Willmore Submanifolds in a sphere

Haizhong Li

Abstract: Let \( x : M \rightarrow S^{n+p} \) be an \( n \)-dimensional submanifold in an \((n+p)\)-dimensional unit sphere \( S^{n+p} \), \( x : M \rightarrow S^{n+p} \) is called a Willmore submanifold if it is a extremal submanifold to the following Willmore functional:

\[
\int_M (S - nH^2)^rac{1}{2} dv,
\]

where \( S = \sum_{\alpha,i,j} (h_{ij}^\alpha)^2 \) is the square of the length of the second fundamental form, \( H \) is the mean curvature of \( M \). In [13], author proved an integral inequality of Simons’ type for \( n \)-dimensional compact Willmore hypersurfaces in \( S^{n+1} \) and gave a characterization of Willmore tori. In this paper, we generalize this result to \( n \)-dimensional compact Willmore submanifolds in \( S^{n+p} \). In fact, we obtain an integral inequality of Simons’ type for compact Willmore submanifolds in \( S^{n+p} \) and give a characterization of Willmore tori and Veronese surface by use of our integral inequality.

2000 Mathematics Subject Classification: 53C42, 53A10.

Key words and phrases: Willmore functional, integral inequality, Willmore tori, Veronese surface.

1. Introduction

Let \( M \) be an \( n \)-dimensional compact submanifold of an \((n+p)\)-dimensional unit sphere space \( S^{n+p} \). If \( h_{ij}^\alpha \) denotes the second fundamental form of \( M \), \( S \) denotes the square of the length of the second fundamental form, \( H \) denotes the mean curvature vector and \( H \) denotes the mean curvature of \( M \), then we have

\[
S = \sum_{\alpha,i,j} (h_{ij}^\alpha)^2, \quad H = \sum_{\alpha} H^\alpha e_\alpha, \quad H^\alpha = \frac{1}{n} \sum_k h_{kk}^\alpha, \quad H = |H|,
\]

where \( e_\alpha (n+1 \leq \alpha \leq n+p) \) are orthonormal normal vector fields of \( M \) in \( S^{n+p} \).

We define the following non-negative function on \( M \)

\[
\rho^2 = S - nH^2, \quad (1.1)
\]

*The author is supported by a research fellowship of the Alexander von Humboldt Stiftung 2001/2002 and the Zhongdian grant of the NSFC.
which vanishes exactly at the umbilic points of $M$.

Willmore functional is the following non-negative functional (see [4], [21] or [27])

$$
\int_M \rho^n dv = \int_M (S - nH^2)^{\frac{n}{2}} dv,
$$

it was shown in [4], [21] and [27] that this functional is an invariant under Moebius (or conformal) transformations of $S^{n+p}$. We use the term Willmore submanifolds to call its critical points, because when $n = 2$, the functional essentially coincides with the well-known Willmore functional $W(x)$ and its critical points are the Willmore surfaces. Willmore conjecture says that $W(x) \geq 4\pi^2$ holds for all immersed tori $x : M \to S^3$.

The conjecture was approached by Willmore [30], Li-Yau [18], Montiel-Ros [20], Ros [23], Langer-Singer [10] and many others (see [29], [31] and references there).

In this paper, we first prove the following theorem (c.f. Guo-Li-Wang [8], Pedit-Willmore [21])

**Theorem 1.1** Let $M$ be an $n$-dimensional submanifold in an $(n+p)$-dimensional unit sphere $S^{n+p}$. Then $M$ is a Willmore submanifold if and only if for $n + 1 \leq \alpha \leq n + p$

$$
-\rho^{n-2}[SH^\alpha + \sum_{\beta,i,j} H^\beta h^\alpha_{ij} - \sum_{\beta,i,j,k} h^\beta_{ij} h^\gamma_{ik} h^\delta_{kj} - nH^2 H^\alpha] + (n-1)H^\alpha \Delta(\rho^{n-2}) + 2(n-1)\sum_i (\rho^{n-2})_i H^\alpha_i + (n-1)\rho^{n-2} \Delta \perp H^\alpha - \sum_{i,j} (\rho^{n-2})_{i,j} (nH^\alpha \delta_{ij} - h^\alpha_{ij}) = 0,
$$

(1.2)

where $\Delta(\rho^{n-2}) = \sum_i (\rho^{n-2})_{i,i}$, $\Delta \perp H^\alpha = \sum_i H^\alpha_{i,ii}$, and $(\rho^{n-2})_{i,j}$ is the Hessian of $\rho^{n-2}$ with respect to the induced metric $dx \cdot dx$, $H^\alpha_i$ and $H^\alpha_{ij}$ are the components of the first and second covariant derivative of the mean curvature vector field $H$ (see (2.14)-(2.17)).

**Remark 1.1.** When $n = 2$ and $p = 1$, Theorem 1.1 was well-known (see Blaschke [1], Thomsen [26], Bryant [2] and chapter 7 of [31]). When $n = 2$ and $p \geq 1$, Theorem 1.1 was proved by J. Weiner in [28], in this case (1.2) reduces to the following well-known equation of Willmore surfaces (see [28] or [14])

$$
\Delta \perp H^\alpha + \sum_{i,j} h^\alpha_{ij} h^\beta_{ij} H^\beta - 2H^2 H^\alpha = 0, \quad 3 \leq \alpha \leq 2 + p.
$$

(1.3)

When $n \geq 2$ and $p = 1$, Theorem 1.1 was proved by the author in [13].

**Remark 1.2.** We should note that for $n \geq 2$, C.P. Wang [27] got the Euler-Lagrange equation of Willmore functional for compact $n$-dimensional submanifolds without umbilical points in an $(n+p)$-dimensional unit sphere $S^{n+p}$ in terms of Moebius geometry. We also note that a different version of Theorem 1.1 was announced in Pedit-Willmore [21]. From the expression of (1.2), in the cases $n = 3$ and $n = 5$ we need assume that $M$ has no umbilical points to guarantee $(\rho^{n-2})_{i,j}$ is continuous on $M$. We will make this assumption in this paper.

