Existence, Uniqueness and Homogenization of Nonlinear Parabolic Problems with Dynamical Boundary Conditions in Perforated Media

María Anguiano

Abstract. We consider a nonlinear parabolic problem with nonlinear dynamical boundary conditions of pure-reactive type in a media perforated by periodically distributed holes of size $\varepsilon$. The novelty of our work is to consider a nonlinear model where the nonlinearity also appears in the boundary. The existence and uniqueness of solution is analyzed. Moreover, passing to the limit when $\varepsilon$ goes to zero, a new nonlinear parabolic problem defined on a unified domain without holes with zero Dirichlet boundary condition and with extra terms coming from the influence of the nonlinear dynamical boundary conditions is rigorously derived.

Mathematics Subject Classification. Primary 35B27; Secondary 35K57.

Keywords. Homogenization, perforated media, dynamical boundary conditions.

1. Introduction and Setting of the Problem

Partial differential equations with dynamical boundary conditions have the main characteristic of involving the time derivative of the unknown on the boundary of the domain. Its use dates back at least to 1901 in the context of heat transfer in a solid in contact with a moving fluid. From the second half of the twentieth century until today, they have been studied in many disciplines (such as diffusion phenomena in thermodynamics, phase-transition phenomena in material science, climate science, control theory, and special flows in hydrodynamics).

Several approaches have been used for these problems in a periodically perforated domain, like Homogenization Theory. Many recent papers in the
literature have treated the homogenization of elliptic problems with nonlinear boundary conditions with prescribed growth. In particular, in Cioranescu et al. [1], the authors apply the periodic unfolding method in perforated domains to a class of elliptic problems with nonlinear conditions on the boundary of the holes. The homogenization of quasilinear elliptic problems in periodically perforated domains with nonlinear Robin boundary conditions has been considered in Cabarrubias and Donato [2], Chourabi and Donato [3,4], and Donato et al. [5].

For linear parabolic problems with linear dynamical boundary conditions of pure-reactive type in periodically perforated domains, the asymptotic behavior of the solution, when the size of the perforations tends to zero, is studied in Timofte [6]. However, to our knowledge, there does not seem to be in the literature any study of the asymptotic behavior of the solution of nonlinear parabolic models associated with nonlinear dynamical boundary conditions of pure-reactive type in periodically perforated domains (up to the stochastic framework, see Wang and Duan [7]).

Let us introduce the model we will be involved in this paper. Let Ω be a bounded connected open set in $\mathbb{R}^N$ ($N \geq 2$), with smooth enough boundary $\partial \Omega$. Let $Y = [0,1]^N$ be the representative cell in $\mathbb{R}^N$ and $F$ an open subset of $Y$ with smooth enough boundary $\partial F$, such that $\bar{F} \subset Y$. We denote $Y^* = Y \setminus F$.

For $k \in \mathbb{Z}^N$, each cell $Y_{k,\varepsilon} = \varepsilon k + \varepsilon Y$ is similar to the unit cell $Y$ rescaled to size $\varepsilon$ and $F_{k,\varepsilon} = \varepsilon k + \varepsilon F$ is similar to $F$ rescaled to size $\varepsilon$. We denote $Y^*_{k,\varepsilon} = Y_{k,\varepsilon} \setminus \bar{F}_{k,\varepsilon}$. We denote by $F_\varepsilon$ the set of all the holes contained in $\Omega$, i.e. $F_\varepsilon = \cup_{k \in K} \{ F_{k,\varepsilon} : \bar{F}_{k,\varepsilon} \subset \Omega \}$, where $K := \{ k \in \mathbb{Z}^N : Y_{k,\varepsilon} \cap \Omega \neq \emptyset \}$.

Let $\Omega_\varepsilon = \Omega \setminus F_\varepsilon$. By this construction, $\Omega_\varepsilon$ is a periodically perforated domain with holes of the same size as the period.

We consider the following problem for a nonlinear reaction–diffusion equation with nonlinear dynamical boundary conditions of pure-reactive type on the surface of the holes and zero Dirichlet condition on the exterior boundary:

$$
\begin{cases}
\frac{\partial u_{\varepsilon}}{\partial t} - \Delta u_{\varepsilon} + \kappa u_{\varepsilon} + f(u_{\varepsilon}) = h(x,t) & \text{in } \Omega_\varepsilon \times (0,T), \\
\frac{\partial u_{\varepsilon}}{\partial \bar{n}} + \varepsilon \frac{\partial u_{\varepsilon}}{\partial t} + \varepsilon g(u_{\varepsilon}) = \varepsilon \rho(x,t) & \text{on } \partial F_\varepsilon \times (0,T), \\
u_{\varepsilon}(x,0) = u_0^0(x), & \text{for } x \in \Omega_\varepsilon, \\
u_{\varepsilon}(x,0) = \psi_0^0(x), & \text{for } x \in \partial F_\varepsilon, \\
u_{\varepsilon} = 0, & \text{on } \partial \Omega \times (0,T),
\end{cases}
$$

(1.1)

where $\bar{n}$ is the outer normal to $\partial F_\varepsilon$, $T > 0$, and

$$
\kappa > 0, \quad u_0^0 \in L^2(\Omega), \quad \psi_0^0 \in L^2(\partial F_\varepsilon),
$$

(1.2)

$$
h \in L^2(0,T;L^2(\Omega)), \quad \rho \in L^2(0,T;H^1_0(\Omega)),
$$

(1.3)

are given.
We also assume that the functions $f$ and $g \in C(\mathbb{R})$ are given, and satisfy that there exist exponents $p$ and $q$, such that:

\[ 2 \leq p < +\infty, \text{ if } N = 2 \quad \text{and} \quad 2 \leq p \leq \frac{2N}{N-2}, \text{ if } N > 2, \quad (1.4) \]

\[ 2 \leq q < +\infty, \text{ if } N = 2 \quad \text{and} \quad 2 \leq q \leq \frac{2N}{N-2}, \text{ if } N > 2, \quad (1.5) \]

and constants $\alpha_1 > 0, \alpha_2 > 0, \beta > 0, \text{ and } l > 0$, such that:

\[ \alpha_1 |s|^p - \beta \leq f(s)s \leq \alpha_2 |s|^p + \beta, \quad \text{for all } s \in \mathbb{R}, \quad (1.6) \]

\[ \alpha_1 |s|^q - \beta \leq g(s)s \leq \alpha_2 |s|^q + \beta, \quad \text{for all } s \in \mathbb{R}, \quad (1.7) \]

\[ (f(s) - f(r))(s - r) \geq -l (s - r)^2, \quad \text{for all } s, r \in \mathbb{R}, \quad (1.8) \]

and

\[ (g(s) - g(r))(s - r) \geq -l (s - r)^2, \quad \text{for all } s, r \in \mathbb{R}. \quad (1.9) \]

It is easy to see from (1.6) and (1.7) that there exists a constant $C > 0$, such that:

\[ |f(s)| \leq C \left( 1 + |s|^{p-1} \right), \quad |g(s)| \leq C \left( 1 + |s|^{q-1} \right), \quad \text{for all } s \in \mathbb{R}. \quad (1.10) \]

Let us denote

\[ \mathcal{F}(s) := \int_0^s f(r)dr \quad \text{and} \quad \mathcal{G}(s) := \int_0^s g(r)dr. \]

Then, there exist positive constants $\tilde{\alpha}_1, \tilde{\alpha}_2, \text{ and } \tilde{\beta}$, such that:

\[ \tilde{\alpha}_1 |s|^p - \tilde{\beta} \leq \mathcal{F}(s) \leq \tilde{\alpha}_2 |s|^p + \tilde{\beta} \quad \forall s \in \mathbb{R}, \quad (1.11) \]

and

\[ \tilde{\alpha}_1 |s|^q - \tilde{\beta} \leq \mathcal{G}(s) \leq \tilde{\alpha}_2 |s|^q + \tilde{\beta} \quad \forall s \in \mathbb{R}. \quad (1.12) \]

**Remark 1.1.** If $u_\varepsilon$ is regular enough, then a compatibility condition for problem (1.1) is that $\psi^0_\varepsilon$ must coincide with the restriction to $\partial F_\varepsilon$ of $u^0_\varepsilon$, and therefore, the fourth equation in (1.1) is omitted. Nevertheless, this equation seems necessary for the concept of weak solution (see Definition 3.1).

In this paper, our main motivation is to study the asymptotic behavior, as $\varepsilon \to 0$, of the solution $u_\varepsilon$ of (1.1). As we mentioned before, we only have references in the literature of this approach in the stochastic context. In that sense, a particularly interesting situation is treated in Wang and Duan [7] with the help of the two-scale convergence. There, the authors obtain the asymptotic behavior of the solution of a stochastic partial differential equation with random dynamical boundary conditions, under the restrictive assumption $g(s) = s$, i.e., the nonlinearity does not appear in the boundary. However, we will obtain the asymptotic behavior of the solution of (1.1) where the nonlinearity also appears in the boundary. We use the energy method of Tartar [8], which has been considered by many authors (see, for instance, Cioranescu and Donato [9]) and the technique introduced by Vanninathan [10] for the Steklov problem which transforms surface integrals into volume.
integrals. This technique was already used as a main tool to homogenize the non homogeneous Neumann problem for the elliptic case by Cioranescu and Donato [9].

In this sense, when \( \varepsilon \to 0 \), we have got a new nonlinear reaction–diffusion equation with constant coefficient defined on \( \Omega \times (0,T) \), with zero Dirichlet boundary condition on the boundary, and with a constant extra term in front of the derivative which comes from the well-balanced contribution of the dynamical part of the boundary condition on the surface of the holes.

The structure of the paper is as follows. In Sect. 2, we give some notations which are used in the paper. In Sect. 3, we give a weak formulation of the problem and the concept of weak solution, and establish the existence and uniqueness of solution using the monotonicity method. Some a priori estimates are rigorously established in Sect. 4. A compactness result, which is the main key when we will pass to the limit later, is addressed in Sect. 5. In Sect. 6, the main goal of proving the asymptotic behavior of the solution is finally established in Theorem 6.1.

2. Some Notations

In this section, we give some notations which are used in the paper.

