ON A FRACTIONAL q-INTEGRAL OPERATOR INVOLVING 
THE BASIC ANALOUGE OF FOX-WRIGHT FUNCTION

Abstract: The fractional q-calculus is the q-extension of the ordinary fractional calculus. In the second half of the twentieth century there was a significant increase of activity in the area of the q-calculus due to its applications in mathematics and physics. Particularly, the operators of fractional calculus and their q-analogues have many applications. They can be used in crack problems in elasticity, in chaos theory, control systems, signal processing, bio-medical engineering, radars, sonars, etc. The aim of this paper is to define a new fractional q-integral operator of Kober type using the basic analogue of Fox-Wright function as kernel, and to establish a composition formula for a particular type of these operators. Also, some particular cases are obtained.

AMS Subject Classification: 05A30, 33D05, 33D15, 47B33, 45P05
Key Words: q-fractional calculus; fractional q-integral operator; basic analogue of Fox-Wright function and composition of operators

1. Introduction

The fractional calculus treats the calculus of integrals and derivatives of any arbitrary real or complex order. It is almost as old as calculus itself [31], and it has received much attention due to its ability to model many natural phenomena [24, 30], and to solve a lot of problems in sciences, such as physics,
The fractional $q$-calculus is the $q$-extension of the ordinary fractional calculus. The first formulae in what we now call $q$-calculus were obtained by Euler in the eighteenth century. Many remarkable results (like Jacobi’s triple product identity and the theory of $q$-hypergeometric functions) were obtained in the nineteenth century. In 1910, Jackson [26] introduced the notion of the definite $q$-integral, and he also was the first to develop $q$-calculus in a systematic way. In the second half of the twentieth century there was a significant increase of activity in the area of the $q$-calculus due to its applications in mathematics and physics, [22]. The treatment of the fractional calculus from the point of view of $q$-calculus can open new perspectives, [5]. Particularly, the $q$-analysis has found many applications in the theory of partitions, combinatorics, exactly solvable models in statistical mechanics, computer algebra, geometric functions theory, optimal control problems, $q$-difference and $q$-integral equations [3, 4, 21, 27, 29].

The operators of fractional calculus and their $q$–analogues have many applications, for example, they can be used to solve dual integral equations which arise in crack problems in elasticity [45]. They find applications also in chaos theory [50, 53, 54], control systems, signal processing, bio-medical engineering, radars, sonars, etc. [9, 48, 49]. By applying the fractional $q$-integral operators, many researchers have obtained a lot of fractional $q$–integral inequalities and applications [6, 7, 8, 10, 18, 34, 35, 43].

Rajkovic et al. [38] consider that the fractional calculus is a very suitable tool in describing and solving a lot of problems in sciences, such as physics, electromagnetics, acoustics, viscoelasticity, electrochemistry and material science (see, for example [32]). Of course, for mathematics itself it provides new possibilities such as it is emphasized in [12, 23, 53]. Their treatment from the point of view of $q$-calculus can open new perspectives (for example, see [5]). Another important property of fractional integrals is that certain multiples of them map some orthogonal polynomials to orthogonal polynomials, [25].

In this paper a new fractional $q$-integral operator of Kober type using the basic analogue of Fox-Wright function as kernel is defined, and a composition formula for a particular type of this operators is given. Also, some particular cases are obtained.
2. Some operators on fractional and q-fractional calculus

The concept of differ-integral of complex order $\alpha$, which is a generalization of the ordinary $n$-th derivative and $n$ times integral to any complex number, can be introduced in several ways. The most widely used definition of an integral of fractional order is via an integral transform, called the Riemann-Liouville operator of fractional integration, [39]:

$$aI_{x}^{\alpha}f(x) = \frac{1}{\Gamma(\alpha)} \int_{a}^{x} (x-t)^{\alpha-1} f(t) \, dt, \quad Re(\alpha) > 0,$$

$$aD_{x}^{\alpha}f(x) = \frac{d^n}{dx^n} aI_{x}^{n-\alpha}f(x), \quad Re(\alpha) > 0, \quad n = [Re(\alpha)] + 1. \quad (1)$$

Many authors [1, 2, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 28, 33, 37, 38, 40, 41, 42, 51, 52] have defined and studied operators of fractional integration through an integral transform.

2.1. Erdélyi-Kober operator of fractional integration

This operator of fractional order $\alpha$ ($Re(\alpha) > 0$), is introduced first by Kober and Erdélyi, and further developed by Sneddon [45] in the form

$$I_{\eta, \alpha}f(x) = x^{-(\alpha+\eta)} \frac{\Gamma(\alpha)}{\Gamma(\alpha)} \int_{0}^{x} (x-t)^{\alpha-1} t^{\eta} f(t) \, dt$$

$$= x^{-(\alpha+\eta)} \frac{d^n}{dx^n} x^{\eta+\alpha+n} I_{\eta, \alpha+n}f(x), \quad \text{for} \quad Re(\alpha) < 0, \quad n > -Re(\alpha), \quad (2)$$

and has found very wide applications. See also Kiryakova [28].

2.2. Basic analogues of the Riemann-Liouville fractional integral operator

Agarwal [1] defined a basic analogue of the Riemann-Liouville fractional integral operator in the following form:

$$I_{q}^{\alpha}f(x) = \frac{1}{\Gamma_q(\alpha)} \int_{0}^{x} (x-qt)^{\alpha-1} f(t) \, dq = \frac{1 - (y/x)^{qk}}{1 - (y/x)^{qk+v}} \prod_{k=0}^{\infty} \left[ 1 - \frac{y}{x} q^k \right]. \quad (3)$$

where $\alpha$ is an arbitrary order of integration, and

$$(x - y)_v \equiv x^v \left( \frac{y}{x}, q \right) = x^v \prod_{k=0}^{\infty} \left[ 1 - \frac{y}{x} q^k \right]. \quad (4)$$
In 2012 Sulaiman [47] presented the following basic analogue of the Riemann-Liouville fractional integral operator:

\[ J_q^\alpha f(x) = \frac{1}{\Gamma_q(\alpha)} \int_0^t (t-x)^{(\alpha-1)} f(x) \, dq \, t, \quad Re(\alpha) > 0, \quad (5) \]

where

\[(t-x)^{(n)} = \begin{cases} (t-x)(t-qx) \ldots (t-q^{n-1}x), & \text{if } n \in \mathbb{Z}^+ \\ t^n \prod_{k=0}^{\infty} \left[ \frac{1-(\frac{x}{t})q^k}{1-(\frac{x}{t})q^{k+n}} \right], & \text{if } n \notin \mathbb{Z}^+. \end{cases} \quad (6)\]

2.3. Basic analogue of Kober fractional $q$-integral operator

A basic analogue of the Kober fractional $q$-integral operator has been defined by Agarwal [1] in the following form:

\[ I_{q}^{\eta,\alpha} f(x) = \frac{x^{-(\eta+\alpha)}}{\Gamma_q(\alpha)} \int_0^x t^\eta (x-tq)^{\alpha-1} f(t) \, dq \, t, \quad (7) \]

provided $\eta, \alpha \in \mathbb{C}$, $Re(\alpha) > 0$, $|q| < 1$.