In order to state our main result, we first give the following two important examples

**Example 1** (see [13] or [8]). The tori

$$
W_{m,n-m} = S^m \left( \sqrt{\frac{n-m}{n}} \right) \times S^{n-m} \left( \sqrt{\frac{m}{n}} \right), \quad 1 \leq m \leq n - 1
$$

(1.4)
are Willmore hypersurfaces in $S^{n+1}$. We call $W_{m,n-m}$, $1 \leq m \leq n-1$, **Willmore tori**. In fact, the principal curvatures $k_1, \ldots, k_n$ of $W_{m,n-m}$ are

$$
  k_1 = \ldots = k_m = \sqrt{\frac{m}{n-m}}, \quad k_{m+1} = \ldots = k_n = -\sqrt{\frac{n-m}{m}}.
$$

We have from (1.5)

$$
  H = \frac{1}{n} \left( m \sqrt{\frac{m}{n-m}} - (n-m) \sqrt{\frac{n-m}{m}} \right), \quad S = \frac{m^2}{n-m} + \frac{(n-m)^2}{m},
$$

$$
  \sum_{i,j,k} h_{ij} h_{jk} h_{ki} = \sum_i k_i^3 = m \left( \frac{m}{n-m} \right)^{\frac{3}{2}} - (n-m) \left( \frac{n-m}{m} \right)^{\frac{3}{2}},
$$

where $h_{ij} = h^{n+1}_{ij}$. Thus we easily check that (1.2) holds, i.e., $W_{m,n-m}$ are Willmore hypersurfaces. In particular, we note that $\rho^2$ of $W_{m,n-m}$ for all $1 \leq m \leq n-1$ satisfy

$$
  \rho^2 = n.
$$

We recall that well-known Clifford minimal tori are

$$
  C_{m,n-m} = S^m \left( \sqrt{\frac{m}{n}} \right) \times S^{n-m} \left( \sqrt{\frac{n-m}{n}} \right), \quad 1 \leq m \leq n-1,
$$

It is remarkable that a Willmore torus coincides with a Clifford minimal torus if and only if $n = 2m$ for some $m$.

**Remark 1.3.** When $n = 2$, we can see from (1.3) that all minimal surfaces are Willmore surfaces. In [22], Pinkall constructed many compact non-minimal flat Willmore surfaces in $S^3$. In [3], Castro-Urbano constructed many compact non-minimal Willmore surfaces in $R^4$. Ejiri [7] and Li-Vrancken [17] constructed many non-minimal flat tori in $S^5$ and $S^7$. Bryant [2] classified the Willmore spheres in $S^3$ and Montiel [19] classified the Willmore spheres in $S^4$. When $n \geq 3$, minimal submanifolds are not Willmore submanifolds in general, for example, Clifford minimal tori $C_{m,n-m} = S^m \left( \sqrt{\frac{m}{n}} \right) \times S^{n-m} \left( \sqrt{\frac{n-m}{n}} \right)$ are not Willmore submanifolds when $n \neq 2m$. In [8], the authors proved that all $n$-dimensional minimal Einstein submanifolds in a sphere are Willmore submanifolds (we note that this result was stated in [21] by Pedit and Willmore).

**Example 2** (see [6] or [11]). **Veronese surface.** Let $(x, y, z)$ be the natural coordinate system in $R^3$ and $u = (u_1, u_2, u_3, u_4, u_5)$ the natural coordinate system in $R^5$. We consider the mapping defined by

$$
  u_1 = \frac{1}{\sqrt{3}} yz, \quad u_2 = \frac{1}{\sqrt{3}} xz, \quad u_3 = \frac{1}{\sqrt{3}} xy, \quad u_4 = \frac{1}{2\sqrt{3}} (x^2 - y^2), \quad u_5 = \frac{1}{6} (x^2 + y^2 - 2z^2),
$$

where $x^2 + y^2 + z^2 = 3$. This defines an isometric immersion of $S^2(\sqrt{3})$ into $S^4(1)$. Two points $(x, y, z)$ and $(-x, -y, -z)$ of $S^2(\sqrt{3})$ are mapped into the same point of $S^4$.  

3
This real projective plane imbedded in $S^4$ is called the Veronese surface. We know that Veronese surface is a minimal surface in $S^4$ (see [6] or [11]), thus it is a Willmore surface. We also note that $\rho^2$ of the Veronese surface satisfies

$$\rho^2 = \frac{4}{3}. \quad (1.8)$$

In the theory of minimal submanifolds in $S^{n+p}$, the following J. Simons' integral inequality is well-known

**Theorem 1.2** (Simons [25], Lawson [11], Chern-Do Carmo-Kobayashi [6]) Let $M$ be an $n$-dimensional ($n \geq 2$) compact minimal submanifold in $(n + p)$-dimensional unit sphere $S^{n+p}$. Then we have

$$\int_M S \left( \frac{n}{2 - 1/p} - S \right) \, dv \leq 0. \quad (1.9)$$

In particular, if

$$0 \leq S \leq \frac{n}{2 - 1/p}, \quad (1.10)$$

then either $S \equiv 0$ and $M$ is totally geodesic, or $S \equiv \frac{n}{2 - 1/p}$. In the latter case, either $p = 1$ and $M$ is a Clifford torus $C_{m,n-m}$, or $n = 2$, $p = 2$ and $M$ is the Veronese surface.

In this paper we prove the following integral inequality of Simons' type for compact Willmore submanifolds in $S^{n+p}$.

**Theorem 1.3** Let $M$ be an $n$-dimensional ($n \geq 2$) compact Willmore submanifold in $(n + p)$-dimensional unit sphere $S^{n+p}$. Then we have

$$\int_M \rho^n \left( \frac{n}{2 - 1/p} - \rho^2 \right) \, dv \leq 0. \quad (1.11)$$

In particular, if

$$0 \leq \rho^2 \leq \frac{n}{2 - 1/p}, \quad (1.12)$$

then either $\rho^2 \equiv 0$ and $M$ is totally umbilic, or $\rho^2 \equiv \frac{n}{2 - 1/p}$. In the latter case, either $p = 1$ and $M$ is a Willmore torus $W_{m,n-m}$ defined by (1.4); or $n = 2$, $p = 2$ and $M$ is the Veronese surface.

**Remark 1.4.** In case $p = 1$, Theorem 1.3 was proved by the author in [13]. We also classified all isoparametric Willmore hypersurfaces in $S^{n+1}$ in [13].

2. Preliminaries

Let $x : M \to S^{n+p}$ be an $n$-dimensional submanifold in an $(n + p)$-dimensional unit sphere $S^{n+p}$. Let $\{e_1, \cdots, e_n\}$ be a local orthonormal basis of $M$ with respect to the induced metric, $\{\theta_1, \cdots, \theta_n\}$ are their dual form. Let $e_{n+1}, \cdots, e_{n+p}$ be the local unit orthonormal normal vector field. In this paper we make the following convention on the range of indices:
Then we have the structure equations

\begin{align}
 dx &= \sum_i \theta_i e_i, \\
 de_i &= \sum_j \theta_{ij} e_j + \sum_{\alpha,j} h_{ij}^\alpha \theta_j e_\alpha - \theta_i x, \\
 de_\alpha &= - \sum_{i,j} h_{ij}^\alpha \theta_j e_i + \sum_{\beta} \theta_{\alpha\beta} e_\beta.
\end{align}

The Gauss equations are

\begin{align}
 R_{ijkl} &= (\delta_{ik}\delta_{jl} - \delta_{il}\delta_{jk}) + \sum_\alpha (h_{ik}^\alpha h_{jl}^\alpha - h_{il}^\alpha h_{jk}^\alpha), \\
 R_{ik} &= (n-1)\delta_{ik} + n\sum_\alpha H^\alpha h_{ik}^\alpha - \sum_\alpha_{\alpha,j} h_{ij}^\alpha h_{jk}^\alpha, \\
 n(n-1)R &= n(n-1) + n^2 H^2 - S,
\end{align}

where \( R \) is the normalized scalar curvature of \( M \) and \( S = \sum_{\alpha,i,j} (h_{ij}^\alpha)^2 \) is the norm square of the second fundamental form, \( H = \sum_\alpha H^\alpha e_\alpha = \frac{1}{n} \sum_\alpha (\sum_k h_{kk}^\alpha) e_\alpha \) is the mean curvature vector and \( H = |H| \) is the mean curvature of \( M \).

