Abstract

We study standard and nonlocal nonlinear Schrödinger (NLS) equations obtained from the coupled NLS system of equations (Ablowitz-Kaup-Newell-Segur (AKNS) equations) by using standard and nonlocal reductions respectively. By using the Hirota bilinear method we first find soliton solutions of the coupled NLS system of equations then using the reduction formulas we find the soliton solutions of the standard and nonlocal NLS equations. We give examples for particular values of the parameters and plot the function $|q(t,x)|^2$ for the standard and nonlocal NLS equations.

Keywords. Ablowitz-Musslimani reduction, Nonlocal NLS equations, Hirota bilinear form, Soliton solutions

1 Introduction

When the Lax pairs are $sl(2,R)$ valued matrices (Ablowitz-Kaup-Newell-Segur (AKNS) equations) and polynomials of the spectral parameter of degree two then the resulting equations are the following coupled nonlinear Schrödinger equations [1],

\[ a q_t = \frac{1}{2} q_{xx} - q^2 r, \]  
(1.1)

\[ a r_t = -\frac{1}{2} r_{xx} + r^2 q, \]  
(1.2)

where $q(t,x)$ and $r(t,x)$ are complex dynamical variables, $a$ is a complex number in general. We call the above system of coupled equations as nonlinear Schrödinger system (NLS system). The standard (local) reduction of this system is obtained by letting

\[ r(t,x) = k\bar{q}(t,x), \]  
(1.3)

*gurses@fen.bilkent.edu.tr
†Email:aslipekcan@hacettepe.edu.tr
where \( k \) is a real constant and \( \bar{q} \) is the complex conjugate of the function \( q \). When this condition on the dynamical variables \( q \) and \( r \) is used in the system of equations (1.1) and (1.2), they reduce to the following nonlinear Schrödinger equation (NLS)

\[
a q_t = \frac{1}{2} q_{xx} - kq^2 \bar{q},
\]

provided that \( \bar{a} = -a \). Recently, Ablowitz and Musslimani [2]-[4] found another integrable reduction. It is a nonlocal reduction of the NLS system (1.1) and (1.2) which is given by

\[
r(t, x) = k\bar{q}(\varepsilon_1 t, \varepsilon_2 x),
\]

where \( (\varepsilon_1)^2 = (\varepsilon_2)^2 = 1 \). Under this condition the NLS system (1.1) and (1.2) reduce to

\[
a q_t(t, x) = \frac{1}{2} q_{xx}(t, x) - kq^2(t, x) \bar{q}(\varepsilon_1 t, \varepsilon_2 x),
\]

provided that \( \bar{a} = -\varepsilon_1 a \). There is only one standard reduction where \( (\varepsilon_1, \varepsilon_2) = (1, 1) \) but there are three different nonlocal reductions where \( (\varepsilon_1, \varepsilon_2) = \{(-1,1), (1,-1), (-1,-1)\} \). Hence for these values of \( \varepsilon_1 \) and \( \varepsilon_2 \) and for different signs of \( k \) (\( \text{sign}(k) = \pm 1 \)), we have six different nonlocal integrable NLS equations. They are respectively the time reflection symmetric (T-symmetric), the space reflection symmetric (S-symmetric), and the space-time reflection symmetric (ST-symmetric) nonlocal nonlinear Schrödinger equations which are given by

1. T-symmetric nonlinear Schrödinger equation:

\[
a q_t(t, x) = \frac{1}{2} q_{xx}(t, x) - kq^2(t, x) \bar{q}(-t, x), \quad \bar{a} = a.
\]

2. S-symmetric nonlinear Schrödinger equation:

\[
a q_t(t, x) = \frac{1}{2} q_{xx}(t, x) - kq^2(t, x) \bar{q}(t, -x), \quad \bar{a} = -a.
\]

3. ST-symmetric nonlinear Schrödinger equation:

\[
a q_t(t, x) = \frac{1}{2} q_{xx}(t, x) - kq^2(t, x) \bar{q}(-t, -x), \quad \bar{a} = a.
\]

Nonlocal NLS equations have the focusing and defocusing cases when the \( \text{sign}(k) = -1 \) and \( \text{sign}(k) = 1 \) respectively. All these equations are integrable. They possess Lax pairs and recursion operators. In addition to the above equations (1.7)-(1.9) we have also the equations for \( q(-t, x) \), \( q(t, -x) \), and \( q(-t, -x) \) respectively. Since they are obtained from (1.7)-(1.9) by \( t \to -t; x \to -x \); and \( (t \to -t, x \to -x) \) reflections respectively, we do not display them here.
Ablowitz and Musslimani have observed [2] that one-soliton solutions of the nonlocal NLS equations blow up in a finite time. Existence of this singular behavior of one-soliton solutions of nonlocal NLS equations was also observed in Ref. [10]. Ablowitz and Musslimani have found many other nonlocal integrable equations such as nonlocal modified Korteweg-de Vries equation, nonlocal Davey-Stewartson equation, nonlocal sine-Gordon equation, and nonlocal (2 + 1)-dimensional three-wave interaction equations [21]-[24]. After the work of Ablowitz and Musslimani there is an increasing interest in obtaining the nonlocal reductions of systems of integrable equations and their properties [5]-[19].

The main purpose of this work is to search for possible integrable reductions of the NLS system (1.1) and (1.2) and investigate the applicability of the Hirota direct method to find the (soliton) solutions of the reduced nonlinear Schrödinger equations.

By using the Hirota method we first find one- and two-soliton solutions of the NLS system of equations (1.1) and (1.2). We then investigate whether the system of equations (1.1) and (1.2) satisfy the Hirota integrability, i.e. existence of three-soliton solution [20]-[22]. We showed that the system possesses three-soliton solution. Then by using the reductions (1.3) and (1.5) we obtain one-, two-, and also three-soliton solutions of the standard and nonlocal NLS equations, namely the equations (1.4) and (1.7)-(1.9) respectively. In this paper we give the general soliton solutions but we study only S-symmetric nonlocal NLS equations. We observe that all types of nonlocal NLS equations have singular and non-singular solutions depending on the values of the parameters in the solutions. In addition to the solitary wave solutions there are regular and singular localized solutions. We give examples for certain values of the parameters and plot the function $|q(x, t)|^2$ for the S-symmetric case.

For the case S-symmetric nonlocal NLS equation (1.8) we are at variance with Stalin et al.’s results [19] (see Remark 2 and Remark 3 in Sections 4.1 and 4.2 respectively). They claim that they produce soliton solutions of the nonlocal NLS equation (S-symmetric) but it seems that they are solving the NLS system of equations (1.1) and (1.2) rather than solving nonlocal NLS equation (1.8), because they ignore the constraint equations satisfied by the parameters of the one-soliton solutions.

The lay out of the paper is as follows. In Section 2 we apply Hirota method to the NLS system (1.1) and (1.2) and find one-, two-, and three-soliton solutions. In Section 3 we obtain soliton solutions of the standard NLS equation by using the standard reduction. In Section 4 we investigate soliton solutions of S-symmetric nonlocal NLS equation and give some examples for one-soliton, two-soliton, and three-soliton solutions and plot the function $|q(x, t)|^2$ for each example.
2 Hirota Method for Coupled NLS System

To find soliton solutions we use the Hirota method for (1.1) and (1.2). For this purpose we let

\[
q = \frac{F}{f}, \quad r = \frac{G}{f}.
\]  

(2.1)

The equation (1.1) becomes

\[
2aF_t f^2 - 2aF f f - F_{xx} f^2 + 2F_x f f - 2F f_x f + 2GF^2 = 0,
\]  

(2.2)

which is equivalent to

\[
f(2aD_t - D_x^2)F \cdot f + F(D_x^2 f \cdot f + 2GF) = 0.
\]  

(2.3)

Similarly the equation (1.2) becomes

\[
2aG_t f^2 - 2aG f f + G_{xx} f^2 - 2G_x f f + 2G f_x f - 2G^2 f = 0,
\]  

(2.4)

which is equivalent to

\[
f(2aD_t + D_x^2)G \cdot f - G(D_x^2 f \cdot f + 2GF) = 0.
\]  

(2.5)

Hence the Hirota bilinear form of the coupled NLS system (1.1) and (1.2) is

\[
P_1(D)\{F \cdot f\} \equiv (2aD_t - D_x^2 + \alpha)\{F \cdot f\} = 0
\]  

(2.6)

\[
P_2(D)\{G \cdot f\} \equiv (2aD_t + D_x^2 - \alpha)\{G \cdot f\} = 0
\]  

(2.7)

\[
P_3(D)\{f \cdot f\} \equiv (D_x^2 - \alpha)\{f \cdot f\} = -2GF,
\]  

(2.8)

where \(\alpha\) is an arbitrary constant.

