Top quark pair property measurements using the ATLAS detector at the LHC

Thursday, 11 July 2019 10:30 (15 minutes)

Precise measurements of the properties of the top quark test the Standard Model (SM) and can be used to constrain new physics models. The top-quark is predicted in the SM to decay almost exclusively into a W boson and a b-quark. We present a wide range of searches for non-SM top quark decays using the 13 TeV ATLAS datasets, including $t \to q H$ and $t \to q Z$. In addition, measurements of the spin correlation and colour flow in $t\bar{t}$ production are also presented.