The Codazzi equations are

\begin{align}
 h_{ij}^\alpha &= h_{i,j}^\alpha, \\
 \sum_k h_{ijk}^\alpha \theta_k &= dh_{ij}^\alpha + \sum_k h_{kj}^\alpha \theta_k + \sum_k h_{ik}^\alpha \theta_j + \sum_\beta h_{ij}^\beta \theta_\beta.
\end{align}

The second covariant derivative of \( h_{ij}^\alpha \) is defined by

\begin{align}
 \sum_l h_{ijkl}^\alpha \theta_l &= dh_{ijk}^\alpha + \sum_l h_{ljk}^\alpha \theta_i + \sum_l h_{ilk}^\alpha \theta_j + \sum_l h_{ijl}^\alpha \theta_k + \sum_\beta h_{ij}^\beta \theta_\beta.
\end{align}

By exterior differentiation of (2.8), we have the following Ricci identities

\begin{align}
 h_{ijkl}^\alpha - h_{ijlk}^\alpha &= \sum_m h_{mj}^\alpha R_{mikl} + \sum_m h_{im}^\alpha R_{mjkl} + \sum_\beta h_{ij}^\beta R_{\beta kkl}.
\end{align}

The Ricci equations are

\begin{align}
 R_{\alpha \beta ij} &= \sum_k (h_{ik}^\alpha h_{kj}^\beta - h_{ik}^\beta h_{kj}^\alpha),
\end{align}

We define the following non-negative function on \( M \)

\begin{align}
 \rho^2 &= S - nH^2,
\end{align}
which vanishes exactly at the umbilical points of \( M \).

Willmore functional is the following functional (see [4], [21] and [27])

\[
W(x) := \int_M \rho^n dv = \int_M (S - nH^2)^\frac{n}{2} dv. \tag{2.13}
\]

By Gauss equation (2.6), (2.13) is equivalent to

\[
W(x) = [n(n-1)]^\frac{n}{2} \int_M (H^2 - R + 1)^\frac{n}{2} dv. \tag{2.13}'
\]

It was shown in [4], [21] and [27] that this functional is an invariant under Moebius (or conformal) transformations of \( S^{n+p} \). We use the term Willmore submanifolds to call its critical points. When \( n = 2 \), the functional essentially coincides with the well-known Willmore functional and its critical points are Willmore surfaces.

We define the first, second covariant derivatives and Laplacian of the mean curvature vector field \( H = \sum_\alpha H^\alpha e_\alpha \) in the normal bundle \( N(M) \) as follows

\[
\sum_i H^\alpha_i \theta_i = dH^\alpha + \sum_\beta H^\beta \theta_\beta, \quad \tag{2.14}
\]

\[
\sum_j H^\alpha_{ij} \theta_j = dH^\alpha_{ij} + \sum_j H^\alpha_{ij} \theta_{ji} + \sum_\beta H^\beta_{ij} \theta_\beta, \quad \tag{2.15}
\]

\[
\Delta H^\alpha = \sum_i H^\alpha_{ii}, \quad H^\alpha = \frac{1}{n} \sum_k h^\alpha_k. \quad \tag{2.16}
\]

Let \( f \) be a smooth function on \( M \), we define the first, second covariant derivatives \( f_i, f_{i,j} \) and Laplacian of \( f \) as follows

\[
df = \sum_i f_i \theta_i, \quad \sum_j f_{i,j} \theta_j = df_i + \sum_j f_j \theta_{ji}, \quad \Delta f = \sum_i f_{i,i}. \tag{2.17}
\]

### 3. Proof of Theorem 1.1

Let \( x : M \to S^{n+p} \) be a compact submanifold in a unit sphere \( S^{n+p} \). From Wang [27], we have the following relations of the connections of the Mobeius metric \( \tilde{\rho}^2 dx \cdot dx \) and induced metric \( dx \cdot dx \)

\[
\omega_{ij} = \theta_{ij} + (\ln \tilde{\rho})_i \theta_j - (\ln \tilde{\rho})_j \theta_i, \quad \omega_{\alpha \beta} = \theta_{\alpha \beta}, \quad \tilde{\rho} = \sqrt{\frac{n}{n-1}} \rho, \tag{3.1}
\]

where \( \rho \) is defined by (1.1).

We get by use of (3.15) of [27] and (3.1)

\[
\sum_j \tilde{\rho} C_{\alpha i j} \theta_j = \sum_j C_{\alpha i j} \omega_j = dC_{\alpha i} + \sum_j C_{\alpha j} \omega_{ji} + \sum_\beta C_{\alpha i}^\beta \omega_{\beta i} = dC_{\alpha i} + \sum_j C_{\alpha j} \theta_{ji} + \sum_\beta C_{\alpha i}^\beta \theta_{ji} + \sum_\beta \sum_k [(\ln \tilde{\rho})_k \theta_i - (\ln \tilde{\rho})_i \theta_k] \cdot C_{\alpha k}^\beta,
\]
Thus (3.2) and (3.4) of [27], we have

\[
\sum_i C_i^\alpha = -\tilde{\rho}^{-3} \Delta^\bot H^\alpha - \tilde{\rho}^{-3} \sum_i (\sum_k (h_k^\alpha - H^\alpha \delta_{ik}) (\ln \tilde{\rho}))_{k,i} - 2(n-1) \rho^{-3} \sum_i H_i^\alpha (\ln \tilde{\rho})_i - (n-3) \rho^{-3} \sum_i (\ln \tilde{\rho}) (h_i^\alpha - H^\alpha \delta_{ij}),
\]

where \(\Delta^\bot H^\alpha\) is defined by (2.16).