2.4. The operator $L_q \{ \cdot \}$

This operator was introduced in 2008 by Delgado and Galué [11] as follows:

\[ L_q \{l, b_1, b_2, \ldots, b_r, \gamma, m_1, m_2, \ldots, m_r; f(x)\} = \frac{x^{-\gamma-1}}{\Gamma_q(l+1)} \]

\[ \times \int_0^x t^{\gamma r+1} \phi_r \left[ q^{-l}, q^{m_1+b_1}, \ldots, q^{m_r+b_r} ; q, \frac{t}{x} \right] f(t) \, dq \, t, \quad (8) \]

where $l, m_1, m_2, \ldots, m_r \in \mathbb{N}_0$, $\gamma \in \mathbb{C}$, $b_1, b_2, \ldots, b_r \neq 0, -1, -2, \ldots$, $\left| \frac{t}{x} \right| < 1$.

2.5. The operator $L_q^n \{ \cdot \}$

In 2010 Galué [15] considered an $q$-fractional integral operator involving the basic analogue of the generalized hypergeometric function in the following form:

\[ L_q^n \{M, b_1, b_2, \ldots, b_r, \gamma, m_1, m_2, \ldots, m_r; f(x)\} \]
\[ x^{-\gamma-1} \frac{\Gamma_q(M+1)}{\Gamma_q(M+1)} \int_0^x t^{\gamma+1} \phi_r \left[ q^{-M}, q^{b_1+m_1}, ..., q^{b_r+m_r} ; q, q^n t \right] f(t) \, dq \, t, \quad (9) \]

\[ M, m_1, m_2, ..., m_r \in \mathbb{N}_0, \ n \in \mathbb{N}, \ \gamma \in \mathbb{C}, \]

\[ b_1, b_2, ..., b_r \neq 0, -1, -2, ..., \left| \frac{t}{x} \right| < 1, \]

with a representation in series given by

\[ L_q^n \{ M, b_1, b_2, ..., b_r, \rho, m_1, m_2, ..., m_r ; f(x) \} = \]

\[ \frac{(1-q)}{\Gamma_q(M+1)} \sum_{k=0}^{\infty} t^{(\rho+1)k} \phi_r \left[ q^{-M}, q^{b_1+m_1}, ..., q^{b_r+m_r} ; q, q^n+k \right] f(xq^k), \quad (10) \]

\[ M, m_1, ..., m_r \in \mathbb{N}_0, \ n \in \mathbb{N}, \ \rho \in \mathbb{C}, \ b_1, b_2, ..., b_r \neq 0, -1, -2, ... . \]

3. Preliminaries

In this section we present some definitions, q-analogues of functions and known results needed in this paper.

**Definition 1.** If \( q \in \mathbb{R} \) is fixed, a subset \( A \) of \( \mathbb{C} \) is called q-geometric if \( qz \in A \) whenever \( z \in A \), [4].

**Definition 2.** A function \( f \) which is defined on a q-geometric set \( A, 0 \in A \), is said to be q-regular at zero if \( \lim_{n \to \infty} f(zq^n) = f(0) \) for all \( z \in A \), [4].

**Definition 3.** A function \( f \) defined on \([0, a]\) is called q-absolutely continuous, that is \( f \in AC_q[0, a] \), if \( f \) is q-regular at zero, and there exists \( K > 0 \) such that \( \sum_{j=0}^{\infty} |f(tq^j) - f(tq^{j+1})| \leq K \) for all \( t \in [qa, a] \), [4].

3.1. q-Functions

In this section some necessary preliminaries on the q-functions are presented.
3.1.1. Basic analogue of the $q$-shifted factorial.

For real or complex $a$ and $0 < |q| < 1$, the $q$-factorial is defined as, \[44\]:

\[
(a; q)_n \equiv (q^a; q)_n = \begin{cases} 
1, & n = 0 \\
(1-q^a)(1-q^{a+1}) \ldots (1-q^{a+n-1}), & n = 1, 2, \ldots 
\end{cases} \tag{11}
\]

Also, \[21\],

\[(a; q)_\infty = \lim_{x \to \infty} (a; q)_n = \prod_{k=0}^{\infty} \left(1 - aq^k\right), \tag{12}\]

which converges for $|q| < 1$ and diverges for $a \neq 0$ and $|q| \geq 1$, and for any complex number $\alpha$,

\[(a; q)_\alpha = \frac{(a; q)_\infty}{(aq^\alpha; q)_\infty}. \tag{13}\]

3.1.2. Basic analogue of the gamma function.

In \[21\], the basic analogue of the gamma function is defined in the following form:

\[
\Gamma_q(x) = \frac{(q; q)_\infty}{(q^x; q)_\infty} (1-q)^{1-x} = \frac{(q; q)_{x-1}}{(1-q)^{x-1}}, \quad 0 < q < 1, \quad x \neq 0, -1, -2, \ldots \tag{14}\]

3.1.3. Basic hypergeometric series.

This series was introduced by Heine \[21\], and is defined as follows:

\[2\phi_1(a, b; c; q, z) = \sum_{n=0}^{\infty} \frac{(a; q)_n (b; q)_n}{(q; q)_n (c; q)_n} z^n, \tag{15}\]

where it is assumed that $c \neq q^{-m}$ for $m = 0, 1, \ldots$, and $(a; q)_n$ is the $q$-shifted factorial defined in (11).

3.1.4. Generalized basic hypergeometric series.

A generalization of the basic hypergeometric series $2\phi_1$, is given by \[21\]:

\[r\phi_s(a_1, a_2, \ldots, a_r; b_1, b_2, \ldots, b_s; q, z) = \sum_{n=0}^{\infty} \frac{(a_1; q)_n (a_2; q)_n \ldots (a_r; q)_n}{(q; q)_n (b_1; q)_n \ldots (b_s; q)_n} \left[(-1)^n q^n \right]^{1+s-r} z^n, \tag{16}\]
where \( b_1, \ldots, b_s \neq q^{-m} \) for \( m = 0, 1, \ldots; \binom{n}{r} = n(n-1)/2; q \neq 0 \) when \( r > s + 1 \) and \( \lim_{q \to 1^-} r \phi_s = rF_s \). The \( r \phi_s \)-series terminates if one of its numerator parameters is of the form \( q^{-m} \) with \( m = 0, 1, 2, \ldots \), and \( q \neq 0 \), since \((q^{-m}; q)_n = 0\) for \( n = m + 1, m + 2, \ldots \).

### 3.1.5. Basic analogue of the Fox-Wright function.

Recently, Annaby and Mansour [4] introduced the following basic analogue of the Fox-Wright function:

\[
r \psi_s \left[ \begin{array}{c}
(\alpha_1, A_1), \ldots, (\alpha_r, A_r) \\
(\beta_1, B_1), \ldots, (\beta_s, B_s)
\end{array} \right] q, z = \frac{\prod_{i=1}^r \Gamma_q(\alpha_i + A_i k)}{\prod_{j=1}^s \Gamma_q(\beta_j + B_j k)} \times \left[ (q^{(k)})_{\sum_{j=1}^r B_j - \sum_{i=1}^s A_i + 1} z^k \right],
\]

(17)

where \( \Gamma_q(x) \) is the basic analogue of the gamma function as defined in (14).

In this paper we consider (17) with the following conditions: \( A_i, B_j \in \mathbb{R}^+ \), \( \text{Re} (\alpha_i) > 0 \), \( \text{Re} (\beta_j) > 0 \), \( i = 1, \ldots, r; j = 1, \ldots, s \), \( \sum_{j=1}^r B_j - \sum_{i=1}^s A_i + 1 \geq 0 \), \( 0 < q < 1 \), \( |z| < 1 \).

