), (l, [0.5, 0.3])\} \).

Clearly, C is both VILI – ideal and vague lattice ideal of L.

Theorem 3.10: Let A be a vague set of a lattice implication algebra L. Then A is a VILI – ideal of L if and only if

\( A(\alpha, \beta) \) is an ILI – ideal of L when \( A(\alpha, \beta) \neq \emptyset \), \( \alpha, \beta \in [0, 1] \).

Proof: Assume that A is a VILI – ideal of L and \( A(\alpha, \beta) \neq \emptyset \), \( \alpha, \beta \in [0, 1] \).

Then there exist \( x \in A(\alpha, \beta) \), and hence \( V_A(0) \geq V_A(x) \geq [a, \beta] \). That is \( 0 \in A(\alpha, \beta) \).

Let \( x, y, z \in L \), if \( (((x \rightarrow y)' \rightarrow y)' \rightarrow z) \in A(\alpha, \beta) \) and \( z \in A(\alpha, \beta) \), then

\( V_A(((x \rightarrow y)' \rightarrow y)' \rightarrow z)) \geq [a, \beta], V_A(z) \geq [a, \beta] \).

It follows that

\( V_A((x \rightarrow y)' \rightarrow z) \geq \text{imin}\{V_A(((x \rightarrow y)' \rightarrow y)' \rightarrow z)), V_A(z)\} \geq [a, \beta] \).

That is \((x \rightarrow y)' \in A(\alpha, \beta) \). So, \( A(\alpha, \beta) \) is an ILI ideal of L.

Conversely, Suppose that for any \( \alpha, \beta \in [0, 1], A(\alpha, \beta) \neq \emptyset \) and hence \( A(\alpha, \beta) \) is an ILI ideal of L. By \( 0 \in A(\alpha, \beta) \) it follows that

\( V_A(0) \geq V_A(x) \).

For any \( x, y, z \in L \), let

\[ [a, \beta] = \text{imin}\{V_A(((x \rightarrow y)' \rightarrow y)' \rightarrow z)), V_A(z)\} \]

It follows that \( A(\alpha, \beta) \neq \emptyset \) and hence \( A(\alpha, \beta) \) is an ILI – ideal of L. Since \((x \rightarrow y)' \rightarrow y)' \rightarrow z) \in A(\alpha, \beta) \), \( z \in A(\alpha, \beta) \) this implies \((x \rightarrow y)' \in A(\alpha, \beta) \). That is

\( V_A((x \rightarrow y)' \rightarrow z) \geq [a, \beta] = \text{imin}\{V_A(((x \rightarrow y)' \rightarrow y)' \rightarrow z)), V_A(z)\} \).

So, A is a VILI – ideal of L.
Corollary 3.11: Let $A$ be a vague set of a lattice implication algebra $L$. Then $A$ is a VILI – ideal of $L$ if and only if $A_x$ is an ILI – ideal when $A_x \neq \emptyset$, $a \in [0, 1]$.

Lemma 3.12: (Extension property for VILI – ideals) Let $A$ and $B$ be VILI- ideals of lattice implication algebra $L$ such that $A \subseteq B$, that is $V_A(x) \leq V_B(x)$, $\forall x \in L$. If $A$ is a VILI- ideal of $L$, then so is $B$.

Proof: Let $A$ and $B$ be VLI- ideals of lattice implication algebra $L$ such that $A \subseteq B$.

Since $A \subseteq B$, that is $V_A(x) \leq V_B(x)$, $\forall x \in L$, implies that $A_a \subseteq B_a$ for every $a \in [0, 1]$.

If $A$ is a VILI- ideal of $L$ then by corollary 3.11, $A_a \neq \emptyset$ is an ILI – ideal for $a \in [0, 1]$. Using theorem 3.9, $B_a \neq \emptyset$ is an ILI – ideal $a \in [0, 1]$. It follows from corollary 3.11 that $B$ is a VILI – ideal of lattice implication algebra $L$.

Theorem 3.13: Let $I$ be an ILI – ideal of a lattice implication algebra $L$. The vague set $A$ defined by 

\[ V_A(x) = \{a \in [0, 1] \mid x \in I \} \]

is an ILI – ideal of $L$. Define $I = \{x \in L \mid V_A(x) \neq \emptyset \}$.

Proof: Let $A$ be a vague set of $L$ such that $A \neq \emptyset$.

Assume that $V_A(x) \leq \forall x \in L$, implies that $A_a \subseteq B_a$ for every $a \in [0, 1]$. If $A$ is a VILI- ideal of $L$, then by corollary 3.11, $A_a \neq \emptyset$ is an ILI – ideal for $a \in [0, 1]$. Using theorem 3.9, $B_a \neq \emptyset$ is an ILI – ideal $a \in [0, 1]$. It follows from corollary 3.11 that $B$ is a VILI – ideal of lattice implication algebra $L$.

Theorem 3.14: Let $A$ be a VILI – ideal of a lattice implication algebra $L$. Then $A$ is a vague set of $L$.

Proof: Let $A$ be a vague set of $L$, defined by $V_A(x) \leq \forall x \in L$. If $x \in I$, then $V_A(x) = \{a \in [0, 1] \mid x \in I \}$, $\forall x \in L$. Let $x, y \in L$.

Then $V_A((x \to y)') = \{a \geq \min(V_A(((x \to y') \to y') \to z') \}, V_A(z)) \}.$

Assume that $(x \to y)' \in I$ then either $(((x \to y') \to y') \to z') \notin 1$ or $z \notin L$. It follows that $V_A((x \to y')) = \{a \in [0, 1] \mid \min(V_A(((x \to y') \to y') \to z') \}, V_A(z)) \}.$

So $A$ is a VILI – ideal of $L$.