On the other hand, we have from (3.10) and (3.14) of [27]

\[
\sum_i A_i B_i^\alpha + \sum_{\beta,i,j,k} C_{ikj}^\beta B_i^\beta B_j^\alpha = -\tilde{\rho}^{-3} \sum_i (\ln \tilde{\rho})_{i,j} (h_i^\alpha - H^\alpha \delta_{ij}) + \tilde{\rho}^{-3} \sum_i (\ln \tilde{\rho}) (h_i^\alpha - H^\alpha \delta_{ij}) + \tilde{\rho}^{-3} \sum_i (\ln \tilde{\rho}) (h_i^\alpha - H^\alpha \delta_{ij}).
\]

Putting (3.3) and (3.4) into the following Willmore condition (see (2.34) and (4.27) of [27])

\[
-(n-1) \sum_i C_i^\alpha + \sum_i A_i B_i^\alpha + \sum_{\beta,i,j,k} C_{ikj}^\beta B_i^\beta B_j^\alpha = 0,
\]

we get

\[
\frac{n-1}{\tilde{\rho}^2} \left\{ -\tilde{\rho}^{n-2} \sum_i \frac{a^\alpha}{n-1} (S H^\alpha \sum_i H_i^\alpha + \sum_{\beta,i,j,k} H_i^\beta h_i^\beta h_i^\alpha - \sum_{\beta,i,j,k} h_i^\beta h_i^\beta h_i^\alpha - n H^2 H^\alpha) \right. \\
+ \rho^{n-2} \Delta^\bot H^\alpha + \frac{n-2}{n-1} \rho^{n-2} \sum_i (\ln \tilde{\rho}) (h_i^\alpha - H^\alpha \delta_{ij}) + 2(n-2) \rho^{n-2} \sum_i (\ln \tilde{\rho}) H_i^\alpha + \frac{n-2}{n-1} \rho^{n-2} \sum_i (\ln \tilde{\rho}) (h_i^\alpha - H^\alpha \delta_{ij}) \right\} = 0.
\]

We can check the following identity by a direct computation

\[
-\frac{1}{n-1} \sum_{i,j} (\rho^{n-2})_{i,j} (n H^\alpha \delta_{ij} - h_i^\alpha) + \rho^{n-2} \Delta^\bot H^\alpha + 2 \sum_i (\rho^{n-2})_{i,j} H_i^\alpha + H^\alpha \Delta (\rho^{n-2}) \\
= \frac{(n-2)^2}{n-1} \rho^{n-2} \sum_i (\ln \tilde{\rho}) (h_i^\alpha - H^\alpha \delta_{ij}) + \frac{n-2}{n-1} \sum_{i,j} (\ln \tilde{\rho}) (h_i^\alpha - H^\alpha \delta_{ij}) + 2(n-2) \rho^{n-2} (\ln \tilde{\rho}) \sum_i (h_i^\alpha - H^\alpha \delta_{ij}) + \rho^{n-2} \Delta^\bot H^\alpha.
\]

Thus (3.5)' is equivalent to (1.2) by use of (3.6). We complete the proof of Theorem 1.1.

Remark 3.1 Fix index \(\alpha\) with \(n + 1 \leq \alpha \leq n + p\), define \(\Box^\alpha : M \to R\) by

\[
\Box^\alpha f = (n H^\alpha \delta_{ij} - h_i^\alpha) f_{i,j},
\]

7
where $f$ is any smooth function on $M$ and $f_{i,j}$ is defined by (2.17). We know that $\Box$ is a self-adjoint operator (cf. Cheng-Yau [5], Li [15,16]). It is remarkable that this operator naturally appears in Willmore equation (1.2). In fact, by use of this self-adjoint operator, Willmore equation (1.2) can be written as the following equivalent form

$$
-\rho^{n-2}[SH^\alpha + \sum_{\beta,i,j,k} H^\beta h^\alpha_{ij} - \sum_{\beta,i,j,k} h^\alpha_{ij} h^\beta_{ik} h^\beta_{kj} - nH^2 H^\alpha] + (n-1)\rho^{n-2} \Delta H^\alpha + 2(n-1)\sum_i (\rho^{n-2})_i H^\alpha_i + (n-1)H^\alpha \Delta(\rho^{n-2}) - \Box(\rho^{n-2}) = 0, \quad n + 1 \leq \alpha \leq n + p. 
$$

(1.2)′

4. The Lemmas

We first prove the following Lemma (c.f. Simons [25], Chern-Do Carmo-Kobayashi [6] or Schoen-Simon-Yau [24])

**Lemma 4.1** Let $M$ be an $n$-dimensional $(n \geq 2)$ submanifold in $S^{n+p}$. Then we have

$$
\frac{1}{2} \Delta \rho^2 = |\nabla h|^2 - n^2 |\nabla H|^2 + \sum_{\alpha,i,j} (h^\alpha_{ij})^2 + n \sum_{\alpha,i,j,m} H^\beta h^\alpha_{ij} h^\alpha_{im} + n \rho^2 - \sum_{\alpha,i,j,k,m} h^\alpha_{ij} h^\alpha_{lm} h^\alpha_{mj} - \frac{1}{2} \Delta(nH^2),
$$

(4.1)

where $|\nabla h|^2 = \sum_{\alpha,i,j} (h^\alpha_{ij})^2$ and $|\nabla H|^2 = \sum_{\alpha,i} (H^\alpha_i)^2$, $H^\alpha_i$ is defined by (2.14).

**Proof.** By the definition of $\Delta$ and $\rho^2$, we have by use of (2.7) and (2.10)

$$
\frac{1}{2} \Delta \rho^2 = \frac{1}{2} \Delta(\sum_{\alpha,i,j} (h^\alpha_{ij})^2) - \frac{1}{2} \Delta(nH^2)
$$

$$
= \sum_{\alpha,i,j} (h^\alpha_{ij})^2 + h^\alpha_{ij} h^\alpha_{ik} - \frac{1}{2} \Delta(nH^2)
$$

$$
= |\nabla h|^2 - n^2 |\nabla H|^2 + \sum_{\alpha,i,j} (h^\alpha_{ij})^2 + \sum_{\alpha,i,j,m} h^\alpha_{ij} h^\alpha_{lm} h^\alpha_{mj} + \sum_{\alpha,i,j,k,m} h^\alpha_{ij} h^\alpha_{lm} R_{mi} - \frac{1}{2} \Delta(nH^2). 
$$

(4.2)

By use of (2.4) and (2.5), we have

$$
\sum_{\alpha,i,j,m} h^\alpha_{ij} h^\alpha_{im} R_{mi} + \sum_{\alpha,i,j,m} h^\alpha_{ij} h^\alpha_{lm} h^\beta_{mj} + \sum_{\alpha,i,j,k,m} h^\alpha_{ij} h^\beta_{ik} R_{\beta \alpha jk}
$$

$$
= nS - n^2 H^2 - \sum_{\alpha,i,j,m} h^\alpha_{ij} h^\alpha_{im} R_{mi} + \sum_{\alpha,i,j,m} h^\alpha_{ij} h^\beta_{im} h^\beta_{mj} + \sum_{\alpha,i,j,k,m} h^\alpha_{ij} h^\beta_{ik} R_{\beta \alpha jk}
$$

$$
= \left[ \sum_{\alpha,i,j,m,l} h^\alpha_{ij} h^\alpha_{im} h^\alpha_{mg} h^\alpha_{lj} - \sum_{\alpha,i,j,k,m} h^\alpha_{ij} h^\alpha_{km} h^\beta_{mj} h^\beta_{ik} - \sum_{\alpha,i,j,k} h^\alpha_{ij} h^\beta_{ik} R_{\beta \alpha jk} \right]. 
$$

(4.3)

On the other hand, we have by (2.11)

$$
\sum_{\alpha,i,j,k} (R_{\beta \alpha jk})^2 = \sum_{\alpha,i,j,k} (h^\beta_{ij} h^\alpha_{ik} - h^\alpha_{ij} h^\beta_{ik}) R_{\beta \alpha jk}
$$

$$
= \sum_{\alpha,i,j,k,l} h^\alpha_{ij} h^\alpha_{im} h^\alpha_{ml} h^\beta_{ij} - \sum_{\alpha,i,j,k,m} h^\alpha_{ij} h^\alpha_{km} h^\beta_{mj} h^\beta_{ik} - \sum_{\alpha,i,j,k} h^\alpha_{ij} h^\beta_{ik} R_{\beta \alpha jk}. 
$$

(4.4)
Putting (4.3) into (4.2), we obtain (4.1) by use of (4.4).