We denote by \( \chi_{\Omega_\varepsilon} \) the characteristic function of the domain \( \Omega_\varepsilon \).

We denote by \( (\cdot,\cdot)_{\Omega_\varepsilon} \) (respectively, \( (\cdot,\cdot)_{\partial F_\varepsilon} \)) the inner product in \( L^2(\Omega_\varepsilon) \) (respectively, in \( L^2(\partial F_\varepsilon) \)), and by \( |\cdot|_{\Omega_\varepsilon} \) (respectively, \( |\cdot|_{\partial F_\varepsilon} \)) the associated norm. We also denote \( (\cdot,\cdot)_{\Omega_\varepsilon} \) the inner product in \( (L^2(\Omega_\varepsilon))^N \).

If \( r \neq 2 \), we will also denote \( (\cdot,\cdot)_{\Omega_\varepsilon} \) (respectively, \( (\cdot,\cdot)_{\partial F_\varepsilon} \)) the duality product between \( L^r(\Omega_\varepsilon) \) and \( L^r(\Omega_\varepsilon) \) (respectively, the duality product between \( L^r(\partial F_\varepsilon) \) and \( L^r(\partial F_\varepsilon) \)). We will denote \( |\cdot|_{r,\Omega_\varepsilon} \) (respectively, \( |\cdot|_{r,\partial F_\varepsilon} \)) the norm in \( L^r(\Omega_\varepsilon) \) (respectively, in \( L^r(\partial F_\varepsilon) \)).

By \( \parallel \cdot \parallel_{\Omega_\varepsilon} \), we denote the norm in \( H^1(\Omega_\varepsilon) \), which is associated with the inner product \( ((\cdot,\cdot))_{\Omega_\varepsilon} := (\nabla\cdot,\nabla\cdot)_{\Omega_\varepsilon} + (\cdot,\cdot)_{\Omega_\varepsilon} \).

By \( \parallel \cdot \parallel_{\Omega_\varepsilon,T} \) (respectively, \( \parallel \cdot \parallel_{r,\partial F_\varepsilon,T} \)), we denote the norm in \( L^2(0,T;H^1(\Omega_\varepsilon)) \). By \( \parallel \cdot \parallel_{r,\Omega_\varepsilon,T} \) (respectively, \( \parallel \cdot \parallel_{r,\partial F_\varepsilon,T} \)), we denote the norm in \( L^r(0,T;L^r(\Omega_\varepsilon)) \) (respectively, \( L^r(0,T;L^r(\partial F_\varepsilon)) \)).

We denote by \( \gamma_0 \) the trace operator \( u \mapsto u_{\partial \Omega_\varepsilon} \). The trace operator belongs to \( \mathcal{L}(H^1(\Omega_\varepsilon),H^{1/2}(\partial \Omega_\varepsilon)) \), and we will use \( \|\gamma_0\| \) to denote the norm of \( \gamma_0 \) in this space.

We will use \( \parallel \cdot \parallel_{\partial \Omega_\varepsilon} \) to denote the norm in \( H^{1/2}(\partial \Omega_\varepsilon) \), which is given by \( \parallel \phi \parallel_{\partial \Omega_\varepsilon} = \inf\{\|v\|_{\Omega_\varepsilon} : \gamma_0(v) = \phi\} \). We remember that with this norm, \( H^{1/2}(\partial \Omega_\varepsilon) \) is a Hilbert space.

Finally, we denote by \( H^r_{\partial \Omega}(\Omega_\varepsilon) \) and \( H^r_{\partial \Omega}(\partial \Omega_\varepsilon) \), for \( r \geq 0 \), the standard Sobolev spaces which are closed subspaces of \( H^r(\Omega_\varepsilon) \) and \( H^r(\partial \Omega_\varepsilon) \), respectively, and the subscript \( \partial \Omega \) means that, respectively, traces or functions in \( \partial \Omega_\varepsilon \) vanish on this part of the boundary of \( \Omega_\varepsilon \), that is:

\[
H^r_{\partial \Omega}(\Omega_\varepsilon) = \{v \in H^r(\Omega_\varepsilon) : \gamma_0(v) = 0 \text{ on } \partial \Omega\},
\]
and

\[ H^r_{\partial \Omega} (\partial \Omega_\varepsilon) = \{ v \in H^r (\partial \Omega_\varepsilon) : v = 0 \text{ on } \partial \Omega \}. \]

Let us notice that, in fact, we can consider an element of \( H^{1/2} (\partial F_\varepsilon) \) as an element of \( H^{1/2}_{\partial \Omega} (\partial \Omega_\varepsilon) \).

Analogously, for \( r \geq 2 \), we denote:

\[ L^r_{\partial \Omega} (\partial \Omega_\varepsilon) := \{ v \in L^r (\partial \Omega_\varepsilon) : v = 0 \text{ on } \partial \Omega \}. \]

Let us notice that, in fact, we can consider the given \( \psi^0_\varepsilon \) as an element of \( L^2_{\partial \Omega} (\partial \Omega_\varepsilon) \).

Let us consider the space:

\[ H^p := L^p (\Omega_\varepsilon) \times L^p_{\partial \Omega} (\partial \Omega_\varepsilon) \quad \forall p \geq 2, \]

with the natural inner product \( ((v, \phi), (w, \psi))_{H^p} = (v, w)_{\Omega_\varepsilon} + \varepsilon (\phi, \psi)_{\partial F_\varepsilon} \), which, in particular, induces the norm \( |(\cdot, \cdot)|_{H^p} \) given by:

\[ |(v, \phi)|^2_{H^p} = |v|_{\Omega_\varepsilon}^2 + \varepsilon |\phi|_{\partial F_\varepsilon}^2, \quad (v, \phi) \in H^p. \]

For the sake of clarity, we shall omit to write explicitly the index \( p \) if \( p = 2 \), so we denote by \( H \) the Hilbert space:

\[ H := L^2 (\Omega_\varepsilon) \times L^2_{\partial \Omega} (\partial \Omega_\varepsilon). \]

Let us also consider the space:

\[ V_1 := \{ (v, \gamma_0(v)) : v \in H^1_{\partial \Omega} (\Omega_\varepsilon) \}. \]

We note that \( V_1 \) is a closed vector subspace of \( H^1_{\partial \Omega} (\Omega_\varepsilon) \times H^{1/2}_{\partial \Omega} (\partial \Omega_\varepsilon) \), and therefore, with the norm \( \| (\cdot, \cdot) \|_{V_1} \) given by:

\[ \| (v, \gamma_0(v)) \|^2_{V_1} = \| v \|^2_{\Omega_\varepsilon} + \| \gamma_0(v) \|^2_{\partial F_\varepsilon}, \quad (v, \gamma_0(v)) \in V_1, \]

\( V_1 \) is a Hilbert space.

In what follows, we shall denote by \( C \) different constants which are independent of \( \varepsilon \).

3. Existence and Uniqueness of Solution

We state in this section a result on the existence and uniqueness of solution of problem (1.1). Instead of working directly with our equation, we will apply a general result which is a slight modification of Theorem 1.4, Chapter 2 in Lions [11].

In the sequel, we assume that:

\[ |(u^0_\varepsilon, \psi^0_\varepsilon)|_H \leq C. \quad (3.1) \]
Definition 3.1. A weak solution of (1.1) is a pair of functions \((u_\varepsilon, \psi_\varepsilon)\), satisfying:

\[
\begin{align*}
    u_\varepsilon &\in C([0,T]; L^2(\Omega_\varepsilon)), \quad \psi_\varepsilon \in C([0,T]; L^2_0(\partial \Omega_\varepsilon)), \quad \text{for all } T > 0, \\
    u_\varepsilon &\in L^2(0,T; H^1_0(\Omega_\varepsilon)) \cap L^p(0,T; L^p(\varepsilon)), \quad \text{for all } T > 0, \\
    \psi_\varepsilon &\in L^2(0,T; H^{1/2}_0(\partial \Omega_\varepsilon)) \cap L^q(0,T; L^q_0(\partial \Omega_\varepsilon)), \quad \text{for all } T > 0, \\
    \gamma_0(u_\varepsilon(t)) &= \psi_\varepsilon(t), \quad \text{a.e. } t \in (0,T], \\
    \frac{d}{dt}(u_\varepsilon(t), v)_{\Omega_\varepsilon} + \varepsilon \frac{d}{dt}(\psi_\varepsilon(t), \gamma_0(v))_{\partial F_\varepsilon} + (\nabla u_\varepsilon(t), \nabla v)_{\Omega_\varepsilon} + \kappa(u_\varepsilon(t), v)_{\Omega_\varepsilon} \\
    &\quad + (f(u_\varepsilon(t)), v)_{\Omega_\varepsilon} + \varepsilon (g(\psi_\varepsilon(t)), \gamma_0(v))_{\partial F_\varepsilon} = (h(t), v)_{\Omega_\varepsilon} + \varepsilon (\rho(t), \gamma_0(v))_{\partial F_\varepsilon}, \quad \text{in } \mathcal{D}'(0,T), \text{for all } v \in H^1_0(\Omega_\varepsilon) \cap L^p(\Omega_\varepsilon) \text{ such that } \gamma_0(v) \in L^q_0(\partial \Omega_\varepsilon), \\
    u_\varepsilon(0) &= u_0^\varepsilon, \quad \text{and } \psi_\varepsilon(0) = \psi_0^\varepsilon.
\end{align*}
\]

Remark 3.2. In view of Theorem 3 in Chapter 5 subsection 5.9.2 in Evans [12], it is not difficult to prove that it \((u_\varepsilon, \psi_\varepsilon)\) satisfies (3.3)–(3.6), and then, \((u_\varepsilon, \psi_\varepsilon)\) satisfies (3.2). The function \(\psi_\varepsilon\) is the \(L^2_0(\partial \Omega_\varepsilon)\)-continuous version of \(\gamma_0(u_\varepsilon)\) (see (3.11)–(3.12) below).

We have the following result.

