Abstract

Background

The theme of death in Western society has been removed from everyday life and replaced with specialized medical language. Such censorship does not reduce the fear of death, especially among young people, and it limits the possibility to elaborate on experiences linked to death, generating negative effects, especially in cases of traumatic grief. The objective of this follow-up study was to detect how and if experiences of death education changed the relationship between the community and a local hospice. Furthermore, it was stressed the theme of representation of death, in order to see whether participants were able to remind any possible attitude change following the project. Finally, it was analysed how they considered how they remembered the effect of the elaboration of the trauma caused by the suicide of a student.

Methods

This was a qualitative research study based on semi-structured interviews with palliative care professionals and teachers of students who had taken part in a death education intervention 3 years earlier. The interviews were examined through thematic analysis.

Results

The results confirmed the efficacy of the death education intervention initiated 3 years earlier. The education initiative contributed to modifying the students’ and teachers’ perspectives of end-of-life professionals and their understanding of the structures within which palliative care is implemented. It also modified the participants’ perspectives on the representation of death and promoted a new outlook on life. The hospice staff also perceived a change in the attitudes of the community, and this change had a positive impact on their everyday work.

Conclusions

This study confirmed the usefulness of creating continuity between a hospice and the community through a school education initiative. The death education project provided an educational space in which it was possible to elaborate on experiences linked to death and to re-evaluate and appreciate the structures of end-of-life care and the professionals who work in the area.
Keywords: Hospice, Palliative care, Death education, Adolescents, Suicide.

Background
The theme of death in Western society has been removed from everyday life and replaced with specialized medical language. On the one hand, this can be attributed to medical progress, which has eradicated many once life-threatening illnesses, thereby removing fear of infections and contagions. On the other hand, it may be related to the innate tendency of people to avoid anything that reminds them of their finitude [1]. As affirmed by Terror Management theory, awareness of death is inevitable, and such awareness may occur at any moment for uncontrollable reasons and generate a feeling of latent and constant terror [2]. Anguish linked to death can be managed through supportive cultural systems, which may include symbolic practices, allowing us to envisage salvation after death [3, 4]. However, these systems are fragile and may be undermined by mortality salience elicited by the reality of everyday life and by mass media constantly sensationalizing and describing death in an unrealistic way [5 – 8]. One of the most evident examples of this type of denial can be seen in stigmatization of those who work in funeral homes or morgues [9, 10] as well as those who work in hospices. Such stigmatization is due to people’s inability to identify with these professionals, who are isolated from community life as a result and sufferer increased levels of stress [11 – 13]. This form of social denial contributes to a reduced awareness of finitude among people and decreased cooperation and solidarity, both of which are needed for authentic human relations.

Young people are bombarded by media messages that sensationalize death, and they are surrounded by adults who are incapable of addressing the topic in their daily lives [14 – 16]. In truth, this type of censorship does not reduce fear or anxiety related to death [17]. Furthermore, it restricts the possibility of developing a symbolic language to elaborate the experiences that accompany terror surrounding death [17]. The latter can give rise to negative effects, especially in the case of traumatic grief [17].

In light of the aforementioned issues, we developed a death education intervention with 138 students (males, n = 63; females, n = 75) of three high schools in a town in the South of Italy, focusing on their experiences of traumatic grief caused by the death, by suicide, of one of their school mates. The main
hypothesis of the death education intervention was that adolescents who participated in death education experience would express their emotions better, with a higher sense of control over their death imagery and death anxiety [18, 19]. This was based on the conviction that death education is useful in creating a debate in which to explore the various ways of conceptualizing death, to lead to a greater understanding and clarification of personal value systems. The death education intervention was divided into two parts. In the first part, meditation, psychodrama, and moviemaking were used to reflect upon the meaning of death, spirituality, and transcendence and upon the meaning of suicide. In the second part, the students visited a local hospice, where they had the opportunity to discuss the forms of dying with the hospice staff, how the patients were supported by the team of palliative care, and how their families handled their grief. The intervention produced very positive results [20]. Subsequently, an intervention was designed in conjunction with the municipality, hospice, and local high schools. The intervention drew on a previous model based on experiences of death education [21]. It also drew on the World Health Organization’s (2017) definition of palliative care. The main objective of the intervention was to encourage young people to consider the generosity of those who work with competence and passion to enhance and improve the quality of life of those who must die. The intervention highlighted that life was a precious gift, which must be safeguarded, although this did not mean denying death (or prolonging or accelerating it). The discussion path considered how having to face the death of a loved one caused relatives and friends to consider huge existential questions. The team of professionals who took part in the intervention comprised psychologists who were experts in death education, experts in religious sciences, and palliative care doctors and nurses working in the local hospice.

