Algebra/Group theory

Quasi-hereditary property of double Burnside algebras

ABSTRACT

In this short note, we investigate some consequences of the vanishing of simple biset functors. As a corollary, if there is no non-trivial vanishing of simple biset functors (e.g., if the group $G$ is commutative), then we show that $kB(G, G)$ is a quasi-hereditary algebra in characteristic zero. In general, this is not true without the non-vanishing condition, as over a field of characteristic zero, the double Burnside algebra of the alternating group of degree 5 has infinite global dimension.

RÉSUMÉ

Dans cette note, on s’intéresse à quelques conséquences du phénomène dit de disparition des foncteurs à bi-ensembles simples. On démontre que, dans le cas où il n’y a pas de disparitions non triviales de foncteurs simples (par exemple, si le groupe est commutatif), alors l’algèbre de Burnside double en caractéristique zéro est quasi-héréditaire. Sans l’hypothèse de non-disparitions triviales, ce résultat est en général faux. En effet, l’algèbre de Burnside double du groupe alterné de degré 5 en caractéristique zéro est de dimension globale infinie.

Notations. Let $k$ be a field. We denote by $C_k$ the biset category. This is the category whose objects are finite groups and morphisms are given by the double Burnside module (see Definition 3.1.1 of [2]). For a finite group $G$, we denote by $\Sigma(G)$ the full subcategory of $C_k$ consisting of the subquotients of $G$. If $D$ is a $k$-linear subcategory of $C_k$, we denote by $\mathcal{F}_{D, k}$ the category of $k$-linear functors from $D$ to $k$-Mod. If $L$ is a subquotient of $K$, we write $L \subseteq K$ and if it is a proper subquotient, we write $L \subsetneq K$. If $V$ and $W$ are objects in the same Abelian category, we denote by $[V : W]$ the number of subquotients of $V$ isomorphic to $W$.

1. Evaluation of functors

Let us first recall some basic facts about the category of biset functors. Let $\mathcal{D}$ be an admissible subcategory of $C_k$ in the sense of Definition 4.1.3 of [2]. The category $\mathcal{D}$ is a skeletally small $k$-linear category, so the category of biset functors is an Abelian category. The representable functors, also called Yoneda functors, are projective, so this category has enough

E-mail address: baptiste.rognerud@epfl.ch.
Theorem 2.1. (See Theorem 7.2 [6].) Let \( D \) be an admissible subcategory of the biset category. Let \( k \) be a field such that \( \text{char}(k) \) does not divide \( |\text{Out}(H)| \) for \( H \in \text{Ob}(D) \). If \( D \) has a finite number of isomorphism classes of objects, then \( \mathcal{F}_{D,k} \) is a highest-weight category.

The set indexing the simple functors is the set, denoted by \( \Lambda \), of isomorphism classes of pairs \((H, V)\) where \( H \in \text{Ob}(D) \) and \( V \) is a \( k\text{Out}(H) \)-simple module. Let \( H \) and \( K \) be two objects of \( D \). Then

\[
\bigoplus_{X \in D} \text{Hom}_D(X, K)\text{Hom}_D(H, X),
\]

\( X \subseteq H \)

can be viewed as a submodule of \( \text{Hom}_D(H, K) \) via composition of morphisms. We denote by \( I_D(H, K) \) this submodule and by \( \overline{\text{Hom}}_D(H, K) \) the quotient \( \text{Hom}_D(H, K)/I_D(H, K) \). This is a natural right \( k\text{Out}(H) \)-module. If \( V \) is a \( k\text{Out}(H) \)-module, we denote by \( \Delta_{H,V}^D \) the functor

\[
\Delta_{H,V}^D := K \mapsto \overline{\text{Hom}}_D(H, K) \otimes_{k\text{Out}(H)} V.
\]

When the context is clear, we simply denote by \( \Delta_{H,V} \) this functor. If \((H, V) \in \Lambda\), then \( \Delta_{H,V} \) is a standard object of \( \mathcal{F}_{D,k} \).