Theorem 3.3. Under the assumptions (1.2)–(1.9), there exists a unique solution \((u_\varepsilon, \psi_\varepsilon)\) of the problem (1.1). Moreover, this solution satisfies the energy equality:

\[
\begin{align*}
    \frac{1}{2} \frac{d}{dt} \left( \|u_\varepsilon(t), \psi_\varepsilon(t)\|_{H^1_\varepsilon}^2 \right) &+ |\nabla u_\varepsilon(t)|_{\Omega_\varepsilon}^2 + \kappa |u_\varepsilon(t)|_{\Omega_\varepsilon}^2 \\
    &+ (f(u_\varepsilon(t)), u_\varepsilon(t))_{\Omega_\varepsilon} + \varepsilon (g(\psi_\varepsilon(t)), \psi_\varepsilon(t))_{\partial F_\varepsilon} &\quad \text{in } \mathcal{D}'(0,T), \text{for all } v \in H^1_\varepsilon(\Omega_\varepsilon), \\
    (v, w)_{\Omega_\varepsilon} + \varepsilon (\gamma_0(v), \phi)_{\partial F_\varepsilon} &= 0, \quad \text{for all } v \in H^1_\varepsilon(\Omega_\varepsilon),
\end{align*}
\]

Proof. The proof of this result is standard. For the sake of completeness, we give a sketch of a proof.

First, we prove that \(V_1\) is densely embedded in \(H\). In fact, if we consider \((w, \phi) \in H\), such that:

\[
(v, w)_{\Omega_\varepsilon} + \varepsilon (\gamma_0(v), \phi)_{\partial F_\varepsilon} = 0, \quad \text{for all } v \in H^1_\varepsilon(\Omega_\varepsilon),
\]

in particular, we have:

\[
(v, w)_{\Omega_\varepsilon} = 0, \quad \text{for all } v \in H^1_0(\Omega_\varepsilon),
\]

and therefore, \(w = 0\). Consequently:

\[
(\gamma_0(v), \phi)_{\partial F_\varepsilon} = 0, \quad \text{for all } v \in H^1_\varepsilon(\Omega_\varepsilon),
\]

and then, as \(H^{1/2}_\varepsilon(\partial \Omega_\varepsilon) = \gamma_0(H^1_\varepsilon(\Omega_\varepsilon))\) is dense in \(L^2_0(\partial \Omega_\varepsilon)\), we have that \(\phi = 0\).

Now, on the space \(V_1\), we define a continuous symmetric linear operator \(A_1: V_1 \rightarrow V'_1\), given by:

\[
(A_1((v, \gamma_0(v))), (w, \gamma_0(w))) = (\nabla v, \nabla w)_{\Omega_\varepsilon} + \kappa(v, w)_{\Omega_\varepsilon},
\]

for all \(v, w \in H^1_\varepsilon(\Omega_\varepsilon)\).
We observe that $A_1$ is coercive. In fact, we have:

$$
\langle A_1 ((v, \gamma_0(v)), (v, \gamma_0(v))) \rangle \geq \min \left\{ 1, \kappa \right\} \|v\|^2_{\Omega_\varepsilon} = \frac{1}{1 + \|\gamma_0\|^2} \min \left\{ 1, \kappa \right\} \|v\|^2_{\Omega_\varepsilon} + \frac{\|\gamma_0\|^2}{1 + \|\gamma_0\|^2} \min \left\{ 1, \kappa \right\} \|v\|^2_{\Omega_\varepsilon} \geq \frac{1}{1 + \|\gamma_0\|^2} \min \left\{ 1, \kappa \right\} \|v, \gamma_0(v)\|^2_{V_1},
$$

(3.10)

for all $v \in H^1_{\partial\Omega}(\Omega_\varepsilon)$. Let us denote:

$$
V_2 = L^p(\Omega_\varepsilon) \times L^2(\partial\Omega_\varepsilon), \quad V_3 = L^2(\Omega_\varepsilon) \times L^q(\partial\Omega_\varepsilon),
$$

$$
A_2(v, \phi) = (f(v), 0), \quad A_3(v, \phi) = (0, \varepsilon g(\phi)), \quad \vec{h}(t) = (h(t), \varepsilon \rho(t)).
$$

From (1.10), one deduces that $A_i : V_i \to V'_i$, for $i = 2, 3$. Observe also that by (1.3):

$$
\vec{h} \in L^2(0, T; H) \subset L^2(0, T; V'_1).
$$

With this notation, and denoting $V = \bigcap_{i=1}^3 V_i$, $p_1 = 2, p_2 = p, p_3 = q$, $\vec{u}_\varepsilon = (u_\varepsilon, \psi_\varepsilon)$, one has that (3.2)–(3.7) is equivalent to:

$$
\vec{u}_\varepsilon \in C([0, T]; H), \quad \vec{u}_\varepsilon \in \bigcap_{i=1}^3 L^{p_i}(0, T; V_i), \quad \text{for all } T > 0, \quad (3.11)
$$

$$
(\vec{u}_\varepsilon)'(t) + \sum_{i=1}^3 A_i(\vec{u}_\varepsilon(t)) = \vec{h}(t) \quad \text{in } \mathcal{D}'(0, T; V'), \quad (3.12)
$$

$$
\vec{u}_\varepsilon(0) = (u_0^\varepsilon, \psi_0^\varepsilon). \quad (3.13)
$$

Applying a slight modification of [11, Ch.2, Th.1.4], it is not difficult to see that problem (3.11)–(3.12) has a unique solution. Moreover, $\vec{u}_\varepsilon$ satisfies the energy equality:

$$
\frac{1}{2} \frac{d}{dt} |\vec{u}_\varepsilon(t)|^2_H + \sum_{i=1}^3 \langle A_i(\vec{u}_\varepsilon(t)), \vec{u}_\varepsilon(t) \rangle_i = \langle \vec{h}(t), \vec{u}_\varepsilon(t) \rangle_H \quad \text{a.e. } t \in (0, T),
$$

where $\langle \cdot, \cdot \rangle_i$ denotes the duality product between $V'_i$ and $V_i$. This last equality turns out to be just (3.8).

**Remark 3.4.** The assumption $\kappa > 0$ is not necessary for the existence and uniqueness of weak solution to (1.1).
4. A Priori Estimates

Let us begin with a variant of the Trace Theorem in $\Omega_\varepsilon$.

**Lemma 4.1.** There exists a positive constant $C$ independent of $\varepsilon$, such that:

$$\varepsilon |\gamma_0(v)|_{p,\partial F_\varepsilon}^p \leq C \left( |v|_{p,\Omega_\varepsilon}^p + \varepsilon^p |\nabla v|_{p,\Omega_\varepsilon}^p \right), \quad 1 \leq p < \infty,$$

(4.1)

for any $v \in W^{1,p}(\Omega_\varepsilon)$, $v = 0$ on $\partial \Omega$.

**Proof.** For any function $v(y) \in W^{1,p}(Y^* \varepsilon)^N$, using the Trace Theorem (see Chapter 5, Section 5.5, Theorem 1 in Evans [12], for more details), we have for every $k \in \mathbb{Z}^N$:

$$\int_{\partial(F+k)} |\gamma_0(v)|^p d\sigma(y) \leq C \left( \int_{Y^*+k} |v|^p dy + \int_{Y^*+k} |\nabla v|^p dy \right),$$

(4.2)

where $1 \leq p < \infty$ and the constant $C$ depends only on $p$ and $Y$.

By the change of variable:

$$y = \frac{x}{\varepsilon}, \quad d\sigma(y) = \varepsilon^{-(N-1)} d\sigma(x), \quad \partial_y = \varepsilon \partial_x,$$

(4.3)

we rescale (4.2) from $Y^*+k$ to $Y_{k,\varepsilon}^*$ and from $F+k$ to $F_{k,\varepsilon}$. This yields that, for any function $v(x) \in W^{1,p}(Y_{k,\varepsilon}^*)^N$, one has:

$$\varepsilon \int_{\partial F_{k,\varepsilon}} |\gamma_0(v)|^p d\sigma(x) \leq C \left( \int_{Y_{k,\varepsilon}^*} |v|^p dx + \varepsilon^p \int_{Y_{k,\varepsilon}^*} |\nabla v|^p dx \right),$$

with the same constant $C$ as in (4.2). Summing the inequalities, for every $k \in K$, gives the desired result (4.1). \square

Let us obtain some a priori estimates for $u_\varepsilon$.

**Lemma 4.2.** Under the assumptions (1.2)–(1.9) and (3.1), there exists a constant $C$ independent of $\varepsilon$, such that the solution $u_\varepsilon$ of the problem (1.1) satisfies:

$$\|u_\varepsilon\|_{\Omega_\varepsilon,T} \leq C. \quad (4.4)$$

**Proof.** By (3.8) and taking into account (1.6), (1.7) and (3.10), we have:

$$\frac{d}{dt} \left( (|u_\varepsilon(t)|_{\Omega_\varepsilon}^2 + \|\psi_\varepsilon(t)\|^2_{\partial F_\varepsilon} \right) + 2 \min \left\{ 1, \kappa \right\} \left( \|u_\varepsilon(t)\|_{\Omega_\varepsilon}^2 + \|\psi_\varepsilon(t)\|_{\partial F_\varepsilon}^2 \right)$$

$$+ 2 \alpha_1 (|u_\varepsilon(t)|_{p,\Omega_\varepsilon}^p + \varepsilon |\psi_\varepsilon(t)|_{q,\partial F_\varepsilon}^q)$$

$$\leq 2 \beta (\|\Omega_\varepsilon\| + \varepsilon |\partial F_\varepsilon|) + |h(t)|_{\varepsilon_\varepsilon}^2 + \varepsilon |\rho(t)|_{\partial F_\varepsilon}^2$$

$$+ |u_\varepsilon(t)|_{\varepsilon_{\varepsilon}}^2 + \varepsilon |\psi_\varepsilon(t)|_{\partial F_\varepsilon}^2, \quad (4.5)$$

where $|\Omega_\varepsilon|$ and $|\partial F_\varepsilon|$ denote the measure of $\Omega_\varepsilon$ and $\partial F_\varepsilon$, respectively.
Integrating (4.5) between 0 and $t$ and using (1.3), we obtain:

$$
\left| (u_\varepsilon(t), \psi_\varepsilon(t)) \right|^2_H + \frac{2 \min \{1, \kappa \}}{1 + \|\gamma_0\|^2} \int_0^t \left( \|u_\varepsilon(s)\|^2_{\Omega_\varepsilon} + \|\psi_\varepsilon(s)\|^2_{\partial F_\varepsilon} \right) ds
$$

$$
+ 2\alpha_1 \int_0^t \|u_\varepsilon(s)\|^p_{p, \Omega_\varepsilon} + \varepsilon |\psi_\varepsilon(s)|^q_{q, \partial F_\varepsilon} ds
$$

$$
\leq 2\beta t (|\Omega_\varepsilon| + \varepsilon |\partial F_\varepsilon|) + (u_0^\varepsilon, \psi_0^\varepsilon)^2_H + \int_0^T \left( |h(s)|^2_{\Omega_\varepsilon} + \varepsilon |\rho(s)|^2_{\partial F_\varepsilon} \right) ds
$$

$$
+ \int_0^t \left| (u_\varepsilon(s), \psi_\varepsilon(s)) \right|^2_H ds. \quad (4.6)
$$

