**Figure S1.** Negative controls of the immunohistochemical labelling of the following antibodies: IFN-$\gamma$ (A-C), IL-1$\beta$ (D-F), IL-10 (G-I), arginase-I (J-L). In the 1st control, the primary antibody was not added (A,D,G,J). In the 2nd control, no secondary antibody was added, and only the primary antibody was incorporated into the incubation. In the 3rd control, neither primary nor secondary antibodies were added (C,F,I,L). Some capillaries are visible (arrows) due to the lack of perfusion for tissue fixation (A,J).