2.1 One-Soliton Solution of the NLS System

To find one-soliton solution we use the following expansions for the functions \(F\), \(G\), and \(f\),

\[
F = \varepsilon F_1, \quad G = \varepsilon G_1, \quad f = 1 + \varepsilon^2 f_2,
\]  

(2.9)

where

\[
F_1 = e^{\theta_1}, \quad G_1 = e^{\theta_2}, \quad \theta_i = k_i x + \omega_i t + \delta_i, \ i = 1, 2.
\]  

(2.10)

When we substitute (2.9) into the equations (2.6)-(2.8), we obtain the coefficients of \(\varepsilon\) as

\[
P_1(D)\{F_1 \cdot 1\} = 2aF_{1,t} - F_{1,xx} + \alpha F_1 = 0,
\]  

(2.11)

\[
P_2(D)\{G_1 \cdot 1\} = 2aG_{1,t} + G_{1,xx} - \alpha G_1 = 0,
\]  

(2.12)
yielding the dispersion relations
\[
\omega_1 = \frac{(k_1^2 - \alpha)}{2a}, \quad \omega_2 = \frac{(\alpha - k_2^2)}{2a}.
\] (2.13)

From the coefficient of \(\varepsilon^2\)
\[
f_{2,xx} - \alpha f_2 = -G_1 F_1,
\] (2.14)
we obtain the function \(f_2\) as
\[
f_2 = \frac{e^{(k_1+k_2)x+(\omega_1+\omega_2)t+\delta_1+\delta_2}}{\alpha - (k_1+k_2)^2}.
\] (2.15)

The coefficients of \(\varepsilon^3\) vanish due to the dispersion relations and (2.15). From the coefficient of \(\varepsilon^4\)
\[
(D_x^2 - \alpha)\{f_2 \cdot f_2\} = 2(f_2 f_{2,xx} - f_{2,x}^2) - \alpha f_2^2 = 0,
\] (2.16)
y by using the function \(f_2\) given in (2.15), we get that \(\alpha = 0\). Let us also take \(\varepsilon = 1\). Hence a pair of solutions of the NLS system (1.1) and (1.2) is given by \((q(t,x), r(t,x))\) where
\[
q(t,x) = e^{\theta_1} + Ae^{\theta_1+\theta_2}, \quad r(t,x) = \frac{e^{\theta_2}}{1 + Ae^{\theta_1+\theta_2}},
\] (2.17)
with \(\theta_i = k_i x + \omega_i t + \delta_i,\ i = 1, 2,\ \omega_1 = \frac{k_1^2}{2a},\ \omega_2 = -\frac{k_2^2}{2a}\) and \(A = -\frac{1}{(k_1+k_2)^2}\). Here \(k_1, k_2, \delta_1,\) and \(\delta_2\) are arbitrary complex numbers.

### 2.2 Two-Soliton Solution of the NLS System

For two-soliton solution, we take
\[
f = 1 + \varepsilon^2 f_2 + \varepsilon^4 f_4, \quad G = \varepsilon G_1 + \varepsilon^3 G_3, \quad F = \varepsilon F_1 + \varepsilon^3 F_3,
\] (2.18)
where
\[
F_1 = e^{\theta_1} + e^{\theta_2}, \quad G_1 = e^{\eta_1} + e^{\eta_2},
\] (2.19)
with \(\theta_i = k_i x + \omega_i t + \delta_i, \eta_i = \ell_i x + m_i t + \alpha_i\) for \(i = 1, 2\). When we insert the above expansions into (2.6)-(2.8), we obtain the coefficients of \(\varepsilon\) as
\[
P_1(D)\{F_1 \cdot 1\} = 2aF_{1,t} - F_{1,xx} = 0,
\] (2.20)
\[
P_2(D)\{G_1 \cdot 1\} = 2aG_{1,t} + G_{1,xx} = 0.
\] (2.21)

Here we get the dispersion relations
\[
\omega_i = \frac{k_i^2}{2a}, \quad m_i = -\frac{\ell_i^2}{2a}, \quad i = 1, 2.
\] (2.22)
The coefficient of $\varepsilon^2$ gives

$$f_{2,xx} = -G_1 F_1$$

(2.23)

yielding the function $f_2$

$$f_2 = e^{\theta_1+\eta_1+\alpha_{11}} + e^{\theta_1+\eta_2+\alpha_{12}} + e^{\theta_2+\eta_1+\alpha_{21}} + e^{\theta_2+\eta_2+\alpha_{22}} = \sum_{1 \leq i, j \leq 2} e^{\theta_i+\eta_j+\alpha_{ij}},$$

(2.24)

where

$$e^{\alpha_{ij}} = -\frac{1}{(k_i + l_j)^2}, \quad 1 \leq i, j \leq 2.$$  

(2.25)

From the coefficients of $\varepsilon^3$ we get

$$2a(F_{1,t} f_2 - F_1 f_{2,t}) - F_{1,xx} f_2 + 2F_{1,x} f_{2,x} - F_{1,f_{2,xx}} + 2aF_{3,t} - F_{3,xx} = 0,$$

(2.26)

$$2a(G_{1,t} f_2 - G_1 f_{2,t}) + G_{1,xx} f_2 - 2G_{1,x} f_{2,x} + G_{1,f_{2,xx}} + 2aG_{3,t} + G_{3,xx} = 0.$$  

(2.27)

These equations give the functions $F_3$ and $G_3$ as

$$F_3 = A_1 e^{\theta_1+\theta_2+m} + A_2 e^{\theta_1+\theta_2+n}, \quad G_3 = B_1 e^{\theta_1+\eta_1+\eta_2} + B_2 e^{\theta_2+m+n},$$

(2.28)

where

$$A_i = -\frac{(k_1 - k_2)^2}{(k_1 + l_i)^2(k_2 + l_i)^2}, \quad B_i = -\frac{(l_1 - l_2)^2}{(l_1 + k_i)^2(l_2 + k_i)^2}, \quad i = 1, 2.$$  

(2.29)

The coefficient of $\varepsilon^4$ gives

$$f_{4,xx} + (f_2 f_{2,xx} - f_2^2) + G_1 F_3 + G_3 F_1 = 0,$$

(2.30)

yielding the function $f_4$ as

$$f_4 = M e^{\theta_1+\theta_2+m+n},$$

(2.31)

where

$$M = \frac{(k_1 - k_2)^2(l_1 - l_2)^2}{(k_1 + l_1)^2(k_2 + l_2)^2(k_1 + l_1)^2(k_2 + l_2)^2}.$$  

(2.32)