By Lemma 4.1 with $p = 2$, we can deduce:

$$
\varepsilon |\rho(t)|^2_{\partial F_\varepsilon} \leq C \left( |\rho(t)|^2_{\Omega_\varepsilon} + \varepsilon^2 |\nabla \rho(t)|^2_{\Omega_\varepsilon} \right) \leq C ||\rho(t)||^2_{\Omega_\varepsilon},
$$

which together with (1.3) gives:

$$
\int_0^T \left( |h(s)|^2_{\Omega_\varepsilon} + \varepsilon |\rho(s)|^2_{\partial F_\varepsilon} \right) ds \leq C. \quad (4.7)
$$

On the other hand, the number of holes is given by:

$$
N(\varepsilon) = \frac{|\Omega|}{(2\varepsilon)^N} \left( 1 + o(1) \right),
$$

then using the change of variable (4.3), we can deduce:

$$
|\partial F_\varepsilon| = N(\varepsilon)|\partial F_{k, \varepsilon}| = N(\varepsilon)\varepsilon^{N-1} |\partial F| \leq \frac{C}{\varepsilon}. \quad (4.8)
$$

And since $|\Omega_\varepsilon| \leq |\Omega|$, we have that:

$$
|\Omega_\varepsilon| + \varepsilon |\partial F_\varepsilon| \leq C. \quad (4.9)
$$

Taking into account (3.1), (4.7)–(4.8) in (4.6) and applying Gronwall Lemma, in particular, we obtain that there exists a positive constant $C$, such that:

$$
\left| (u_\varepsilon(t), \psi_\varepsilon(t)) \right|^2_H \leq C,
$$

for all $t \in (0, T)$.

Now, taking into account (3.1), (4.7)–(4.9) in (4.6), we get (4.4). \qed

Now, if we want to take the inner product in (1.1) with $u_\varepsilon'$, we need that $u'_\varepsilon \in L^2(0, T; H^1_{\partial \Omega}(\Omega_\varepsilon)) \cap L^p(0, T; L^p(\Omega_\varepsilon))$ with $\gamma_0(u'_\varepsilon) \in L^q(0, T; L^q_{\partial \Omega}(\Omega_\varepsilon))$. However, we do not have it for our weak solution. Therefore, we use the Galerkin method and the following lemma to prove, rigorously, new a priori estimates for $u_\varepsilon$.

**Lemma 4.3.** (Lemma 11.2 in Robinson [13]) Let $X, Y$ be Banach spaces, such that $X$ is reflexive, and the inclusion $X \subset Y$ is compact. Assume that $\{u_m\}$ is uniformly bounded in $L^\infty(0, T; X)$:

$$
\text{ess sup}_{t \in [0, T]} \|u_m(t)\|_X \leq C,
$$

then for all $t \in (0, T)$, we have:

$$
\left| (u_\varepsilon(t), \psi_\varepsilon(t)) \right|^2_H \leq C,
$$

for all $t \in (0, T)$.
and that $u_m \rightarrow u$ weakly in $L^2(0,T;X)$, then

$$\text{ess sup}_{t \in [0,T]} \|u(t)\|_X \leq C.$$  

Furthermore, if $u \in C([0,T];Y)$, then $u(t) \in X$ for all $t \in [0,T]$ and

$$\sup_{t \in [0,T]} \|u(t)\|_X \leq C.$$  

Let us observe that the space $H^1_{\partial \Omega}((\Omega_\varepsilon) \times H^{1/2}_{\partial \Omega}(\partial \Omega_\varepsilon)$ is compactly imbedded in $H$, and therefore, for the symmetric and coercive linear continuous operator $A_1 : V_1 \rightarrow V'_1$, where $A_1$ is given by (3.9), there exists a non-decreasing sequence $0 < \lambda_1 \leq \lambda_2 \leq \ldots$ of eigenvalues associated to the operator $A_1$ with $\lim_{j \rightarrow \infty} \lambda_j = \infty$, and there exists a Hilbert basis of $H$, $\{(w_j, \gamma_0(w_j)) : j \geq 1\} \subset D(A_1)$, with $\text{span}\{(w_j, \gamma_0(w_j)) : j \geq 1\}$ densely embedded in $V_1$, such that:

$$A_1((w_j, \gamma_0(w_j))) = \lambda_j(w_j, \gamma_0(w_j)) \quad \forall j \geq 1.$$  

Remark 4.4. It can be proved that if $p = q \geq 2$, then $\text{span}\{(w_j, \gamma_0(w_j)) : j \geq 1\}$ is densely embedded in $V_1 \cap H_p$.

Taking into account the above facts, we denote by:

$$(u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t))) = (u_{\varepsilon,m}(t;0,u_0^0,\psi_0^0), \gamma_0(u_{\varepsilon,m}(t;0,u_0^0,\psi_0^0)))$$

the Galerkin approximation of the solution $$(u_{\varepsilon}(t;0,u_0^0,\psi_0^0), \gamma_0(u_{\varepsilon}(t;0,u_0^0,\psi_0^0)))$$
to (1.1) for each integer $m \geq 1$, which is given by:

$$(u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t))) = \sum_{j=1}^{m} \delta_{\varepsilon mj}(t)(w_j, \gamma_0(w_j)), \quad (4.10)$$

and is the solution of

$$\frac{d}{dt}((u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t))), (w_j, \gamma_0(w_j)))_H$$

$$+ \langle A_1((u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t))), (w_j, \gamma_0(w_j)))$$

$$+ (f(u_{\varepsilon,m}(t)), w_j)_{\Omega_\varepsilon} + \varepsilon(g(\gamma_0(u_{\varepsilon,m}(t))), \gamma_0(w_j))_{\partial \Omega_\varepsilon}$$

$$= (h(t), w_j)_{\Omega_\varepsilon} + \varepsilon(\rho(t), \gamma_0(w_j))_{\partial \Omega_\varepsilon}, \quad j = 1, \ldots, m, \quad (4.11)$$

with initial data:

$$(u_{\varepsilon,m}(0), \gamma_0(u_{\varepsilon,m}(0))) = (u_0^0_{\varepsilon,m}, \gamma_0(u_0^0_{\varepsilon,m})), \quad (4.12)$$

where

$$\delta_{\varepsilon mj}(t) = (u_{\varepsilon,m}(t), w_j)_{\Omega_\varepsilon} + (\gamma_0(u_{\varepsilon,m}(t)), \gamma_0(w_j))_{\partial \Omega_\varepsilon},$$

and $(u_0^0_{\varepsilon,m}, \gamma_0(u_0^0_{\varepsilon,m})) \in \text{span}\{(w_j, \gamma_0(w_j)) : j = 1, \ldots, m\}$ converge (when $m \rightarrow \infty$) to $(u_0^0_{\varepsilon}, \psi_0^0_{\varepsilon})$ in a suitable sense which will be specified below.

Lemma 4.5. Suppose that in addition to the assumptions (1.2)–(1.9), we have $p = q \geq 2$. Then, for any initial condition $(u_0^0_{\varepsilon}, \psi_0^0_{\varepsilon}) \in V_1 \cap H_p$, there exists a constant $C$ independent of $\varepsilon$, such that the solution $u_\varepsilon$ of the problem (1.1) satisfies:

$$\sup_{t \in [0,T]} \|u_\varepsilon(t)\|_{\Omega_\varepsilon} \leq C. \quad (4.13)$$
Proof. Let $(u^0_\varepsilon, \psi^0_\varepsilon) \in V_1 \cap H_p$. For all $m \geq 1$, by Remark 4.4, there exists $(u^0_{\varepsilon,m}, \gamma_0(u^0_{\varepsilon,m})) \in \text{span}\{(w_j, \gamma_0(w_j)) : 1 \leq j \leq m\}$, such that the sequence $(u^0_{\varepsilon,m}, \gamma_0(u^0_{\varepsilon,m}))$ converges to $(u^0_\varepsilon, \psi^0_\varepsilon)$ in $V_1$ and in $H_p$. Then, in particular, we know that there exists a constant $C$, such that:

$$||(u^0_{\varepsilon,m}, \gamma_0(u^0_{\varepsilon,m}))||_{V_1} \leq C, \quad ||(u^0_{\varepsilon,m}, \gamma_0(u^0_{\varepsilon,m}))||_{H_p} \leq C. \quad (4.14)$$

For each integer $m \geq 1$, we consider the sequence $\{(u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t)))\}$ defined by (4.10)–(4.12) with these initial data.