**Lemma 4.2** Let $M$ be an $n$-dimensional $(n \geq 2)$ submanifold in $S^{n+p}$, then we have

$$|\nabla h|^2 \geq \frac{3n^2}{n+2} |\nabla^\perp H|^2,$$  \hspace{1cm} (4.5)

where $|\nabla h|^2 = \sum_{\alpha,i,j,k} (h_{ijk}^\alpha)^2$, $|\nabla^\perp H|^2 = \sum_{\alpha,i} (H_{i}^{\alpha})^2$, $H_{i}^{\alpha}$ is defined by (2.14).

**Proof.** We construct the following symmetric trace-free tensor (c.f. [9] or [13])

$$F_{ij} = h_{ij}^\alpha - \frac{n}{n+2} (H_{i}^{\alpha} \delta_{jk} + H_{j}^{\alpha} \delta_{ik} + H_{k}^{\alpha} \delta_{ij}).$$  \hspace{1cm} (4.6)

Then we can easily compute that

$$|F|^2 = \sum_{\alpha,i,j,k} (F_{ij}^\alpha)^2 = |\nabla h|^2 - \frac{3n^2}{n+2} |\nabla^\perp H|^2.$$  

Then we have

$$|\nabla h|^2 \geq \frac{3n^2}{n+2} |\nabla^\perp H|^2,$$

which proves the Lemma 4.2.

Define tensors

$$\tilde{h}_{ij}^\alpha = h_{ij}^\alpha - H_{i}^{\alpha} \delta_{ij},$$  \hspace{1cm} (4.7)

$$\tilde{\sigma}_{\alpha\beta} = \sum_{i,j} \tilde{h}_{ij}^\alpha \tilde{h}_{ij}^\beta, \quad \sigma_{\alpha\beta} = \sum_{i,j} h_{ij}^\alpha h_{ij}^\beta.$$  \hspace{1cm} (4.8)

Then the $(p \times p)$-matrix $(\tilde{\sigma}_{\alpha\beta})$ is symmetric and can be assumed to be diagonalized for a suitable choice of $e_{n+1}, \cdots, e_{n+p}$. We set

$$\tilde{\sigma}_{\alpha\beta} = \tilde{\sigma}_{\alpha} \delta_{\alpha\beta}.$$  \hspace{1cm} (4.9)

We have by a direct calculation

$$\sum_{k} \tilde{h}_{kk}^\alpha = 0, \quad \tilde{\sigma}_{\alpha\beta} = \sigma_{\alpha\beta} - nH^{\alpha}H^{\beta}, \quad \rho^2 = \sum_{\alpha} \tilde{\sigma}_{\alpha} = S - nH^2,$$  \hspace{1cm} (4.10)

$$\sum_{\beta,i,j,k} h_{ij}^{\alpha} h_{ik}^{\beta} h_{kj}^{\beta} = \sum_{\beta,i,j,k} \tilde{h}_{ij}^{\alpha} \tilde{h}_{ik}^{\beta} \tilde{h}_{kj}^{\beta} + 2 \sum_{\beta,i,j} H^{\beta} \tilde{h}_{ij}^{\alpha} \tilde{h}_{ij}^{\beta} + H^{\alpha} \rho^2 + nH^{\alpha}H^2,$$  \hspace{1cm} (4.11)

$$\sum_{\alpha,i,j,m} h_{ij}^{\beta} h_{ij}^{\alpha} h_{im}^{\alpha} = \sum_{\alpha,i,j,m} \tilde{h}_{ij}^{\beta} \tilde{h}_{ij}^{\alpha} \tilde{h}_{im}^{\alpha} + 2 \sum_{\alpha,i,j} H^{\alpha} \tilde{h}_{ij}^{\alpha} \tilde{h}_{ij}^{\beta} + H^{\beta} \rho^2 + nH^2H^{\beta}.$$  \hspace{1cm} (4.12)

From (4.7), (4.10), (4.11) and Theorem 1.1, we have

**Lemma 4.3.** Let $M$ be an $n$-dimensional submanifold in an $(n+p)$-dimensional unit sphere $S^{n+p}$. Then $M$ is a Willmore submanifold if and only if for $n+1 \leq \alpha \leq n+p$
\[
\frac{1}{2} \Delta \rho^2 \geq |\nabla h|^2 - n^2 |\nabla^\perp H|^2 + \sum_{\alpha,i,j,k} (h_{ij}^\alpha h_{kkij}) + n \sum_{\alpha,\beta,i,j,m} H^\beta \tilde{h}_{mj}^\alpha \tilde{h}_{ij} \tilde{h}_{im}^\alpha + \sum_{\alpha,\beta,i,j,m} (R_{\alpha\beta ij})^2 - \frac{1}{2} \Delta(nH^2).
\]

Proof. By use of \((4.10)\) and \((4.12)\), \((4.1)\) becomes

\[
\frac{1}{2} \Delta \rho^2 = |\nabla h|^2 - n^2 |\nabla^\perp H|^2 + \sum_{\alpha,i,j,k} (h_{ij}^\alpha h_{kkij}) + n \sum_{\alpha,\beta,i,j,m} H^\beta \tilde{h}_{mj}^\alpha \tilde{h}_{ij} \tilde{h}_{im}^\alpha + \sum_{\alpha,\beta,i,j,m} (R_{\alpha\beta ij})^2 - \frac{1}{2} \Delta(nH^2).
\]
By (2.11), we have
\[
\sum_{\alpha,\beta,j,k} (R_{\alpha jk})^2 = \sum_{\alpha,\beta,j,k} \left( \sum_l h_{ij}^\alpha h_{lk}^{\alpha} - \sum_l h_{ij}^\beta h_{lk}^{\beta} \right)^2 = \sum_{\alpha,\beta,j,k} N(A_\alpha A_\beta - A_\beta A_\alpha),
\]
(4.16)
where
\[
A_\alpha := (\tilde{h}_i^\alpha) = (h_i^\alpha - H^\alpha \delta_{ij}).
\]
(4.17)
By use of Lemma 4.4, (4.9), (4.10) and (4.16), we get
\[
- \sum_{\alpha,\beta} \tilde{\sigma}_{\alpha\beta}^2 - \sum_{\alpha,\beta,j,k} (R_{\alpha jk})^2 = - \sum_{\alpha} \tilde{\sigma}_{\alpha}^2 - \sum_{\alpha,\beta} N(A_\alpha A_\beta - A_\beta A_\alpha)
\geq - \sum_{\alpha} \tilde{\sigma}_{\alpha}^2 - 2 \sum_{\alpha \neq \beta} \tilde{\sigma}_{\alpha} \tilde{\sigma}_{\beta}
= - 2(\sum_{\alpha} \tilde{\sigma}_{\alpha})^2 + \sum_{\alpha} \tilde{\sigma}_{\alpha}^2
\geq - 2\rho^4 + \frac{1}{p} \left( \sum_{\alpha} \tilde{\sigma}_{\alpha} \right)^2
\geq -(2 - \frac{1}{p}) \rho^4.
\]
(4.18)
Putting (4.18) into (4.15), we get (4.14).

