Simple weight modules over the quantum Schrödinger algebra

Yan-an Cai, Yongsheng Cheng, Genqiang Liu

Abstract

In the present paper, using the technique of localization, we determine the center of the quantum Schrödinger algebra $S_q$ and classify simple modules with finite-dimensional weight spaces over $S_q$, when $q$ is not a root of unity. It turns out that there are four classes of such modules: dense $U_q(sl_2)$-modules, highest weight modules, lowest weight modules, and twisted modules of highest weight modules.

Keywords: Quantum Schrödinger algebra, center, simple weight module, twisting functor

1 Introduction

In this paper, we denote by $\mathbb{Z}$, $\mathbb{Z}_+$, $\mathbb{N}$, $\mathbb{C}$ and $\mathbb{C}^*$ the sets of all integers, nonnegative integers, positive integers, complex numbers, and nonzero complex numbers, respectively. Let $q$ be a nonzero complex number which is not a root of unity. For $n, i \in \mathbb{Z}$, denote $[n]_q = \frac{q^n - q^{-n}}{q - q^{-1}}$, $(n)_q = \frac{[n][n-1]_q \cdots [n-i+1]_q}{[i][i-1]_q \cdots [1]_q}$. For an associative algebra $A$, we use $Z(A)$ to denote its center.

The representations of quantum groups have attracted extensive attention of many mathematicians and physicists. However most of the research is related to the quantum groups of simple Lie algebras. In the present paper, we study the representations of the quantum group corresponding to a non-semisimple Lie algebra which is called the Schrödinger Lie algebra. In the $(1 + 1)$-dimensional space, the Schrödinger Lie algebra $S$ is the semidirect product of $sl_2$ and the three-dimensional Heisenberg Lie algebra. It can describe symmetries of the free particle Schrödinger equation, see [5]. The representation theory of the Schrödinger algebra has been studied by many authors. A classification of the simple highest weight representations of the Schrödinger algebra were given in [5]. All simple weight modules with finite dimensional weight spaces were classified in [6]. The simple weight modules of conformal Galilei algebra which generalized Schrödinger algebra in $l$-spatial dimension were studied in [10]. In [13], the authors studied the Whittaker modules over $S$, simple Whittaker modules and related Whittaker vectors were determined. Quasi-Whittaker modules over $S$ were defined and classified in [3].

In 1996, in order to research the $q$-deformed heat equations, a $q$-deformation of the universal enveloping algebra of the Schrödinger Lie algebra was introduced by Dobrev et
al., see [4]. It is an associative algebra over \( \mathbb{C} \) generated by \( P_t, P_x, G, K_1, D, m \) subject to the following nontrivial relations:

\[
\begin{align*}
    P_t G - q G P_t &= P_x, \quad [P_x, K_1] = Gq^{-D}, \quad [D, G] = G, \quad (1.1) \\
    [D, P_x] &= -P_x, \quad [D, P_t] = -2P_t, \quad [D, K_1] = 2K_1, \quad (1.2) \\
    [P_t, K_1] &= \frac{q^D - q^{-D}}{q - q^{-1}}, \quad P_x G - q^{-1} G P_x = m, \quad P_t P_x - q^{-1} P_x P_t = 0. \quad (1.3)
\end{align*}
\]

If we denote

\[
K^{\pm 1} = q^{\pm D}, E = P_t, F = -K_1, Y = G, X = P_x, C = -m,
\]

and replace \( q \) with \( q^{-1} \), then they satisfy the following relations:

\[
\begin{align*}
    K E K^{-1} &= q^2 E, \quad K F K^{-1} = q^{-2} F, \quad [E, F] = \frac{K - K^{-1}}{q - q^{-1}}, \quad (1.4) \quad \text{R1} \\
    K X K^{-1} &= q X, \quad K Y K^{-1} = q^{-1} Y, \quad q Y X - X Y = C, \quad (1.5) \quad \text{R2} \\
    E X &= q X E, \quad E Y = X + q^{-1} Y E, \quad [C, S_q] = 0, \quad (1.6) \quad \text{R3} \\
    F X &= Y K^{-1} + X F, \quad F Y = Y F. \quad (1.7) \quad \text{R4}
\end{align*}
\]

Let \( S_q \) be the associative algebra over \( \mathbb{C} \) generated by the elements \( C, E, F, K, K^{-1}, X \) and \( Y \) subject to the defining relations (1.4)-(1.7). We call \( S_q \) the quantum Schrödinger algebra.

For any \( z \in \mathbb{C} \), the quotient algebra \( S_q/(C - z)S_q \) is a quantized symplectic oscillator algebras of rank one, see [8]. In particular, \( \mathfrak{S}_q := S_q/C S_q \) is the smash product of the quantum plane \( \mathbb{C}_q[X, Y] \) and \( U_q(\mathfrak{sl}_2) \). We call \( \mathfrak{S}_q \) the centerless quantum Schrödinger algebra. The subalgebra of \( \mathfrak{S}_q \) generated by \( E, K, K^{-1}, X \) and \( Y \) is the quantum spatial ageing algebra defined in [2].

An \( S_q \)-module \( V \) is called a weight module if \( K \) acts diagonally on \( V \), i.e.,

\[
V = \oplus_{\lambda \in \mathbb{C}^*} V_\lambda,
\]

where \( V_\lambda = \{ v \in V \mid Kv = \lambda v \} \). For \( \omega \in \mathbb{C}^* \), denote \( V(\omega) = \oplus_{i \in \mathbb{Z}} V_{\omega^i} \). If \( V \) is simple, then \( V = V(\omega) \) for some \( \omega \). For a weight module \( V \), let \( \text{supp}(V) = \{ \lambda \in \mathbb{C}^* | V_\lambda \neq 0 \} \).

The goals of this paper are to determine the centers of \( \mathfrak{S}_q \) and \( S_q \), and to classify all simple weight \( S_q \)-modules with finite dimensional weight spaces.

For a simple weight \( S_q \)-module \( V \) with finite dimensional weight spaces, if \( XV = YV = 0 \), then \( M \) is a simple \( U_q(\mathfrak{sl}_2) \)-module. All the simple \( U_q(\mathfrak{sl}_2) \)-modules were classified in [1]. Since highest (lowest) weight modules have been classified in [4], it remains to classify those simple weight modules on which either \( X \) or \( Y \) or both act nonzero and, furthermore, which have neither a highest nor a lowest weight. We denote the class of such modules by \( \mathcal{N} \).

The paper is organized as follows. In section 2, we will determine the center for the algebras \( \mathfrak{S}_q \) and \( S_q \). In section 3, some basic results for our discussions on weight modules will be given. We will give details on twisting functors in section 4. Finally, in section 5, we classify simple weight modules in \( \mathcal{N} \).
2 The center of the algebras $\mathcal{S}_q$ and $S_q$

In this section, we will determine the center for the algebra $\mathcal{S}_q$ and $S_q$. Indeed, we will prove the following theorem.

**Theorem 2.1.** (i) The center of the centerless quantum Schrödinger algebra $\mathcal{S}_q$ is trivial.

   (ii) The center of the quantum Schrödinger algebra $S_q$ is $Z(S_q) = \mathbb{C}[C]$.

Note that this is not so similar with the center of the enveloping algebra of the (centerless) Schrödinger algebra, see [7].

In [8], using the action of the center on simple highest weight modules, Gan and Khare showed that for any nonzero complex number $z$, the center of $S_q/(C - z)S_q$ is trivial. However, their method is not applicable to the case that $z = 0$. When $C$ acts trivially on a simple highest weight module $M$, we must have that both $X$ and $Y$ act trivially on $M$, see Proposition 3.10 in [8].

Before proving Theorem 2.1, we will give the following useful formulas in the centerless quantum Schrödinger algebra.

**Lemma 2.2.** The following equalities hold in the centerless quantum Schrödinger algebra.

$$
\tilde{E}X = X\tilde{E}, \tilde{E}Y = q^{-1}Y\tilde{E}, \tilde{E}K = q^{-1}K\tilde{E},
$$

$$
\tilde{F}X = X\tilde{F}, \tilde{F}Y = qY\tilde{F}, \tilde{F}K = qK\tilde{F},
$$

$$
\tilde{E}\tilde{F}^i = \tilde{F}^i\tilde{E} + (q^{-2i} - 1)\tilde{E}^{i-1}XYK,
$$

$$
\tilde{F}\tilde{E}^i = \tilde{E}^i\tilde{F} + q^{-2}(q^{2i} - 1)\tilde{F}^{i-1}XYK,
$$

where $\tilde{E} = EY - qYE = X + (q^{-1} - q)YE$, $\tilde{F} = FX - q^{-2}XF = YK^{-1} + (1 - q^{-2})XF$ and $i \in \mathbb{Z}_+$.