Using (14) and (13) in (17), we can write

\[
r \psi_s \left[ \begin{array}{c}
(\alpha_1, A_1), \ldots, (\alpha_r, A_r) \\
(\beta_1, B_1), \ldots, (\beta_s, B_s)
\end{array} \right] q, z = \frac{\prod_{i=1}^r \Gamma_q(\alpha_i)}{\prod_{j=1}^s \Gamma_q(\beta_j)} \times \sum_{k=0}^{\infty} \frac{\prod_{i=1}^r (q^{a_i}; q)_{A_i k}}{(q; q)_k \prod_{j=1}^s (q^{\beta_j}; q)_{B_j k}} \left[ (1 - q) k \right] z^k,
\]

(18)

\( A_i, B_j \in \mathbb{R}^+ \), \( \text{Re} (\alpha_i) > 0 \), \( \text{Re} (\beta_j) > 0 \), \( i = 1, \ldots, r; j = 1, \ldots, s \),

\[
\sum_{j=1}^r B_j - \sum_{i=1}^s A_i + 1 \geq 0, 0 < q < 1, |z| < 1.
\]

The normalized form of (18) is given by

\[
r \psi_s^* \left[ \begin{array}{c}
(\alpha_1, A_1), \ldots, (\alpha_r, A_r) \\
(\beta_1, B_1), \ldots, (\beta_s, B_s)
\end{array} \right] q, z = \sum_{k=0}^{\infty} \frac{\prod_{i=1}^r (q^{a_i}; q)_{A_i k}}{(q; q)_k \prod_{j=1}^s (q^{\beta_j}; q)_{B_j k}} \times \left[ (1 - q) k \right] z^k,
\]

(19)

\( A_i, B_j \in \mathbb{R}^+ \), \( \text{Re} (\alpha_i) > 0 \), \( \text{Re} (\beta_j) > 0 \), \( i = 1, \ldots, r; j = 1, \ldots, s \),
\[
\sum_{j=1}^{s} B_j - \sum_{i=1}^{r} A_i + 1 \geq 0, \; |z| < 1.
\]

**Particular Cases:**

**Case 1:** In (17) taking \( q \to 1^- \), we have as particular case the hypergeometric function of Fox-Wright (see for example, [46]).

**Case 2:** Taking \( A_r = 1 \) and \( \alpha_r = -M, \; M \in \mathbb{N}_0, \) in (19), we have

\[
\psi_s \left[ \frac{(\alpha_1, A_1), \ldots, (\alpha_r, A_{r-1}), (-M, 1)}{(\beta_1, B_1), \ldots, (\beta_s, B_s)} \bigg| q, z \right] = \sum_{k=0}^{\infty} \left( \frac{q^{-M}; q}{q^{M}} \right)_k \prod_{j=1}^{s} (q^{\alpha_j}; q)_k \left[ (1-q)^k q^{(k)} \right] \sum_{j=1}^{s} B_j - \sum_{i=1}^{r-1} A_i \frac{z^k}{q^{(k)}}, \tag{20}
\]

\( A_i, \; B_j \in \mathbb{R}^+, \; Re (\alpha_i) > 0, \; Re (\beta_j) > 0, \; i = 1, \ldots, r, \; j = 1, \ldots, s, \; M \in \mathbb{N}_0, \sum_{j=1}^{s} B_j - \sum_{i=1}^{r-1} A_i \geq 0, \; 0 < q < 1, \; |z| < 1.\)

**Case 3:** For \( r = s + 1 \) in (20) we obtain \( i = j \) and then for \( A_j = B_j = 1 \) results

\[
s+1\psi_s \left[ \frac{(\alpha_1, 1), \ldots, (\alpha_s, 1), (-M, 1)}{(\beta_1, 1), \ldots, (\beta_s, 1)} \bigg| q, z \right] = \sum_{k=0}^{M} \left( \frac{q^{-M}; q}{q^{M}} \right)_k \prod_{j=1}^{s} (q^{\alpha_j}; q)_k \frac{z^k}{q^{(k)}}
\]

\[
= s+1\psi_s \left( \frac{q^{-M}, q^{\alpha_1}, \ldots, q^{\alpha_s}, q^{-1}, \ldots, q^{-1}; q, z}{} \right), \tag{21}
\]

\( \alpha_j \in \mathbb{C}, \; Re (\beta_j) \neq 0, -1, -2, \ldots, \; j = 1, \ldots, s, \; M \in \mathbb{N}_0, \; 0 < q < 1, \; |z| < 1.\)

The next theorem establishes the absolute convergence of the basic analogue of the Fox-Wright function, as we hope to be a new result.

**Theorem 4.** Let be \( A_i, \; B_j \in \mathbb{R}^+, \; Re (\alpha_i) > 0, \; Re (\beta_j) > 0, \; i = 1, \ldots, r, \; j = 1, \ldots, s, \; z \in \mathbb{C} \) and \( 0 < q < 1.\)

i) If \( \sum_{j=1}^{s} B_j - \sum_{i=1}^{r} A_i + 1 > 0, \) the series

\[
r\psi \left[ \frac{(\alpha_1, A_1), \ldots, (\alpha_r, A_r)}{(\beta_1, B_1), \ldots, (\beta_s, B_s)} \bigg| q, z \right] \]

converges absolutely for all \( z \in \mathbb{C}.\)

ii) If \( \sum_{j=1}^{s} B_j - \sum_{i=1}^{r} A_i + 1 < 0, \; z \neq 0, \) the series

\[
r\psi \left[ \frac{(\alpha_1, A_1), \ldots, (\alpha_r, A_r)}{(\beta_1, B_1), \ldots, (\beta_s, B_s)} \bigg| q, z \right] \]

diverges.
iii) If \( \sum_{j=1}^{s} B_j - \sum_{i=1}^{r} A_i + 1 = 0 \), the series
\[
\sum_{r} \psi_{s} \left[ \begin{array}{c} (\alpha_1, A_1) , \ldots , (\alpha_r, A_r) \\ (\beta_1, B_1) , \ldots , (\beta_s, B_s) \end{array} \right] q, z \]
converges absolutely for \(|z| < 1\).

The proof of this theorem follows in straight way from (18) applying the ratio test.

### 3.2. Known Results

#### 3.2.1. Identities.

The following \( q \)-identities are given in [21], page 6: eqs. (1.2.33), (1.2.35), (1.2.38):

\[
(a; q)_{n+k} = (a; q)_n (aq^n; q)_k, \tag{22}
\]

\[
(aq^k; q)_{n-k} = \frac{(a; q)_n}{(a; q)_k}, \tag{23}
\]

\[
(aq^{-n}; q)_k = \frac{(a; q)_k (qa^{-1}; q)_n q^{-nk}}{(a^{-1}q^{1-k}; q)_n}. \tag{24}
\]

In 2010, Galué [15] presented the following identities:

\[
\sum_{k=0}^{\nu} q^{(y-w)k} = q^{(y-w)\nu} \frac{(q^{-y}; q)_w}{(q^{1-y}; q)_w (q^{-y}; q)_1}, \tag{25}
\]

\[
\frac{(q^{\beta_i + m_i - 1 - M_1 + j}; q)_{m_{i1}}}{(q^{\beta_i}; q)_{m_{i1}}} = \frac{(q^{\beta_i + m_i - 1 - M_1}; q)_j \Gamma_q (\beta_i + m_i - 1 - M_1) \Gamma_q (\beta_i - 1 - M_1)}{(q^{\beta_i - 1 - M_1}; q)_j \Gamma_q (\beta_i + m_i) \Gamma_q (\beta_i - 1 - M_1)}, \tag{26}
\]

\[i = 1, \ldots, s.\]

#### 3.2.2. The \( q \)-integral.

Jackson [26] introduced the \( q \)-integral as

\[
\int_{a}^{b} f(t) \, dq \, t = \int_{a}^{b} f(t) \, dq \, t - \int_{0}^{a} f(t) \, dq \, t, \tag{27}
\]

where

\[
\int_{0}^{a} f(t) \, dq \, t = a (1 - q) \sum_{n=0}^{\infty} f(aq^n) q^n. \tag{28}
\]
3.2.3. The \( q \)-binomial theorem.