**Lemma 4.6.** Let M be an n-dimensional submanifold in an (n + p)-dimensional unit sphere \( S^{n+p} \), then we have
\[
\frac{1}{2} \Delta (\rho^n) \geq \frac{1}{2} n \{ - n(n-1) \rho^{n-2} |\nabla^\perp \mathbf{H}|^2 + \rho^{n-2} \sum_{\alpha,\beta,i,j,k} (h_i^\alpha h_j^\beta) + \rho^n |n + nH^2 - (2 - \frac{1}{p}) \rho^4 - \frac{1}{2} \Delta(nH^2) \}.
\]
(4.19)

**Proof.** First it is easy to check the following calculation
\[
\frac{1}{2} \Delta (\rho^n) = \frac{1}{2} \Delta (\rho^2 \frac{\rho^{n-2}}{2}) = \frac{1}{2} n(n-2) \rho^{n-2} \sum_i \rho_i^2 + \frac{n}{2} \rho^{n-2} \Delta (\rho^2)
\geq \frac{n}{4} \rho^{n-2} \Delta (\rho^2).
\]
(4.20)
Noting
\[
|\nabla h|^2 - n^2 |\nabla^\perp \mathbf{H}|^2 = (|\nabla h|^2 - \frac{3n^2}{n+2} |\nabla^\perp \mathbf{H}|^2) + (\frac{3n^2}{n+2} - n) |\nabla^\perp \mathbf{H}|^2 - n(n-1) |\nabla^\perp \mathbf{H}|^2
\geq (|\nabla h|^2 - \frac{3n^2}{n+2} |\nabla^\perp \mathbf{H}|^2) - n(n-1) |\nabla^\perp \mathbf{H}|^2,
\]
(4.21)
we get from (4.5), (4.14) and (4.21)
\[
\frac{1}{2} \Delta \rho^2 \geq - n(n-1) |\nabla^\perp \mathbf{H}|^2 + \sum_{\alpha,i,j,k} (h_i^\alpha h_j^\beta) + n \sum_{\alpha,\beta,j,j,m} H^\alpha \tilde{h}_j^\beta \tilde{h}_j^\alpha \tilde{h}_m^\alpha
+ n \rho^2 + nH^2 \rho^2 - (2 - \frac{1}{p}) \rho^4 - \frac{1}{2} \Delta(nH^2).
\]
(4.22)
We obtain (4.19) by putting (4.22) into (4.20).

**Lemma 4.7.** Let \( x : M \rightarrow S^{n+p} \) be an \( n \)-dimensional compact submanifold in \( S^{n+p} \). Let \( f \) and \( g \) be two any smooth functions on \( M \). Then we have

\[
\int_M g \Delta f \, dv = -\int_M (\sum_i f_i g_i) \, dv = \int_M f \Delta g \, dv.
\]

**Proof.** Integrating the following identities over \( M \)

\[
g \Delta f = g \sum_i f_i \cdot i = \sum_i (f_i g_i)i - \sum_i f_i g_i,
\]

\[
f \Delta g = f \sum_i g_i \cdot i = \sum_i (g_i f_i)i - \sum_i f_i g_i,
\]

we get (4.23).

**Lemma 4.8.** Let \( M \) be an \( n \)-dimensional compact Willmore submanifold in an \((n+p)\)-dimensional unit sphere \( S^{n+p} \), then we have

\[
-\rho \left( \nabla \cdot H \right)^2 \, dv + \rho \left( \sum_{\alpha, \beta, i, j, m} H^\beta h^{\alpha}_{ij} \tilde{h}_{ji} \tilde{h}_{im} \right) \, dv
\]

\[
= -\frac{1}{2} \rho \left( \nabla \cdot H \right)^2 \, dv + \rho \left( \sum_{\alpha, \beta, i, j, m} H^\beta h^{\alpha}_{ij} \tilde{h}_{ji} \tilde{h}_{im} \right) \, dv
\]

\[
= \frac{1}{2} \rho \left( \nabla \cdot H \right)^2 \, dv + \rho \left( \sum_{\alpha, \beta, i, j, m} H^\beta h^{\alpha}_{ij} \tilde{h}_{ji} \tilde{h}_{im} \right) \, dv.
\]

**Proof.** We have the following calculation by use of Stokes formula and Lemma 4.7

\[
-\rho \left( \nabla \cdot H \right)^2 \, dv + \rho \left( \sum_{\alpha, \beta, i, j, m} H^\beta h^{\alpha}_{ij} \tilde{h}_{ji} \tilde{h}_{im} \right) \, dv
\]

\[
= \frac{1}{2} \rho \left( \nabla \cdot H \right)^2 \, dv + \rho \left( \sum_{\alpha, \beta, i, j, m} H^\beta h^{\alpha}_{ij} \tilde{h}_{ji} \tilde{h}_{im} \right) \, dv.
\]

Putting (4.13) into (4.25), using Stokes formula and Lemma 4.7, we get (4.24).

**Lemma 4.9.** Let \( M \) be an \( n \)-dimensional compact submanifold in an \((n+p)\)-dimensional unit sphere \( S^{n+p} \), then we have

\[
\int_M \rho^{n-2} \sum_{\alpha, i, j, k} (h^\alpha_{ij} h^\alpha_{kk})_j \, dv = \int_M \left( \sum_{\alpha, i, j} H^\alpha h^\alpha_{ij} (\rho^{n-2})_i \right) \, dv + \frac{n^2}{2} \int_M \sum_i (\rho^{n-2})_i (H^2)_i \, dv.
\]

**Proof.** We have the following calculation by use of Stokes formula and Lemma 4.7

\[
\int_M \rho^{n-2} \sum_{\alpha, i, j, k} (h^\alpha_{ij} h^\alpha_{kk})_j \, dv
\]

\[
= -\int_M \sum_{\alpha, i, j, k} (\rho^{n-2})_j h^\alpha_{ij} h^\alpha_{kk} \, dv
\]

\[
= -\int_M \sum_{\alpha, i, j, k} (\rho^{n-2})_j h^\alpha_{ij} h^\alpha_{kk} \, dv + \int_M \sum_{\alpha, i, j, k} (\rho^{n-2})_j h^\alpha_{ij} h^\alpha_{kk} \, dv
\]

\[
+ n^2 \int_M \sum_{\alpha, j} H^\alpha (\rho^{n-2})_j H^\alpha_j \, dv
\]

\[
= n \int_M \sum_{\alpha, i, j} H^\alpha h^\alpha_{ij} (\rho^{n-2})_i \, dv + \frac{n^2}{2} \int_M \sum_i (\rho^{n-2})_i (H^2)_i \, dv.
\]
By use of Stokes formula and Lemma 4.7, we also have