The coefficients of $\varepsilon^5$;

$$2a(F_{3,t} f_2 - F_3 f_{2,t}) - F_{3,xx} f_2 + 2F_{3,x} f_{2,x} - F_{3,f_{2,xx}} + 2a(F_{1,t} f_4 - F_1 f_{4,t})$$

$$- F_{1,xx} f_4 + 2F_{1,x} f_{4,x} - F_{1,f_{4,xx}} = 0,$$

$$2a(G_{3,t} f_2 - G_3 f_{2,t}) + G_{3,xx} f_2 - 2G_{3,x} f_{2,x} + G_{3,f_{2,xx}} + 2a(G_{1,t} f_4 - G_1 f_{4,t})$$

$$+ G_{1,xx} f_4 - 2G_{1,x} f_{4,x} + G_{1,f_{4,xx}} = 0,$$

the coefficient of $\varepsilon^6$;

$$f_{2,xx} f_4 - 2f_2 f_{4,xx} + f_2 f_{4,xx} + G_3 F_3 = 0,$$

the coefficients of $\varepsilon^7$;

$$2a(F_{3,t} f_4 - F_3 f_{4,t}) - F_{3,xx} f_4 + 2F_{3,x} f_{4,x} - F_{3,f_{4,xx}} = 0,$$

$$2a(G_{3,t} f_4 - G_3 f_{4,t}) + G_{3,xx} f_4 - 2G_{3,x} f_{4,x} + G_{3,f_{4,xx}} = 0.$$
and the coefficient of \( \varepsilon^8; \)
\[
f_4 f_{4,xx} - f_{4,x}^2 = 0,
\]
vanish directly due to the functions \( F_1, G_1, \) and \( F_3, G_3, f_2, f_4 \) that are previously found. If we take \( \varepsilon = 1 \) then two-soliton solution of the NLS system (1.1) and (1.2) is given with the pair \((q(t, x), r(t, x))\) where
\[
q(t, x) = \frac{e^{\theta_1} + e^{\theta_2} + A_1 e^{\theta_1 + \theta_2 + \eta_1} + A_2 e^{\theta_1 + \theta_2 + \eta_2}}{1 + e^{\theta_1 + \alpha_1 + \lambda_1} + e^{\theta_1 + \eta_2 + \alpha_1} + e^{\theta_2 + \eta_2 + \alpha_2} + e^{\theta_2 + \eta_2 + \alpha_2} + M e^{\theta_1 + \theta_2 + \eta_1 + \eta_2}} \tag{2.33}
\]
\[
r(t, x) = \frac{e^{\eta_1} + e^{\eta_2} + B_1 e^{\theta_1 + \eta_1 + \eta_2} + B_2 e^{\theta_2 + \eta_1 + \eta_2}}{1 + e^{\theta_1 + \alpha_1 + \lambda_1} + e^{\theta_1 + \eta_2 + \alpha_1} + e^{\theta_2 + \eta_2 + \alpha_2} + e^{\theta_2 + \eta_2 + \alpha_2} + M e^{\theta_1 + \theta_2 + \eta_1 + \eta_2}} \tag{2.34}
\]
with \( \theta_i = k_i x + \frac{k_i^2}{2a} t + \delta_i, \eta_i = \ell_i x - \frac{\ell_i^2}{2a} t + \alpha_i \) for \( i = 1, 2 \). Here \( k_i, \ell_i, \delta_i, \) and \( \alpha_i, i = 1, 2 \) are arbitrary complex numbers.

### 2.3 Three-Soliton Solution of the NLS System

Hirota integrability is defined as the existence of three-soliton solutions. For this purpose we find three-soliton solutions of the NLS system (1.1) and (1.2) and all of its reductions.

For three-soliton solution, we take
\[
f = 1 + \varepsilon^2 f_2 + \varepsilon^4 f_4 + \varepsilon^6 f_6, \quad G = \varepsilon G_1 + \varepsilon^3 G_3 + \varepsilon^5 G_5, \quad F = \varepsilon F_1 + \varepsilon^3 F_3 + \varepsilon^5 F_5, \tag{2.35}
\]
and
\[
F_1 = e^{\theta_1} + e^{\theta_2} + e^{\theta_3}, \quad G_1 = e^{\eta_1} + e^{\eta_2} + e^{\eta_3}, \tag{2.36}
\]
where \( \theta_i = k_i x + \omega_i t + \delta_i, \eta_i = \ell_i x + m_i t + \alpha_i \) for \( i = 1, 2, 3 \). We insert the expansions to the Hirota bilinear form of NLS system (2.6)-(2.8) and obtain the coefficients of \( \varepsilon^n, 1 \leq n \leq 12 \) as
\[
\varepsilon : 2a F_{1,t} - F_{1,xx} = 0, \tag{2.37}
\]
\[
2a G_{1,t} + G_{1,xx} = 0, \tag{2.38}
\]
\[
\varepsilon^2 : f_{2,xx} + G_1 F_1 = 0, \tag{2.39}
\]
\[
\varepsilon^3 : 2a (F_{1,t} f_2 - F_{1,xx} f_2) - F_{1,xx} f_2 + 2 F_{1,x} f_{2,x} - F_1 f_{2,xx} + 2a F_{3,t} - F_{3,xx} = 0, \tag{2.40}
\]
\[
2a (G_{1,t} f_2 - G_{1,xx} f_2) + G_{1,xx} f_2 - 2 G_{1,x} f_{2,x} + G_1 f_{2,xx} + 2a G_{3,t} + G_{3,xx} = 0, \tag{2.41}
\]
\[
\varepsilon^4 : f_{4,xx} + f_2 f_{2,xx} - f_{2,x}^2 + G_1 F_3 + G_3 F_1 = 0, \tag{2.42}
\]
\[ \varepsilon^5 : 2a(F_{3,1}f_2 - F_3f_{2,1}) - F_{3,xx}f_2 + 2F_{3,xx}f_2 - F_{3,xx}f_2 + 2a(F_1,tf_4 - F_1f_4,1) \]
\[ - F_{1,xx}f_4 + 2F_{1,xx}f_4 - F_{1,xx}f_4 + 2aF_{5,t} - F_{5,xx} = 0, \quad (2.43) \]
\[ 2a(G_{3,1}f_2 - G_3f_{2,1}) + G_{3,xx}f_2 - 2G_{3,xx}f_2 + G_{3,xx}f_2 + 2a(G_{1,1}f_4 - G_1f_4,1) \]
\[ + G_{1,xx}f_4 - 2G_{1,xx}f_4 + G_{1,xx}f_4 + 2aG_{5,t} + G_{5,xx} = 0, \quad (2.44) \]
\[ \varepsilon^6 : f_{2,xx}f_4 - 2f_{2,xx}f_4 + f_{2,xx}f_6 + f_{2,xx}f_6 + f_{2,xx}f_6 + G_3F_1 + G_1F_5 + G_3F_3 = 0, \quad (2.45) \]
\[ \varepsilon^7 : 2a(F_{3,1}f_2 - F_3f_{2,1}) - F_{3,xx}f_4 + 2F_{3,xx}f_4 - F_{3,xx}f_4 + 2a(F_1,tf_6 - F_1f_6,1) \]
\[ - F_{1,xx}f_6 + 2F_{1,xx}f_6 - F_{1,xx}f_6 + 2a(F_5,tf_2 - F_5f_2,1) - F_{5,xx}f_2 \]
\[ + 2F_{5,xx}f_2 - F_{5,xx}f_2 = 0, \quad (2.46) \]
\[ 2a(G_{3,1}f_4 - G_3f_{4,1}) + G_{3,xx}f_4 - 2G_{3,xx}f_4 + G_{3,xx}f_4 + 2a(G_{1,1}f_6 - G_1f_6,1) \]
\[ + G_{1,xx}f_6 - 2G_{1,xx}f_6 + G_{1,xx}f_6 + 2a(G_{5,1}f_2 - G_5f_{2,1}) + G_{5,xx}f_2 \]
\[ - 2G_{5,xx}f_1 + G_{5}f_{2,xx} = 0, \quad (2.47) \]
\[ \varepsilon^8 : f_{2,xx}f_6 - 2f_{2,xx}f_6 + f_{2,xx}f_6 + f_{2,xx}f_6 + f_{2,xx}f_6 + f_{2,xx}f_6 + G_3F_5 + G_3F_3 = 0, \quad (2.48) \]
\[ \varepsilon^9 : 2a(F_{3,1}f_6 - F_3f_{6,1}) - F_{3,xx}f_6 + 2F_{3,xx}f_6 - F_{3,xx}f_6 + 2a(F_5,tf_4 - F_5f_4,1) \]
\[ - F_{5,xx}f_4 + 2F_{5,xx}f_4 - F_{5,xx}f_4 = 0, \quad (2.49) \]
\[ 2a(G_{3,1}f_6 - G_3f_{6,1}) + G_{3,xx}f_6 - 2G_{3,xx}f_6 + G_{3,xx}f_6 + 2a(G_{5,1}f_4 - G_5f_{4,1}) \]
\[ + G_{5,xx}f_4 - 2G_{5,xx}f_4 + G_{5,xx}f_4 = 0, \quad (2.50) \]
\[ \varepsilon^{10} : f_{4,xx}f_6 - 2f_{4,xx}f_6 + f_{4,xx}f_6 + f_{4,xx}f_6 + G_5F_5 = 0, \quad (2.51) \]
\[ \varepsilon^{11} : 2a(F_{5,1}f_6 - F_5f_{6,1}) - F_{5,xx}f_6 + 2F_{5,xx}f_6 - F_{5,xx}f_6 = 0, \quad (2.52) \]
\[ 2a(G_{5,1}f_6 - G_5f_{6,1}) + G_{5,xx}f_6 - 2G_{5,xx}f_6 + G_{5,xx}f_6 = 0, \quad (2.53) \]
\[ \varepsilon^{12} : f_{6,6,xx} - f_{6,6,xx} = 0. \quad (2.54) \]