**Proof.** Following the defining relations, we have

$$
\tilde{E}X = (X + (q^{-1} - q)YE)X = X^2 + (q^{-1} - q)YEX
$$

$$
= X^2 + (q^{-1} - q)qYXE = X^2 + (q^{-1} - q)XYE
$$

$$
= X(X + (q^{-1} - q)YE) = X\tilde{E},
$$

$$
\tilde{E}Y = (X + (q^{-1} - q)YE)Y = XY + (q^{-1} - q)YEY
$$

$$
= qYX + (q^{-1} - q)Y(X + q^{-1}YE) = q^{-1}Y(X + (q^{-1} - q)YE)
$$

$$
= q^{-1}Y\tilde{E},
$$

$$
\tilde{E}K = (X + (q^{-1} - q)YE)K = XK + (q^{-1} - q)YEK
$$

3
\[ \begin{align*}
&= q^{-1}KX + (q^{-1} - q)q^{-2}YE = q^{-1}K(X + (q^{-1} - q)YE) \\
&= q^{-1}K\tilde{E},
\end{align*} \]

\[ \begin{align*}
\tilde{F}X &= (YK^{-1} + (1 - q^{-2})XF)X = YK^{-1}X + (1 - q^{-2})XF \\
&= q^{-1}YXK^{-1} + (1 - q^{-2})X(YK^{-1} + XF) = X(YK^{-1} + (1 - q^{-2})XF) \\
&= X\tilde{F},
\end{align*} \]

\[ \begin{align*}
\tilde{F}Y &= (YK^{-1} + (1 - q^{-2})XF)Y = YK^{-1}Y + (1 - q^{-2})XYF \\
&= qY^2K^{-1} + (1 - q^{-2})XYF = qY(YK^{-1} + (1 - q^{-2})XF) \\
&= qY\tilde{F},
\end{align*} \]

\[ \begin{align*}
\tilde{F}K &= (YK^{-1} + (1 - q^{-2})XF)K = Y + (1 - q^{-2})q^{2}XK \\
&= qKYK^{-1} + q(1 - q^{-2})XKF = qK(YK^{-1} + (1 - q^{-2})XF) \\
&= qK\tilde{F}.
\end{align*} \]

We use induction on \( i \) to prove the last two equalities. First, we have

\[ \begin{align*}
E\tilde{F} &= E(FX - q^{-2}XF) \\
&= (FE + \frac{K - K^{-1}}{q - q^{-1}})X - q^{-1}XEF \\
&= qFXE + \frac{KX - K^{-1}X}{q - q^{-1}} - q^{-1}X(FE + \frac{K - K^{-1}}{q - q^{-1}}) \\
&= q(FX - q^{-2}XF)E + \frac{KX - K^{-1}X}{q - q^{-1}} - \frac{q^{-1}XK - q^{-1}XXK^{-1}}{q - q^{-1}} \\
&= q\tilde{F}E + \frac{1 - q^{-2}}{q - q^{-1}}KX \\
&= q\tilde{F}E + q^{-1}KX.
\end{align*} \]

Hence, we have

\[ \begin{align*}
\tilde{E}\tilde{F} &= (X + (q^{-1} - q)YE)\tilde{F} = X\tilde{F} + (q^{-1} - q)YE\tilde{F} \\
&= \tilde{F}X + (q^{-1} - q)Y(q\tilde{F}E + q^{-1}KX) \\
&= \tilde{F}X + (q^{-1} - q)q\tilde{F}E + (q^{-2} - 1)YKX \\
&= \tilde{F}X + (q^{-1} - q)\tilde{F}YE + (q^{-2} - 1)XYK \\
&= \tilde{F}\tilde{E} + (q^{-2} - 1)XYK.
\end{align*} \]

This means the last two equalities hold for \( i = 1 \). Suppose they are true for \( i \), then

\[ \begin{align*}
\tilde{E}\tilde{F}^{i+1} &= \tilde{E}\tilde{F}^{i}\tilde{F} = \tilde{F}^{i}\tilde{E}\tilde{F} + (q^{-2i} - 1)\tilde{F}^{i-1}XYK \tilde{F}
\end{align*} \]
\[ \tilde{F}^i (\tilde{F} \tilde{E} + (q^{-2} - 1)XYK) + (q^{-2i} - 1)q^{-2} \tilde{F}^i XYK \]
\[ = \tilde{F}^{i+1} \tilde{E} + (q^{-2(i+1)} - 1)\tilde{F}^i XYK, \]
\[ \tilde{F} \tilde{E} \tilde{F}^{i+1} = \tilde{F} \tilde{E} \tilde{E} \tilde{E} + \tilde{E} \tilde{F} \tilde{E} + q^{-2}(q^{2i} - 1)\tilde{E}^{i-1}XYK \tilde{E} \]
\[ = \tilde{E}^i (\tilde{E} \tilde{F} + (1 - q^{-2})XYK) + (q^{2i} - 1)\tilde{E}^i XYK \]
\[ = \tilde{E}^{i+1} \tilde{F} + q^{-2}(q^{2(i+1)} - 1)\tilde{E}^i XYK. \]

We will use localization to determine the center of the centerless quantum Schrödinger algebra. Since we have

\[ EY^i = q^{-i}Y^i E + [i]_q Y^{i-1}X - \frac{q + q^2 - q^{2-i} - q^{i+1}}{(1 - q^2)(q - 1)}CY^{i-2}, \]
\[ XY^i = q^iY^i X - \frac{q^i - 1}{q - 1}CY^{i-1}, \]

the set \( \{Y^i|i \in \mathbb{Z}_+\} \) is a left and right Ore subset of \( \mathfrak{S}_q \). Similarly, for any \( s \in \{E, F, X, Y, C\} \), the set \( \{s^i|i \in \mathbb{Z}_+\} \) is a left and right Ore subset of \( \mathfrak{S}_q \). Hence, we can consider the corresponding localization \( \mathfrak{S}_q^{(a)} \). For \( \mathfrak{S}_q^{(X,Y)} \) we have the following analogue to the Poincaré-Birkhoff-Witt theorem.

**Lemma 2.3.** The set \( \{X^a Y^b K^c \tilde{E}^d \tilde{F}^e|(a, b, c, d, e) \in \mathbb{Z} \times \mathbb{Z} \times \mathbb{Z} \times \mathbb{Z}_+ \times \mathbb{Z}_+\} \) is a basis for \( \mathfrak{S}_q^{(X,Y)} \).

**Proof.** By Poincaré-Birkhoff-Witt theorem, we know that \( \{X^a Y^b K^c E^d F^e|(a, b, c, d, e) \in \mathbb{Z}_+ \times \mathbb{Z}_+ \times \mathbb{Z} \times \mathbb{Z}_+ \times \mathbb{Z}_+\} \) is a basis for \( \mathfrak{S}_q \). By the definition of localization, \( \{X^a Y^b K^c E^d F^e\} \) \( (a, b, c, d, e) \in \mathbb{Z} \times \mathbb{Z} \times \mathbb{Z} \times \mathbb{Z}_+ \times \mathbb{Z}_+\) is a basis for \( \mathfrak{S}_q^{(X,Y)} \), and hence \( \{X^a Y^b K^c \tilde{E}^d \tilde{F}^e|(a, b, c, d, e) \in \mathbb{Z} \times \mathbb{Z} \times \mathbb{Z} \times \mathbb{Z}_+ \times \mathbb{Z}_+\} \) spans \( \mathfrak{S}_q^{(X,Y)} \). So it remains to show this is a linearly independent set. Since

\[ X^a Y^b K^c \tilde{E}^d \tilde{F}^e = cX^{a+c} Y^{b+d} K^c E^d F^e + \sum_{d' \leq d, e' \leq e} c_{d', e'} (X, Y, K) E^{d'} F^{e'}, \]

where \( c \neq 0 \) and \( c_{d', e'} (X, Y, K) \) are polynomials in \( X, Y, K \), the independence of the set \( \{X^a Y^b K^c \tilde{E}^d \tilde{F}^e|(a, b, c, d, e) \in \mathbb{Z} \times \mathbb{Z} \times \mathbb{Z} \times \mathbb{Z}_+ \times \mathbb{Z}_+\} \) follows from the independence of \( \{X^a Y^b K^c E^d F^e|(a, b, c, d, e) \in \mathbb{Z}_+ \times \mathbb{Z}_+ \times \mathbb{Z} \times \mathbb{Z}_+ \times \mathbb{Z}_+\} \). \( \Box \)

Now we are ready to prove Theorem 2.1.