The set \( \Lambda \) is ordered by \((H, V) < (K, W)\) if \( K \subseteq H \), that is if \( K \) is a strict subquotient of \( H \). So the highest-weight structure gives the fact that the projective indecomposable biset functors have a filtration by standard functors. This filtration has the following properties:

**Proposition 1.1.** Let \( F \in \mathcal{F}_{D,k} \) be a finitely generated functor and let \( G \in \text{Ob}(D) \). Then

1. \( \text{Rad}(F(G)) \subseteq [\text{Rad}(F)](G) \).
2. If none of the simple quotients of \( F \) vanishes at \( G \), then \( \text{Rad}(F(G)) = [\text{Rad}(F)](G) \).

**Proof.** Let \( M \) be a maximal subfunctor of \( F \). Then \( M(G) \) is a maximal submodule of \( F(G) \) if the simple quotient \( F/M \) does not vanish at \( G \) and \( M(G) = F(G) \) otherwise. For the second part, if \( N \) is a maximal submodule of \( F(G) \), let \( \overline{N} \) be the subfunctor of \( F \) generated by \( N \). There is a maximal subfunctor \( M \) of \( F \) such that \( \overline{N} \subseteq M \subseteq F \). We have \( \overline{N}(G) = N \subseteq M(G) \subseteq F(G) \). By maximality, \( M(G) = N \). The result follows. \( \Box \)

**Remark 1.2.** In Section 9 of [3], the authors gave some conditions for the fact that the evaluation of the radical of the so-called standard functor is the radical of the evaluation. The elementary result of Proposition 1.1 gives new lights on this section. Indeed, Proposition 9.1 [3] gives a sufficient condition for the non-vanishing of the simple quotients of these standard functors.

Over a field, the category of finitely generated projective biset functors is Krull–Schmidt in the sense of [5] (Section 4), so every finitely generated biset functor has a projective cover.

**Corollary 1.3.** Let \( F \in \mathcal{F}_{D,k} \) be a finitely generated functor and let \( G \in \text{Ob}(D) \). Then,

1. If \( F \) has a unique quotient \( S \), and \( S(G) \neq 0 \), then \( F(G) \) is an indecomposable \( \text{End}_D(G) \)-module.
2. If \( P \) is an indecomposable projective biset functor such that \( \text{Top}(P)(G) \neq 0 \), then \( P(G) \) is an indecomposable projective \( \text{End}_D(G) \)-module.

2. **Highest-weight structure of the biset functors category**

Let us recall the famous theorem of Webb about the highest-weight structure of the category of biset functors.
• If \( P_{H,V} \) denotes a projective cover of the simple \( S_{H,V} \), then \( P_{H,V} \) is filtered by a finite number of standard functors. The first quotient is \( \Delta_{H,V} \), which appears with multiplicity one. The other standard objects that appear as subquotients are some \( S_{K,W} \) for \( K \subset H \).

• Moreover the standard functors have finite length. The unique simple quotient of \( \Delta_{H,V} \) is the simple functor \( S_{H,V} \). The other simple functors which appear as composition factor of \( \Delta_{H,V} \) are some \( S_{K,W} \) for \( H \subset K \).

**Definition 2.2.** Let \( k \) be a field. Let \( G \) be a finite group. Let \( \Sigma(G) \) be the full subcategory of \( C_k \) consisting of the subquotients of \( G \). Then the group \( G \) is called an \( NV_k \)-group if the simple functors \( S \) of \( \mathcal{F}_{\Sigma(G),k} \) do not vanish at \( G \).

It is well known that commutative groups are \( NV_k \)-groups for every field \( k \) (see Proposition 3.2 of [4]), but there are non-commutative \( NV_k \)-groups.

**Theorem 2.3.** Let \( G \) be a finite group. Let \( k \) be a field such that \( \text{char}(k) \) does not divide \( |\text{Out}(H)| \) for all subquotients \( H \) of \( G \). If \( G \) is an \( NV_k \)-group, then \( kB(G,G) \) is a quasi-hereditary algebra.