From the equalities (2.37) and (2.38) we obtain the dispersion relations

\[ \omega_i = \frac{k_i^2}{2a}, \quad m_i = -\frac{\ell_i^2}{2a}, \quad i = 1, 2, 3. \quad (2.55) \]

Equation (2.39) gives the function \( f_2 \)

\[ f_2 = \sum_{1 \leq i, j \leq 3} e^{\theta_i + \theta_j + \alpha_{ij}}, \quad e^{\alpha_{ij}} = -\frac{1}{(k_i + \ell_j)^2}, \quad 1 \leq i, j \leq 3. \quad (2.56) \]

From the coefficients of \( \varepsilon^3 \), we obtain the functions \( F_3 \) and \( G_3 \)

\[ F_3 = \sum_{1 \leq i, j, s \leq 3} A_{ijs} e^{\theta_i + \theta_j + \theta_s}, \quad A_{ijs} = -\frac{(k_i - k_j)^2}{(k_i + \ell_s)(k_j + \ell_s)}, \quad 1 \leq i, j, s \leq 3, i < j, \quad (2.57) \]

\[ G_3 = \sum_{1 \leq i, j, s \leq 3} B_{ijs} e^{\theta_i + \theta_j + \theta_s}, \quad B_{ijs} = -\frac{(\ell_i - \ell_j)^2}{(\ell_i + k_s)(\ell_j + k_s)}, \quad 1 \leq i, j, s \leq 3, i < j. \quad (2.58) \]

The equation (2.42) yields the function \( f_4 \)

\[ f_4 = \sum_{1 \leq i, j \leq 3, 1 \leq p < r \leq 3} M_{ijpr} e^{\theta_i + \theta_j + \theta_p + \theta_r}, \quad (2.59) \]
where
\[
M_{ijpr} = \frac{(k_i - k_j)^2(l_p - l_r)^2}{(k_i + l_p)^2(k_i + l_r)^2(k_j + l_p)^2(k_j + l_r)^2},
\]
(2.60)
for \(1 \leq i < j \leq 3, 1 \leq p < r \leq 3\). From the coefficients of \(\varepsilon^3\) we obtain the functions \(F_5\) and \(G_5\),
\[
F_5 = V_{12}e^{\theta_1 + \theta_2 + \theta_3 + \eta_1 + \eta_2} + V_{13}e^{\theta_1 + \theta_2 + \theta_3 + \eta_1 + \eta_3} + V_{23}e^{\theta_1 + \theta_2 + \theta_3 + \eta_2 + \eta_3},
\]
(2.61)
\[
G_5 = W_{12}e^{\theta_1 + \theta_2 + \eta_1 + \eta_2 + \eta_3} + W_{13}e^{\theta_1 + \theta_2 + \eta_1 + \eta_2 + \eta_3} + W_{23}e^{\theta_2 + \theta_3 + \eta_1 + \eta_2 + \eta_3},
\]
(2.62)
where
\[
V_{ij} = \frac{S_{ij}}{(k_i + k_2 + k_3 + \ell_i + \ell_j)^2 - 2a(\omega_1 + \omega_2 + \omega_3 + m_i + m_j)},
\]
(2.63)
\[
W_{ij} = -\frac{Q_{ij}}{(k_i + k_2 + \ell_1 + \ell_2 + \ell_3)^2 - 2a(\omega_1 + \omega_2 + m_1 + m_2 + m_3)},
\]
(2.64)
for \(1 \leq i < j \leq 3\). Here \(S_{ij}\) and \(Q_{ij}\) are given in Appendix of Ref. [23]. The equation (2.45) gives the function \(f_6\)
\[
f_6 = He^{\theta_1 + \theta_2 + \theta_3 + \eta_1 + \eta_2 + \eta_3},
\]
(2.65)
where the coefficient \(H\) is also represented in Appendix of Ref. [23]. The rest of the equations (2.46)-(2.54) are satisfied directly. Let us also take \(\varepsilon = 1\). Hence three-soliton solution of the coupled NLS system (1.1) and (1.2) is given with the pair \((q(t, x), r(t, x))\) where
\[
q(t, x) = \frac{e^{\theta_1} + e^{\theta_2} + e^{\theta_3} + \sum_{1 \leq i, j, s \leq 3} A_{ijs}e^{\theta_i + \theta_j + \eta_s} + \sum_{1 \leq i, j, s \leq 3} V_{ij}e^{\theta_i + \theta_j + \eta_s + \eta_j} + \sum_{1 \leq p < r < s \leq 3} M_{ijpr}e^{\theta_i + \theta_j + \eta_r + \eta_s} + H e^{\theta_1 + \theta_2 + \theta_3 + \eta_1 + \eta_2 + \eta_3}}{1 + \sum_{1 \leq i, j, s \leq 3} e^{\theta_i + \eta_j + \alpha_{ij}} + \sum_{1 \leq i, j, s \leq 3} M_{ijpr}e^{\theta_i + \theta_j + \eta_r + \eta_s}},
\]
(2.66)
\[
r(t, x) = \frac{e^{\eta_1} + e^{\eta_2} + e^{\eta_3} + \sum_{1 \leq i, j, s \leq 3} B_{ijs}e^{\eta_i + \eta_j + \theta_s} + \sum_{1 \leq i, j, s \leq 3} W_{ij}e^{\theta_i + \eta_j + \eta_s} + \sum_{1 \leq p < r < s \leq 3} M_{ijpr}e^{\theta_i + \theta_j + \eta_r + \eta_s} + H e^{\theta_1 + \theta_2 + \theta_3 + \eta_1 + \eta_2 + \eta_3}}{1 + \sum_{1 \leq i, j, s \leq 3} e^{\eta_i + \eta_j + \alpha_{ij}} + \sum_{1 \leq i, j, s \leq 3} M_{ijpr}e^{\theta_i + \theta_j + \eta_r + \eta_s}},
\]
(2.67)

**Remark 1.** Notice that the authors of Ref. [19] used another form of Hirota perturbation expansion for one-soliton solution;
\[
q(t, x) = \frac{g(t, x)}{f(t, x)},
\]
(2.68)
where
\[
g(t, x) = \varepsilon g_1 + \varepsilon^3 g_3, \quad f(t, x) = 1 + \varepsilon^2 f_2 + \varepsilon^4 f_4,
\]
(2.69)
different than the form (2.59) that we use. The solution found in Ref. [19],
\[
q(t, x) = \frac{\alpha_1 e^{\xi_1} + e^{\xi_1 + 2\xi_1 + \delta_1}}{1 + e^{\xi_1 + \xi_1 + \delta_1} + e^{2(\xi_1 + \xi_1) + \delta_1}},
\]
(2.70)
the numerator and denominator are factorizable and it reduces to our solution (2.17)

\[ q(t,x) = \frac{\alpha_1 e^{\xi_1} (1 + \frac{1}{\alpha_1} e^{\xi_1 + \delta_1})}{(1 + e^{\xi_1 + \Delta}) (1 + \frac{1}{\alpha_1} e^{\xi_1 + \xi_1 + \delta_1})} = \frac{\alpha_1 e^{\xi_1}}{1 + e^{\xi_1 + \Delta}}. \]  

(2.71)

For two-soliton solution, the following form of Hirota perturbation expansion

\[ g(t,x) = \sum_{n=0}^{3} \varepsilon^{2n+1} g_{2n+1}, \quad f(t,x) = 1 + \sum_{n=1}^{4} \varepsilon^{2n} f_{2n}, \]

(2.72)

is used in Ref. [19]. Our two-soliton solutions (2.33) and (2.34) are much simpler and shorter than the one given in [19]. Similar to one-soliton solution, one expects that the two-soliton solution given in Ref. [19] is equivalent to the solutions (2.33) and (2.34).