**Lemma 4.10.** Let $M$ be an $n$-dimensional compact submanifold in an $(n + p)$-dimensional unit sphere $S^{n+p}$, then we have

$$-\frac{1}{2} \int_M \rho^{n-2} \Delta (nH^2) dv = \frac{n}{2} \int_M \sum_i (\rho^{n-2})_i (H^2)_i dv. \quad (4.27)$$

## 5. The Proof of Theorem 1.3

Now we begin to prove the Theorem 1.3. Integrating (4.19) over $M$ and using Stokes formula, we have

$$0 \geq \frac{n}{2} \left\{ -n(n-1) \int_M \rho^{n-2} |\nabla^\perp H|^2 dv + n \int_M \rho^{n-2} \sum_{\alpha,\beta,i,j} H^\beta \bar{h}^\alpha_{ji} \bar{h}^{\alpha}_{im} dv 
+ \int_M \rho^{n-2} \sum_{\alpha,i,j,k} (\bar{h}^\alpha_{ij} \bar{h}^\alpha_{kk})_j dv - \frac{1}{2} \int_M \rho^{n-2} \Delta (nH^2) dv 
+ \int_M \rho^n (n + nH^2 - (2 - \frac{1}{p}) \rho^2) dv \right\}. \quad (5.1)$$

Putting (4.24), (4.26) and (4.27) into (5.1), we get

$$0 \geq \frac{n}{2} \left\{ -n \int_M \rho^{n-2} \sum_{\alpha,\beta} H^\alpha H^\beta \bar{\sigma}_{\alpha\beta} dv + \int_M \rho^n (n + nH^2 - (2 - \frac{1}{p}) \rho^2) dv \right\}$$

$$= \frac{n}{2} \left\{ \int_M \rho^{n-2} (H^2 \rho^2 - \sum_{\alpha,\beta} H^\alpha H^\beta \bar{\sigma}_{\alpha\beta}) dv + \int_M \rho^n (n - (2 - \frac{1}{p}) \rho^2) dv \right\} \quad (5.2)$$

where we used

$$\sum_{\alpha,\beta} H^\alpha H^\beta \bar{\sigma}_{\alpha\beta} = \sum_{\alpha} (H^\alpha)^2 \bar{\sigma}_{\alpha} \leq \sum_{\alpha} (H^\alpha)^2 \cdot \sum_{\beta} \bar{\sigma}_{\beta} = H^2 \rho^2. \quad (5.3)$$

Thus we reach the following integral inequality of Simons’ type

$$\int_M \rho^n (n - (2 - \frac{1}{p}) \rho^2) dv \leq 0. \quad (5.4)$$

Therefore we have proved the integral inequality (1.11) in Theorem 1.3.

If (1.12) holds, then we conclude from (5.4) that either $\rho^2 \equiv 0$, or $\rho^2 \equiv n/(2 - \frac{1}{p})$. In the first case, we know that $S \equiv nH^2$, i.e. $M$ is totally umbilic; in the latter case, i.e.,

$$\rho^2 = \sum_{\alpha,i,j} (\bar{h}^\alpha_{ij})^2 \equiv n/(2 - \frac{1}{p}), \quad (5.5)$$

we have from (4.21) (in this case, (4.21) becomes an equality)

$$\left( \frac{3n^2}{n + 2} - n \right) |\nabla^\perp H|^2 = 0,$$
we have $\nabla^\perp \mathbf{H} = 0$, thus we have from (4.5) (in this case (4.5) becomes an equality)
\[
\nabla h = 0, \quad \text{i.e.,} \quad h_{ijk}^\alpha = 0.
\] (5.6)

It follows that all inequalities in (4.18), (4.19), (4.21), (4.22), (5.1) and (5.2) are actually equalities. In deriving (4.19) from (4.18), we made use of inequalities $N(A_\alpha A_\beta - A_\beta A_\alpha) \leq 2N(A_\alpha) \cdot N(A_\beta)$. Hence
\[
N(A_\alpha A_\beta - A_\beta A_\alpha) = 2N(A_\alpha) \cdot N(A_\beta), \quad \alpha \neq \beta.
\] (5.7)

From (4.18) we obtain
\[
\tilde{\sigma}_1 = \tilde{\sigma}_2 = \cdots = \tilde{\sigma}_p,
\] (5.8)
where $\tilde{\sigma}_\alpha$ is defined by (4.9).

From (5.7) and Lemma 4.4, we conclude that at most two of the matrices $A_\alpha = (\tilde{h}_{ij}^\alpha) = (h_{ij}^\alpha - H^\alpha \delta_{ij})$ are nonzero, in which case they can be assumed to be scalar multiples of $\tilde{A}$ and $\tilde{B}$ in Lemma 4.4. We now consider the case $p = 1$ and $p \geq 2$ separately.

**Case** $p = 1$. From (5.6), we know that $M$ is an isoparametric hypersurface. In this case Theorem 1.3 already has been proved by the author in [13] (see Theorem 3 of [13]). We conclude that $M$ is one of Willmore tori, that is, $M = W_{m,n-m}$ for some $m$ with $1 \leq m \leq n - 1$.

**Case** $p \geq 2$. In this case, we know that at most two of $A_\alpha = (\tilde{h}_{ij}^\alpha)$, $\alpha = n+1, \cdots, n+p$, are different from zero. If all of $A_\alpha = (\tilde{h}_{ij}^\alpha)$ are zero, which is contradiction with (5.5). Assume that only one of them, say $A_\alpha$, is different zero, which is contradiction with (5.8). Therefore we may assume that
\[
A_{n+1} = \lambda \tilde{A}, \quad A_{n+2} = \mu \tilde{B}, \quad \lambda, \mu \neq 0,
\]
\[
A_\alpha = 0, \quad \alpha \geq n + 3,
\]
where $\tilde{A}$ and $\tilde{B}$ are defined in Lemma 4.4.