The present study investigated the effects of this experience 3 years later on the participants (teachers/hospice staff) who had taken part in the original intervention.

Methods
Participants
The study involved 20 individuals: 11 members (males, \( n = 5 \); females, \( n = 6 \)) of a local hospice aged between 29 and 50 years (\( \mu = 44; \sigma = 5.98 \)) and nine school teachers aged between 29 and 63 years
(µ = 48.1; σ = 9.18). The hospice staff comprised two psychologists, three doctors, four nurses, a family liaison officer, and a spiritual guide. Among the hospice staff, 70% of individuals were university graduates, 8 of 11 individuals married/cohabiting, and 9 of 11 individuals had children. All the interviewees were Italian citizens.

The teachers who took part in the intervention were staff members of local schools in the same town where the original study took place. The schools were as follows: two classical lyceums, a scientific lyceum, a European linguistic lyceum, an Upper Secondary Educational Institute and a linguistic lyceum. In the study group, 90% of the participants were teachers who taught humanistic classes (religion, history, and Italian), and their ages ranged between 31 and 63 years (µ = 53,11; σ = 10,20). All the teachers were university graduates and possessed Italian citizenship (Table 1).

As the students who had participated in the original intervention had finished their studies, they could not be included in the present research, and they could not be traced, as their anonymity was assured in the original intervention.

Each participant was asked to sign an informed consent form authorizing their participation, the data treatment, and the audio-recordings of the interviews. The study was approved by the ethics committee for psychological research of the University of Padova, Italy.

**Aims, data collection and analysis**

The objective of this follow-up study was to detect how and if experiences of death education changed the relationship between the community and a local hospice. Furthermore, it was stressed the theme of representation of death, in order to see whether participants were able to remind any possible attitude change following the project. Finally, it was analysed how they considered how they remembered the effect of the elaboration of the trauma caused by the suicide of a student.

The study followed qualitative research methodology based on thematic analysis [22, 23] which focuses on the recognition of meanings and concepts [24, 25]. To develop a conceptual framework for understanding how the community experienced and made meaning of the death education experience, the thematic analysis shed light on patterns in the dataset [26].

With respect the credibility of the methodology, in accordance with the CORE-Q checklist [27] and
thematic analysis, the study was partially theory driven, as studies on the ontological representation of death guided the exploration of the data [28, 29]. Therefore, we assumed that with respect to the possible transferability and dependability of the following results, it was necessary that any process was based on both a-prior categories (with regard to the representation of death) and categories that only became clear as the analysis progressed (with regard to the effects of the death education experience) [21, 30]. Six main phases characterized the process: preparatory organization, generation of categories or themes, coding data, testing emerging understanding, searching for alternative explanations, and writing up the report [31].

The interviews were conducted in settings that were familiar to the participants. The mean duration of each interview was 60 minutes. In the interviews, the participants were asked about how they considered that the project had changed perceptions among the community. The interviews were analysed using ATLAS.ti software, which we used to apply codes to text segments. These codes were then combined into “code families” from which the main thematic areas emerged. Networks were also created to highlight logical relations among the identified thematic areas. Lastly, in order to check the confirmability of our results, at the end of the process after six months, we submitted the results of all the analyses to participants, asking them to give us an opinion or further suggestions.

Results

Based on the responses of the participants, three main thematic areas emerged: (1) changes following the death education intervention, (2) the usefulness of the death education intervention in terms of the elaboration of traumatic grief in the community, and (3) motivations to reintroduce the death education intervention.

**Thematic area 1: Changes following the death education intervention**

Some participants reported that the theme of death was not novel, as the traumatic grief that surrounding a student’s suicide had previously forced the community to ask questions about the issue of youth suicide. Caterina, one of the teachers, stated that “It was like seeing a person disappear overnight, not being able to convince oneself that everything was over. We feel that the person will
return and that he/she has gone away only for a moment.”