Multiplying by the derivative $\delta'_\varepsilon \gamma_j$ in (4.11), and summing from $j = 1$ to $m$, we obtain:

$$|(u'_{\varepsilon,m}(t), \gamma_0(u'_{\varepsilon,m}(t)))|^2_{H}$$

$$+ \frac{1}{2} \frac{d}{dt} \left( \langle A_1((u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t))), (u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t))) \rangle \right.$$  

$$+ \langle f(u_{\varepsilon,m}(t)), u'_{\varepsilon,m}(t) \rangle + \varepsilon \langle g(\gamma_0(u_{\varepsilon,m}(t))), \gamma_0(u'_{\varepsilon,m}(t)) \rangle_{\partial F_\varepsilon}$$

$$= (h(t), u'_{\varepsilon,m}(t))_{\Omega_\varepsilon} + \varepsilon \langle \rho(t), \gamma_0(u'_{\varepsilon,m}(t)) \rangle_{\partial F_\varepsilon}.$$  

We observe that

$$(f(u_{\varepsilon,m}(t)), u'_{\varepsilon,m}(t))_{\Omega_\varepsilon} = \frac{d}{dt} \int_{\Omega_\varepsilon} \mathcal{F}(u_{\varepsilon,m}(t))dx,$$

and

$$(g(\gamma_0(u_{\varepsilon,m}(t))), \gamma_0(u'_{\varepsilon,m}(t)))_{\partial F_\varepsilon} = \frac{d}{dt} \int_{\partial F_\varepsilon} \mathcal{G}(\gamma_0(u_{\varepsilon,m}(t)))d\sigma(x).$$

Then, we deduce:

$$|(u'_{\varepsilon,m}(t), \gamma_0(u'_{\varepsilon,m}(t)))|^2_{H}$$

$$+ \frac{1}{2} \frac{d}{dt} \left( \langle A_1((u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t))), (u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t))) \rangle \right.$$  

$$\leq \frac{1}{2} ||h(t)||^2_{\Omega_\varepsilon} + \frac{1}{2} ||u'_{\varepsilon,m}(t)||^2_{H_\varepsilon} + \varepsilon \frac{1}{2} ||\rho(t)||^2_{\partial F_\varepsilon} + \varepsilon \frac{1}{2} ||\gamma_0(u'_{\varepsilon,m}(t))||^2_{\partial F_\varepsilon}$$

$$- \frac{d}{dt} \int_{\Omega_\varepsilon} \mathcal{F}(u_{\varepsilon,m}(t))dx - \varepsilon \frac{d}{dt} \int_{\partial F_\varepsilon} \mathcal{G}(\gamma_0(u_{\varepsilon,m}(t)))d\sigma(x).$$

Integrating now between 0 and $t$, taking into account the definition of $A_1$ and (3.10), and using (1.11) and (1.12), we obtain that:

$$\int_0^t \left( (u'_{\varepsilon,m}(s), \gamma_0(u'_{\varepsilon,m}(s))) \right)^2_{H} ds + \min \left\{ \frac{1}{\varepsilon}, \kappa \right\} \left( \|u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t))\|_{V_1}^2 \right.$$  

$$+ 2\tilde{\alpha}_1 ||u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t))||_{H_p}^p$$

$$\leq \max \left\{ 1, \kappa \right\} ||u^0_{\varepsilon,m}, \gamma_0(u^0_{\varepsilon,m})||_{V_1}^2 + \int_0^T \left( ||h(s)||^2_{\Omega_\varepsilon} + \varepsilon ||\rho(s)||^2_{\partial F_\varepsilon} \right) ds$$

$$+ 2\tilde{\alpha}_2 ||u^0_{\varepsilon,m}, \gamma_0(u^0_{\varepsilon,m})||_{H_p}^p + 4\tilde{\beta} (||\Omega_\varepsilon|| + \varepsilon ||\partial F_\varepsilon||), \quad (4.15)$$

for all $t \in (0, T)$.

Taking into account (4.14) and using (4.7)–(4.8) in (4.15), we have proved that the sequence $\{(u_{\varepsilon,m}, \gamma_0(u_{\varepsilon,m}))\}$ is bounded in $C([0, T]; V_1 \cap H_p)$, and $\{(u'_{\varepsilon,m}, \gamma_0(u'_{\varepsilon,m}))\}$ is bounded in $L^2(0, T; H)$, for all $T > 0$. 

If we work with the truncated Galerkin equations (4.10)–(4.12) instead of the full PDE, we note that the calculations of the proof of Lemma 4.2 can be following identically to show that \( \{(u_{\varepsilon,m}, \gamma_0(u_{\varepsilon,m}))\} \) is bounded in \( L^2(0,T; V_1) \), for all \( T > 0 \).

Moreover, taking into account the uniqueness of solution to (1.1) and using Aubin–Lions compactness lemma (e.g., cf. Lions [11]), it is not difficult to conclude that the sequence \( \{(u_{\varepsilon,m}, \gamma_0(u_{\varepsilon,m}))\} \) converges weakly in \( L^2(0,T; V_1) \) to the solution \((u_{\varepsilon}, \gamma_0(u_{\varepsilon}))\) to (1.1). Since the inclusion \( H^1(\Omega_\varepsilon) \subset L^2(\Omega_\varepsilon) \) is compact and \( u_{\varepsilon} \in C([0,T]; L^2(\Omega_\varepsilon)) \), it follows using Lemma 4.3 that the estimate (4.13) is proved. □

**Lemma 4.6.** Under the assumptions in Lemma 4.5, assume that \( f, g \in C^1(\mathbb{R}) \), \( h \in W^{1,2}(0,T; L^2(\Omega)) \) and \( \rho \in W^{1,2}(0,T; H^1_0(\Omega)) \), then there exists a constant \( C \) independent of \( \varepsilon \), such that the solution \( u_{\varepsilon} \) of the problem (1.1) satisfies:

\[
\|u'_{\varepsilon}\|_{\Omega_\varepsilon,T} \leq C. \tag{4.16}
\]

**Proof.** We first note that under the conditions imposed, we have that:

\[
f'(s) \geq -l, \quad g'(s) \geq -l \quad \forall s \in \mathbb{R}. \tag{4.17}
\]

Observe that as we are assuming that \( f, g \in C^1(\mathbb{R}) \), \( h \in W^{1,2}(\mathbb{R}; L^2(\Omega)) \) and \( \rho \in W^{1,2}(\mathbb{R}; H^1_0(\Omega)) \), we can differentiate with respect to time in (4.11), and then, multiplying by the derivative \( \delta_{\varepsilon m j} \) and summing from \( j = 1 \) to \( m \), we obtain:

\[
\frac{1}{2} \frac{d}{dt} \left\| (u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t))) \right\|^2_{H} + \frac{2 \min \{1, \kappa\}}{1 + \|\gamma_0\|^2} \left\| (u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t))) \right\|^2_{V_1} \\
\leq (2l + 1) \left\| (u'_{\varepsilon,m}(t), \gamma_0(u'_{\varepsilon,m}(t))) \right\|^2_{H} + \|h'(t)\|^2_{\Omega_\varepsilon} + \varepsilon |\rho'(t)|^2_{\partial \Omega_\varepsilon}.
\]

Then, using (3.10) and (4.17), we have:

\[
\frac{d}{dt} \left\| (u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t))) \right\|^2_{H} + \frac{2 \min \{1, \kappa\}}{1 + \|\gamma_0\|^2} \left\| (u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t))) \right\|^2_{V_1} \\
\leq (2l + 1) \left\| (u'_{\varepsilon,m}(t), \gamma_0(u'_{\varepsilon,m}(t))) \right\|^2_{H} + \|h'(t)\|^2_{\Omega_\varepsilon} + \varepsilon |\rho'(t)|^2_{\partial \Omega_\varepsilon}.
\]

Integrating between \( r \) and \( t \):

\[
\left\| (u_{\varepsilon,m}(t), \gamma_0(u_{\varepsilon,m}(t))) \right\|^2_{H} + \frac{2 \min \{1, \kappa\}}{1 + \|\gamma_0\|^2} \int_{r}^{t} \left\| (u_{\varepsilon,m}(s), \gamma_0(u_{\varepsilon,m}(s))) \right\|^2_{V_1} ds \\
\leq \left\| (u'_{\varepsilon,m}(r), \gamma_0(u'_{\varepsilon,m}(r))) \right\|^2_{H} + (2l + 1) \int_{r}^{t} \left\| (u'_{\varepsilon,m}(s), \gamma_0(u'_{\varepsilon,m}(s))) \right\|^2_{H} ds \\
+ \int_{r}^{t} (\|h'(s)\|^2_{\Omega_\varepsilon} + \varepsilon |\rho'(s)|^2_{\partial \Omega_\varepsilon}) ds,
\]
for all $0 \leq r \leq t$. Now, integrating with respect to $r$ between 0 and $t$:

$$
\int_0^t \left| (u'_{\varepsilon,m}(s), \gamma_0(u'_{\varepsilon,m}(s))) \right|^2_H ds + \frac{2\min \{1, \kappa\}}{1 + \|\gamma_0\|^2} \int_0^t \| (u'_{\varepsilon,m}(s), \gamma_0(u'_{\varepsilon,m}(s))) \|_{V_1}^2 ds
$$

$$
\leq 2(l + 1) \int_0^t \left| (u'_{\varepsilon,m}(s), \gamma_0(u'_{\varepsilon,m}(s))) \right|^2_H ds + \int_0^T \left| h'(s) \right|^2_{\Omega_\varepsilon} + \varepsilon \left| \rho'(s) \right|^2_{\partial F_\varepsilon} ds,
$$

for all $t \in (0, T)$.