**Proof of Theorem 2.1.** (i) Consider the localization \( \mathfrak{S}_q^{(X,Y)} \), then we have \( Z(\mathfrak{S}_q) = Z(\mathfrak{S}_q^{(X,Y)}) \cap \mathfrak{S}_q \). Let \( Z = \sum r(a, b, c, d, e)X^a Y^b K^c \tilde{E}^d \tilde{F}^e \) be any nonzero element in \( Z(\mathfrak{S}_q^{(X,Y)}) \). Since

\[ 0 = KZ - ZK \]

5
\[
\sum r K X^a Y^b K^c \tilde{E}^d \tilde{F}^e - \sum r X^a Y^b K^c \tilde{E}^d \tilde{F}^e K
= \sum q^{a-b} r X^a Y^b K^c+1 \tilde{E}^d \tilde{F}^e - \sum q^{e-d} r X^a Y^b K^c+1 \tilde{E}^d \tilde{F}^e,
\]
we have for each \((a, b, c, d, e) \in \mathbb{Z}^3 \times \mathbb{Z}_+^2\),
\[
\sum r(a, b, c, d, e)(q^{a-b} - q^{e-d}) = 0.
\]
Therefore, \(r(a, b, c, d, e) = 0\) unless \(e = a - b + d\). So \(Z = \sum r(a, b, c, d)X^a Y^b K^c \tilde{E}^d \tilde{F}^{a-b+d}\).

From
\[
0 = XZ - ZX
= \sum r X^{a+1} Y^b K^c \tilde{E}^d \tilde{F}^{a-b+d} - \sum r X^a Y^b K^c \tilde{E}^d \tilde{F}^{a-b+d} X
= \sum r X^{a+1} Y^b K^c \tilde{E}^d \tilde{F}^{a-b+d} - \sum q^{c-b} r X^{a+1} Y^b K^c \tilde{E}^d \tilde{F}^{a-b+d},
\]
we know that
\[
r(a, b, c, d, e)(q^{c-b} - 1) = 0.
\]
Hence, \(r(a, b, c, d) = 0\) unless \(b = c\), which means that \(Z = \sum r(a, b, c)X^a Y^b K^b \tilde{E}^c \tilde{F}^{a-b+c}\).

From
\[
0 = YZ - ZY
= \sum (q^{-a} - q^{-2b}) r(a, b, c)X^a Y^{b+1} K^b \tilde{E}^c \tilde{F}^{a-b+c},
\]
we have \(r(a, b, c) = 0\) unless \(a = b\). So
\[
Z = \sum r(a, b)(XY K)^a \tilde{E}^b \tilde{F}^b = \sum_{a=s}^t \sum_{b=0}^n r(a, b)(XY K)^a \tilde{E}^b \tilde{F}^b.
\]
Following from
\[
0 = Z \tilde{E} - \tilde{E} Z
= \sum_{a=s}^t \sum_{b=0}^n r(a, b)(XY K)^a \tilde{E}^b \tilde{F}^b \tilde{E} - \sum_{a=s}^t \sum_{b=0}^n r(a, b) \tilde{E}(XY K)^a \tilde{E}^b \tilde{F}^b
= \sum_{a=s}^t \sum_{b=0}^n r(a, b)(XY K)^a \tilde{E}^b (\tilde{E} \tilde{F}^b + (1 - q^{-2b}) \tilde{F}^{b-1}(XY K))
- \sum_{a=s}^t \sum_{b=0}^n q^{-2a} r(a, b)(XY K)^a \tilde{E}^{b+1} \tilde{F}^b
= \sum_{a=s}^t \sum_{b=0}^n r(a, b)(1 - q^{-2a})(XY K)^a \tilde{E}^{b+1} \tilde{F}^b
\]
\[
+ \sum_{a=s}^{t} \sum_{b=0}^{n} r(a, b)q^{2(b-1)}(1 - q^{-2b})(XYK)^{a+1} \tilde{E}^{b} \tilde{F}^{b-1},
\]

we deduce that
\[
\begin{align*}
 r(t, n)(1 - q^{-2t}) &= 0, \\
 r(t, n)q^{2(n-1)}(1 - q^{-2n}) &= 0.
\end{align*}
\]

Thus, we have \( t = n = 0 \), that is \( Z = \sum_{a \leq 0} r(a)(XYK)^{a} \). So, the first statement of Theorem 2.1 follows.

(ii) By (i) and Theorem 11.1 in [8], for any complex number \( z \), the center of \( \mathcal{S}_{q}/(C-z)\mathcal{S}_{q} \) is trivial. Suppose that \( Z = \sum_{(a, b, c, d, e) \in \mathbb{Z}_{+}^{5}} r(a, b, c, d, e, C)X^{a}Y^{b}K^{c}E^{d}F^{e} \) is an element of the center of \( \mathcal{S}_{q} \), where each coefficient \( r(a, b, c, d, e, C) \) is a polynomial in \( C \). Suppose that there is some \( (a, b, c, d, e) \in \mathbb{Z}_{+}^{5} \) with \( a + b + c + d + e > 0 \) such that the corresponding coefficient \( r(a, b, c, d, e, C) \) is not zero. Choose \( z \in \mathbb{C} \) such that \( r(a, b, c, d, e, z) \neq 0 \). Then the image of \( Z \) in \( \mathcal{S}_{q}/(C-z)\mathcal{S}_{q} \) is not a scalar for any \( z \in \mathbb{C} \), which is impossible. \( \square \)

3 Some basic results

In this section, we will give some basic results for our arguments on weight modules.

A classification and explicit description of all simple highest weight \( \mathcal{S}_{q} \)-modules was given by Dobrev et al. in [4, 8]. Using the involution given in [4], we can also obtain explicit description of simple lowest weight \( \mathcal{S}_{q} \)-modules. Here we recall these results which are necessary for our arguments.

**Theorem 3.1.** Let \( V \) be a simple highest weight \( \mathcal{S}_{q} \)-module with central charge \( z \in \mathbb{C} \).

(i) If \( z = 0 \), then \( V \) is a simple highest weight \( U_{q}(\mathfrak{sl}_{2}) \)-module, that is \( XV = YV = 0 \).

(ii) For \( \lambda \in \mathbb{C}^{*} \) and \( z \in \mathbb{C}^{*} \), let \( M(\lambda, z) \) be the Verma module generated by \( v_{0,0} \), where \( K_{v_{0,0}} = \lambda v_{0,0}, C_{v_{0,0}} = zv_{0,0} \). Then \( M(\lambda, z) \) has the basis \( \{v_{k,l} := Y^{k}F^{l}v_{0,0} | k, l \in \mathbb{Z}_{+}\} \) on which the \( \mathcal{S}_{q} \)-action is given by

\[
\begin{align*}
K.v_{k,l} &= \lambda q^{-k-2l}v_{k,l}, \quad C.v_{k,l} = zv_{k,l}, \\
Y.v_{k,l} &= v_{k+1,l}, \quad F.v_{k,l} = v_{k,l+1}, \\
X.v_{k,l} &= -\frac{q^{k} - 1}{q - 1}v_{k-1,l} - \lambda^{-1}q^{k+l-1}[l]_{q}v_{k+1,l-1}, \\
E.v_{k,l} &= \frac{q^{1-k-l} - \lambda^{-1}q^{k+l-1}}{q - q^{-1}}[l]_{q}v_{k,l-1} - \frac{q + q^{2-k} - q^{k+1}}{(1 - q^{2})(q - 1)}zv_{k-2,l}.
\end{align*}
\]
The module $M(\lambda, z)$ is simple if $\lambda^2 \in \mathbb{C}^* \setminus q^{-3+2N}$. For $\lambda$ with $\lambda^2 = q^{2d-3} \in q^{-3+2N}$ and $z \in \mathbb{C}^*$, denote by $N(\lambda, z)$ the unique simple quotient of $M(\lambda, z)$ with basis \( \{u_{k,l} \mid k, l \in \mathbb{Z}_+, l \leq d - 1\} \), on which the $S_q$-action is given by

\[
K.v_{k,l} = \lambda q^{-k-2l}v_{k,l}, \quad C.v_{k,l} = zv_{k,l}, \quad Y.v_{k,l} = v_{k+1,l},
\]

\[
F.v_{k,l} = \begin{cases} 
  v_{k,l+1}, & l < d - 1, \\
  -\sum_{i=0}^{d-1} \left( -\frac{q^{d-1}}{\lambda^2} \right) \left( \frac{d}{2} \right)_q v_{k+2d-2i+1, l}, & l = d - 1,
\end{cases}
\]

\[
X.v_{k,l} = -zq^k - 1 \sum_{i=0}^{d-1} v_{k-1,l} - \lambda^{-1}q^{k+l-1} [l]_q v_{k+1,l}, \quad
\]

\[
E.v_{k,l} = \frac{\lambda q^{1-k-l} - \lambda^{-1}q^{k+l-1}}{q-q^{-1}} [l]_q v_{k,l-1} - \frac{q + q^2 - q^{2-k} - q^{k+1}}{(1-q^2)(1-q)} z v_{k-2,l}.
\]

If the central charge of $V$ is nonzero, then $V$ is isomorphic to either some $M(\lambda, z)$ or $N(\lambda, z)$.