The experience of reflecting upon the meaning of dying enabled an exploration of ontological representations of death, as elaborated upon by Andrea, one of the hospice nurses:

The course of death education allowed me, in the first place, to examine the ontological representations I had concerning death and, while reflecting upon them, to modify the most distressing ones. Initially, I saw death as something to avoid, something I preferred not to think about, that I preferred to cast aside, and now, instead, I am able to face the idea of death in a calmer way, I am able to speak about it, to mention it; I am able to accept death as, indeed, the conclusion of a path that is part of life. This allows me to act as a support for the patients’ relatives in the hospice and also as a support for my own relatives and friends.

For many of the hospice staff, understanding the meaning of the term passage and being able to question it was important, as Andrea emphasised:

I reconsidered my ideas of death, and now I do not consider death as the end of something but rather as a passage. The more I felt that death represented a crossing, the stronger I felt and the more my view concerning life changed too: the idea of life as a succession of experiences that were preserved after death also became stronger.

Lucio, one of the nurses, stressed:

My personal approach to the little things in everyday life has radically changed: I felt more enriched, just waking up in the morning and going to bed in the evening. I was definitely more aware of the fact that all the little things in life should be appreciated. As regards my approach to life, I certainly learned to transform my fear of dying into a desire to live.

According to Giancarlo, one of the teachers, the intervention gave him:

Participation in the project confirmed that death does not paralyze life, quite the opposite. I could explain this through this metaphor: there is a room, and there are two doors, or better, a revolving door, and life is exactly at the border of these two dimensions. So, I could say that the effect was that I became more aware of my own way of seeing life and death rather than actually changing the way I relate to life.
Some teachers reported that they perceived a change in their students concerning their way of seeing life: Michela, one of the teachers, affirmed:

The students understood that each moment and simple things like a hug or a smile to a person who was suffering, that is, being there, present, was beyond words. I could see that the kids had grown up: the narratives of other experiences made them feel much closer to one another and part of the great mystery of life.

The teachers reported that they experienced feelings they had not prior to their participation in the intervention. Giulio, another teacher, stated that he experienced a paradox:

Talking about the meaning of death, which is the last experience in human life before eternal life, has contributed to make more meaningful and truer my everyday life. In this way, I certainly learned to grasp nuances in life that perhaps I took for granted before. Because of this, I learned to value life itself even more.

There was a shift in how the community viewed the hospice (end-of-life care) and hospice staff after the death education project. Prior to the project, the hospice and hospice staff were surrounded by an aura of mystery and fear because of prejudice on the part of the community (i.e., social censorship).

Giulio affirmed:

The general fear was of entering a sort of “factory of death.” When I proposed to visit the hospice, the students were full of prejudices that certainly came from what we, as adults, communicate to them, from the way in our society we talk about the hospice.

All the teachers stressed the usefulness of the intervention in overthrowing these prejudices, as Caterina affirmed:

The intervention has served to break down barriers, various prejudices concerning the hospice, and I must say I keep talking about it fondly; the idea of dying at the hospice, with all the people I love close to me, has made me rethink and reevaluate the concept of this place, and now I see it as a place full of dignity. Before this experience, I knew nothing about the work of end-of-life professionals, I did not have any kind of experience in this field. I have often worked in close contact with people suffering and marginalized in the past, but I did not know there were personnel qualified in end-of-life
care. And I must say I found this particularly impressive.

Giancarlo (teacher) affirmed:

The students had faith in this course and in the end, they changed their opinion, and they also talked about this experience at home and with their friends. Thanks to the themes addressed during this path, their fears and anguish declined. This allowed the students to delve deep into themselves and better understand their emotions.

**Thematic area 2: Usefulness of death education for the elaboration of traumatic grief in the community**

In relation to the elaboration of traumatic grief, almost all the hospice staff and the professors expressed the concept in very positive terms. Valeria, a psychologist at the hospice, affirmed: There is a huge difference between being silent, as often happens after a suicide, and being able to talk about it, considering death as something natural. In the latter case, the elaboration of grief helps people draw on resources they need to face the situation and the distress, without isolating themselves, but on the contrary talking about grief at the community level offers support to all. Fabio, a doctor, declared:

Talking about death can make us reflect upon the fact that death is part of life and that therefore it is not something obscene but rather something that is natural. It is important to intervene with a philosophical reflection concerning life, considering it a good that is not endless, but on the contrary available for a limited amount of time.