By Lemma 4.1 with $p = 2$, we can deduce:

$$
\varepsilon \left| \rho'(t) \right|^2_{\partial F_\varepsilon} \leq C \left( \left| \rho'(t) \right|^2_{\Omega_\varepsilon} + \varepsilon^2 |\nabla \rho'(t)|^2_{\Omega_\varepsilon} \right) \leq C \left| \rho'(t) \right|^2_{\Omega_\varepsilon},
$$

and using that $h \in W^{1,2}(0, T; L^2(\Omega))$ and $\rho \in W^{1,2}(0, T; H^1_0(\Omega))$, we have:

$$
\int_0^T \left| h'(s) \right|^2_{\Omega_\varepsilon} + \varepsilon \left| \rho'(s) \right|^2_{\partial F_\varepsilon} ds \leq C.
$$

In particular, taking into account (4.7)-(4.8) in (4.15), we have:

$$
\int_0^t \left| (u'_{\varepsilon,m}(s), \gamma_0(u'_{\varepsilon,m}(s))) \right|^2_H ds
$$

$$
\leq C \left( 1 + \|(u^0_{\varepsilon,m}, \gamma_0(u^0_{\varepsilon,m}))\|_{V_1}^2 + \|(u^0_{\varepsilon,m}, \gamma_0(u^0_{\varepsilon,m}))\|_{H_p}^p \right),
$$

which, jointly with (4.18)-(4.19), yields that:

$$
\int_0^t \left| (u'_{\varepsilon,m}(s), \gamma_0(u'_{\varepsilon,m}(s))) \right|^2_{V_1} ds
$$

$$
\leq C \left( 1 + \|(u^0_{\varepsilon,m}, \gamma_0(u^0_{\varepsilon,m}))\|_{V_1}^2 + \|(u^0_{\varepsilon,m}, \gamma_0(u^0_{\varepsilon,m}))\|_{H_p}^p \right),
$$

and using (4.14), we have proved that the sequence $\{(u'_{\varepsilon,m}, \gamma_0(u'_{\varepsilon,m}))\}$ is bounded in $L^2(0, T; V_1)$, for all $T > 0$. Then, the sequence $\{(u'_{\varepsilon,m}, \gamma_0(u'_{\varepsilon,m}))\}$ converges weakly in $L^2(0, T; V_1)$ to $(u'_{\varepsilon}, \gamma_0(u'_{\varepsilon}))$, for all $T > 0$, and using the lower semicontinuity of the norm and (4.20), in particular, we get:

$$
\|u'_{\varepsilon}\|_{\Omega_\varepsilon,T} \leq \liminf_{m \to \infty} \|u'_{\varepsilon,m}\|_{\Omega_\varepsilon,T}
$$

$$
\leq C \liminf_{m \to \infty} \left( 1 + \|(u^0_{\varepsilon,m}, \gamma_0(u^0_{\varepsilon,m}))\|_{V_1}^2 + \|(u^0_{\varepsilon,m}, \gamma_0(u^0_{\varepsilon,m}))\|_{H_p}^p \right)
$$

$$
= C \left( 1 + \|(u^0_{\varepsilon}, \psi^0_{\varepsilon})\|_{V_1}^2 + \|(u^0_{\varepsilon}, \psi^0_{\varepsilon})\|_{H_p}^p \right),
$$

which, jointly with $(u^0_{\varepsilon}, \psi^0_{\varepsilon}) \in V_1 \cap H_p$, implies (4.16). \qed

### 4.1. The Extension of $u_\varepsilon$ to the Whole $\Omega \times (0, T)$

Since the solution $u_\varepsilon$ of the problem (1.1) is defined only in $\Omega_\varepsilon \times (0, T)$, we need to extend it to the whole $\Omega \times (0, T)$. We denote by $\tilde{v}$ the extension to the whole $\Omega \times (0, T)$ for any function $v$ defined on $\Omega_\varepsilon \times (0, T)$. For finding a suitable extension $\tilde{u}_\varepsilon$ into all $\Omega \times (0, T)$, we shall use the following well-known extension Lemma.
Lemma 4.7. (Lemma 1 in Cioranescu and Saint Jean Paulin [14]) Every function \( \varphi_\varepsilon \in H^1(\Omega_\varepsilon) \), with \( \varphi_\varepsilon = 0 \) on \( \partial\Omega \), can be extended to a function \( \tilde{\varphi}_\varepsilon \in H^1_0(\Omega) \), such that:

\[
|\nabla \tilde{\varphi}_\varepsilon|_\Omega \leq C|\nabla \varphi_\varepsilon|_{\Omega_\varepsilon},
\]

where the constant \( C \) does not depend on \( \varepsilon \).

Let us obtain some a priori estimates for the extension of \( u_\varepsilon \) to the whole \( \Omega \times (0,T) \).

Corollary 4.8. Assume the assumptions in Lemma 4.6. Then, there exists an extension \( \tilde{u}_\varepsilon \) of the solution \( u_\varepsilon \), of the problem (1.1) into \( \Omega \times (0,T) \), such that:

\[
\|\tilde{u}_\varepsilon(t)\|_{\Omega,T} \leq C, \quad |\tilde{u}_\varepsilon|_{p,\Omega,T} \leq C,
\]

(4.21)

\[
\sup_{t \in [0,T]} \|\tilde{u}_\varepsilon(t)\|_\Omega \leq C,
\]

(4.22)

\[
|\tilde{u}_\varepsilon'|_{p,\Omega,T} \leq C,
\]

(4.23)

where the constant \( C \) does not depend on \( \varepsilon \).

Proof. Using Lemma 4.7 together with the estimate (4.4) [(respectively, the estimate (4.13)], we obtain the first estimate in [(4.21) (respectively, the estimate (4.22)).

By the Sobolev injection Theorem, if \( N = 2 \), we have the continuous embedding \( H^1_0(\Omega) \subset L^p(\Omega) \), and if \( N > 2 \), we have the continuous embedding \( H^1_0(\Omega) \subset L^{2N/(N-2)}(\Omega) \) which, jointly with the assumption (1.4), yields the continuous embedding \( H^1_0(\Omega) \subset L^p(\Omega) \).

Therefore, the continuous embedding \( H^1_0(\Omega) \subset L^p(\Omega) \) implies that using Lemma 4.7 together with the estimate (4.4), we can deduce the second estimate in (4.21).

Finally, using the continuous embedding \( H^1_0(\Omega) \subset L^p(\Omega) \), Lemma 4.7 and the estimate (4.16), we can deduce the estimate (4.23). \( \square \)

5. A Compactness Result

In this section, we obtain some compactness results about the behavior of the sequence \( \tilde{u}_\varepsilon \) satisfying the a priori estimates given in Corollary 4.8.

Due to the periodicity of the domain \( \Omega_\varepsilon \), from Theorem 2.6 in Cioranescu and Donato [15] one has, for \( \varepsilon \to 0 \), that:

\[
\chi_{\Omega_\varepsilon} \ast \frac{|Y^*|}{|Y|} \text{ weakly-star in } L^\infty(\Omega),
\]

(5.1)

where the limit is the proportion of the material in the cell \( Y \).

Let \( \xi_\varepsilon \) be the gradient of \( u_\varepsilon \) in \( \Omega_\varepsilon \times (0,T) \) and let us denote by \( \tilde{\xi}_\varepsilon \) its extension with zero to the whole of \( \Omega \times (0,T) \), that is:

\[
\tilde{\xi}_\varepsilon = \begin{cases} 
\xi_\varepsilon & \text{in } \Omega_\varepsilon \times (0,T), \\
0 & \text{in } (\Omega \backslash \Omega_\varepsilon) \times (0,T).
\end{cases}
\]

(5.2)
Proposition 5.1. Under the assumptions in Lemma 4.6, there exists a function \( u \in L^2(0,T; H^1_0(\Omega)) \cap L^p(0,T; L^p(\Omega)) \) \([u]\) will be the unique solution of the limit system \((6.1)\) and a function \( \xi \in L^2(0,T; L^2(\Omega)) \), such that for all \( T > 0 \):

\[
\tilde{u}_\varepsilon(t) \to u(t) \quad \text{weakly in } H^1_0(\Omega), \quad \forall t \in [0,T], \quad (5.3)
\]

\[
\tilde{u}_\varepsilon(t) \to u(t) \quad \text{strongly in } L^2(\Omega), \quad \forall t \in [0,T], \quad (5.4)
\]

\[
f(\tilde{u}_\varepsilon(t)) \to f(u(t)) \quad \text{strongly in } L^p(\Omega), \quad \forall t \in [0,T], \quad (5.5)
\]

\[
g(\tilde{u}_\varepsilon(t)) \to g(u(t)) \quad \text{strongly in } L^p(\Omega), \quad \forall t \in [0,T], \quad (5.6)
\]

\[
\tilde{\xi}_\varepsilon \to \xi \quad \text{weakly in } L^2(0,T; L^2(\Omega)), \quad (5.7)
\]

where \( \tilde{\xi}_\varepsilon \) is given by \((5.2)\).

Moreover, if we suppose that there exists a constant \( l > 0 \), such that:

\[
(g(s) - g(r))(s - r) \leq l (s - r)^2, \quad \forall s, r \in \mathbb{R}, \quad (5.8)
\]

then

\[
g(\tilde{u}_\varepsilon(t)) \to g(u(t)) \quad \text{weakly in } W^{1,p'}_0(\Omega), \quad \forall t \in [0,T]. \quad (5.9)
\]

Proof. By \((4.21)\), we observe that the sequence \( \{\tilde{u}_\varepsilon\} \) is bounded in the spaces \( L^2(0,T; H^1_0(\Omega)) \cap L^p(0,T; L^p(\Omega)) \), for all \( T > 0 \). Let us fix \( T > 0 \). Then, there exists a subsequence \( \{\tilde{u}_{\varepsilon'}\} \subset \{\tilde{u}_\varepsilon\} \) and function \( u \in L^2(0,T; H^1_0(\Omega)) \cap L^p(0,T; L^p(\Omega)) \), such that:

\[
\tilde{u}_{\varepsilon'} \rightharpoonup u \text{ weakly in } L^2(0,T; H^1_0(\Omega)), \quad (5.10)
\]

\[
\tilde{u}_{\varepsilon'} \rightharpoonup u \text{ weakly in } L^p(0,T; L^p(\Omega)). \quad (5.11)
\]

By the estimate \((4.22)\), for each \( t \in [0,T] \), we have that \( \{\tilde{u}_\varepsilon(t)\} \) is bounded in \( H^1_0(\Omega) \), and since we have \((5.10)\), we can deduce:

\[
\tilde{u}_{\varepsilon'}(t) \rightharpoonup u(t) \text{ weakly in } H^1_0(\Omega), \quad \forall t \in [0,T].
\]

Now, we analyze the convergence for the nonlinear term \( f \). By the estimate \((4.23)\), we see that the sequence \( \{\tilde{u}_\varepsilon\} \) is bounded in \( L^p(0,T; L^p(\Omega)) \), for all \( T > 0 \). Then, we have that \( \tilde{u}_\varepsilon(t) : [0,T] \to L^p(\Omega) \) is an equicontinuous family of functions.