**Proof.** By Corollary 3.3 of [3], the simple \( kB(G,G) \)-modules are exactly the evaluation at \( G \) of the simple biset functors \( S_{H,V} \in \mathcal{F}_{\Sigma(G),k} \). Now, by Corollary 1.3, if \( P_{H,V} \) is a projective cover of \( S_{H,V} \) in \( \mathcal{F}_{\Sigma(G),k} \), then \( P_{H,V}(G) \) is a projective cover of \( S_{H,V}(G) \) as \( kB(G,G) \)-modules. Moreover, since the standard functor \( \Delta_{H,V} \in \mathcal{F}_{\Sigma(G),k} \) has a simple top, its evaluation at \( G \) is indecomposable.

Let \( M_0 = 0 \subset M_1 \subset \cdots \subset M_n = P_{H,V} \) be a standard filtration of \( P_{H,V} \) in \( \mathcal{F}_{\Sigma(G),k} \). The evaluation functor is exact, so the \( kB(G,G) \)-modules \( M_i(G) \) produce a filtration of the projective indecomposable module \( P_{H,V}(G) \). Moreover, the quotient \( M_i(G)/M_{i-1}(G) = [M_i/M_{i-1}]G \) is the evaluation at \( G \) of a standard functor indexed by a pair \((K,W)\) such that \( K \subset H \). It remains to look at the composition factors of \( \Delta_{H,V}(G) \). We have:

\[
\Delta_{H,V}(G)/\text{Rad}(\Delta_{H,V}(G)) = [\Delta_{H,V}/\text{Rad}(\Delta_{H,V})](G) = S_{H,V}(G).
\]

Moreover, by Proposition 3.5 of [3], a simple \( kB(G,G) \)-module \( S_{K,W}(G) \) is a composition factor of \( \Delta_{H,V}(G) \) if and only if \( S_{K,W} \) is a composition factor of \( \Delta_{H,V} \). As a consequence, \( \Delta_{H,V}(G) \) has a simple top \( S_{H,V}(G) \) and the other composition factors are some \( S_{K,W} \) for \( H \subset K \). This shows that \( kB(G,G) \)-Mod is a highest-weight category in which the standard objects are the evaluation at \( G \) of the standard functors of \( \mathcal{F}_{\Sigma(G),k} \).

As immediate corollary, for the double Burnside algebras, we have:

**Corollary 2.4.** Let \( k \) be a field such that \( \text{char}(k) \) does not divide \( |\text{Out}(H)| \) for all subquotients \( H \) of an \( NV_k \)-group \( G \). Then the global dimension of \( kB(G,G) \) is finite.

It should now be clear that the situation will not be that simple if some simple functors vanish at \( G \). Indeed, let \( S_{H,V} \) be a simple functor of \( \mathcal{F}_{\Sigma(G),k} \) such that \( S_{H,V}(G) \neq 0 \). If in a standard filtration of \( P_{H,V} \) there is a standard functor \( \Delta_{K,W} \) such that \( S_{K,W}(G) = 0 \), then \( \Delta_{K,W}(G) \) is not in the set of standard modules for \( kB(G,G) \) that we considered in the proof of Theorem 2.3. In the rest of this paper, we look at the case of \( G = A_5 \). We first show that the situation described here actually happens for this group, and we show that there is no hope to choose a better filtration for the projective \( kB(G,G) \)-modules.

The reason is that \( kB(G,G) \) has infinite global dimension.

3. The example of \( A_5 \)

Let \( k \) be a field of characteristic different from 2, 3 and 5. The double Burnside algebra \( kB(A_5, A_5) \) is a rather complicated object. Unfortunately, it seems to the author that \( G = A_5 \) is the smallest (or one of the smallest) example where the situation described above can appear. Indeed, this situation requires the existence of enough non-split extensions between simple functors in \( \mathcal{F}_{\Sigma(G),k} \). It is well known that this category is not semi-simple if there are some non-cyclic groups in \( \Sigma(G) \) (Theorem 1.1 [1]), but as it can be seen in Proposition 11.2 of [6], if the category \( \Sigma(G) \) does not contain enough increasing chains (for the subquotient relation) of objects, then there are not so many non-split extensions in \( \mathcal{F}_{\Sigma(G),k} \). Moreover, \( A_5 \) is also one of the first groups where the evaluation of the radical of the standard functor is not the radical of the evaluation (see Example 13.5 of [3]), so it is a good candidate for our purpose.

