MISpheroID: a knowledgebase and transparency tool for minimum information in spheroid identity

Commonly used acronym: MISpheroID
Created on: 10-02-2022 - Last modified on: 11-02-2022

Contact person
Olivier De Wever

Organisation
Name of the organisation Ghent University (UGent)
Department Department of Human Structure and Repair
Country Belgium
Geographical Area Flemish Region

SCOPE OF THE METHOD

| The Method relates to | Other: transparency and reproducibility in 3D culture conditions such as spheroids, organoids, etc |
|-----------------------|--------------------------------------------------------------------------------------------------|
| The Method is situated in | Basic Research, Education and training, Translational - Applied Research |
| Type of method | Other: knowledgebase and transparency tool |

DESCRIPTION

Method keywords
3D cel culture
spheroids
organoids
Reproducibility
transparency
standardization

Scientific area keywords
spheroids
reproducibility
in vitro 3D modelling
transparency
standardization

Method description
Spheroids are three-dimensional cellular models with widespread basic and translational application across academia and industry. However, methodological transparency and guidelines for spheroid research have not yet been established. The MISpheroID Consortium developed a crowdsourcing knowledgebase that assembles the experimental parameters of 3,058 published spheroid-related experiments. Interrogation of this knowledgebase identified heterogeneity in the methodological setup of spheroids. Empirical evaluation and interlaboratory validation of selected variations in spheroid methodology revealed diverse impacts on spheroid metrics. To facilitate interpretation, stimulate transparency and increase awareness, the Consortium defines the MISpheroID string, a minimum set of experimental parameters required to report spheroid research. Thus, MISpheroID combines a valuable resource and a tool for three-dimensional cellular models to mine experimental parameters and to improve reproducibility.

Lab equipment
no

Method status
Published in peer reviewed journal

PROS, CONS & FUTURE POTENTIAL

Advantages
Thus, MISpheroID is a unique open-access resource that facilitates systematic
reporting on essential spheroid methodology with the aim to increase consistency and awareness in both academic and industrial research environments.

**Challenges**

Keep it updated and keep it active in the long term.

**Modifications**

Include additional essential spheroid methodological aspects based on empirical evidence.

**Future & Other applications**

Other emerging 3D model systems, such as organoids and self-renewing multicellular aggregates that self-organize into lumen-containing ex-vivo organs, may also benefit from the MISpheroID tool to improve transparency and document heterogeneity.