Many of the teachers also had a very positive view of the death education intervention. Rosaria stated:

A student of mine had suffered a great loss but, thanks to this intervention, he could go on with his life, elaborating on his grief, and this allowed him to get through it peacefully and calmly. This intervention was fundamental because it allowed us to understand that life, which ends with death, is made of steps that are very satisfying but also of other steps that are made of intense suffering. So, a life without suffering is not possible, but it is not necessary either; by eliminating loneliness and involving people in social relationships within the community, suicide can be prevented.
Matteo, a doctor in the hospice, expressed the following sentiments:

The course of death education could be reintroduced because from the palliative doctor’s point of view or from the point of view of the end-of-life care staff who are striving to create a network between themselves and the community, I think this is one of the most important and fundamental ways to change our culture concerning end-of-life care. It would be a Copernican revolution if we could improve the life quality and well-being of people and of community. This would certainly result in a more mature approach to death.

Among the nurses Lucio said:

Death education is useful because it means going back to our origins; in the past, indeed, when there wasn’t a very sophisticated health network, these paths to accompany people facing death were conducted at home, and therefore there was much more solidarity. A communitarian path would help rediscover what we already have inside of us, that is, the importance of accompanying a person right until his/her last instant of life. Thanks to these death education paths, there is a more welcoming atmosphere in the hospice, and the sense of responsibility towards the patients and their families increased, because we now operate in a cultural environment that needs to seriously deepen the themes of death.

The teachers’ declarations on the usefulness of death education at the community level appeared to be just as positive as those of the hospice staff. In some cases, they favoured a proactive approach, with some putting forward innovative proposals to facilitate death education in schools, parishes, and city squares. Antonio one of the teachers, affirmed:

It would be useful especially because of the psychological help the patients’ relatives could receive, but also because it would promote human growth: everyone could become aware of the fact that every one of us will one day live the experience of death.

**Thematic area 3: Motivations to reintroduce the death education intervention**

The psychologist Valeria declared that “The educational, pedagogical, and formative power inherent in this intervention might help people understand that sooner or later they will have to handle separation, loss, and illness.” According to Catia, who was the family liaison officer, a similar
intervention should be proposed again:

From a professional’s point of view, it would help those who are part of the palliative care team, like us, to reformulate and reconsider our knowledge and competencies, as well as what we think we have learned, which can be questioned precisely thanks to the discussion with the students.

According to Rosaria (teacher):

On a personal level, I believe that an intervention like this one has a lot to offer because it allows the teacher to enter into a relation with other teachers, and it allows us to break through barriers with the students, so that we do not rigidly distinguish between the teacher and the student, and this is very worthwhile. I think it is a way to grow up together.

Both the teachers and hospice personnel reported that they believed that the students would welcome the reintroduction of the intervention. Catia stressed:

For the students, this is certainly an experience to repeat, especially at this age when it is important to start reflecting upon and facing the theme of life and death. Reintroducing this project in schools would also be helpful to us as professionals and as parents of adolescent children. I am really frightened by the idea that my children might not be prepared to face death-related events, which may be expected, sudden, or long and painful, like those often associated with a terminal illness.

Luisa, one of the teachers, affirmed:

It would be useful to repeat this experience because we have new students every year, and the intervention could create a cycle of events, with important outcomes. The students had an opportunity to experience something that few, if any, students have today in schools that is, the possibility deal in a serious way with these themes and to be able to approach them both as individuals and as a community.

Catia expressed the main strengths that should be maintained in a future intervention:

One of the main strengths was the multidisciplinary approach, which allowed that students to meet all the hospice staff, even those who might have marginal roles, such as administrative staff. Another strength was the possibility to engage with the students, to take the time to talk to them, and to allow their fears to emerge, together with their anxieties concerning the themes of death and dying. Not
even the teamwork should be underestimated: everyone, with his/her own competence, tried to offer the best contribution possible.