In order to simplify the computations, we will use the following results.

• Let \( P_{K,W} \) be a projective indecomposable functor in \( \mathcal{F}_{\Sigma(G),k} \). Let \( \Delta_{J,U} \) be a standard object in this category. Then

\[
[P_{K,W} : \Delta_{J,U}] = [V_{J,U} : S_{K,W}] = [\Delta_{J,U} : S_{K,W}].
\]

Here \( V_{J,U} \) denotes the co-standard functor indexed by \((J,U)\). The first equality is the so-called BGG-reciprocity and the last equality follows from the usual duality in the biset-functor category. See Paragraph 8 of [6] for more details. Note that for \( A_5 \) all the \( k\text{Out}(H) \)-simple modules that we will consider are self-dual.
If $\mathcal{D}$ is an admissible full-subcategory of $\Sigma(G)$, then there is a restriction functor from $\mathcal{F}^{\Sigma(G)}_{\mathcal{D}}$ to $\mathcal{F}^{\mathcal{D}}_{\mathcal{D}}$. By Proposition 7.3 of [6], if $H \in \mathcal{D}$, then we have:

$$\left[P^{\Sigma(G)}_{H,V} : \Delta^{\Sigma(G)}_{K,W} \right] \Sigma(G) = \left[P^{\mathcal{D}}_{H,V} : \Delta^{\mathcal{D}}_{K,W} \right] \mathcal{D}.$$  

(2)

**Lemma 3.1.** Let $k$ be the non-trivial simple $k$Out($C_3$) $\cong k$Out($A_4$) $\cong kC_2$-module. There is a non-split exact sequence of functors of $\mathcal{F}^{\Sigma(A_4)}_{\mathcal{D}}$:

\[ 0 \to \Delta_{C_1,k} \to P_{A_4,k} \to \Delta_{A_4,k} \to 0. \]

**Proof.** We know that $P_{A_4,k}$ has a finite $\Delta$-filtration with quotient $\Delta_{A_4,k}$. We need to understand the other standard quotients of such a filtration. By the highest-weight structure of $\mathcal{F}^{\Sigma(A_4)}_{\mathcal{D}}$, such a standard quotient must be indexed by a subquotient of $A_4$. By using the BGG-reciprocity (1) and formula (2), a standard functor $\Delta_{H,V}$ appears in $P_{A_4,k}$ if and only if $S_{A_4,k}$ is a composition factor of $\Delta_{H,V}$ in $\mathcal{F}^{\Sigma(A_4)}_{\mathcal{D}}$. Using Proposition 3.5 of [3], this is equivalent to the fact that $S_{A_4,k}(A_4)$ is a composition factor of $\Delta_{H,V}(A_4)$. As an immediate consequence, we have:

- $\Delta_{A_4,k}$ is not in a $\Delta$-filtration of $P_{A_4,k}$. Indeed, $\Delta_{A_4,k}$ is isomorphic to $kB$, the usual Burnside functor. By the work of Bouc (see Sections 5.4 and 5.5 of [2]), the simple subquotients of $kB$ are the $S_{H,k}$ for a $B$-group $H$. As consequence, the simple functor $S_{A_4,k}$ is not a subquotient of $kB$.
- $\Delta_{A_4,k}$ is not a subquotient of $P_{A_4,k}$. Indeed, the only composition factor of $\Delta_{A_4,k}$ with $A_4$ as a minimal group if $S_{A_4,k}$.

We have the following: the subquotients of $A_4$ are: $A_4, V_4, C_3, C_2, 1$.