For any simple $S_q$-module we have the following property.

**Lemma 3.2.** Let $s \in \{E, F, X, Y\}$ and $V$ be a simple $S_q$-module. If the action of $s$ on $V$ is not injective, then $s$ acts on $V$ locally nilpotently.

To prove this lemma, we need the following equalities.

**Lemma 3.3.** For $r, s \in \mathbb{N}$, the following equalities hold in the algebra $S_q$.

(i) \( E^{(r)}F^{(s)} = \sum_{j \geq 0} F^{(s-j)} \left[ \begin{array}{c} K;2j-r-s \\ j \end{array} \right] E^{(r-j)} \), where $E^{(r)} = \frac{E^r}{[r]_q!}$, $F^{(r)} = \frac{F^r}{[r]_q!}$.

\[
\left[ \begin{array}{c} K;r \\ s \end{array} \right] = \prod_{i=1}^s \frac{Kq^{-j+1} - q^{-r+j-1}}{q^j - q^{-j}}.
\]

(ii) \( E^{r+1}Y^r = (q^{-r}EY + q[r]_qX)E^rY^{r-1} \).

(iii) \( X^rY^s = q^{rs}Y^sX^r + \sum_{i=1}^{\min(r,s)} (-1)^{i+r}s+i \prod_{j=0}^{i-1} \frac{(1-q^{-r+j})(1-q^{s+j})}{(q-1)(q+r+1)} C_{i}s^{-i}X^{r-i}. \)

(iv) \( XF^r = F^rX - q^{r-1}[r]_qYF^{r-1}K^{-1}. \)

**Proof.** (i) comes from the formula (a2) on page 103 in [9].

(ii) follows from induction on $r$.

\[
E^{r+2}Y^{r+1} = E(E^{r+1}Y^r)Y
= E(q^{-r}EY + q[r]_qX)E^rY^r
= (q^{-r}E^{2}Y + q^{2}[r]_qXE)E^rY^r
= (q^{-r}E(q^{-1}YE + X) + q^{2}[r]_qXE)E^rY^r
= (q^{r-1}YE + (q^{r+1} + q^{2}[r]_q)X)E^{r+1}Y^r
\]
\[= (q^{-r-1}EY + q[r + 1]qX)E^{r+1}Y^r.\]

(iii) Following from induction on \(s\) and \(r\), it is easy to get

\[XY^s = q^sY^sX - \frac{q^s - 1}{q - 1}CY^{s-1},\]
\[X^rY = q^rY^rX - \frac{q^r - 1}{q - 1}CX^{r-1}.\]

Replacing \(q\) by \(q^{-1}\) and \(C\) by \(-q^{-1}C\), we may assume that \(s < r\). Then the induction follows from

\[
X^{r+1}Y^s = X\left(\sum_{i=1}^{s}(-1)^i q^{r+i} \prod_{j=0}^{i-1} \frac{(1-q^{-r-j})(1-q^{-s+j})}{(q-1)(q^{j+1}-1)} C^i Y^{s-i}X^{r-i}\right)
\]
\[
= q^sXY^sX^r + \sum_{i=1}^{s-1}(-1)^i q^{r+i} \prod_{j=0}^{i-1} \frac{(1-q^{-r-j})(1-q^{-s+j})}{(q-1)(q^{j+1}-1)} C^i XY^{s-i}X^{r-i}
\]
\[
= q^s\left(q^sY^sX^{r+1} - \frac{q^s - 1}{q - 1} CY^{s-1}X^r\right)
\]
\[
+ \sum_{i=1}^{s-1}(-1)^i q^{r+s+i} \prod_{j=0}^{i-1} \frac{(1-q^{-r-j})(1-q^{-s+j})}{(q-1)(q^{j+1}-1)} C^i Y^{s-i}X^{r+1-i}
\]
\[
= q^{(r+1)s}Y^sX^{r+1} - q^s\frac{q^s - 1}{q - 1} CY^{s-1}X^r
\]
\[
+ \sum_{i=1}^{s}(-1)^i q^{(r+1)s+i} \prod_{j=0}^{i-1} \frac{(1-q^{-r-j})(1-q^{-s+j})}{(q-1)(q^{j+1}-1)} C^i Y^{s-i}X^{r+1-i}
\]
\[
= q^{(r+1)s}Y^sX^{r+1} - q^{(r+1)s+1}\left(1-q^{-r-1}\right)(1-q^{-s}) CY^{s-1}X^r
\]
\[
+ \sum_{i=2}^{s}(-1)^i \left(q^{(r+1)s+i-1}\frac{(1-q^{-r+i-1})(1-q^{-s+i-1})}{(q-1)(q^{i-1})} + q^{r+s+i-1}\frac{q^{s+i-1} - 1}{q - 1}\right)
\]
\[
\cdot \prod_{j=0}^{i-2} \frac{(1-q^{-r-j})(1-q^{-s+j})}{(q-1)(q^{j+1}-1)} C^i Y^{s-i}X^{r+1-i}
\]
\[
= q^{(r+1)s}Y^sX^{r+1} + \sum_{i=1}^{s}(-1)^i q^{(r+1)s+i} \prod_{j=0}^{i-1} \frac{(1-q^{-r-i})(1-q^{-s+j})}{(q-1)(q^{j+1}-1)} C^i Y^{s-i}X^{r+1-i};
\]
and
\[
X^r Y^{s+1} = q^{rs} Y^s X^r Y + \sum_{i=1}^s (-1)^i q^{rs+i} \prod_{j=0}^{i-1} \left( 1 - q^{-r+j} \right) \left( 1 - q^{-s+j} \right) \frac{C^i Y^{s-i} X^{r-i} Y}{(q-1)(q^{j+1}-1)}
\]
\[
= q^{rs} Y^s \left( q^r Y X^r - \frac{q^r - 1}{q-1} CX^{r-1} \right)
\]
\[
+ \sum_{i=1}^s (-1)^i q^{rs+i} \prod_{j=0}^{i-1} \left( 1 - q^{-r+j} \right) \left( 1 - q^{-s+j} \right) \frac{C^i Y^{s-i}}{(q-1)(q^{j+1}-1)} \left( q^{r-i} Y X^{r-i} - \frac{q^{r-i} - 1}{q-1} CX^{r-i-1} \right)
\]
\[
= q^{r(s+1)} Y^{s+1} X^r - q^{rs} \frac{q^r - 1}{q-1} CY^s X^{r-1}
\]
\[
+ \sum_{i=1}^s (-1)^i q^{r(s+1)+i} \prod_{j=0}^{i-1} \left( 1 - q^{-r+j} \right) \left( 1 - q^{-s+j} \right) \frac{C^{i+1} Y^{s-i} X^{r-i-1}}{(q-1)(q^{j+1}-1)}
\]
\[
= q^{r(s+1)} Y^{s+1} X^r - q^{r(s+1)+1} \frac{(1 - q^{-r})(1 - q^{-s-1})}{(q-1)^2} CY^s X^{r-1}
\]
\[
+ \sum_{i=2}^s (-1)^i q^{r(s+1)+i} \left( q^{-i} \frac{(1 - q^{-r+i-1})(1 - q^{-s+i-1})}{(q-1)(q^i-1)} + q^{-r-i} q^{-r+i+1} - 1 \right)
\]
\[
\cdot \prod_{j=0}^{i-2} \frac{(1 - q^{-r+j})(1 - q^{-s+j})}{(q-1)(q^{j+1}-1)} CY^{s+1-i} X^{r-i}
\]
\[
+ (-1)^{s+1} q^{(r+1)s} q^{rs} \frac{q^{-rs} - 1}{q-1} \prod_{j=0}^{s-1} \left( 1 - q^{-r+j} \right) \left( 1 - q^{-s+j} \right) \frac{C^{s+1} X^{r-s-1}}{(q-1)(q^{j+1}-1)}
\]
\[
= q^{r(s+1)} Y^{s+1} X^r + \sum_{i=1}^{s+1} (-1)^i q^{r(s+1)+i} \prod_{j=0}^{i-1} \left( 1 - q^{-r+j} \right) \left( 1 - q^{-s+j} \right) \frac{C^{i+1} Y^{s+1-i} X^{r-i}}{(q-1)(q^{j+1}-1)}.
\]