Theorem 3.15: Let $A$ be a VILI – ideal of a lattice implication algebra $L$.

Then $I = \{x \in L \mid V_A(x) = V_A(0)\}$ is an ILI – ideal of $L$.

Proof: Let $I = \{x \in L \mid V_A(x) = V_A(0)\}$, obviously $0 \in I$.

Let $x, y, z \in L$ such that $((x \to y') \to y') \to z') \in I$.

Then $V_A(((x \to y') \to y') \to z')) = V_A(z) = V_A(0)$ and so $\forall z \in L$, $V_A((x \to y') \to y') \geq \min(V_A(((x \to y') \to y') \to z'))$, $V_A(z) = \emptyset$.

Since $V_A(0) \geq V_A((x \to y'))$ for all $x, y \in I$, it follows that $V_A((x \to y')) = V_A(0)$, and there by $(x \to y') \in I$.

Therefore $I$ is an ILI – ideal of $L$.

Example 3.15: The vague set $A = \{(0, [0.7, 0.2]), (a, [0.7, 0.2]), (b, [0.5, 0.3]), (c, [0.5, 0.3]), (d, [0.7, 0.2]), (l, [0.5, 0.3])\}$ of $L$ (in example 3.2) is a VILI – ideal of $L$. Define $I = \{x \in L \mid V_A(x) = V_A(0)\}$, then $I = \{0, a, d\}$. Clearly $I$ is an ILI – ideal of $L$.

Definition 3.16: Let $F$ be a vague set of a lattice implication algebra $L$. $F$ is said to be an Implicative v- filter of $L$ if it satisfies the following conditions:

1. $\forall x \in L$, $V_F(I) \geq V_F(x)$,
2. $\forall x, y, z \in L$, $F_F(x \to z) \geq \min\{V_F(x \to y), V_F(x \to (y \to z))\}$

Example 3.17: Clearly the vague set $D = \{(a, [0.5, 0.3]), (b, [0.7, 0.2]), (c, [0.7, 0.2]), (d, [0.5, 0.3]), (l, [0.7, 0.2])\}$ of $L$ (in example 3.2) is an implicative v- filter of $L$.

Theorem 3.18: Let $F$ be a vague set of a lattice implication algebra $L$. Then $F$ is an implicative v- filter of $L$ if and only if $F_s$ is an implicative filter of $L$ when $F_s(\alpha, \beta) = \emptyset$, $\alpha, \beta \in [0, 1]$.

Proof: Assume that $F$ is an implicative v- filter of $L$ and $\alpha, \beta \in [0, 1]$ such that $F_s(\alpha, \beta) \neq \emptyset$.

Then there exist $x \in L$ such that $V_F(0) \geq [\alpha, \beta]$. That is $I = F_s(\alpha, \beta)$.

Let $x, y, z \in L$, $\forall x \to y \in F_s(\alpha, \beta)$, and $x \to (y \to z) \in F_s(\alpha, \beta)$ then $F_s(I) \geq [\alpha, \beta]$, $V_F(I) \geq [\alpha, \beta]$.

It follows that $V_F(x \to z) \geq \min\{V_F(x \to (y \to z))\}, V_F(x \to y) \geq [\alpha, \beta]$.

That is $(x \to z) \in F_s(\alpha, \beta)$. So, $F_s(\alpha, \beta)$ is an implicative filter of $L$.

Conversely, Suppose that $F_s(\alpha, \beta) \neq \emptyset$ is an implicative filter of $L$.

For any $x \in L$, $x \in F_s(\alpha, \beta)$, and hence $F(x)$ is an implicative filter of $L$. By $I \in F_s(\alpha, \beta)$, it follows that $V_F(I) \geq V_F(x)$.

Let $x, y, z \in L$, let $[\alpha, \beta] = \min\{V_F(x \to (y \to z))\}$.

It follows that $F_s(\alpha, \beta) \neq \emptyset$ and hence $F_s(\alpha, \beta)$ is an implicative filter of $L$.

Since $x \to (y \to z) \in F_s(\alpha, \beta)$, $x \to y \in F_s(\alpha, \beta)$ This implies that $(x \to z) \in F_s(\alpha, \beta)$.

That is $V_F(x \to z) \geq [\alpha, \beta] = \min\{V_F(x \to (y \to z))\}$.

So, $F_s$ is an implicative v- filter of $L$.

Example 3.19: Let $F$ be a vague set of a lattice implication algebra $L$. Then $F$ is an implicative v- filter of $L$ if and only if $F_s$ is an implicative filter of $L$, when $F_s(\alpha) \neq \emptyset$, $\alpha \in [0, 1]$. 

Corollary 3.19: Let $F$ be a vague set of a lattice implication algebra $L$. Then $F$ is an implicative v- filter of $L$ if and only if $F_s$ is an implicative filter of $L$, when $F_s(\alpha) \neq \emptyset$, $\alpha \in [0, 1]$. 

End of example.
**Theorem 3.20:** Let $A$ be a vague set of a lattice implication algebra $L$. Then $A$ is an implicative $v$-filter of $L$ if and only if $A'$ is a VILI–ideal of $L$.

**Proof:** Let $A$ be an implicative $v$-filter of $L$. By corollary 3.19, $A_{\alpha}$ is an implicative filter of $L$.

By the theorem 3.7 in [7], $(A_{\alpha})'$ is an IIL-ideal of $L$.

It is obvious that if $A$ is a vague set of $L$ then $(A')_{\alpha} = (A_{\alpha})'$, $\forall \alpha \in [0, 1]$.

Then $(A')_{\alpha}$ is an IIL–ideal of $L$.

By the corollary 3.10, we have $A'$ is a VILI–ideal of $L$.

Hence the theorem.

---