3 Standard Reduction of the NLS System

Here we consider the standard reduction (1.3) and obtain soliton solutions of the reduced equation (1.4) with the condition

\[ \bar{a} = -a \]  

(3.1)
satisfied.

3.1 One-Soliton Solution for the Standard NLS Equation

We first obtain the conditions on the parameters of one-soliton solution of the NLS system to satisfy the equality (1.3) i.e.,

\[ \frac{e^{k_2 x - \frac{k_2^2}{2a} t + \delta_2}}{1 + A e^{(k_1 + k_2) x + \frac{(k_1^2 - k_2^2)}{2a} t + \delta_1 + \delta_2}} = k \frac{e^{\xi_1 x + \frac{k_2^2}{2a} t + \delta_1}}{1 + \bar{A} e^{(\bar{k}_1 + k_2) x + \frac{(\bar{k}_1^2 - k_2^2)}{2a} t + \delta_1 + \delta_2}}. \]  

(3.2)

Hence one of the set of the constraints that the parameters must satisfy is the following:

i) \( k_2 = \bar{k}_1 \),  
ii) \( -\frac{k_2^2}{2a} = \frac{\bar{k}_1^2}{2a} \),  
iii) \( e^{\delta_2} = k e^{\delta_1} \),  
iv) \( A = \bar{A} \),

v) \( k_1 + k_2 = (\bar{k}_1 + \bar{k}_2) \),  
vi) \( \frac{(k_1^2 - k_2^2)}{2a} = (\frac{\bar{k}_1^2 - \bar{k}_2^2}{2a}) \),  

vii) \( e^{\delta_1 + \delta_2} = e^{\delta_1 + \delta_2} \).  

(3.3)

Consider the condition ii). We have

\[ -\frac{k_2^2}{2a} = -\frac{\bar{k}_1}{-2a} = \frac{\bar{k}_1^2}{2a}, \]

(3.4)

by (3.1) and the condition i). Similarly, the conditions iv) \(-vi\) are also satisfied directly by (3.1) and i). Now consider the relation \( e^{\delta_2} = k e^{\delta_1}\) or \( e^{\delta_2} = k e^{\delta_1}\) given in iii) of (3.3). Note that since \( k \) is a real constant we have \( k = k \). Consequently, we have

\[ e^{\delta_1 + \delta_2} = k e^{\delta_1} e^{\delta_1} \quad \text{and} \quad e^{\delta_1 + \delta_2} = k e^{\delta_1} e^{\delta_1}, \]
yielding the equality $e^{\delta_1 + \delta_2} = e^{\bar{\delta}_1 + \bar{\delta}_2}$.

Therefore the parameters of one-soliton solution of the equation (1.4) must have the following properties:

1) $\bar{a} = -a$,  
2) $k_2 = k_1$,  
3) $e^{\delta_2} = ke^{\bar{\delta}_1}$.  

(3.5)

**Example 1.** Let us illustrate a particular example of one-soliton solution of (1.4). For $(k_1, k_2, e^{\delta_1}, e^{\delta_2}, k, a) = (1 + i, 1 - i, i, i, -1, \frac{i}{2})$, one-soliton solution becomes

$$q(t, x) = \frac{ie^{(1+i)x+2t}}{1 + \frac{1}{4}e^{2x+4t}}. \tag{3.6}$$

To sketch the graph of this solution in real plane we will consider $q(t, x)\bar{q}(t, x) = |q(t, x)|^2$,

$$|q(t, x)|^2 = \frac{16e^{2x+4t}}{(4 + e^{2x+4t})^2}. \tag{3.7}$$

The graph of (3.7) is given in Figure 1.

![Figure 1: One-soliton solution for (3.7).](image)

### 3.2 Two-Soliton Solution for the Standard NLS Equation

Similar to one-soliton solution case, we obtain the conditions on the parameters of two-soliton solution given by (2.33) and (2.34) of the NLS system to satisfy the equality (1.3);

1) $\bar{a} = -a$,  
2) $\ell_i = \bar{k}_i$, $i = 1, 2$,  
3) $e^{\alpha_i} = ke^{\bar{\delta}_i}$, $i = 1, 2$.  

(3.8)

**Example 2.** Consider the following parameters: $(k_1, \ell_1, k_2, \ell_2) = (1 + i, 1 - i, 2 + 2i, 2 - 2i)$ with $(e^{\alpha_j}, e^{\delta_j}, k, a) = (-1 + i, 1 + i, -1, i)$ for $j = 1, 2$. In this case two-soliton solution is

$$q(t, x) = \frac{Y_1}{Y_2}, \tag{3.9}$$

where

$$Y_1 = (1 + i)e^{(1+i)x+t} + (1 + i)e^{(2+2i)x+4t} + \left( -\frac{1}{50} + \frac{7}{50}i \right) e^{(4+2i)x+6t} + \left( -\frac{7}{200} + \frac{1}{200}i \right) e^{(5+3i)x+9t}. \tag{3.11}$$
and
\[ Y_2 = 1 + \frac{1}{2} e^{2x+2t} + \left( \frac{4}{25} + \frac{3}{25}i \right) e^{(3-i)x+5t} + \left( \frac{4}{25} - \frac{3}{25}i \right) e^{(3+i)x+5t} + \frac{1}{8} e^{4x+8t} + \frac{1}{400} e^{6x+10t}. \]

The graph of the function \(|q(t, x)|^2\) corresponding to the solution (3.9) is given in Figure 2.a.

**Example 3.** In this example we just give the graphs of two-soliton solutions defined by the function \(|q(t, x)|^2\) corresponding to \((k_1, \ell_1, k_2, \ell_2) = \left(-\frac{1}{2} - \frac{2}{5}i, -\frac{1}{2} + \frac{2}{5}i, -\frac{13}{25} + \frac{2}{5}i, -\frac{13}{25} - \frac{2}{5}i\right)\) and \((k_1, \ell_1, k_2, \ell_2) = \left(-\frac{1}{2} - \frac{2}{5}i, -\frac{1}{2} + \frac{2}{5}i, -\frac{13}{25} - \frac{2}{5}i, -\frac{13}{25} + \frac{2}{5}i\right)\) with \((e^{\alpha_j}, e^{\delta_j}, k, a) = (-1 + i, 1 + i, -1, i)\) for \(j = 1, 2\) in Figures 2.b and 2.c, respectively.

![Figure 2](image_url)

Figure 2: Different types of two-soliton solutions for the equation (1.4).