(iv) follows from induction on \( r \):
\[
XF^{r+1} = XF^r F
\]
\[
= (F^r X - q^{-1[r]} Y F^{r-1} K^{-1}) F
\]
\[
= F^r XF - q^{r+1[r]} Y F^r K^{-1}
\]
\[
= F^r (FX - Y K^{-1}) - q^{r+1[r]} Y F^r K^{-1}
\]
\[
= F^{r+1} X - q^{[r+1]} Y F^r K^{-1}.
\]

Proof of Lemma 3.2. We only need to prove the lemma for \( u = E, X \). By assumption, there exists a nonzero vector \( v \in V \) such that \( u.v = 0 \).
(i) If \( u = E \), then we need to show that \( E \) acts nilpotently on \( X^aK^bF^cY^dE \). This follows from the following computation. For \( m \gg 0 \), we have

\[
\frac{1}{[m]_q!\ [c]_q!}E^mX^aK^bF^cY^dE = q^{ma-2mb}X^aK^bE\left(m\right)F(c)Y^dE = q^{ma-2mb}X^aK^b\sum_{j \geq 0}E^{(c-j)}\left(K;2j-m-c\right)E^{(m-j)}Y^dE
\]

\[
= \sum_{j \geq 0}q^{ma-2mb}\prod_{i=0}^{d}(m-j-i)qX^aK^bE^{(c-j)}\left(K;2j-m-c\right)E^{(m-j-d-1)}E^{d+1}Y^dE
\]

\[
= \sum_{j \geq 0}q^{ma-2mb}\prod_{i=0}^{d}(m-j-i)qX^aK^bE^{(c-j)}\left(K;2j-m-c\right)E^{(m-j-d-1)}(q^{-d}EY + q[d]qX)E^{d}Y^{d-1}E
\]

\[
= \sum_{j \geq 0}q^{ma-2mb}\prod_{i=0}^{d}(m-j-i)qX^aK^bE^{(c-j)}\left(K;2j-m-c\right)E^{(m-j-d-1)}\prod_{i=1}^{d}(q^{-i}EY + q[i]qX)Ev
\]

= 0.

(ii) For \( u = X \), similarly it suffices to show that \( X \) acts nilpotently on \( E^{a}K^{b}Y^{c}F^{d}E \). Since for \( m \gg 0 \), we have

\[X^{m}E^{a}K^{b}Y^{c}F^{d}E = q^{-ma-mb}E^{a}K^{b}X^{m}Y^{c}F^{d}E,\]

where \( c(i,s,r) = (-1)^{i}q^{s+i}\prod_{j=0}^{i-1}\frac{(1-q^{-r+j})(1-q^{a+s+j})}{(q-1)(q^{r+s+j}-1)} \). We only need to show that \( X \) acts nilpotently on \( F^{d}E \) for any \( d \in \mathbb{N} \), which follows by the following fact: if \( X^{r}F^{s}E = 0 \), then \( X^{r+2}F^{s+1}E = 0 \).

Indeed, we have

\[X^{r+2}F^{s+1}E = X^{r+1}(F^{s+1}X - q^{s}[s+1]qYF^{s}K^{-1})E \]

\[= -q^{s}[s+1]qX^{r+1}YF^{s}K^{-1}E \]

\[= -q^{s}[s+1]q\left(q^{r+1}YX^{r+1}F^{s} - \frac{q^{r+1}-1}{q-1}X^{r}\right)F^{s}K^{-1}E \]

\[= 0.\]

For \( L \in \mathcal{N} \), we have the following crucial property.

**Theorem 3.4.** Let \( L \in \mathcal{N} \). Then \( \text{supp}(L) = \lambda q^{Z} \) for some \( \lambda \in \mathbb{C}^{*} \), and \( \dim L_{\lambda q^{i}} = \dim L_{\lambda q^{j}}, \) for all \( i, j \in \mathbb{Z} \).
Proof. Suppose $L = \oplus_{i \in \mathbb{Z}} L_{\lambda^i}$. If there exists some $i \in \mathbb{Z}$ such that $\dim L_{\lambda^i} > \dim L_{\lambda^{i+1}}$, then the action of $X$ on $L$ is not injective, and hence $X$ acts on $L$ locally nilpotently.

If $\dim L_{\lambda^{i-1}} > \dim L_{\lambda^{i+1}}$, then the action of $E$ on $L$ is not injective and $E$ acts locally nilpotently on $L$. Since $EX = qXE$, there exists $v \in L$ such that $Xv = Ev = 0$, which means that $L$ is a highest weight module. This contradicts with our assumption.

Therefore, we have $\dim L_{\lambda^{i-1}} \leq \dim L_{\lambda^{i+1}} < \dim L_{\lambda^i}$. From this we know that $Y$ acts locally nilpotently on $L$. If $L$ has zero central charge, then following from $qYX - XY = C$, there exists nonzero $v \in L$ such that $Xv = Yv = 0$. Hence $XL = YL = 0$, which is impossible. If $L$ has nonzero central charge $z$, then there exists nonzero $v \in L$ with $Yv = 0, X^m v \neq 0$ and $X^{m+1}v = 0$. So, we have

$$0 = q^{m+1} Y X^{m+1} v = (X^{m+1}Y + \frac{q^{m+1} - 1}{q-1} X^m C)v = z \frac{q^{m+1} - 1}{q-1} X^m v \neq 0,$$

which is a contradiction. $\square$

4 Twisting functor

In this section, we recall the technique of localization which was used by Mathieu to classify simple weight modules over simple Lie algebras, see [11].

Since for $u \in \{F, Y\}$, $\{u^i | i \in \mathbb{Z}^+\}$ is an Ore set for $S_q$, we have the following automorphism.

Proposition 4.1. For $b \in \mathbb{C}^*$, the assignment

$$\Theta_b^{(F)}(F^{\pm 1}) = F^{\pm 1}, \quad \Theta_b^{(F)}(Y) = Y, \quad \Theta_b^{(F)}(C) = C,$$

$$\Theta_b^{(F)}(X) = X - \frac{b - 1}{q^2 - 1} F^{-1} Y K^{-1}, \quad \Theta_b^{(F)}(K^i) = b^{-i} K^i,$$

$$\Theta_b^{(F)}(E) = E + \frac{1 - b^{-1}}{(q^2 - 1)(q - q^{-1})} K F^{-1} - \frac{1 - b}{(q^2 - 1)(q - q^{-1})} K^{-1} F^{-1}$$

extends uniquely to an automorphism $\Theta_b^{(F)} : S_q^{(F)} \to S_q^{(F)}$ and the assignment

$$\Theta_b^{(Y)}(Y^{\pm 1}) = Y^{\pm 1}, \quad \Theta_b^{(Y)}(F) = F, \quad \Theta_b^{(Y)}(C) = C,$$

$$\Theta_b^{(Y)}(X) = bX - \frac{b - 1}{q - 1} C Y^{-1}, \quad \Theta_b^{(Y)}(K^i) = b^{-i} K^i,$$

$$\Theta_b^{(Y)}(E) = b^{-1} E + \frac{b - b^{-1}}{q - q^{-1}} Y^{-1} X - \frac{b + qb^{-1} - q - 1}{(q - q^{-1})(q - 1)} C Y^{-2}$$

extends uniquely to an automorphism $\Theta_b^{(Y)} : S_q^{(Y)} \to S_q^{(Y)}$.