One of the most important summation formulas for hypergeometric series is given by the binomial theorem, whose \( q \)-analogue, derived by Cauchy (1843), Heine (1847) and other mathematicians, is [21]:

\[
\phi_0 \left[ \frac{\alpha}{q}; x \right] = \sum_{n=0}^{\infty} \frac{(\alpha; q)_n x^n}{(q; q)_n} = \frac{(\alpha x; q)_\infty}{(x; q)_\infty}, \quad |x| < 1, \quad |q| < 1.
\] (29)

3.2.4. \( q \)-analogue of the Karlsson-Minton summation formula.

Gasper [21] derived a \( q \)-analogue of the Karlsson-Minton summation formula, which is given by ([p.16, No. (1.9.10)]:}

\[
r_{r+2}^{\phi_{r+1}} \left[ \frac{q^{-n}, b, b_1 q^{m_1}, ..., b_r q^{m_r}}{b q, b_1, ..., b_r}; q, q \right]
= \frac{b^n (q; q)_n (b_1/q; q)_{m_1} ... (b_r/q; q)_{m_r}}{(b q; q)_n (b_1/q; q)_{m_1} ... (b_r/q; q)_{m_r}},
\] (30)

for \( n \geq m_1 + ... + m_r; \quad m_1, m_2, ..., m_r \) nonnegative integers.

4. The operator \( I^n_q (\cdot) \)

In this section a new fractional \( q \)-integral operator, denoted by \( I^n_q (\cdot) \) is defined.

Definition 5. Let be \( f \) a \( q \)-absolutely continuous function on \([0,x]\), then we define the operator

\[
I^n_q \left[ \frac{\rho, (M, 1), (\alpha_i, A_i)_{1,r-1}}{(\beta_j, B_j)_{1,s}} \right] f(x) = \frac{x^{-\rho-1}}{\Gamma_q (M + 1)} \times 
\int_0^x t^{\rho} r_{\psi_s^*} \left[ \frac{(\alpha_1, A_1), ..., (\alpha_{r-1}, A_{r-1}), (-M, 1)}{(\beta_1, B_1), ..., (\beta_s, B_s)} \right] \frac{q^n t^s}{x} f(t) \, dq t,
\] (31)

\( A_i, B_j \in \mathbb{R}^+, \quad Re (\alpha_i) > 0, \quad Re (\beta_j) > 0, \quad i = 1, \cdots, r - 1; \quad j = 1, \cdots, s, \quad \sum_{j=1}^{s} B_j - \sum_{i=1}^{r-1} A_i \geq 0, \quad M \in \mathbb{N}_0, \quad n \in \mathbb{N}, \quad \rho \in \mathbb{C}, \quad 0 < q < 1, \quad \left| \frac{t}{x} \right| < 1. \)
By virtue of the result (28), the operator (31) can be written as

\[
I^n_q \left[ \frac{\rho, (M, 1), (\alpha_i, A_i)_{1,s}}{\beta_j, B_j}_{1,s} \right] f(x) = \frac{(1-q)}{\Gamma_q(M+1)} \sum_{k=0}^{\infty} q^{(\rho+1)k} \times
\]

\[
r \psi_s^* \left[ \frac{(\alpha_1, A_1), \ldots, (\alpha_r, A_r), (-M, 1)}{(\beta_1, B_1), \ldots, (\beta_s, B_s)} \right]_{1,s} f(x^q^k),
\]

(32)

For convenience we will use the notation:

\[
I^n_q (\cdot) \equiv I^n_q \left[ \frac{\rho, (M, 1), (\alpha_i, A_i)_{1,s}}{\beta_j, B_j}_{1,s} \right].
\]

Particular Cases:

Case 1. The operator \( L^n_q (\cdot) \) was considered by Galué.

Taking \( r = s + 1, A_i = B_i = 1, \alpha_i = \beta_i + m_i, m_i \in \mathbb{N}_0; i = 1, \ldots, s \) in (31), then according to (21) and using (9) we get

\[
I^n_q \left[ \frac{\rho, (-M, 1), (\beta_i + m_i, 1)}{(\beta_i, 1)}_{1,s} \right] f(x) = L^n_q \{M, \beta_1, \ldots, \beta_s, \rho, m_1, \ldots, m_s; f(x)\},
\]

(33)

\[m_i, M \in \mathbb{N}_0, \text{Re} (\beta_i) \neq 0, -1, -2, \ldots, i = 1, \ldots, s, n \in \mathbb{N}, \rho \in \mathbb{C}, 0 < q < 1, \]

Case 2. Operator \( L_q (\cdot) \) established by Delgado and Galué.

It is obtained directly from (33) making \( n = 1. \)

If we consider \( r = s + 1, A_i = B_i, \alpha_i = \beta_i, i = 1, \ldots, s, n = M + 1 \) in (31), then for \( \left| \frac{t}{x} \right| < 1: \)

\[
I^n_q \left[ \frac{\rho, (M, 1)}{-} \right] f(x) = \frac{x^{-\rho-1}}{\Gamma_q(M+1)} \int_0^x t^{\rho} \times
\]

\[
\times 1 \psi_0^* \left[ \frac{(-M, 1)}{-}; q, q^n\frac{t}{x} \right] f(t) d_q t, M \in \mathbb{N}_0, \rho \in \mathbb{C}, 0 < q < 1,
\]
and now, applying (21), (29), and (12) respectively, we obtain again for $\left| \frac{t}{x} \right| < 1$:

$$
I^\nu_q \left[ \rho, (M, 1) \right] f(x) = \frac{x^{-\nu - 1}}{\Gamma_q (M + 1)} \int_0^x t^\nu \times \prod_{k=0}^{\infty} \left[ \frac{1 - (q^{-M+n} \frac{t}{x})^q}{1 - (q^{-M+n} \frac{t}{x})^{q+M}} \right] f(t) \, dt, \quad M \in \mathbb{N}_0, \, \rho \in \mathbb{C}, \, 0 < q < 1. \tag{34}
$$

This expression will be used in the next results.

**Case 3.** Basic analogue of Kober fractional integral operator.

From (34) with $n = M + 1$ it results

$$
I^{M+1}_q \left[ \rho, (M, 1) \right] f(x) = \frac{x^{-\rho - M - 1}}{\Gamma_q (M + 1)} \int_0^x t^\rho (x - t q)_M f(t) \, dt, \tag{35}
$$

where we have used (4). Therefore from (7) we can write

$$
I^{M+1}_q \left[ \rho, (M, 1) \right] f(x) = I^{\rho, M+1}_q f(x), \tag{36}
$$

$$
M \in \mathbb{N}_0, \, \rho \in \mathbb{C}, \, 0 < q < 1, \left| \frac{t}{x} \right| < 1.
$$

**Case 4.** Basic analogues of Riemann-Liouville fractional integral operator.

4.1. From (35) with $\rho = 0$ and using (3), we have

$$
I^{M+1}_q \left[ 0, (M, 1) \right] f(x) = x^{-(M+1)} I^{M+1}_q f(x), \tag{37}
$$

$$
M \in \mathbb{N}_0, \, 0 < q < 1, \left| \frac{t}{x} \right| < 1.
$$

4.2. From (35) with $\rho = 0$, $n = M$ and using (6) and later (5), we obtain

$$
I^M_q \left[ 0, (M, 1) \right] f(x) = x^{-(M+1)} J^{M+1}_q f(x), \tag{38}
$$

$$
M \in \mathbb{N}, \, 0 < q < 1, \left| \frac{t}{x} \right| < 1.
$$
4.1. Composition formulae for $I_q^n \, \cdot$ fractional $q$-integral operators.