In this case, the inequality (5.3) is actually equality, that is,
\[
\sum_{\alpha,\beta} H^\alpha H^\beta \tilde{\sigma}_{\alpha\beta} = H^2 \rho^2.
\] (5.9)

In fact, (5.9) is
\[
2\lambda^2 (H^{n+1})^2 + 2\mu^2 (H^{n+2})^2 = [(H^{n+1})^2 + (H^{n+2})^2 + \cdots + (H^{n+p})^2] [2\lambda^2 + 2\mu^2].
\]
In view of $\lambda, \mu \neq 0$, we follow
\[
H^\alpha = 0, \quad n + 1 \leq \alpha \leq n + p,
\]
that is, $\mathbf{H} = 0$, i.e., $M$ is a minimal submanifold in $S^{n+p}$, (5.5) becomes
\[
S = \sum_{\alpha,\beta} (h_{ij}^\alpha)^2 = \frac{n}{2 - 1/p}.
\]
From Main Theorem of Chern-Do Carmo-Kobayashi [6], we conclude that $n = 2, p = 2$ and $M$ is a Veronese surface defined by example 2. We complete the proof of Theorem 1.3.
6. Some Related Results

For $p \geq 2$, we can improve Theorem 1.3 as follows

**Theorem 6.1** Let $M$ be an $n$-dimensional ($n \geq 2$) compact Willmore submanifold in $(n + p)$-dimensional unit sphere $S^{n+p}$. Then we have

$$
\int_M \rho^n \left( \frac{2}{3} n - \rho^2 \right) dv \leq 0.
$$

(6.1)

In particular, if

$$
0 \leq \rho^2 \leq \frac{2}{3} n,
$$

(6.2)

then either $\rho^2 \equiv 0$ and $M$ is totally umbilic, or $\rho^2 \equiv \frac{2}{3} n$. In the latter case, $n = 2, p = 2$ and $M$ is the Veronese surface.

**Remark 6.1** When $n = 2$, Theorem 6.1 was proved by author in [14] (see Theorem 3 of [14]). When $p \geq 2$, the pinching constant $\frac{2}{3} n / \rho^2$ in Theorem 6.1 is better than the pinching constant $n / (2 - 1/p)$ in Theorem 1.3.

We need the following lemma to prove our Theorem 6.1

**Lemma 6.1** (see Theorem 1 of [12]). Let $A_{\alpha+1}, \ldots, A_{n+p}$ be symmetric $(n \times n)$-matrices, which are defined by (4.17). Set $\tilde{\sigma}_{\alpha\beta} = \text{tr}(A_{\alpha}^t A_{\beta})$, $\tilde{\sigma}_{\alpha} = \tilde{\sigma}_{\alpha\alpha} = N(A_{\alpha}) := \text{tr}(A_{\alpha}^t A_{\alpha})$, $\rho^2 = \sum_{\alpha} \tilde{\sigma}_{\alpha}$ (see (4.8)-(4.10)), we have

$$
\sum_{\alpha,\beta} N(A_{\alpha} A_{\beta} - A_{\beta} A_{\alpha}) + \sum_{\alpha,\beta} \tilde{\sigma}_{\alpha\beta}^2 \leq \frac{3}{2} \rho^4.
$$

(6.3)

Moreover, the equality holds if and only if at most two matrices $A_{\alpha}$ and $A_{\beta}$ are not zero and these two matrices can be transformed simultaneously by an orthogonal matrix into scalar multiples of $\tilde{A}$, $\tilde{B}$, respectively, where $\tilde{A}$ and $\tilde{B}$ are defined in Lemma 4.4.

**Proof of Theorem 6.1** In the proof of Lemma 4.5, using Lemma 6.1 instead of Lemma 4.4, we can get

$$
\frac{1}{2} \Delta \rho^2 \geq |\nabla h|^2 - n^2 |\nabla H|^2 + \sum_{\alpha,i,j,k} (h^\alpha_{ij} h^\alpha_{kki}) + n \sum_{\alpha,\beta,i,j,m} H^\beta h^\alpha_{mj} h^\alpha_{ij} h^\alpha_{im} + n \rho^2 + n H^2 \rho^2 - \frac{3}{2} \rho^4 - \frac{1}{2} \Delta (n H^2).
$$

(6.4)

Repeating process of the proof of Lemma 4.6, we have

$$
\frac{1}{2} \Delta (\rho^n) \geq \frac{1}{2} n \{ - n(n-1) \rho^{n-2} |\nabla H|^2 + \rho^{n-2} \sum_{\alpha,i,j,k} (h^\alpha_{ij} h^\alpha_{kki}) + \rho^n [n + n H^2 - \frac{3}{2} \rho^2] + n \rho^{n-2} \sum_{\alpha,\beta,i,j,m} H^\beta h^\alpha_{mj} h^\alpha_{ji} h^\alpha_{im} - \frac{1}{2} \rho^{n-2} \Delta (n H^2) \}.
$$

(6.5)

Integrating (6.5) over $M$, using Stokes formula, (4.24), (4.26) and (4.27) we can get (6.1) by the similar argument as the proof of Theorem 1.3.
If (6.2) holds, then we conclude from (6.1) that either $\rho^2 \equiv 0$ and $M$ is totally umbilic, or $\rho^2 \equiv \frac{2}{3}n$. In the latter case, i.e.,

$$\rho^2 \equiv \frac{2}{3}n, \tag{6.6}$$

using the similar argument as the proof of theorem 1.3, we can conclude that $\nabla \perp H \equiv 0$, $h^0_{ijk} \equiv 0$ and $H \equiv 0$, i.e., $M$ is a minimal submanifold with (6.6). From Theorem 3 of [12], we know that $n = 2$, $p = 2$ and $M$ is the Veronese surface. We complete the proof of Theorem 6.1.

We now mention the following example

**Example 6.1 ([8]).** $M_{m_1, \ldots, m_{p+1}} := S^{m_1}(a_1) \times \cdots \times S^{m_{p+1}}(a_{p+1})$ is an $n$-dimensional Willmore submanifold in $S^{n+p}$, where $n = m_1 + \cdots + m_{p+1}$ and $a_i$ are defined by

$$a_i = \sqrt{\frac{n - m_i}{np}}, \quad i = 1, \ldots, p + 1.$$

From Proposition 4.1 of [8], we can check that the function $\rho^2$ of $M_{m_1, \ldots, m_{p+1}}$ satisfies $\rho^2 = np$ and $M_{m_1, \ldots, m_{p+1}}$ is a minimal submanifold if and only if

$$m_1 = m_2 = \cdots = m_{p+1} = \frac{n}{p+1}, \quad a_i = \sqrt{\frac{1}{p+1}}, \quad i = 1, \ldots, p + 1.$$

Motivated by Chern’s conjecture about minimal submanifolds in $S^{n+p}$ (see [6]) and Theorem 1.3, we propose the following problem:

**Problem.** Let $x : M \to S^{n+p}$ be an $n$-dimensional compact Willmore submanifold in an $(n+p)$-dimensional unit sphere $S^{n+p}$ with $\rho^2 := S - nH^2 = \text{constant}$. Is the set of values of $\rho^2$ discrete?

**Acknowledgements:** The author began to do this research work during his stay in department of mathematics of Harvard University as a visitor in the academic year of 1999-2000. He would like to express his thanks to Prof. S.-T.Yau for his encouragement and help. He would like to express his thanks to Prof. C.L.Terng for her useful suggestions and help. He also thank the referee for some helpful comments which make this paper more readable than the original version of the paper.