According to the cleric Luigi:

The most meaningful part of the intervention was that the students had the opportunity to visit the hospice, which in the eyes of the community represents a place of death and therefore a place to avoid: this experience had a major emotional impact on the students; another important aspect was the interaction between students and different professional figures. In this way, a sort of osmosis occurred. Finally, another meaningful aspect was the contact with the young generation concerning a thematic area that is rarely directly explored.

According to Caterina (teacher), it was important that the intervention will be reintroduced:

The encounters with the psychologist were very important: the students, at first, found it difficult to open up, but then, thanks to the psychologist’s help, they managed to do so, and certain bad situations between students changed. What impressed me the most is that many of the kids chose me to talk about certain problems they had, or even to talk about their parents’ or grandparents’ relationship with death and suffering; what surprised me also was that we talked about death in class, whereas they usually asked me to talk about it outside of class time. Seeing kids who normally hang around in small groups all coming together was amazing.

Along the same lines, Giulio, a teacher, stated “Another positive aspect emerged concerning the capability to resolve certain critical situations that were present in the classes, like arguments and discussions, and it was possible to build more empathy among the students.”

Please insert “Figure 3 about here.

Finally, with respect the last confirmability phase, the results of all the analyses were submitted again to the participants, asking them whether they confirmed the findings. The answers were all positive and some of them suggested to add some considerations, as for example priest Luigi, who further emphasized this aspect: “The tests are going great. I confirm that the project has paved the way in the work of the hospice team for a new look of understanding palliative care and spiritual accompaniment.” Among the nurses, Maria affirmed: “Yes, all well and good, but I would like to stress
more that here in hospice we were all amazed at the maturity shown by the students. They discussed with us and showed great depth of thought, despite their young age, and this was even more important, because it means that they really think about death even though no one seriously talks to them about it, and this course permitted them to reflect on this issue in a more profound way.” The teacher Giovanni said: “Yes, I absolutely agree, but I want to make some additions. It is very important to affirm that all the schools should realize death education courses, inserting them into the educational system in a structural and interdisciplinary way. In fact, I do not believe that only the spiritual dimension can help to manage death. Indeed, there are texts of great importance, but also theatrical, musical, pictorial works. Art also helps to manage anguish. We all need good and beautiful readings that enrich our language and the ability to give word to experiences of loss and mortality”. The teacher Francesco wanted to add: “I agree with everything, but now that I have the chance, I feel I still have something to express. The project has highlighted the relationship between love and death. Yes, love is what allows us to live but it is also what allows us to face the passage of death. Without love, death is unbearable. The project has therefore enhanced love and this aspect must be highlighted. I believe that the students understood first of all that those who do not love are already dead, those who love do not die. This is the synthesis of what we all understood together.”

Discussion
The objective of this study was to explore how the relationship between the community and a local hospice changed following a death education intervention based on an analysis of the themes of death, dying, and suicide and to evaluate the efficacy of a death education intervention 3 years after its introduction in the local schools.

The analyses of the interviews revealed three main themes and highlighted that the death education intervention had produced meaningful changes. The analysis also confirmed that the death education intervention had a wide positive effect on students, teachers and the hospice staff. The first major theme was a change in representations of death, the attitude towards life, and perspectives concerning the hospice and palliative care. This intervention modified their perspectives concerning the work of end-of-life professionals and the structures in which palliative care is implemented. It also
emphasized that the last moments of life can be a time of serenity, with the patient’s dignity and respect of paramount importance. The process of reconstructing the meaning of dying allowed teachers to reflect together with the adolescents upon the meaning of the valorisation of life [20, 32]. The participants’ (both teachers and the hospice staff) perspectives on death education confirmed the findings in the literature. According to various studies, death education can be considered an important component of a school’s curriculum by promoting positive attitudes towards life and reflection upon existential themes [33, 34]. The intervention proved useful by eliminating various barriers and cultural prejudices, promoting a shift of perspective concerning the hospice and palliative care. This intervention promoted a change in the teachers’ perspective and, in their perception, also in students’ ones with respect to the hospice and the work of the hospice staff, reducing their prejudices towards hospices and staff in palliative care settings [35].