### 3.3 Three-Soliton Solution for the Standard NLS Equation

The conditions on the parameters of three-soliton solution of the standard NLS equation (1.4) can be easily found by the same analysis used in Section III.A as

1) \(\bar{a} = -a,\) 2) \(\ell_i = \bar{k}_i,\) \(i = 1, 2, 3,\) 3) \(e^{\alpha_i} = ke^{\delta_i},\) \(i = 1, 2, 3.\) \hspace{1cm} (3.10)

**Example 4.** To illustrate some examples of three-soliton solution for the standard NLS equation we give particular values, satisfying above constraints, to the parameters of the solution. The graphs of the functions \(|q(t, x)|^2\) corresponding to \((k_1, l_1, k_2, l_2, k_3, l_3) = \left(-\frac{1}{2} - \frac{2}{5}i, -\frac{1}{2} + \frac{2}{5}i, -\frac{13}{25} - \frac{2}{5}i, -\frac{13}{25} + \frac{2}{5}i, -\frac{27}{50} - \frac{2}{5}i, -\frac{27}{50} + \frac{2}{5}i\right),\) \((k_1, l_1, k_2, l_2, k_3, l_3) = \left(-\frac{1}{2} - \frac{2}{5}i, -\frac{1}{2} + \frac{2}{5}i, -\frac{13}{25} + \frac{2}{5}i, -\frac{13}{25} - \frac{2}{5}i, -\frac{27}{50} + \frac{2}{5}i, -\frac{27}{50} - \frac{2}{5}i\right),\) and \((k_1, l_1, k_2, l_2, k_3, l_3) = \left(-\frac{1}{2} - \frac{2}{5}i, -\frac{1}{2} + \frac{2}{5}i, -\frac{13}{25} + \frac{2}{5}i, -\frac{13}{25} - \frac{2}{5}i, -\frac{27}{50} - \frac{2}{5}i, -\frac{27}{50} + \frac{2}{5}i\right)\) with \((e^{\alpha_j}, e^{\delta_j}, k, a) = (-1 + i, 1 + i, -1, i)\) for \(j = 1, 2, 3\) are given in Figures 3.a, 3.b, and 3.c, respectively.

12
4 Nonlocal Reduction of the NLS System

In this section we use the reduction (1.5) introduced by Ablowitz and Musslimani [2]-[4] to obtain soliton solutions for three different nonlocal NLS equations (1.7)-(1.9) with the condition

$$\bar{a} = -\varepsilon_1 a$$

satisfied.

4.1 One-Soliton Solution for Nonlocal NLS Equation

Here we find the conditions on the parameters of one-soliton solution of the NLS system to satisfy the equality (1.5). We must have

$$e^{k_2 x - \frac{k_2^2}{2a} t + \delta_2} \frac{e^{k_1 \varepsilon_2 x + \frac{k_1^2}{2a} \varepsilon_1 t + \delta_1}}{1 + A e^{(k_1 + k_2) x + \frac{(k_1^2 - k_2^2)}{2a} t + \delta_1 + \delta_2}} = k \frac{e^{\tilde{k}_1 \varepsilon_2 x + \frac{\tilde{k}_1^2}{2a} \varepsilon_1 t + \delta_1}}{1 + \tilde{A} e^{(\tilde{k}_1 + \tilde{k}_2) x + \frac{(\tilde{k}_1^2 - \tilde{k}_2^2)}{2a} \varepsilon_1 t + \delta_1 + \delta_2}}$$

yielding the conditions

i) $k_2 = \varepsilon_2 \tilde{k}_1$,  
ii) $-\frac{k_2^2}{2a} = \frac{\tilde{k}_1^2}{2a} \varepsilon_1$,  
iii) $e^{\delta_2} = k e^{\delta_1}$,  
iv) $\bar{A} = A$,

v) $(k_1 + k_2) = (\tilde{k}_1 + \tilde{k}_2) \varepsilon_2$,  
vi) $\frac{(k_1^2 - k_2^2)}{2a} = \frac{(\tilde{k}_1^2 - \tilde{k}_2^2)}{2a} \varepsilon_1$,  
vii) $e^{\delta_1 + \delta_2} = e^{\delta_1 + \delta_2}$.  

(4.3)

From i) we have $k_2^2 = \tilde{k}_1^2$. If we use this relation in the left hand side of ii) with (4.1) we get that the condition ii) is satisfied directly since

$$-\frac{k_2^2}{2a} = -\frac{\tilde{k}_1^2}{2a} \varepsilon_1.$$

For iv) we only need the equality $(k_1 + k_2)^2 = (\tilde{k}_1 + \tilde{k}_2)^2$ holds. Indeed it is satisfied directly since

$$(k_1 + k_2)^2 = (\tilde{k}_2 \varepsilon_2 + \tilde{k}_1 \varepsilon_2)^2 = (\tilde{k}_1 + \tilde{k}_2)^2$$
obtained the following conditions:

The condition \( v \) is already true since

\[
(k_1 + k_2) = (\bar{k}_2 \varepsilon_2 + \bar{k}_1 \varepsilon_2) = (\bar{k}_1 + \bar{k}_2) \varepsilon_2
\]

by the condition \( k_2 = \bar{k}_1 \varepsilon_2 \) or equivalently \( k_1 = \bar{k}_2 \varepsilon_2 \). Similarly, \( vi \) is satisfied directly since

\[
\frac{(k_1^2 - k_2^2)}{2a} = \frac{(\bar{k}_2^2 - \bar{k}_1^2)}{-2\varepsilon_1 \bar{a}} = \frac{(\bar{k}_1^2 - \bar{k}_2^2)}{2\bar{a}} \varepsilon_1,
\]

by \( k_2^2 = \bar{k}_1^2, \bar{k}_2^2 = \bar{k}_1^2 \), and \( \bar{a} = -\varepsilon_1 a \).

In Section 3.1 we proved that the condition \( vii \) is satisfied automatically by the condition \( iii \). Hence for one-soliton solutions of the nonlocal reductions of the NLS system we have obtained the following conditions:

1) \( \bar{a} = -\varepsilon_1 a \), 2) \( k_2 = \bar{k}_1 \varepsilon_2 \), 3) \( e^{\delta_2} = ke^{\delta_1} \).

Therefore one-soliton solution of the nonlocal NLS equations is given by

\[
q(t, x) = \frac{e^{k_1 x + \frac{k_1^2}{2} t + \delta_1}}{1 - 2a (\bar{k}_1 + k_2) \varepsilon_2 + (k_1 + k_2)^2} \quad (4.5)
\]

with the conditions \( (4.4) \) satisfied.

Now and then we will consider only the case \( (\varepsilon_1, \varepsilon_2) = (1, -1) \) (S-symmetric case). Here the nonlocal reduction is \( r(t, x) = k\bar{q}(t, -x) \) giving \( \bar{a} = a, k_2 = -\bar{k}_1, \) and

\[
ag(t, x) = \frac{1}{2} q_x(t, x) - kq(t, x)\bar{q}(t, -x)q(t, x),
\]

with \( e^{\delta_2} = ke^{\delta_1} \). From \( \bar{a} = -a \), we have \( a = iy, y \in \mathbb{R} \). If \( k_1 = \alpha + i\beta, \alpha, \beta \in \mathbb{R} \) then the solution of \( (4.6) \) becomes

\[
q(t, x) = \frac{e^{(\alpha+i\beta)x} + \frac{(\alpha+i\beta)^2}{2\beta} t + \delta_1}{1 + k e^{\frac{2\alpha\beta}{\beta} t + \delta_1 + \delta_1}}, \quad (4.7)
\]

where \( \beta \neq 0 \). Here the solution is complex valued. Hence let us consider the real valued function \( |q(t, x)|^2 \). We have

\[
|q(t, x)|^2 = \frac{16\beta^4 e^{2\alpha x + \frac{2\alpha\beta}{\beta} t + \delta_1 + \delta_1}}{(ke^{\frac{2\alpha\beta}{\beta} t + \delta_1 + \delta_1} + 4\beta^2 \cos(2\beta x))^2 + 16\beta^4 \sin^2(2\beta x)}, \quad (4.8)
\]

This function is singular at \( x = \frac{n\pi}{2\beta}, ke^{\frac{2\alpha\beta}{\beta} t + \delta_1 + \delta_1} + 4\beta^2 (-1)^n = 0 \) both for focusing and defocusing cases. If \( \alpha = 0 \), the function \( (4.8) \) becomes

\[
|q(t, x)|^2 = \frac{2\beta^2}{k[B + \cos(2\beta x)]}, \quad (4.9)
\]
for \( B = \frac{\rho^2 + 16\beta^4}{8\rho\beta^2} \) where \( \rho = ke^{\delta_1 + \bar{\delta}_1} \). Clearly, the solution (4.9) is non-singular if \( B > 1 \) or \( B < -1 \).