By Rellich–Kondrachov Theorem and \((1.4)\), for \( p \geq 2 \), if \( N = 2 \), we have the compact embedding \( H^1_0(\Omega) \subset L^p(\Omega) \) and if \( N > 2 \), using that \( p \leq 2N/(N - 2) \), we also have the compact embedding \( H^1_0(\Omega) \subset L^p(\Omega) \).

Since, for each \( t \in [0,T] \), we have that \( \{\tilde{u}_\varepsilon(t)\} \) is bounded in \( H^1_0(\Omega) \), the compact embedding \( H^1_0(\Omega) \subset L^p(\Omega) \) implies that it is precompact in \( L^p(\Omega) \).

Then, applying the Ascoli–Arzelà Theorem, we deduce that \( \{\tilde{u}_\varepsilon(t)\} \) is a precompact sequence in \( C([0,T]; L^p(\Omega)) \). Hence, since we have \((5.11)\), we can deduce that:

\[
\tilde{u}_{\varepsilon'} \to u \text{ strongly in } C([0,T]; L^p(\Omega)). \quad (5.12)
\]

Thanks to \((1.10)\), applying Theorem 2.4 in Conca et al. \([16]\) for \( G(x,v) = f(v), t = p' \), and \( r = p \), we have that the map \( v \in L^p(\Omega) \mapsto f(v) \in L^{p'}(\Omega) \)
is continuous in the strong topologies. Then, taking into account (5.12), we get:

\[ f(\tilde{u}_\varepsilon(t)) \to f(u(t)) \quad \text{strongly in } L^{p'}(\Omega) \quad \forall t \in [0, T]. \]

Similarly, we analyze the convergence for the nonlinear term \( g \) and, we can deduce:

\[ g(\tilde{u}_\varepsilon(t)) \to g(u(t)) \quad \text{strongly in } L^{p'}(\Omega), \quad \forall t \in [0, T]. \quad (5.13) \]

In particular, from (5.12), we have:

\[ \tilde{u}_\varepsilon(t) \to u(t) \quad \text{strongly in } L^{p}(\Omega), \quad \forall t \in [0, T], \quad \forall p \geq 2. \]

To prove (5.9), let us first note that there exists \( C > 0 \), such that:

\[ |\nabla g(\tilde{u}_\varepsilon(t))|_{p', \Omega} \leq C. \quad (5.14) \]

We observe that under the condition (5.8), we have that:

\[ g'(s) \leq l, \quad \forall s \in \mathbb{R}. \]

Then, from the estimate (4.22), we get:

\[
\int_\Omega \left| \frac{\partial g}{\partial x_i}(\tilde{u}_\varepsilon(t)) \right|^{p'} dx \leq \int_\Omega \left| \frac{\partial \tilde{u}_\varepsilon(t)}{\partial x_i} \right|^{p'} dx \leq C \int_\Omega |\nabla \tilde{u}_\varepsilon(t)|^{p'} dx \\
\leq C \int_\Omega |\nabla \tilde{u}_\varepsilon(t)|^{2} dx \leq C,
\]

and we have proved (5.14). Then, from (5.13) and (5.14), we can deduce:

\[ g(\tilde{u}_\varepsilon(t)) \rightharpoonup g(u(t)) \quad \text{weakly in } W^{1,p'}_0(\Omega), \quad \forall t \in [0, T]. \]

Finally, from the estimate (4.4) and (5.2), we have \( |\xi_\varepsilon|_{\Omega,T} \leq C \), and hence, up a sequence, there exists \( \xi \in L^2(0,T,L^2(\Omega)) \), such that \( \xi_{\varepsilon'} \rightharpoonup \xi \) weakly in \( L^2(0,T;L^2(\Omega)) \).

By the uniqueness of solution of the limit problem (6.1), we deduce that the above convergences hold for the whole sequence, and therefore, by the arbitrariness of \( T > 0 \), all the convergences are satisfied, as we wanted to prove. \( \Box \)

### 6. Homogenized Model

In this section, we identify the homogenized model.

**Theorem 6.1.** (Main Theorem) Assume the assumptions in Proposition 5.1. Let \((u_\varepsilon, \psi_\varepsilon)\) be the unique solution of the problem (1.1). Then, as \( \varepsilon \to 0 \), we have:

\[ \tilde{u}_\varepsilon(t) \to u(t) \quad \text{strongly in } L^2(\Omega), \quad \forall t \in [0, T], \]

and

\[ \psi_\varepsilon(t) \to \psi(t) \quad \text{strongly in } L^2(\Gamma), \quad \forall t \in [0, T]. \]
where \( \tilde{\cdot} \) denotes the extension to \( \Omega \times (0,T) \) and \( u \) is the unique solution of the following problem:

\[
\left\{
\begin{array}{l}
\left(\frac{|Y^*|}{|Y|} + \frac{|\partial F|}{|Y|}\right) \frac{\partial u}{\partial t} - \sum_{i,j=1}^N q_{i,j} \frac{\partial^2 u}{\partial x_i \partial x_j} + |Y^*| |\partial F| g(u) \\
= |Y| h(x,t) + \frac{|\partial F|}{|Y|} \rho(x,t), \text{ in } \Omega \times (0,T), \\
u(x,0) = u_0(x), \text{ for } x \in \Omega, \\
u = 0, \text{ on } \partial \Omega \times (0,T).
\end{array}
\right.
\]  

(6.1)

The homogenized matrix \( Q = ((q_{i,j})) \), which is constant and positive definite, is given by:

\[
q_{i,j} = \frac{|Y^*|}{|Y|} \delta_{i,j} - \frac{1}{|Y|} \int_{Y^*} \frac{\partial \eta_j}{\partial y_i} \, dy, 
\]

(6.2)

where the functions \( \eta_j \) are solutions of the system:

\[
\left\{
\begin{array}{l}
-\Delta \eta_j = 0, \text{ in } Y^*, \\
\partial(\eta_j - y_j)/\partial n = 0, \text{ on } \partial F, \\
\eta_j \text{ is } Y - \text{periodic},
\end{array}
\right.
\]

(6.3)

where \( y_j \) are local coordinates in \( Y^* \).

Proof. We multiply system (1.1) by a test function \( v \in D(\Omega) \), and integrating by parts, we have:

\[
\frac{d}{dt} \left( \int_{\Omega} \chi_{\Omega^*} \tilde{u}_\varepsilon(t) vdx \right) + \varepsilon \frac{d}{dt} \left( \int_{\partial F_\varepsilon} \gamma_0(u_{\varepsilon}(t)) v \sigma(x) \right) + \int_{\Omega} \tilde{\xi}_\varepsilon \nabla vdx \\
+ \kappa \int_{\Omega} \chi_{\Omega^*} \tilde{u}_\varepsilon(t) vdx + \int_{\Omega} \chi_{\Omega^*} f(\tilde{u}_\varepsilon(t)) vdx + \varepsilon \int_{\partial F_\varepsilon} g(\gamma_0(u_{\varepsilon}(t))) v \sigma(x) \\
= \int_{\Omega} \chi_{\Omega^*} h(t) vdx + \varepsilon \int_{\partial F_\varepsilon} \rho(t) v \sigma(x),
\]

in \( D'(0,T) \).

We consider \( \varphi \in C^1_c([0,T]) \), such that \( \varphi(T) = 0 \) and \( \varphi(0) \neq 0 \). Multiplying by \( \varphi \) and integrating between 0 and \( T \), we have:

\[
-\varphi(0) \left( \int_{\Omega} \chi_{\Omega^*} \tilde{u}_\varepsilon(0) vdx \right) - \int_0^T \frac{d}{dt} \varphi(t) \left( \int_{\Omega} \chi_{\Omega^*} \tilde{u}_\varepsilon(t) vdx \right) \, dt \\
- \varepsilon \varphi(0) \left( \int_{\partial F_\varepsilon} \gamma_0(u_{\varepsilon}(0)) v \sigma(x) \right) - \varepsilon \int_0^T \frac{d}{dt} \varphi(t) \left( \int_{\partial F_\varepsilon} \gamma_0(u_{\varepsilon}(t)) v \sigma(x) \right) \, dt \\
+ \int_0^T \varphi(t) \int_{\Omega} \tilde{\xi}_\varepsilon \nabla v \, dx \, dt + \kappa \int_0^T \varphi(t) \int_{\Omega} \chi_{\Omega^*} \tilde{u}_\varepsilon(t) v dx \, dt \\
+ \int_0^T \varphi(t) \int_{\Omega} \chi_{\Omega^*} f(\tilde{u}_\varepsilon(t)) v dx \, dt + \varepsilon \int_0^T \varphi(t) \int_{\partial F_\varepsilon} g(\gamma_0(u_{\varepsilon}(t))) v \sigma(x) \, dt \\
= \int_0^T \varphi(t) \int_{\Omega} \chi_{\Omega^*} h(t) v dx \, dt + \varepsilon \int_0^T \varphi(t) \int_{\partial F_\varepsilon} \rho(t) v \sigma(x) \, dt.
\]

(6.4)

For the sake of clarity, we split the proof in three parts. First, for the integrals on \( \Omega \), we only require to use Proposition 5.1 and the convergence
(5.1), second, for the integrals on the boundary of the holes, we make use of a convergence result based on a technique introduced by Vanninathan [10]. Finally, we pass to the limit, as \( \varepsilon \to 0 \), in (6.4).