In this section we establish some formulae for the composition of the operator $q$-fractional integral $I_q^n \, \cdot$ with the operator $L_q \{ M, b_1, b_2, \ldots, b_s, \rho, m_1, m_2, \ldots, m_s; f(x) \}$, presented by Delgado and Galué in [11].

For convenience we will use the following notation:

$$L_q \{ M, b_1, b_2, \ldots, b_r, \rho, m_1, m_2, \ldots, m_r; f(x) \} = L_q \left[ \begin{array}{c} M, b_1, b_2, \ldots, b_r \\ \rho, m_1, m_2, \ldots, m_r \end{array} \right] f(x). \quad (39)$$

**Theorem 6.** Let $f$ be a $q$-absolutely continuous function on $[0, x]$,

$$L_q \left[ \begin{array}{c} M, b_1, b_2, \ldots, b_r \\ \rho, m_1, m_2, \ldots, m_r \end{array} \right] (\cdot) \text{ and } I_q^n \left[ \begin{array}{c} \rho, (M, 1), (\alpha_i, A_i)_{1, r-1} \\ (\beta_j, B_j)_{1,s} \end{array} \right] (\cdot)$$

be fractional $q$-integral operators as defined by (8) and (31) respectively, then

$$L_q \left[ \begin{array}{c} M_2, b_1, b_2, \ldots, b_s \\ \rho + M_1 + 1, m_1, m_2, \ldots, m_s \end{array} \right] \times I_q^n \left[ \begin{array}{c} \rho, (M_1, 1), (\alpha_i, A_i)_{1, r-1} \\ (\beta_j, B_j)_{1,s} \end{array} \right] f(x) \times$$

$$= q^{(1+M_1)M_2} \prod_{v=1}^{s} \left[ \frac{\Gamma_q (b_{v2} + m_{v2} - 1 - M_1) \Gamma_q (b_{v2})}{\Gamma_q (b_{v2} - 1 - M_1) \Gamma_q (b_{v2} + m_{v2})} \right] \times$$

$$I_q^{n+1} \left[ \begin{array}{c} \rho, (M_2 + M_1 + 1, 1), (\alpha_i, A_i)_{1, r-1}, (b_{j2}, m_{j2} - 1 - M_1, 1)_{1,s} \\ (\beta_j, B_j)_{1,s}, (b_{j2} - 1 - M_1, 1)_{1,s} \end{array} \right] f(x), \quad (40)$$

$A_i, B_j \in \mathbb{R}^+, Re (\alpha_i) > 0, Re (\beta_j) > 0, i = 1, \ldots, r - 1; j = 1, \ldots, s$,

$M_1, M_2, m_{j2} \in \mathbb{N}_0, n \in \mathbb{N}, \rho \in \mathbb{C}, 0 < q < 1, \sum_{j=1}^{s} B_j - \sum_{i=1}^{r-1} A_i \geq 0$,

$b_{j2} \neq 1 + M_1, M_1, M_1 - 1, \ldots, M_2 \geq m_{12} + \ldots + m_{s2}$.

**Proof.** On applying (10) with $n = 1$ to (32), using the notations $L_q^n \, \cdot$, $I_q^n \, \cdot$ and the result ([36])

$$\sum_{n=0}^{\infty} \sum_{k=0}^{n} A(k, n) = \sum_{n=0}^{\infty} \sum_{k=0}^{n} A(k, n - k), \quad (41)$$
we have

\[ L_q (\cdot) \mathcal{I}_q^n [\cdot] f (x) = \frac{(1 - q)^2}{\Gamma_q (M_1 + 1) \Gamma_q (M_2 + 1)} \sum_{h=0}^{\infty} q^{(p+M_1+2)h} f \left( xq^h \right) \]

\times \left\{ \sum_{k=0}^{h} q^{-(M_1+1)k} \left[ \sum_{w=0}^{\infty} \frac{q^{-M_2} q^{b_{12}+m_{12}} \cdots q^{b_{s_2}+m_{s_2}}}{q^{b_{12}} \cdots q^{b_{s_2}}} \right] \times \sum_{u=0}^{\infty} \frac{q^{-M_1} q^{\alpha_u}}{(q; q)_{u}} \prod_{u=1}^{r-1} \frac{(q^{\alpha_u}; q)^{A_{u,p}}}{(q; q)_{u}} \right\}

\times \left\{ \sum_{p=0}^{\infty} \frac{(1 - q)^p q^{(p)_2}}{\sum_{u=1}^{s} B_u - \sum_{u=1}^{r-1} A_u} q^{(n+k)p} \right\},

where from [21] [p.6, eq. (1.2.41)]:

\[(a_1; a_2, \ldots, a_m; q)_n = (a_1; q)^n (a_2; q)_n \cdots (a_m; q)_n.\]

Interchanging the order of the series, on the basis of the absolute convergence, we get

\[ L_q (\cdot) \mathcal{I}_q^n [\cdot] f (x) = \frac{(1 - q)^2}{\Gamma_q (M_1 + 1) \Gamma_q (M_2 + 1)} \sum_{h=0}^{\infty} q^{(p+M_1+2)h} f \left( xq^h \right) \times \]

\[ \sum_{p=0}^{\infty} \frac{(q^{-M_1}; q)_{p} \prod_{u=1}^{r-1} (q^{\alpha_u}; q)^{A_{u,p}}}{(q; q)_{p} \prod_{u=1}^{s} (q^{\beta_u}; q)^{B_{u,p}}} \left[ (1 - q)^p q^{(p)_2} \right] \sum_{u=1}^{s} B_u - \sum_{u=1}^{r-1} A_u q^{n+k-p} \]

\times \left\{ \sum_{w=0}^{\infty} \frac{q^{-M_2} q^{b_{12}+m_{12}} \cdots q^{b_{s_2}+m_{s_2}}}{(q; q)_{w}} \prod_{u=1}^{s} (q^{\alpha_u}; q)^{A_{u,p}} \right\}.$$
From (25),

\[
L_q \left( \cdot \right) I^n_q \left[ \cdot \right] f (x) = \frac{(1 - q)^2}{\Gamma_q (M_1 + 1) \Gamma_q (M_2 + 1)} \sum_{h=0}^{\infty} q^{(s+M_1+2)h} f \left( x q^h \right)
\]

\[
\times \sum_{p=0}^{\infty} \frac{(q^{M_1}; q)_{p} \prod_{u=1}^{r-1} (q^{\alpha_u}; q)_{A_{up}}}{(q; q)_{p} \prod_{u=1}^{s} (q^{\beta_u}; q)_{B_{up}}}
\times \left[ (1 - q)^p q^{(\frac{p}{2})} \right] \left( \sum_{u=1}^{s} B_u - \sum_{u=1}^{r-1} A_u \right) q^{np}
\times \left\{ \sum_{w=0}^{\infty} \frac{(q^{M_2}, q^{b_{12}+m_{12}}, \ldots, q^{b_{s2}+m_{s2}}; q)_{w} f (1+h)w}{(q, q^{b_{12}}, \ldots, q^{b_{s2}}; q)_{w}} \right\}
\times \left( \frac{(q^{1-p+M_1}; q)_{w} q^{(p-w-M_1-1)h}}{(q^{2-p+M_1}; q)_{w} (q^{1-p+M_1}; q)_1} \right),
\]