**Example 5.** For the set of parameters \((k_1, k_2, e^{\delta_1}, e^{\delta_2}, k, a) = (i, i, -i, 1, \frac{1}{2})\), we get the solution

\[
q(t, x) = \frac{4ie^{ix+it}}{4 + e^{2ix}},
\]

and therefore

\[
|q(t, x)|^2 = \frac{16}{17 + 8\cos(2x)}.
\]

This solution represents a periodic solution. Its graph is given in Figure 4.

**Example 6.** In addition to the solution given with the conditions (4.4) we have another possible solution of \( r(t, x) = k\bar{q}(t, -x) \) which is given by

\[
q(t, x) = e^{\frac{k_2^2}{2}t + \delta_1} e^{k_1x} \frac{e^{k_1x}}{1 + e^{2k_1x}},
\]

where \( e^{\delta_2} = ke^{\delta_1}, Ak e^{\bar{\delta}_1 + \delta_1} = 1, k_2 = k_1, \) and \( k_1 \) is real. Here \( \bar{a} = -a \). Hence

\[
|q(t, x)|^2 = -\frac{k_2^2}{k} \text{sech}^2(k_1x),
\]

which represents a stationary soliton solution for the focusing case \((k < 0)\). For example, if we consider \( k_1 = \frac{1}{2} \) and \( e^{\delta_1} = 1 + i \) giving \( k = -\frac{1}{2} < 0, \) the above function becomes

\[
|q(t, x)|^2 = \frac{1}{2} \text{sech}^2\left(\frac{1}{2}x\right),
\]

which represents a soliton. Its graph is given in Figure 5.

![Figure 4: Periodic solution for (4.11).](image1)

![Figure 5: One-soliton solution for (4.14).](image2)

**Remark 2.** In Ref. [19], the authors studied a particular form of \( S \)-symmetric nonlocal NLS equation (1.8) where \( a = \frac{i}{2} \) and \( k = -1, \)

\[
iq_t(t, x) = q_{xx}(t, x) + 2q(t, x)q^*(t, -x)q(t, x).
\]

(4.15)
Here $\ast$ is used for complex conjugation. In [19], one-soliton solution of the nonlocal equation (4.15) is given as

$$q(t, x) = \frac{\alpha_1 e^{i\ell_1 x + i\xi_1^0 t} + \xi_1^0}{1 - \alpha_1 \beta_1 e^{i\ell_1 x + i(\ell_1^2 - \xi_1^0) t} + \xi_1^0 + \xi_1^0}.$$  (4.16)

Here we expressed their parameters $k_1, \bar{k}_1$ of [19] as $\ell_1, \bar{\ell}_1$ respectively, not to mix with our $k_1, k_2$. Under the conditions $a = \frac{k}{2}, k = -1, e^{\delta_1} = \alpha_1 e^{\xi_1^0},$ and $e^{\delta_1} = \beta_1 e^{\xi_1^0},$ the solution (4.16) becomes equivalent to our case. They also give the function $q^\ast(t, -x)$ as

$$q^\ast(t, -x) = \frac{\beta_1 e^{i\ell_1 x - i\xi_1^0 t} + \xi_1^0}{1 - \alpha_1 \beta_1 e^{i(\ell_1 + \xi_1) x + i(\ell_1^2 - \xi_1^0) t} + \xi_1^0 + \xi_1^0}.$$  (4.17)

and define the constants $\ell_1, \bar{\ell}_1, \alpha_1, \beta_1, \xi_1^0,$ and $\xi_1^0$ as arbitrary complex constants. But obviously from the relation between the functions $q(t, x)$ and $q^\ast(t, -x)$ the following constraints must be satisfied

$$\alpha_1^* = \beta_1, \quad \ell_1 = (\bar{\ell}_1)^*, \quad \xi_1^0 = (\bar{\xi}_1^0)^*.$$  (4.18)

These conditions are equivalent to our conditions coming from the reduction (1.5) for the S-symmetric case which were missed in [19]. Because of this fact the example given in [19] with the parameters chosen as $\ell_1 = 0.4 + i, \bar{\ell}_1 = -0.4 + i, \alpha_1 = 1 + i,$ and $\beta_1 = 1 - i$ is not valid. They claim that they find the non-singular most general one-bright soliton solution of the equation (4.15) which is not correct, because the above constraints (4.18) are not satisfied by the parameters they have chosen. Indeed such specific parameters they use are not allowed, since $\ell_1 = 0.4 + i \neq -0.4 - i = (\bar{\ell}_1)^*$. Note that if we use the parameters not satisfying (4.18) that they give and e.g. $e^{\bar{\xi}_1^0} = 1 + i$ and $e^{\xi_1^0} = -1 + i$ in the solution then the solution (4.16) and $q^\ast(t, -x)$ becomes

$$q(t, x) = \frac{2 ie^{-i\xi_1} x + i(\xi_1^0 - x^2 - \frac{21}{25} i) t}{1 - e^{-2x + \frac{5}{2} t}}, \quad q^\ast(t, -x) = \frac{-2ie^{i\xi_1^0} x + i(\xi_1^0 + x^2 + \frac{21}{25} i) t}{1 - e^{2x + \frac{5}{2} t}}.$$  (4.19)

One can easily check that the nonlocal NLS equation (4.15) is not satisfied by the above functions.

If we take the parameters satisfying (4.18), for instance $\ell_1 = 0.4 + i, \bar{\ell}_1 = 0.4 - i, \alpha_1 = 1 + i,$ and $\beta_1 = 1 - i$ with $\xi_1^0 = \bar{\xi}_1^0 = 0$, then the solution (4.16) becomes

$$q(t, x) = \frac{(1 + i) e^{i(1 + \xi_1^0) t} x + i(\xi_1^0 + \frac{21}{25} i) t}{1 - \frac{25}{8} e^{\frac{5}{2} i x + \frac{5}{2} t}},$$  (4.20)

and so

$$|q(t, x)|^2 = \frac{2 e^{2x + 8t}}{(\frac{25}{8} e^{5t} - \cos(\frac{x}{5}))^2 + \sin^2(\frac{4}{5} x)},$$  (4.21)

which is not a solitary wave. Indeed it has singularity at $(x, t) = \left(\frac{5}{2} n \pi, \frac{5}{8} \ln(\frac{8}{25})\right)$, $n$ is an integer.
We understand that the authors of Ref. [19] are solving the NLS system of equations (1.1) and (1.2) rather than solving nonlocal NLS equation (1.8) as they claim. They treat $q^*(t,-x)$ as a separate quantity than $q(t,x)$ rather than using the equivalence $q^*(t,-x) = (q(t,x))^*|_{x \rightarrow -x}$. That is the reason why they miss the constraint equations (4.18) for the parameters of the one-soliton solution.

4.2 Two-Soliton Solution for Nonlocal NLS Equation

We obtain the conditions on the parameters of two-soliton solution of the NLS system to satisfy the equality (1.5), where the function $r(t,x)$ is given in (2.34) and $k\bar{q}(\varepsilon_1 t, \varepsilon_2 x)$ is

$$k\bar{q}(\varepsilon_1 t, \varepsilon_2 x) = k \frac{e^{\theta_1} + e^{\theta_2} + \bar{A}_1 e^{\theta_1 + \theta_2 + \bar{\eta}_1} + \bar{A}_2 e^{\theta_1 + \theta_2 + \bar{\eta}_2}}{1 + e^{\theta_1 + \bar{\eta}_1 + \alpha_11} + e^{\theta_1 + \bar{\eta}_2 + \alpha_{12}} + e^{\theta_2 + \eta_1 + \alpha_{21}} + e^{\theta_2 + \eta_2 + \alpha_{22}} + M e^{\theta_1 + \theta_2 + \eta_1 + \eta_2}}, \tag{4.22}$$

where

$$\bar{\theta}_i = \varepsilon_2 \bar{k}_i x + \varepsilon_1 \frac{k_i^2}{2a} t + \bar{\delta}_i,$$

$$\bar{\eta}_i = \varepsilon_2 \bar{\ell}_i x - \varepsilon_1 \frac{\ell_i^2}{2a} t + \bar{\alpha}_i,$$

for $i = 1, 2$. Here we have the following conditions that must be satisfied:

1) $e^{\eta_i} = ke^{\bar{\delta}_i}, i = 1, 2$,
2) $e^{\theta_1 + \eta_1} = e^{\theta_2 + \bar{\eta}_1}, i = 1, 2$,
3) $B_i = \bar{A}_i, i = 1, 2$,
4) $e^{\theta_2 + \eta_2} = e^{\theta_1 + \bar{\eta}_1}$,
5) $e^{\theta_2 + \eta_2} = e^{\theta_1 + \bar{\eta}_2}$,
6) $e^{\theta_1 + \eta_1} = e^{\theta_2 + \bar{\eta}_2}$,
7) $e^{\theta_1 + \theta_2 + \eta_1 + \bar{\eta}_2} = e^{\theta_1 + \theta_2 + \bar{\eta}_1 + \eta_2}$.