**Step 1.** Passing to the limit, as \( \varepsilon \to 0 \), in the integrals on \( \Omega \):

From (5.4)–(5.5) and (5.1), we have, respectively, for \( \varepsilon \to 0 \):

\[
\int_{\Omega} \chi_{\Omega_{\varepsilon}} \tilde{u}_{\varepsilon}(t) v dx \to \frac{|Y^*|}{|Y|} \int_{\Omega} u(t) v dx, \quad \forall v \in \mathcal{D}(\Omega),
\]

and

\[
\int_{\Omega} \chi_{\Omega_{\varepsilon}} f(\tilde{u}_{\varepsilon}(t)) v dx \to \frac{|Y^*|}{|Y|} \int_{\Omega} f(u(t)) v dx, \quad \forall v \in \mathcal{D}(\Omega),
\]

which, integrating in time and using Lebesgue’s Dominated Convergence Theorem, gives:

\[
\int_{0}^{T} \frac{d}{dt} \varphi(t) \left( \int_{\Omega} \chi_{\Omega_{\varepsilon}} \tilde{u}_{\varepsilon}(t) v dx \right) dt \to \frac{|Y^*|}{|Y|} \int_{0}^{T} \frac{d}{dt} \varphi(t) \left( \int_{\Omega} u(t) v dx \right) dt,
\]

\[
\kappa \int_{0}^{T} \varphi(t) \int_{\Omega} \chi_{\Omega_{\varepsilon}} \tilde{u}_{\varepsilon}(t) v dx dt \to \kappa \frac{|Y^*|}{|Y|} \int_{0}^{T} \varphi(t) \int_{\Omega} u(t) v dx dt,
\]

and

\[
\int_{0}^{T} \varphi(t) \int_{\Omega} \chi_{\Omega_{\varepsilon}} f(\tilde{u}_{\varepsilon}(t)) v dx dt \to \frac{|Y^*|}{|Y|} \int_{0}^{T} \varphi(t) \int_{\Omega} f(u(t)) v dx dt.
\]

By (5.4) and (5.1), we have:

\[
\varphi(0) \left( \int_{\Omega} \chi_{\Omega_{\varepsilon}} \tilde{u}_{\varepsilon}(0) v dx \right) \to \varphi(0) \frac{|Y^*|}{|Y|} \int_{\Omega} u(0) v dx, \quad \forall v \in \mathcal{D}(\Omega).
\]

By the assumption (1.3), (5.1) and using Lebesgue’s Dominated Convergence Theorem, we get:

\[
\int_{0}^{T} \varphi(t) \int_{\Omega} \chi_{\Omega_{\varepsilon}} h(t) v dx dt \to \frac{|Y^*|}{|Y|} \int_{0}^{T} \varphi(t) \int_{\Omega} h(t) v dx dt.
\]

On the other hand, using (5.7), we obtain, for \( \varepsilon \to 0 \):

\[
\int_{0}^{T} \varphi(t) \int_{\Omega} \tilde{\xi}_{\varepsilon} \nabla v dx dt \to \int_{0}^{T} \varphi(t) \int_{\Omega} \xi \nabla v dx dt.
\]

**Step 2.** Passing to the limit, as \( \varepsilon \to 0 \), in the surface integrals on the boundary of the holes:

We make use of the technique introduced by Vanninathan [10] for the Steklov problem which transforms surface integrals into volume integrals. This technique was already used as a main tool to homogenize the non homogeneous Neumann problem for the elliptic case by Cioranescu and Donato [9].

By Definition 3.2 in Cioranescu and Donato [9], let us introduce, for any \( h \in L^{s'}(\partial F) \), \( 1 \leq s' \leq \infty \), the linear form \( \mu_{h}^{\varepsilon} \) on \( W_{0}^{1,s}(\Omega) \) defined by:

\[
\langle \mu_{h}^{\varepsilon}, \varphi \rangle = \varepsilon \int_{\partial F_{\varepsilon}} h \left( \frac{x}{\varepsilon} \right) \varphi d\sigma, \quad \forall \varphi \in W_{0}^{1,s}(\Omega),
\]
with $1/s + 1/s' = 1$. It is proved in Lemma 3.3 in Cioranescu and Donato [9] that:

$$
\mu_h^\varepsilon \rightarrow \mu_h \quad \text{strongly in } (W^{1,s}_0(\Omega))', 
$$

where $\langle \mu_h, \varphi \rangle = \mu_h \int_\Omega \varphi dx$, with

$$
\mu_h = \frac{1}{|Y|} \int_{\partial F} h(y) d\sigma.
$$

In what follows, we shall denote by $1$ and by Lebesgue’s Dominated Convergence Theorem, we can deduce, for $\varepsilon \rightarrow 0$:

$$
\varepsilon \int_{\partial F} \gamma_0(u_\varepsilon(t)) v d\sigma(x) = \langle \mu_1^\varepsilon, \tilde{u}_{\varepsilon|\Omega_\varepsilon}(t) v \rangle \rightarrow \mu_1 \int_\Omega u(t) v dx = \frac{\partial F}{|Y|} \int_\Omega u(t) v dx,
$$

for all $v \in \mathcal{D}(\Omega)$, which, integrating in time and using Lebesgue’s Dominated Convergence Theorem, gives:

$$
\varepsilon \int_0^T \frac{d}{dt} \varphi(t) \left( \int_{\partial F} \gamma_0(u_\varepsilon(t)) v d\sigma(x) \right) dt \rightarrow \frac{\partial F}{|Y|} \int_0^T \frac{d}{dt} \varphi(t) \left( \int_\Omega u(t) v dx \right) dt.
$$

Moreover, using Corollary 4.2 in Cioranescu et al. [17] with (5.3), we can deduce, for $\varepsilon \rightarrow 0$:

$$
\varepsilon \int_{\partial F} \gamma_0(u_\varepsilon(0)) v d\sigma(x) = \langle \mu_1^\varepsilon, \tilde{u}_{\varepsilon|\Omega_\varepsilon}(0) v \rangle \rightarrow \mu_1 \int_\Omega u(0) v dx = \frac{\partial F}{|Y|} \int_\Omega u(0) v dx,
$$

for all $v \in \mathcal{D}(\Omega)$.

On the other hand, note that using (6.5) with $s = 2$, taking into account (1.3) and by Lebesgue’s Dominated Convergence Theorem, we can deduce, for $\varepsilon \rightarrow 0$:

$$
\varepsilon \int_0^T \varphi(t) \int_{\partial F} \rho(t) v d\sigma(x) dt = \int_0^T \varphi(t) \langle \mu_1^\varepsilon, \rho(t) v \rangle dt \\
\rightarrow \frac{\partial F}{|Y|} \int_0^T \varphi(t) \int_\Omega \rho(t) v dx dt.
$$

From (5.9) and (6.5), with $s = p'$, we conclude:

$$
\varepsilon \int_{\partial F} g(\gamma_0(u_\varepsilon(t))) v d\sigma(x) = \langle \mu_1^\varepsilon, g(\tilde{u}_{\varepsilon}(t)) v \rangle \rightarrow \frac{\partial F}{|Y|} \int_\Omega g(u(t)) v dx,
$$

for all $v \in \mathcal{D}(\Omega)$, which, integrating in time and using Lebesgue’s Dominated Convergence Theorem, gives:

$$
\varepsilon \int_0^T \varphi(t) \int_{\partial F} g(\gamma_0(u_\varepsilon(t))) v d\sigma(x) dt \rightarrow \frac{\partial F}{|Y|} \int_0^T \varphi(t) \int_\Omega g(u(t)) v dx dt.
$$
Step 3. Passing to the limit, as $\varepsilon \to 0$, in (6.4):

All the terms in (6.4) pass to the limit, as $\varepsilon \to 0$, and, therefore, taking into account the previous steps, we get:

\[
-\varphi(0) \left( \frac{Y^*}{|Y|} + \frac{\partial F}{|Y|} \right) \left( \int_{\Omega} u(0) v dx \right) - \left( \frac{Y^*}{|Y|} + \frac{\partial F}{|Y|} \right) \int_0^T \frac{d}{dt} \varphi(t) \left( \int_{\Omega} u(t) v dx \right) dt + \int_0^T \varphi(t) \int_{\Omega} \xi \nabla v dx dt + \kappa \frac{|Y^*|}{|Y|} \int_0^T \varphi(t) \int_{\Omega} f(u(t)) v dx dt + \frac{|\partial F|}{|Y|} \int_0^T \varphi(t) \int_{\Omega} g(u(t)) v dx dt
\]

\[= \frac{|Y^*|}{|Y|} \int_0^T \varphi(t) \int_{\Omega} h(t) v dx dt + \frac{|\partial F|}{|Y|} \int_0^T \varphi(t) \int_{\Omega} (\rho(t)) v dx dt.\]

Hence, $\xi$ verifies:

\[
\left( \frac{Y^*}{|Y|} + \frac{\partial F}{|Y|} \right) \frac{\partial u}{\partial t} - \text{div} \xi + \frac{|Y^*|}{|Y|} (\kappa u + f(u)) + \frac{|\partial F|}{|Y|} g(u) = \frac{|Y^*|}{|Y|} h + \frac{|\partial F|}{|Y|} \rho, \quad \text{in } \Omega \times (0,T).
\]

\[\text{(6.6)}\]

It remains now to identify $\xi$. The proof is standard, so we omit it. Following, for example, the proof of Theorem 4.7 in Cioranescu and Donato \[9\], we conclude that:

\[\xi = Q\nabla u, \quad \text{in } \Omega \times (0,T), \quad \text{(6.7)}\]

where $Q = ((q_{i,j}))$ is given by (6.2). Then, taking into account (6.7) in (6.6), we have the homogenized model (6.1). \hfill \Box

Definition 6.2. A weak solution of (6.1) is any function $u$, satisfying:

\[u \in C([0,T];L^2(\Omega)), \quad \text{for all } T > 0,\]

\[u \in L^2(0,T;H^1_0(\Omega)) \cap L^p(0,T;L^p(\Omega)), \quad \text{for all } T > 0,\]

\[\begin{cases}
\left( \frac{Y^*}{|Y|} + \frac{\partial F}{|Y|} \right) \frac{d}{dt} (u(t), v) + (Q \nabla u(t), \nabla v) + |Y^*| \kappa(u(t), v) \\
+ \frac{|Y^*|}{|Y|} (f(u(t)), v) + \frac{\partial F}{|Y|} (g(u(t)), v) \\
= \frac{|Y^*|}{|Y|} (h(t), v) + \frac{\partial F}{|Y|} (\rho(t), v),
\end{cases}\]

\[\text{in } D'(0,T), \quad \text{for all } v \in H^1_0(\Omega) \cap L^p(\Omega),\]

\[u(0) = u_0.\]

Remark 6.3. Applying a slight modification of Theorem 1.4, Chapter 2 in Lions [11], we obtain that the problem (6.1) has a unique solution.