that is,

\[
L_q \left( \cdot \right) I^n_q \left[ \cdot \right] f (x) = \frac{(1 - q)^2}{\Gamma_q (M_1 + 1) \Gamma_q (M_2 + 1)} \sum_{h=0}^{\infty} q^{(s+1)h} f \left( x q^h \right)
\]

\[
\times \left\{ \sum_{p=0}^{\infty} \frac{(q^{M_1}; q)_{p} \prod_{u=1}^{r-1} (q^{\alpha_u}; q)_{A_{up}}}{(q; q)_{p} (q^{1-p+M_1}; q)_{1} \prod_{u=1}^{s} (q^{\beta_u}; q)_{B_{up}}}
\times \left[ (1 - q)^p q^{(\frac{p}{2})} \right] \left( \sum_{u=1}^{s} B_u - \sum_{u=1}^{r-1} A_u \right) q^{(n+h)p} \right\}
\times \left\{ \sum_{w=0}^{\infty} q^{M_2}, q^{1-p+M_1}, q^{b_{12}+m_{12}}, \ldots, q^{b_{s2}+m_{s2}} \right\}
\times \left\{ \sum_{u=1}^{s} B_u - \sum_{u=1}^{r-1} A_u \right\} q^{(n+h)p},
\]

where we have used (16).

Now, the formula (30) leads us to

\[
L_q \left( \cdot \right) I^n_q \left[ \cdot \right] f (x) = \frac{(1 - q)^2}{\Gamma_q (M_1 + 1) \Gamma_q (M_2 + 1)} \sum_{h=0}^{\infty} q^{(s+1)h} f \left( x q^h \right)
\]

\[
\times \left\{ \sum_{p=0}^{\infty} \frac{(q^{M_1}; q)_{p} \prod_{u=1}^{r-1} (q^{\alpha_u}; q)_{A_{up}}}{(q; q)_{p} (q^{1-p+M_1}; q)_{1} \prod_{u=1}^{s} (q^{\beta_u}; q)_{B_{up}}}
\times \left[ (1 - q)^p q^{(\frac{p}{2})} \right] \left( \sum_{u=1}^{s} B_u - \sum_{u=1}^{r-1} A_u \right) q^{(n+h)p} \right\}
\times \left\{ \sum_{w=0}^{\infty} q^{M_2}, q^{1-p+M_1}, q^{b_{12}+m_{12}}, \ldots, q^{b_{s2}+m_{s2}} \right\}
\times \left\{ \sum_{u=1}^{s} B_u - \sum_{u=1}^{r-1} A_u \right\} q^{(n+h)p},
\]
\[
\frac{q^{(1-p+M_1)M_2} (q; q)_{M_2}}{(q^{2-p+M_1}; q)_{M_2}} \frac{(q^{h_{12}-1-M_1+p}; q)_{m_{12}}}{(q^{b_{12}}; q)_{m_{12}}} \cdots \frac{(q^{b_{s_2}-1-M_1+p}; q)_{m_{s_2}}}{(q^{h_{s_2}}; q)_{m_{s_2}}},
\]
with \( M_2 \geq m_{12} + \ldots + m_{s_2} \).

On using (22) and (26), we can write (43) in the following form:

\[
L_q (\cdot) I^n_q [\cdot] f (x) = \frac{(1 - q)^2 (q; q)_{M_2} q^{(1+M_1)M_2}}{\Gamma_q (M_1 + 1) \Gamma_q (M_2 + 1)} \frac{\prod_{u=1}^{s} \frac{\Gamma_q (b_{u2} + m_{u2} - 1 - M_1)}{\Gamma_q (b_{u2} - 1 - M_1)}}{\sum_{h=0}^{\infty} q^{(p+1)h} \sum_{h=0}^{\infty} q^{(p+1)h} f \left( xq^h \right)}
\]

\[
\times \sum_{p=0}^{\infty} \left\{ \frac{(q^{-M_1}; q)_p \prod_{u=1}^{r-1} (q^{\alpha_u}; q)_{A_{up}}}{(q; q)_p (q^{1-p+M_1}; q)_{1+M_2} \prod_{u=1}^{s} (q^{\beta_u}; q)_{B_{up}}} \times \left[ (1 - q)^p q^{(p)} \right] \sum_{u=1}^{r} A_u \right\}^{q^{b_{12}+m_{12}-1-M_1}, \ldots, q^{b_{s_2}+m_{s_2}-1-M_1}; q}_p q^{(n+h-M_2)p}.
\]

Following to Galué [15], p.47,

\[
(q^{1-p+M_1}; q)_1^{1+M_2} = \frac{(q; q)_{M_2+M_1+1}}{(q; q)_{M_1}} \frac{(q^{-M_1}; q)_p}{(q^{-M_2-M_1-1}; q)_p} q^{-p(M_2+1)}.
\]

The substitution of this result in (44) yields

\[
L_q (\cdot) I^n_q [\cdot] f (x) = \frac{(1 - q)^2}{\Gamma_q (M_1 + 1) \Gamma_q (M_2 + 1)} \frac{\prod_{u=1}^{s} \frac{\Gamma_q (b_{u2} + m_{u2} - 1 - M_1)}{\Gamma_q (b_{u2} - 1 - M_1)}}{\sum_{h=0}^{\infty} q^{(p+1)h} \sum_{h=0}^{\infty} q^{(p+1)h} f \left( xq^h \right)}
\]

\[
\times \prod_{u=1}^{s} \left[ \frac{\Gamma_q (b_{u2} + m_{u2} - 1 - M_1)}{\Gamma_q (b_{u2} - 1 - M_1)} \frac{\Gamma_q (b_{u2})}{\Gamma_q (b_{u2} + m_{u2})} \right] \times q^{(1+M_1)M_2} \frac{(q; q)_{M_2} (q; q)_{M_1}}{(q; q)_{M_2+M_1+1}}
\]

\[
\times \sum_{h=0}^{\infty} q^{(p+1)h} f \left( xq^h \right) \sum_{p=0}^{\infty} \frac{(q^{-M_2-M_1-1}; q)_p \prod_{u=1}^{r-1} (q^{\alpha_u}; q)_{A_{up}}}{(q; q)_p \prod_{u=1}^{s} (q^{\beta_u}; q)_{B_{up}}}.
\]
On the other hand, applying (13) and after (14), we have

\[ \frac{(q; q)_{M_1} (q; q)_{M_2}}{(q; q)_{M_2 + M_1 + 1}} = \frac{\Gamma_q (M_2 + 1) \Gamma_q (M_1 + 1)}{(1 - q) \Gamma_q (M_1 + M_2 + 2)}, \]

now, taking in account this result and (20), (45) takes the form

\[ L_q (\cdot) I^n_q [\cdot] f (x) = \frac{(1 - q) q^{(1 + M_1) M_2}}{\Gamma_q (M_2 + M_1 + 2)} \]

\[ \times \prod_{v=1}^{s} \left[ \frac{\Gamma_q (b_v + m_v - 1 - M_1) \Gamma_q (b_v)}{\Gamma_q (b_v - 1 - M_1) \Gamma_q (b_v + m_v)} \right] \sum_{h=0}^{\infty} q^{(\rho + 1) h} \]

\[ \times_r + s q \left[ (\alpha_1, A_1), ..., (\alpha_{r-1}, A_{r-1}), (b_{12} + m_{12} - 1 - M_1, 1), ..., (\beta_1, B_1), ..., (\beta_s, B_s), \right. \]

\[ (b_{s2} + m_{s2} - 1 - M_1, 1), (q^{- (M_2 + M_1 + 1)}, 1) \bigg| q, q^{n+1+h} \bigg] f \left( xq^h \right). \tag{46} \]