(4.23)

From the condition 1) we get

$$\ell_i x - \frac{\ell_i^2}{2a} t = \varepsilon_2 \bar{k}_i x + \varepsilon_1 \frac{k_i^2}{2a} t, \quad e^{\alpha_i} = ke^{\bar{\delta}_i}, i = 1, 2, \tag{4.24}$$

yielding $\ell_i = \varepsilon_2 \bar{k}_i, i = 1, 2$. The coefficients of $t$ in the above equality are directly equal with this relation and $\bar{a} = -\varepsilon_1 a$ that we have obtained previously. All the other conditions (ii)-xi) are also satisfied automatically by the following conditions:

1) $\bar{a} = -\varepsilon_1 a$, 2) $\ell_i = \varepsilon_2 \bar{k}_i, i = 1, 2$, 3) $e^{\alpha_i} = ke^{\bar{\delta}_i}, i = 1, 2$. (4.25)

For particular choice of the parameters let us present some solutions of the nonlocal reduction of the NLS system only for $(\varepsilon_1, \varepsilon_2) = (1, -1)$ (S-symmetric case). In this case we have $\bar{a} = -a, \ell_i = -\bar{k}_i$, and $e^{\alpha_i} = ke^{\bar{\delta}_i}$ for $i = 1, 2$. 
Example 7. Consider the set of the parameters \((k_1, \ell_1, k_2, \ell_2) = (\frac{i}{4}, \frac{i}{4}, i, i)\) for \(j = 1, 2\). The solution \(q(t, x)\) becomes

\[
q(t, x) = \frac{e^{\frac{i}{4}ix + \frac{i}{16}it} + e^{ix + it} + \frac{36}{25}e^{\frac{5}{4}ix + \frac{15}{16}it} + \frac{9}{100}e^{\frac{9}{4}ix + \frac{15}{16}it}}{1 + 4e^{\frac{i}{4}ix} + \frac{16}{25}e^{\frac{5}{4}ix} - \frac{15}{16}it + \frac{16}{25}e^{\frac{5}{4}ix} + \frac{1}{4}e2ix + \frac{81}{625}e^{\frac{5}{2}ix}} \tag{4.26}
\]

and so the function \(|q(t, x)|^2\) is

\[
|q(t, x)|^2 = \frac{Y_1}{Y_2}, \tag{4.27}
\]

where

\[
Y_1 = 625(20000 \cos \left(\frac{3}{4}x + \frac{15}{16}t\right) + 28800 \cos \left(\frac{5}{4}x + \frac{15}{16}t\right) + 2592 \cos \left(-\frac{3}{4}x + \frac{15}{16}t\right) + 1800 \cos \left(-\frac{5}{4}x + \frac{15}{16}t\right) + 28800 \cos \left(\frac{1}{2}x\right) + 1800 \cos 2x + 40817),
\]

and

\[
Y_2 = 100\left(340000 \cos \left(\frac{3}{4}x + \frac{15}{16}t\right) + 90368 \cos \left(\frac{5}{4}x + \frac{15}{16}t\right) + 340000 \cos \left(-\frac{3}{4}x + \frac{15}{16}t\right) + 90368 \cos \left(-\frac{5}{4}x + \frac{15}{16}t\right) + 504050 \cos \left(\frac{1}{2}x\right) + 125000 \cos \left(\frac{3}{2}x\right) + 16200 \cos \left(\frac{5}{2}x\right) + 96050 \cos 2x + 51200 \cos \left(\frac{15}{8}t\right)\right) + 111865601.
\]

The graph of (4.27) is given in Figure 6.

![Figure 6: Breather type of wave solution for (4.27).](image)

Remark 3. Two-soliton solution presented in Ref. [19] has the same flaw as stated in Remark 2. They chose the parameters of their solution not satisfying the constraint equations. Because of the relation between the functions \(q(t, x)\) and \(q^*(t, -x)\) their parameters must satisfy the following constraints,

\[
1) \alpha_p^* = \beta_p, \quad 2) \ell_p = (\bar{\ell}_p)^*, \quad p = 1, 2, \quad 3) e^{\gamma_j} = (e^{\Delta_j})^*, \quad (4.28)
\]
where \( j = \{1, 2, 3, 4, 11, 12, 21, 22, 23, 24, 25, 26, 31, 32\} \). Remember that we use \( \ell \) and \( \tilde{\ell} \) instead of the parameters \( k \) and \( \tilde{k} \) (parameters of [19]) respectively. However, they have taken the parameters as in the form \( \tilde{\ell}_1 = a_1 + b_1 i, \tilde{\ell}_2 = c_1 + d_1 i, \) and \( \ell_2 = -c_1 + d_1 i \) for some specific values of \( a_p, b_p, c_p, \) and \( d_p, p = 1, 2 \). Clearly, the parameters do not satisfy the above constraints, hence two-soliton solution of [19] does not satisfy the nonlocal nonlinear Schrödinger equation (4.15).

### 4.3 Three-Soliton Solution for Nonlocal NLS Equation

Similar to one- and two-soliton solution for nonlocal NLS equations, we first obtain the conditions on the parameters of three-soliton solution of the NLS system to satisfy the equality (1.5) where \( r(t, x) \) is given by (2.67) and

\[
\tilde{\theta}_i = \varepsilon_2 \tilde{k}_i x + \varepsilon_1 \frac{\tilde{k}_i^2}{2a} t + \tilde{\delta}_i, \quad i = 1, 2, 3
\]

\[
\bar{\eta}_i = \varepsilon_2 \bar{\ell}_i x - \varepsilon_1 \frac{\bar{\ell}_i^2}{2a} t + \bar{\alpha}_i, \quad i = 1, 2, 3.
\]

Here we obtain that (1.5) is satisfied by the following conditions:

1) \( \bar{a} = -\varepsilon_1 a \),  2) \( \ell_i = \varepsilon_2 \bar{k}_i, i = 1, 2, 3 \)  3) \( e^{\alpha_i} = ke^{\delta_i}, i = 1, 2, 3 \).

For \((\varepsilon_1, \varepsilon_2) = (1, -1)\) (S-symmetric case), the constraints are \( \bar{a} = -a \), \( \ell_i = -\bar{k}_i \), and \( e^{\alpha_i} = ke^{\delta_i} \) for \( i = 1, 2, 3 \). Examples of bounded and non-singular three-soliton solutions are under investigation.

### 5 Conclusion

In this work, by using the standard Hirota method, we found one-, two-, and three-soliton solutions of the integrable coupled NLS system. Then we have studied the standard and nonlocal (Ablowitz-Musslimani type) reductions of NLS system and obtained integrable time T-, space S-, and space-time ST- reversal symmetric nonlocal NLS equations. By using the reduction formulas on the soliton solutions of the coupled NLS system we obtained one-, two-, and three-soliton solutions of the nonlocal NLS equations. It is important to note that to obtain these soliton solutions of the nonlocal NLS equations the parameters of the soliton solutions of NLS system must satisfy certain constraints for each type of nonlocal
NLS equations. These constraints play critical role to obtain the soliton solutions of the nonlocal NLS equations. Although we found solutions of all types of nonlocal NLS equations we gave only the solutions of the S-symmetric case. Furthermore, we gave particular values to the parameters (satisfying the constraint equations) of the solutions and plot the graphs of $|q(t,x)|^2$ to illustrate the solutions.