Proof. First we prove the proposition for $b = q^{2i}, i \in \mathbb{N}$. We claim that formulas (4.1-4.3) correspond to restriction of the conjugation automorphism $a \mapsto Y^{-2i} a Y^{2i}$ of $S_q^{(Y)}$. To prove
this we proceed by induction on $i$. The base $i = 0$ is immediate. Let us check the induction step. For $a = Y, F, C$, the formulas are obvious, we only need to check the formulas for $a = K^n, X$ and $E$. For $u = F$, we have

$$F^{-1}\Theta_{q^{2i}}^{(F)}(F^\pm 1)F = F^{-1}F^\pm 1 = F^\pm 1,$$

$$F^{-1}\Theta_{q^{2i}}^{(F)}(Y)F = F^{-1}YF = Y,$$

$$F^{-1}\Theta_{q^{2i}}^{(F)}(K^n)F = F^{-1}q^{-2ni}K^nF = q^{-2ni}F^{-1}q^{-2n}FK^n = q^{-2n(i+1)}K^n,$$

$$F^{-1}\Theta_{q^{2i}}^{(F)}(X)F = F^{-1}\left(X - \frac{q^{2i} - 1}{q^2 - 1}F^{-1}YK^{-1}\right)F$$

$$= F^{-1}(FX - YK^{-1}) - \frac{q^{2(i+1)} - q^2}{q^2 - 1}F^{-1}YK^{-1}$$

$$= X - \frac{q^{2(i+1)} - 1}{q^2 - 1}F^{-1}YK^{-1},$$

$$F^{-1}\Theta_{q^{2i}}^{(F)}(E)F$$

$$= F^{-1}\left(E + \frac{1 - q^{-2i}}{(q^2 - 1)(q - q^{-1})}KF^{-1} - \frac{1 - q^{2i}}{(q^{-2} - 1)(q - q^{-1})}K^{-1}F^{-1}\right)F$$

$$= F^{-1}EF + \frac{1 - q^{-2i}}{(q^2 - 1)(q - q^{-1})}F^{-1}K - \frac{1 - q^{2i}}{(q^{-2} - 1)(q - q^{-1})}F^{-1}K^{-1}$$

$$= E + F^{-1}\frac{K - K^{-1}}{q - q^{-1}} + \frac{1 - q^{-2i}}{(q^2 - 1)(q - q^{-1})}F^{-1}K - \frac{1 - q^{2i}}{(q^{-2} - 1)(q - q^{-1})}F^{-1}K^{-1}$$

$$= E + \frac{1 - q^{-2(i+1)}}{(q^2 - 1)(q - q^{-1})}KF^{-1} - \frac{1 - q^{2(i+1)}}{(q^{-2} - 1)(q - q^{-1})}K^{-1}F^{-1};$$

For $u = Y$, We have that

$$Y^{-2}\Theta_{q^{2i}}^{(Y)}(K^n)Y^2 = Y^{-2}q^{-2ni}K^nY^2 = Y^{-2}q^{-2ni}q^{-2n}Y^2K^n = q^{-2n(i+1)}K^n,$$

$$Y^{-2}\Theta_{q^{2i}}^{(Y)}(X)Y^2 = Y^{-2}\left(q^{2i}X - \frac{q^{2i} - 1}{q - 1}CY^{-1}\right)Y^2$$

$$= q^{2i}Y^{-2}XY^2 - \frac{q^{2i} - 1}{q - 1}CY^{-1}$$

$$= q^{2i}\left(q^2X - \frac{q^2 - 1}{q - 1}CY^{-1}\right) - \frac{q^{2i} - 1}{q - 1}CY^{-1}$$

$$= q^{2(i+1)}X - \frac{q^{2(i+1)} - 1}{q - 1}CY^{-1},$$
\[ Y^{-2}\Theta^{(Y)}_{q^{2i}}(E)Y^2 \]
\[ = Y^{-2}\left(q^{-2i}E + [2i]qY^{-1}X - \frac{q^{2i} + q^{-2i+1} - q - 1}{(q - q^{-1})(q - 1)}CY^{-2}\right)Y^2 \]
\[ = q^{-2i}Y^{-2}EY^2 + [2i]qY^{-3}XY^2 - \frac{q^{2i} + q^{-2i+1} - q - 1}{(q - q^{-1})(q - 1)}CY^{-2} \]
\[ = q^{-2i}(q^{-2}E + [2]_qY^{-1}X - CY^{-2}) + [2i]_qY^{-1}\left(q^2X - \frac{q^2 - 1}{q - 1}CY^{-1}\right) \]
\[ - \frac{q^{2i} + q^{-2i+1} - q - 1}{(q - q^{-1})(q - 1)}CY^{-2} \]
\[ = q^{-2(i+1)}E + [2(i + 1)]_qY^{-1}X - \frac{q^{2(i+1)} + q^{-2i-1} - q - 1}{(q - q^{-1})(q - 1)}CY^{-2}. \]

Hence, when \( b = q^{2i}, i \in \mathbb{N} \), we have that \( \Theta^{(Y)}_b(xy) = \Theta^{(Y)}_b(x)\Theta^{(Y)}_b(y) \) for any \( x, y \in S^{(Y)}_q \). We can see that if \( p(x) \) is a Laurent polynomial such that \( p(q^{2i}) = 0 \) for all \( i \in \mathbb{N} \), then the polynomial \( p(x) \) is zero. Thus \( \Theta^{(Y)}_b(xy) = \Theta^{(Y)}_b(x)\Theta^{(Y)}_b(y) \) for any \( b \in \mathbb{C} \setminus \{0\}, x, y \in S^{(Y)}_q \). So \( \Theta^{(Y)}_b \) is an automorphism of \( S^{(Y)}_q \) for any \( b \in \mathbb{C}^* \).

**Proposition 4.2.** For \( u \in \{F, Y\} \) and \( x, y \in \mathbb{C}^* \), we have \( \Theta^{(u)}_x \Theta^{(u)}_y = \Theta^{(u)}_{xy} \).

**Proof.** We only need to check \( \Theta^{(u)}_x \Theta^{(u)}_y(X) = \Theta^{(u)}_{xy}(X) \) and \( \Theta^{(u)}_x \Theta^{(u)}_y(E) = \Theta^{(u)}_{xy}(E) \) since the others are trivial. This is done by the following computations.

\[
\Theta^{(F)}_x \Theta^{(F)}_y(X) = \Theta^{(F)}_x(X - \frac{y - 1}{q^2 - 1}F^{-1}YK^{-1})
\]
\[ = X - \frac{x - 1}{q^2 - 1}F^{-1}YK^{-1} - \frac{y - 1}{q^2 - 1}F^{-1}YK^{-1} \]
\[ = X - \frac{xy - 1}{q^2 - 1}F^{-1}YK^{-1} \]
\[ = \Theta^{(F)}_{xy}(X), \]

\[
\Theta^{(F)}_x \Theta^{(F)}_y(E) = \Theta^{(F)}_x(E + \frac{1 - y^{-1}}{(q^2 - 1)(q - q^{-1})}KF^{-1} - \frac{1 - y}{(q^2 - 1)(q - q^{-1})}K^{-1}F^{-1}) \]
\[ = E + \frac{1 - x^{-1}}{(q^2 - 1)(q - q^{-1})}KF^{-1} - \frac{1 - x}{(q^2 - 1)(q - q^{-1})}K^{-1}F^{-1} \]
\[ + \frac{x^{-1}(1 - y^{-1})}{(q^2 - 1)(q - q^{-1})}KF^{-1} - \frac{x(1 - y)}{(q^2 - 1)(q - q^{-1})}K^{-1}F^{-1} \]
\[ = E + \frac{1 - x^{-1}y^{-1}}{(q^2 - 1)(q - q^{-1})}KF^{-1} - \frac{1 - xy}{(q^2 - 1)(q - q^{-1})}K^{-1}F^{-1} \]
\[ = \Theta^{(F)}_{xy}(E), \]
\[ \Theta_x^{(y)}(x) = \Theta_x^{(y)}(y - \frac{y - 1}{q - 1} CY) \]
\[ = y \Theta_x^{(y)}(x) - \frac{y - 1}{q - 1} CY \]
\[ = xy X - \frac{y - 1}{q - 1} CY - \frac{y - 1}{q - 1} CY \]
\[ = xy X - xy - \frac{1}{q - 1} CY \]
\[ = \Theta_x^{(y)}(x). \]

\[ \Theta_x^{(y)}(E) = \Theta_x^{(y)}(y - 1 E + \frac{y - 1}{q - 1} Y - \frac{y + qy - 1 - q - 1}{(q - q^-)(q - 1)} CY - 2) \]
\[ = y - 1 \Theta_x^{(y)}(E) + \frac{y - 1}{q - q^-} Y - \frac{y + qy - 1 - q - 1}{(q - q^-)(q - 1)} CY - 2 \]
\[ = y - 1 \left( x - 1 E + \frac{x - 1}{q - q^-} Y - x - \frac{x q - 1 - q - 1}{(q - q^-)(q - 1)} CY - 2 \right) \]
\[ + \frac{y - 1}{q - q^-} Y - \frac{y - 1}{q - q^-} x - 1 \frac{q - 1}{(q - q^-)(q - 1)} CY - 2 \]
\[ = (xy)^{-1} E + \frac{xy - x - 1}{q - q^-} Y - \frac{x q - 1 - q - 1}{(q - q^-)(q - 1)} CY - 2. \]

Now we can define Mathieu’s twisting functor in our situation. For \( b \in \mathbb{C}^*, u \in \{F, Y\} \), the *twisting functor* \( B_{(u)}^{(b)} : S_q \text{-Mod} \to S_q \text{-Mod} \) is defined as composition of the following functors:

(i) the induction functor \( \text{Ind}_{S_q}^{(u)} := S_q^{(u)} \otimes S_q \);

(ii) twisting the \( S_q^{(u)} \)-action by \( \Theta_{b}^{(u)} \);

(iii) the restriction functor \( \text{Res}_{S_q}^{(u)} \).