Interpreting the above expression with the help of (32) the proof is completed. \( \square \)

**Theorem 7.** Let \( f \) be a \( q \)-absolutely continuous function on \([0, x] \),

\[ L_q \left[ \begin{array}{c} M_u, b_{1u}, b_{2u}, ..., b_{su} \\ \rho, m_{1u}, m_{2u}, ..., m_{su} \end{array} \right] (\cdot) \text{ and } I^n_q \left[ \begin{array}{c} \rho, (M_i, 1), (\alpha_i, A_i)_{1, r-1} \\ (\beta_j, B_j)_{1, s} \end{array} \right] (\cdot) \]

be fractional \( q \)-integral operators as defined in (8) and (31) respectively, then

\[ L_q \left[ \begin{array}{c} M_u, b_{1u}, b_{2u}, ..., b_{su} \\ \rho + M_1 + M_2 + ... + M_{u-1} + u - 1, m_{1u}, m_{2u}, ..., m_{su} \end{array} \right] \]

\[ \times L_q \left[ \begin{array}{c} M_{u-1}, b_{1u-1}, b_{2u-1}, ..., b_{su-1} \\ \rho + M_1 + M_2 + ... + M_{u-2} + u - 2, m_{1u-1}, m_{2u-1}, ..., m_{su-1} \end{array} \right] \]

... \[ L_q \left[ \begin{array}{c} M_2, b_{12}, b_{22}, ..., b_{s2} \\ \rho + M_1 + 1, m_{12}, m_{22}, ..., m_{s2} \end{array} \right] \]
Now, we suppose that eq. (47) is true for \( u \). We observe that for

\[ \rho, (\alpha_i, A_i)_{1,r-1} \]

Proof. To prove (47), we employ the mathematical induction principle. We observe that for \( u = 2 \) in (47), it yields to eq. (40).

Now, we suppose that eq. (47) is true for \( u = l > 2 \), that is,

\[ \rho, (M_1, 1), (\alpha_i, A_i)_{1,r-1} \]

\[ \rho, (M_u + M_{u-1} + \ldots + M_1 + u - 1, 1), (\alpha_i, A_i)_{1,r-1}, \]

\[ (\beta_j, B_j)_{1,s}, (b_{j2} - 1 - M_1, 1)_{1,s}, \ldots, \]

\[ (b_{ju} - u + 1 - M_1 - M_2 - \ldots - M_{u-1}, 1)_{1,s}, \]

\[ f(x), \quad (47) \]

\( A_i, B_j \in \mathbb{R}^+, Re(\alpha_i) > 0, Re(\beta_j) > 0, i = 1, \ldots, r-1; j = 1, \ldots, s, \)

\( M_1, \ldots, M_u, m_{j2}, \ldots, m_{ju} \in \mathbb{N}_0, n \in \mathbb{N}, \rho \in \mathbb{C}, \quad 0 < q < 1, \)

\[ \sum_{j=1}^{r-1} B_j - \sum_{i=1}^{s} A_i \geq 0, b_{vu} \neq u - 1 + M_1 + M_2 + M_{u-1}, \]

\[ u - 2 + M_1 + M_2 + M_{u-1}, u - 3 + M_1 + M_2 + M_{u-1}, \ldots, \]

\[ M_u \geq m_{1u} + \ldots + m_{su}, v = 1, \ldots, s, \quad u = 2, 3, \ldots. \]
we have

\[ \prod_{h=2}^{l} \prod_{v=1}^{s} \Gamma_q \left( b_{vh} + m_{vh} - \left( \sum_{k=1}^{h-1} M_k + h - 1 \right) \right) \Gamma_q (b_{vh}) \]

\[ \times q^{(h-1+\sum_{k=1}^{h-1} M_k) M_h} \]

\[ \times I_{q, l-1}^{n+l-1} \left[ \rho, (M_i + M_{i-1} + \ldots + M_1 + l - 1, 1), (\alpha_i, A_i)_{1,r-1}, \right. \]

\[ (b_{j2} + m_{j2} - 1 - M_1, 1)_{1,s}, \]

\[ (b_{j3} + m_{j3} - 2 - M_1 - M_2, 1)_{1,s}, \ldots, \]

\[ (b_{j} + m_{j} - l + 1 - M_1 - M_2 - \ldots - M_{l-1}, 1)_{1,s} \]

\[ f(x), \quad (48) \]

\[ A_i, B_j \in \mathbb{R}^+, Re(\alpha_i) > 0, Re(\beta_j) > 0, i = 1, \ldots, r - 1, \]

\[ j = 1, \ldots, s, \]

\[ M_1, \ldots, M_l, m_{j2}, \ldots, m_{j} \in \mathbb{N}_0, n \in \mathbb{N}, \rho \in \mathbb{C}, 0 < q < 1, \]

\[ \sum_{j=1}^{s} B_j - \sum_{i=1}^{r-1} A_i \geq 0, b_{ul} \neq l - 1 + M_1 + M_2 + \ldots + M_{l-1}, \]

\[ l - 2 + M_1 + M_2 + \ldots + M_{l-1}, l - 3 + M_1 + M_2 + \ldots + M_{l-1}, \ldots, \]

\[ M_l \geq m_{1l} + \ldots + m_{sl}, v = 1, \ldots, s, l = 3, 4, \ldots \]

On operating both sides of (48) by the operator

\[ L_q \left[ M_{l+1}, b_{l+1}, b_{2l+1}, \ldots, b_{sl+1} \right] \left( \cdot \right), \]

we have

\[ L_q \left[ M_{l+1}, b_{l+1}, b_{2l+1}, \ldots, b_{sl+1} \right] \left( \cdot \right) \]

\[ \rho + M_1 + M_2 + \ldots + M_l + l, m_{1l+1}, m_{2l+1}, \ldots, m_{sl+1} \]

\[ \times L_q \left[ M_l, b_{l}, b_{2l}, \ldots, b_{sl} \right] \left( \cdot \right) \]

\[ \rho + M_1 + M_2 + \ldots + M_{l-1} + l - 1, m_{1l}, m_{2l}, \ldots, m_{sl} \]

\[ \times L_q \left[ M_{l-1}, b_{l-1}, b_{2l-1}, \ldots, b_{sl-1} \right] \left( \cdot \right) \]

\[ \rho + M_1 + M_2 + \ldots + M_{l-2} + l - 2, m_{1l-1}, m_{2l-1}, \ldots, m_{sl-1} \]

\[ \ldots \]

\[ L_q \left[ M_2, b_{12}, b_{22}, \ldots, b_{s2} \right] \left( \cdot \right) \]

\[ \rho + M_1 + 1, m_{12}, m_{22}, \ldots, m_{s2} \]

\[ I_{q, l}^{n} \left[ (\beta_j, B_j)_{1,s} \right] f(x) \]
By applying (40) to the right hand side of (49) we obtain

\[
\begin{align*}
&= \left\{ \prod_{h=2}^{l} \prod_{v=1}^{s} \Gamma_q \left( b_{v+h} + m_{v+h} - \left( \sum_{k=1}^{h-1} M_k + h - 1 \right) \right) \Gamma_q \left( b_{v+h} \right) \right. \\
&\times q^{h-1 + \sum_{k=1}^{h-1} M_k} M_h \} \\
&\times L_q \left[ M_{l+1}, b_{l+1}, b_{2l+1}, \ldots, b_{sl+1} \right] \\
&\left. \rho + M_1 + M_2 + \ldots + M_l + l, m_{1l+1}, m_{2l+1}, \ldots, m_{sl+1} \right]
\end{align*}
\]