The death education experience in the hospice facilitated the elaboration of the suicide committed by a student. Many of the interviewees stressed that the possibility to talk about death and to discuss themes related to death stimulated the students to reflect upon the value of life and the importance of respecting its fragility. Such behaviours may be linked to a fascination with death that young people may have based on the belief that it will free them from anxieties [36]. The scientific literature supports the idea that a mature concept of death may prevent risky behaviours by valuing life [16, 37]. Death education interventions, which aim to increase social support, optimism, and spirituality through specific strategies of adaptive coping, can promote post-traumatic growth among those who have to deal with sudden grief [38 – 41]. The participants (both teachers and the hospice staff) stressed that the death education project served as a bridge to education among the whole community. Furthermore, they appeared interested in repeating the experience in the future. The introduction in high schools of a similar death education intervention appears worthwhile, as is allowed the professionals to improve their knowledge and competences in their everyday work, similarly to other professional updates aimed to increase healthcare relational competencies [42 – 45]. The hospice staff stated that this intervention allowed them to improve both their teamwork skills and their knowledge concerning themes related to death education. It also enabled them to have a
more positive attitude towards the provision of assistance to the terminally ill and their families, as previously described in the literature [46 – 48].

The teachers reported that they appreciated the possibility to visit the hospice and to have discussions with experts in palliative care. They considered their encounters very meaningful experiences. The professionals working in this specific healthcare field represented a privileged point of view from which to talk to the students about death, and they had the perception that the students could perceive the professionals as simple human beings, not omniscient nor omnipotent, removing the aura of mystery and terror linked to themes related to death [49 – 51].

One of the main limitations of the present study was that it did not involve the students who took part in the original project. In future studies, it would be desirable to activate a higher number of follow-ups of these death education interventions to assess their efficacy after some time and extend the existing literature regarding the practices of death education for adolescents.

Conclusions
This study confirmed the usefulness of creating continuity between the hospice and the community through a school death education intervention. Indeed participants confirmed the results of the analyses, so it was possible to affirm that the present follow-up demonstrated the efficacy of the death education intervention. This development of the study identified meaningful changes among the teachers in the intervention in terms of the representation of death and their approach to life, as well as their perceptions of the structures of end-of-life, with these perceptions changing in a positive way. Hospice staff members also perceived a positive change towards them on the part of the community. The intervention had many positive aspects. In particular, the continuity between the hospice and schools engendered a psycho-educational space in which the students could explore their fears and worries surrounding death. This space allowed the students and adults to elaborate on the grief caused by a student’s suicide, allowing them to consider death without dread and to explore emotions that are usually concealed. The death education experience improved the moral environment of the schools and contributed to community building. An extremely positive outcome was that the students themselves had played an active role in the change in the community.
Limits of the study
The most important limitation of this study concerns transferability. In fact, in order to achieve such a result, the following characteristics are necessary: being able to conduct and implement a death education project; being able to involve schools and local hospice to collaborate, engaging hospice professionals and school teachers to work together; ensuring that the research team is able to monitor all steps and maintain constant contact with the actors involved. Indeed, this qualitative research is the result of such a process that has taken years to mature. However, given the positive outcomes, it will be possible to replicate the experience in the same place, with the same actors, but in order to transfer it to other places it would be necessary for the research team to guide any possible projects, explaining and illustrating everything to the new actors, but adapting the intervention to the different cultural and social contexts in which the project should be replicated.

Declarations

Ethics approval and consent to participate
The study was approved by the ethics committee for psychological research of the University of Padova, Italy (No. B9A50488FF46457ADE1F0F9A4FC5760E).

Each participant was asked to sign a written informed consent form authorizing their participation, the data treatment, and the audio-recordings of the interviews.

Consent for publication
Not applicable.

Availability of data and materials
The datasets analysed during the current study are not publicly available due to the large amount of interviews analysed but are available from the corresponding author on reasonable request.

Competing interests
The authors declare that they have no competing interests.

Funding
The authors received no financial support for the research, authorship, and/or publication of this article.

**Authors’ contributions**

All authors contributed to the study conception and design. Material preparation, data collection and analysis were performed by I.T., F.V.S., L.P., S.P. and M.A.W. The first draft of the manuscript was written by I.T. and all authors commented on previous versions of the manuscript. All authors have read and approved the final manuscript.