The following two results are similar as Lemma 10 and Proposition 11 in [6]

**Lemma 4.3.** Let \( u \in \{F, Y\} \). Let \( V \) ba an \( S_q \)-module on which \( u \) acts bijectively and \( W \) be an \( S_q^{(y)} \)-module. Then

(i) \( \text{Ind}_{S_q}^{(u)} \circ \text{Res}_{S_q}^{(u)} (W) \cong W. \)

(ii) \( \text{Res}_{S_q}^{(u)} \circ \text{Ind}_{S_q}^{(u)} (V) \cong V. \)

**Proposition 4.4.** For \( x, y \in \mathbb{C}^*, u \in \{F, Y\} \), we have \( B_{x}^{(u)} \circ B_{y}^{(u)} \cong B_{xy}^{(u)}. \)
**Proposition 4.5.** Let \( L \) be a simple \( S_q \)-module and \( u \in \{ F, Y \} \). Then \( B_b^{(u)}(L) \) is a simple \( S_q \)-module for any \( b \in \mathbb{C}^* \).

**Proof.** This follows from the fact that if \( W \subseteq B_b^{(u)}(L) \) is a submodule, then \( B_{b^{-1}}^{(u)}(B_b^{(u)}(L)) \cong L \) is a submodule.

## 5 Classification of simple modules

In this section, we will classify all simple weight \( S_q \)-modules with finite dimensional weight spaces. First, we have

**Lemma 5.1.** Let \( V \) be a simple weight \( S_q \)-module with finite dimensional weight spaces.

1. If \( E \) acts locally nilpotently on \( V \), then \( V \) is a highest weight module. If \( F \) acts locally nilpotently on \( V \), then \( V \) is a lowest weight module.

2. Suppose in addition that \( V \) has nonzero central charge. If \( X \) acts locally nilpotently on \( V \), then \( V \) is a highest weight module. If \( Y \) acts locally nilpotently on \( V \), then \( V \) is a lowest weight module.

**Proof.**

(i) We only need to prove the claim for the element \( E \), the other case is similar. Suppose \( E \) acts on \( V \) locally nilpotently and \( V \) is not a highest weight module, then \( V \) is not a lowest weight module either, for otherwise \( E \) and \( F \) would both act locally nilpotently on \( V \) and hence \( V \) is a direct sum of finite dimensional modules when restricted to \( U_q(sl_2) \). Since \( V \) has finite dimensional weight spaces, \( V \) is finite dimensional, and hence a highest weight module.

Therefore, \( V \) is either a dense \( U_q(sl_2) \)-module or is in \( \mathcal{N} \). However, \( E \) does not act locally nilpotently on simple dense \( U_q(sl_2) \)-modules, so \( V \) is in \( \mathcal{N} \). By Theorem 3.4, we have \( \text{supp}(V) = \lambda q^x \) for some \( \lambda \in \mathbb{C}^* \) and all nonzero weight spaces of \( V \) have the same dimension. So \( V \) has finite length as a \( U_q(sl_2) \)-module. The only simple weight \( U_q(sl_2) \)-modules on which \( E \) acts locally nilpotently are highest weight modules, therefore, as a \( U_q(sl_2) \)-module, \( V \) has a finite filtration with subquotients being highest weight modules. Therefore, \( V \) must have a highest weight, a contradiction. This proves claim (i).

(ii) Again we only need to consider the claim for the element \( X \). Take any nonzero weight vector \( v \) with weight \( \lambda \) such that \( Xv = 0 \). By claim (i) we may assume that \( E \) acts injectively on \( V \). Since \( EX = qXE \), we must have for any \( i \in \mathbb{Z}_+ \), \( v_i = E^iv \neq 0 \) and \( Xv_i = 0 \).

We claim that the action of \( Y \) on \( V \) is injective for otherwise it would be locally nilpotent and then \( Y^kv = 0 \) for some \( k \in \mathbb{Z}_+ \) while \( Y^{k-1}v \neq 0 \). Thus, we have

\[
0 = XY^kv = -\frac{q^k - 1}{q - 1} Y^{k-1}v \neq 0,
\]

which is a contradiction.
Finally, we show that \( \{ Y^{2i}v_i \mid i \in \mathbb{Z}_+ \} \) is an infinite set of linearly independent elements. First,

\[
X^{2k}Y^{2i}v_i = \sum_{t=1}^{\min(2k,2i)} (-1)^t q^{4kt+t} \prod_{j=0}^{t-1} \frac{(1 - q^{-2k+j})(1 - q^{-2i+j})}{(q - 1)(q^{j+1} - 1)} C^t Y^{2i-t} X^{2k-t} v_i
\]

tells us that \( X^{2k}Y^{2i}v_i = 0 \) only if \( k > i \). Hence, \( Y^{2i}v_i \neq Y^{2j}v_j \) whenever \( i \neq j \). Now suppose \( \sum_{i=0}^{k} a_i Y^{2i}v_i = 0 \), then we have

\[
0 = X^{2k}(\sum_{i=0}^{k} a_i Y^{2i}v_i) = a_k (-z)^{2k} q^{4k^2+2k} \prod_{j=0}^{2k-1} \frac{(1 - q^{-z-2k+j})(1 - q^{-z-2k+j})}{(q - 1)(q^{j+1} - 1)} v_k,
\]

which is impossible. Hence, we have infinitely linearly many independent weight vectors of weight \( \lambda \), a contradiction.

\[ \square \]

**Corollary 5.2.** Let \( L \in \mathcal{N} \). Then both \( E \) and \( F \) act bijectively on \( L \). If in addition \( L \) has nonzero central charge, then also both \( X \) and \( Y \) acts bijectively on \( L \).

**Proof.** From Lemma 5.1 it follows that the actions of \( E, F, X \) and \( Y \) on \( L \) are not locally nilpotent, hence are injective. By Theorem 3.4, these actions restrict to injective actions between finite-dimensional vector spaces of the same dimension. Therefore they all are bijective.

\[ \square \]

**Lemma 5.3.** Let \( L \in \mathcal{N} \).

(i) There exists \( b \in \mathbb{C}^* \) and \( 0 \neq v \in B_b^{(F)}(L) \) such that \( Ev = 0 \).

(ii) Assume that \( CL \neq 0 \). Then there exists \( b \in \mathbb{C}^* \) and \( 0 \neq v \in B_b^{(Y)}(L) \) such that \( Xv = 0 \).

**Proof.** (i) By Corollary 5.2, both \( E \) and \( F \) act bijectively on \( L \), and hence \( EF : L_\lambda \to L_\lambda \) is bijective for any \( \lambda \in \text{supp}(L) \). So there exists \( v \in L_\lambda \) such that \( EFv = av \) for some \( a \in \mathbb{C}^* \).