\times I_q^{n+l-1} \left[ \rho, (M_l + M_{l-1} + \ldots + M_1 + l - 1, 1), (\alpha_i, A_i)_{1,r-1}, \\
(b_j + 2 - M_1 - 1, 1)_{1,s}, (b_j + j) - 2 - M_1 - M_2, 1)_{1,s}, \ldots, \\
(b_j + 2 - M_1 - M_2, 1)_{1,s}, \ldots, \\
(b_j + j - l + 1 - M_1 - M_2 - \ldots - M_{l-1}, 1)_{1,s} \right] f(x) \quad (49)
\]

\[
A_i, B_j \in \mathbb{R}^+, \text{Re} (\alpha_i) > 0, \text{Re} (\beta_j) > 0, i = 1, \ldots, r - 1, j = 1, \ldots, s, \\
M_1, \ldots, M_{l+1}, M_j, \ldots, m_{jl+1} \in \mathbb{N}_0, n \in \mathbb{N}, \rho \in \mathbb{C}, 0 < q < 1,
\]

\[
\sum_{j=1}^{s} B_j - \sum_{i=1}^{r-1} A_i \geq 0, b_{vl+1} \neq l + M_1 + M_2 + \ldots + M_l,
\]

\[
l - 1 + M_1 + M_2 + \ldots + M_l, l - 2 + M_1 + M_2 + \ldots + M_l, \ldots,
\]

\[
M_{l+1} \geq m_{1l+1} + \ldots + m_{sl+1}, v = 1, \ldots, s, l = 3, 4, \ldots
\]

By applying (40) to the right hand side of (49) we obtain

\[
\begin{align*}
&L_q \left[ M_{l+1}, b_{l+1}, b_{2l+1}, \ldots, b_{sl+1} \right] \\
&\left. \rho + M_1 + M_2 + \ldots + M_l + l, m_{1l+1}, m_{2l+1}, \ldots, m_{sl+1} \right]
\end{align*}
\]

\times L_q \left[ M_l, b_l, b_{2l}, \ldots, b_{sl} \right] \\
\left. \rho + M_1 + M_2 + \ldots + M_l + l - 1, m_{1l}, m_{2l}, \ldots, m_{sl} \right]

\times L_q \left[ M_{l-1}, b_{l-1}, b_{2l-1}, \ldots, b_{sl-1} \right] \\
\left. \rho + M_1 + M_2 + \ldots + M_{l-2} + l - 2, m_{1l-1}, m_{2l-1}, \ldots, m_{sl-1} \right]

\ldots

\begin{align*}
&L_q \left[ M_2, b_2, b_2, \ldots, b_{s2} \right] \\
&\left. \rho + M_1 + 1, m_{12}, m_{22}, \ldots, m_{s2} \right]
\end{align*}

\times I_q^{n} \left[ \rho, (M_1, 1), (\alpha_i, A_i)_{1,r-1} \right] f(x)
be fractional $q$-integral operators as defined in (8) and (9) respectively, then

$$L_q \left[ \begin{array}{c}
M_{l+1}, b_{1l+1}, b_{2l+1}, \ldots, b_{sl+1} \\
\rho + M_1 + M_2 + \ldots + M_l + l, m_{1l+1}, m_{2l+1}, \ldots, m_{sl+1}
\end{array} \right] (\cdot)$$

and

$$L_q^n \left[ \begin{array}{c}
M_1, b_{11}, b_{21}, \ldots, b_{s1} \\
\rho, m_{11}, m_{21}, \ldots, m_{s1}
\end{array} \right] (\cdot).$$

which is true for $j = l + 1$. This completes the proof.

For $r = s + 1$, $A_i = B_i = 1$, $\alpha_i = b_i + m_i$, $\beta_i = b_i$, $m_i \in \mathbb{N}_0$; $i = 1, \ldots, s$ in (47), and using (33) we obtain the following corollary.

**Corollary 8.** Let $f$ be a $q$-absolutely continuous function on $[0, x]$,

$$L_q \left[ \begin{array}{c}
M, b_{1u}, b_{2u}, \ldots, b_{su} \\
m_{1u}, m_{2u}, \ldots, m_{su}
\end{array} \right] (\cdot)$$

and $L_q^n \left[ \begin{array}{c}
M_1, b_{11}, b_{21}, \ldots, b_{s1} \\
\rho, m_{11}, m_{21}, \ldots, m_{s1}
\end{array} \right] (\cdot)$
\[ L_q \left[ \frac{M_{u-1}, b_{1u-1}, b_{2u-1}, \ldots, b_{su-1}}{\rho + M_1 + M_2 + \ldots + M_{u-2} + u - 2, m_{1u-1}, m_{2u-1}, \ldots, m_{su-1}} \right] \ldots \]

\[ L_q \left[ \frac{M_2, b_{12}, b_{22}, \ldots, b_{s2}}{\rho + M_1 + 1, m_{12}, m_{22}, \ldots, m_{s2}} \right] L^n_q \left[ \frac{M_1, b_{11}, b_{21}, \ldots, b_{s1}}{\rho, m_{11}, m_{21}, \ldots, m_{s1}} \right] f(x) \]

\[ = \left\{ \prod_{h=2}^{u} \prod_{v=1}^{s} \Gamma_q \left( b_{vh} + m_{vh} - \left( \sum_{k=1}^{h-1} M_k + h - 1 \right) \right) \Gamma_q \left( b_{vh} \right) \right\} \times q^{(h-1+\sum_{k=1}^{h-1} M_k)M_h} \]

\[ \times L^n_{q+u-1} \left[ \frac{M_u + M_{u-1} + \ldots + M_1 + u - 1, b_{11}, b_{21}, \ldots, b_{s1}, b_{12} - 1 - M_1,}{\rho, m_{11}, m_{21}, \ldots, m_{s1},} \right. \]

\[ \left. \ldots, b_{s2} - 1 - M_1, b_{13} - 2 - M_1 - M_2, \ldots, b_{s3} - 2 - M_1 - M_2, \ldots, b_{1u-1} - m_{12}, m_{22}, \ldots, m_{s2}, m_{13}, m_{23}, \ldots, m_{s3}, \ldots, \right. \]

\[ \left. - u + 1 - M_1 - M_2 - \ldots - M_{u-1}, \ldots, b_{su} - u + 1 - M_1 - M_2 - \ldots - M_{u-1} \right] \]

\[ \times f(x), \quad (51) \]

\[ \text{Re} (b_{j1}) \neq 0, -1, -2, \ldots, j = 1, \ldots, s, M_1, \ldots, M_u, m_{j2}, \ldots, m_{ju} \in \mathbb{N}_0, \]

\[ n \in \mathbb{N}, \rho \in \mathbb{C}, 0 < q < 1, b_{vu} \neq u - 1 + M_1 + M_2 + M_{u-1}, \]

\[ u - 2 + M_1 + M_2 + M_{u-1}, u - 3 + M_1 + M_2 + M_{u-1}, \ldots, M_u \geq m_{1u} + \ldots + m_{su}, \]

\[ v = 1, \ldots, s, \ u = 2, 3, \ldots, \]

The result established in [15] is for the case \( b_{j1} \in \mathbb{R}, j = 1, \ldots, s. \)