1. Out($C_2$) $\cong 1$ and we have $\Delta_{C_2,k}(A_4) \cong S_{C_2,k}(A_4)$.
2. Out($V_4$) $\cong S_2$. So there are three $k$Out($V_4$)-simple modules. We denote by $k$ the trivial module and $k_-$ the sign. Finally, we denote by $V$ the simple module of dimension 2. Then we have: $\Delta_{V_4,k}(A_4) \cong S_{A_4,k}(A_4)$, $\Delta_{V_4,k_-}(A_4) \cong S_{A_4,k_-}(A_4)$ and $\Delta_{V_4,V}(A_4) = 0$.
3. Out($C_3$) $\cong C_2$ so there are two simple $k$Out($C_3$)-modules. We denote by $k$ the trivial module and $k_-$ the non-trivial simple module. Then $\Delta_{C_3,k}(A_4)$ is a non-split extension between $S_{A_4,k}(A_4)$ and $S_{C_3,k}(A_4)$, and $\Delta_{C_3,k_-}(A_4)$ is a non-split extension between $S_{A_4,k_-}(A_4)$ and $S_{C_3,k_-}(A_4)$.

So the only standard functors that appear in a standard filtration of $P_{A_4,k}$ in $\mathcal{F}^{\Sigma(A_4)}_{\mathcal{D}}$ are $\Delta_{A_4,k}$ and $\Delta_{C_3,k}$. The structure of the highest-weight category implies that $\Delta_{C_3,k}$ must be a subfunctor of $P_{A_4,k}$ and $\Delta_{A_4,k}$ must be a quotient of this functor. ☐

Now we need to understand the evaluation at $A_5$ of $P_{A_4,k}$.

**Lemma 3.2.**

- $\Delta_{A_4,k_-}(A_5) \cong S_{A_4,k_-}(A_5) \neq 0$.
- $\Delta_{C_3,k_-}(A_5) \cong S_{A_4,k_-}(A_5) \neq 0$.

**Proof.** The first isomorphism follows from the fact that $\Delta_{A_4,k_-}(A_5)$ is one dimensional, with basis $\text{Ind}_{A_4}^{A_5} \otimes 1$. So it is a simple $kB(A_5, A_5)$-module of the form $S_{H,V}(G)$. The element $\text{Ind}_{A_4}^{A_5} \otimes 1$ acts by 1 on $S_{A_4,k_-}(A_5)$. So the minimal group $H$ is smaller than $A_4$. By the highest-weight structure of $\mathcal{F}^{\Sigma(A_3)}_{\mathcal{D}}$, the only possibility is to have $H = A_4$ and $V = k$.

We know that $\Delta_{C_3,k_-}$ is a subquotient of $P_{A_4,k_-}$, so $S_{A_4,k_-}$ is a composition factor of $\Delta_{C_3,k_-}$ by the BGG-reciprocity (1). Since $S_{A_4,k_-}(A_5) \neq 0$, this simple module is a composition factor of $\Delta_{C_3,k_-}(A_5)$. Since we have $\dim_k \left( \Delta_{C_3,k_-}(A_5) \right) = 1$, the result follows. ☐

**Proposition 3.3.** Let $G = A_5$ be the alternating group of degree 5. Let $k$ be a field of characteristic different from 2, 3 and 5. Then $kB(G, G)$ has infinite global dimension. In particular, $kB(G, G)$ is not a quasi-hereditary algebra.

**Proof.** By using Lemma 3.1, we know that $P_{A_4,k_-}$ has a $\Delta$-filtration with $\Delta_{A_4,k_-}$ as quotient and $\Delta_{C_3,k_-}$ as a subfunctor. Since the simple quotient of $P_{A_4,k_-}$ does not vanish at $G$, then $P_{A_4,k_-}(A_5)$ is a projective cover of $S_{A_4,k_-}(A_5)$. By using Lemma 3.2, we see that this projective indecomposable functor is a non-split extension between $S_{A_4,k_-}(A_5)$ and itself. ☐