Since

\[
\Theta_b^{(F)}(E)Fv = (E + \frac{1 - b^{-1}}{(q^2 - 1)(q - q^{-1})}KF^{-1} - \frac{1 - b}{(q^2 - 1)(q - q^{-1})}K^{-1}F^{-1})Fv
\]

\[
= (a + \lambda \frac{1 - b^{-1}}{(q^2 - 1)(q - q^{-1})} - \lambda^{-1} \frac{1 - b}{(q^2 - 1)(q - q^{-1})})v,
\]

we can choose \( b \in \mathbb{C}^* \) such that \( \Theta_b^{(F)}(E)Fv = 0 \).
(ii) Let $L_\lambda$ be a weight space of $L$. Suppose $\dim L_\lambda = m$. Since both $X$ and $Y$ act bijectively on $L$, $XY$ is a bijective operator on $L_\lambda$ and hence there exists $v \in L_\lambda$ such that $XYv = a_1v$ for some $a_1 \in \mathbb{C}^*$. Suppose $C$ acts like $c \in \mathbb{C}^*$ on $L$. If we cannot find $a_1 \neq \frac{c}{q-1}$, then we can find a basis $\{v_1, \ldots, v_m\}$ for $L_\lambda$ such that

$$XYv_1 = \frac{c}{q-1}v_1,$$
$$XYv_i = \frac{c}{q-1}v_i + \epsilon_i v_{i-1}, \quad 2 \leq i \leq m,$$

where $\epsilon_i \in \{0, 1\}, 2 \leq i \leq m$.

Because $X$ acts on $L$ bijectively, so $\{X^k v_i | i = 1, \ldots, m\}$ is a basis for $L_{\lambda q^k}$ for any $k \in \mathbb{Z}_+$. Similarly, $\{Ev_i | 1 \leq i \leq m\}$ is a basis for $L_{\lambda q^2}$. Suppose that $Ev_i = \sum_{j=1}^m a_{ij}X^2v_j$, then

$$XYEv_i = XY(\sum_{j=1}^m a_{ij}X^2v_j)$$
$$= q^{-2}\sum_{j=1}^m a_{ij}X^2XYv_j + \frac{1 - q^{-2}}{q-1}c\sum_{j=1}^m a_{ij}X^2v_j$$
$$= \frac{q^{-2}c}{q-1}Ev_i + \frac{1 - q^{-2}}{q-1}c\sum_{j=1}^m a_{ij}X^2v_j + q^{-2}\sum_{j=2}^m a_{ij}\epsilon_jX^2v_{j-1}$$
$$= \frac{c}{q-1}Ev_i + q^{-2}\sum_{j=2}^m a_{ij}\epsilon_jX^2v_{j-1}.$$

On the other hand, we have

$$XYEv_i = qX(EY - X)v_i = \begin{cases} \frac{c}{q-1}Ev_1 - qX^2v_1, & \text{if } i = 1; \\ \frac{c}{q-1}Ev_i + \epsilon_iEv_{i-1} - qX^2v_i, & \text{if } i \geq 2. \end{cases}$$

Hence, we have

$$\sum_{j=2}^m a_{ij}\epsilon_jX^2v_{j-1} = -q^3X^2v_1,$$
$$\sum_{j=2}^m a_{ij}\epsilon_jX^2v_{j-1} = q^2\epsilon_i\sum_{j=1}^m a_{i-1,j}X^2v_j - q^3X^2v_i, \quad 2 \leq i \leq m.$$

So

$$\epsilon_2a_{12} = -q^3,$$
$$\epsilon_{i+1}a_{i,i+1} = q^2\epsilon_i a_{i-1,i} - q^3, \quad 2 \leq i \leq m - 1.$$
Therefore, we get
\[ 0 = q^2 e_m a_{m-1,m} - q^3. \]
which implies that \( q^{2m} = 1 \), this contradicts with our assumption that \( q \) is not a root of unity.

So, we can find \( a_1 \) which is not \( \frac{a}{q-1} \). Take \( b = (1 - (q - 1)c^{-1}a_1)^{-1} \), then
\[ \Theta_b^{(Y)}(X)Yv = 0. \]

**Proposition 5.4.** Let \( V \) be a uniformly bounded weight \( S_q \)-module with \( \text{supp}(V) \subseteq \lambda q^Z \) for some \( \lambda \in \mathbb{C}^* \). If there is some \( 0 \neq v \in V \) such that \( Ev = 0 \) or \( Xv = 0 \), then \( V \) has a simple highest weight submodule.

**Proof.** By assumption, for \( u = E, X \),
\[ W_u := \{v \in V | u^nv = 0 \text{ for some } n \in \mathbb{N} \} \neq 0. \]
By Lemma 3.2, \( W_u \) is a submodule. Since \( V \) has finite length, any simple submodule of \( W_u \) is a highest weight module.

Now we are ready to prove our main result.

**Theorem 5.5.** (i) Let \( L \in \mathcal{N} \). Then there exists \( b \in \mathbb{C}^*, z \in \mathbb{C}^* \) and \( \lambda \) with \( \lambda^2 = q^{2d-3} \in q^{-3+2N} \), such that \( L \cong B^{(Y)}(N(\lambda, z)) \). In particular, \( L \) has a basis \( \{v_{k,l}|k, l \in \mathbb{Z}, 0 \leq l \leq d - 1\} \), on which the \( S_q \)-action is given by
\[
K.v_{k,l} = \lambda b^{-1}q^{-2l}v_{k,l}, C.v_{k,l} = zv_{k,l}, Y.v_{k,l} = v_{k+1,l},
\]
\[
F.v_{k,l} = \left\{ \begin{array}{ll}
v_{k,l+1}, & l < d - 1, \\
-\sum_{i=0}^{d-1} (-\frac{bq}{\lambda^{i}(q+1)})^d \frac{d}{i} q^{k+2d-2i+1}v_{k+2d-2i+1}, & l = d - 1,
\end{array} \right.
\]
\[
X.v_{k,l} = -zq^{k-1}v_{k-1,l} - \lambda^{-1}bq^{k+l-1}[l]qv_{k+1,l-1},
\]
\[
E.v_{k,l} = \frac{\lambda b^{-1}q^{-k-l} - \lambda^{-1}bq^{k+l-1}[l]qv_{k,l-1}}{q - q^{-1}} - \frac{q + q^2 - b^{-1}q^{2-k} - bq^{k+1}}{(1-q^2)(q-1)}zv_{k-2,l}.
\]
(ii) Let \( z \in \mathbb{C}^* \) and \( \lambda^2 = q^{2d-3} \in q^{-3+2N} \). Then \( B^{(Y)}(N(\lambda, z)) \cong B^{(Y)}(N(\lambda', z')) \) if and only if \( \lambda = \lambda', z = z' \) and \( b^{-1}b' \in q^Z \).

**Proof.** By Lemma 5.3, there exists \( b^{-1} \in \mathbb{C}^* \) and \( 0 \neq v \in B^{(F)}(L) \) such that \( Ev = 0 \). Then by Proposition 5.4, \( B^{(F)}(L) \) contains a simple highest weight submodule \( N \). However, \( B^{(F)}(L) \) is simple by Proposition 4.5. So \( L \cong B^{(F)}(N) \).

Following from Theorem 3.1, one of the following holds:
(a) $XN = YN = 0$ and $z = 0$;

(b) $N \cong M(\lambda, z)$ for some $\lambda$ with $\lambda^2 \not\in q^{-3+2N}$ and $z \in \mathbb{C}^*$;

(c) $N \cong N(\lambda, z)$ for some $\lambda$ with $\lambda^2 \in q^{-3+2N}$ and $z \in \mathbb{C}^*$.

So, if $L$ has zero central charge, we have $XL = \Theta^b_F(X)N = 0$ and $YL = \Theta^b_F(Y)N = 0$ which is impossible. So $L$ has nonzero central charge. Then using the same argument as above, we know that $L \cong B^b_Y(N)$ for some $b$ and some highest weight module $N$, where $N$ can only be the last two cases. However, for case (b), the weight spaces of $B^b_Y(N)$ are unbounded. So, $N$ can be only case (c). From the basis of $B^b_Y(N(\lambda, z))$, we know that it is in $N$. The actions follows from direct calculations.

For (ii), suppose $B^b_Y(N(\lambda, z)) \cong B^b_Y(N(\lambda', z'))$. Then clearly they must have the same central charge must equal, that is $z = z'$. Also, the isomorphism implies the same dimension of weight spaces, which means $\lambda^2 = \lambda'^2$. However, if $\lambda = -\lambda'$, then they are not isomorphic. From

$$\lambda b^{-1} q^Z = \text{supp}(B^b_Y(N(\lambda, z))) = \text{supp}(B^b_Y(N(\lambda', z'))) = \lambda' b'^{-1} q^Z,$$

we know that $b^{-1} b' \in q^Z$.

Conversely, whenever $b = q^t \in q^Z$, it is easy to check that

$$B^b_Y(N(\lambda, z)) \rightarrow B^b_Y(N(\lambda, z)); v_{k+t,l} \mapsto v_{k,l}$$

is an isomorphism. \hfill \Box
