ABSTRACT

The Schiff base (E)-N1[(E)-3-phenylallylidene]benzene-1,2-diamine was derived from the condensation of orthophenylenediamine and cinnamaldehyde. The Schiff base and its Zn(II) complex were characterized based on microanalysis, conductivity, IR, UV-Visible, NMR spectral studies. The analytical data suggest the stoichiometry to be 1:1 (M:L). The molar conductance data reveal that the complex is non-electrolyte. Melting points support the thermal stability of the Schiff base. The UV spectral data support the square planar geometry of the complex. Coordination of ligand was confirmed by the constant change in FT-IR. The NMR (1H & 13C) spectra of the Schiff base and its complex were confirmed by the geometry and magnetic property them. The *in-vitro* antibacterial activity of the synthesized ligand and Zn(II) complex were screened for bio-potential activity using some microorganisms by agar well diffusion method. The antibacterial activity further confirmed by its pharmacokinetics study using Swiss ADME computational study. The antioxidant activity of the Schiff base and Zn(II) complex was also assessed by DPPH free radical scavenging method. IC50 values are also predicted and compared with standard ascorbic acid.

**Keywords:** Cinnamaldehyde, Schiff base, Metal Complex, Antibacterial, Antioxidant, Pharmacokinetics

INTRODUCTION

Schiff base is a multilateral ligand in which C=O group is replaced by C=N by the condensation of the nucleophilic nitrogen atom of amine attack to the electrophilic carbon atom of aldehyde or ketones.1 Schiff base ligands are readily formed from aldehyde than that of the ketones. It was first discovered by Hugo Schiff in 1864.2 This ligand is chemically and biologically very important due to the presence of Sp2 hybridized nitrogen atom of azomethine group.3 Schiff base shows a vital role in organic and bioinorganic chemistry, they form the most stable complexes with transition and post-transition metal ions.4 They are important in the field of modern coordination chemistry because they have industrial, analytical, antibacterial, antifungal, anticancer, antiviral and antitubercular activities and it also shows chelating ability, catalytic and extraction properties.5,6 Antioxidants are the compounds that terminate the attack of free radicals and prevent it from aging and different diseases associate with oxidative damage inside the body system.7 Cinnamaldehyde is one of the main components of bark extract cinnamon. It is used in perfume especially natural, sweet and fruity scents they also used aroma compounds by the smell of cinnamon in almond, apricot and butterscotch.8 It is a potential anti-obesity drug due to its low toxicity, eco-friendly, food flavoring, medical herb and renowned strong adsorption properties.9 Orthophenylenediamine (OPD) is one the organic compound it undergoes condensation with carbonyl compounds (aldehyde and ketones) gives Schiff base which is used as an antioxidant in rubber product and also used in photo-luminescence, catalytic activity and pharmaceutical with various diketone.10 Zinc metal plays an important role in biologist such as absorption of calcium, formation of antibodies, thyroid gland and hormone function and it is present in brain, muscle, bones, kidney and liver.11

The present view of this paper is to the synthesis of transition metal Zn(II) the complex of Schiff base from cinnamaldehyde and...
Orthophenylenediamine (OPD) and characterized by various physicochemical, spectral and bio-potential studies.

**EXPERIMENTAL**

**Materials**
Orthophenylenediamine, cinnamaldehyde, potassium thiocyanate, zinc nitrate, solvent (AnalaR grade) used as it is purchased from a chemical company. The synthesized ligand and zinc complex are stable and stored for a long time at room temperature.

**Methods**
Using Vario make EL-III model instrument at 950-1200°C temperature, predict the elemental analysis of the Schiff and complex. After decomposing the complex with a known weight, the metal ion was estimated by the gravimetric method. Melting point(°C) was measured using Ajay melting point instrument in an open capillary tube. Molar conductance of the Schiff base and complex was measured in acetonitrile solution at 10⁻³M concentration at room temperature by the use of Systronic Conductivity Bridge. UV-Visible spectra of complex and Schiff base were recorded in solid-state spectra (DRS method) on JASCO-V650 made spectrometer in the range of 200-800 nm. Using Shimadzu, FT-IR-4100 type-A model IR spectrometer, IR spectral study of ligand and its metal complex were recorded in the range of 4000 to 400cm⁻¹ as KBr pellet method. The Far IR spectra of the complex were recorded in a Bruker, Germany makes 3000 Hyperion Microscope with Vertex 80 FTIR system model instruments. Using Bruker instrument in DMSO-d6, the ¹H and ¹³C-NMR spectra of Schiff base and its diamagnetic Zn(II) complex were carried.

**Synthesis of Schiff Base**
The goal of green chemistry is to develop Eco-friendly synthetic reactions. Green chemistry involves the use of microwave technology, sonochemistry, phase transfer catalysis, ionic liquids, and many other techniques. The green chemical one-pot multicomponent condensation reaction of 0.486g (4.40 mmol) of Orthophenylenediamine (10 ml ethanol) and 0.624g (4.70 mmol) of cinnamaldehyde (10 ml diethyl ether) using water as a green solvent and stirred continuously for about 10-15 min at room temperature, the shiny powdered yellow color precipitate was formed. The obtained complex was purified by simple filtration followed by washing with water and drying in desiccators and the yield was (73.33%) Scheme-1. This method is experimentally simple, clean, high-yielding, and green, with reduced reaction times.

**Synthesis of Zn(II) Complex**
Green route one-pot multicomponent reactions of a Schiff base, 0.75g, (3.36 mmol) in 20 ml ethanol solution was mixed with zinc nitrate (1g, 3.36 mmol in 10 ml of methanol) and add anionic ligand viz., potassium thiocyanate (0.65 g, 6.72 mmol in 10 ml of water) was added. Then water used as a green solvent and stirred continuously for 10-15 min at room temperature yellow color precipitate was formed. The product was purified by simple filtration followed by washing with water and drying in desiccators and the yield was (87.87%) Scheme-2.

**Evaluation of Antibacterial Activity:** Antibacterial activities of synthetic compounds such as Schiff base and its metal complex evaluated using well diffusion method with MHA. Under aseptic conditions, the MHA plates were inoculated. The test samples in the well were incubated at 37°C for 24 hours. After the incubation period, the diameter of the growth inhibition zones was measured. The antibacterial activity of the given compound was assessed against five bacterial species: *Staphylococcus aureus, Escherichia coli, Vibrio parahaemolyticus, Pseudomonas aeruginosa* and, *Enterococcus* and *Candida albicans* by agar well diffusion method. Each bacterial culture was grown in nutrient broth (bacterial) and potato dextrose broth (fungal) medium for 12 hours at 37°C. Then, each grown culture was swabbed on nutrient agar medium and well were cut about 5 mm using a cork borer. Each well was added with 80 µl of sample and incubated at 37°C for 18 hours. After incubation, the plates were observed for the zone of inhibition and it was measured.
Antioxidant (DPPH Free Radical Method)
The free radical scavenging capacity of the plant extract was measured based on the method delineate by Brand-Williams et al (1995) with slight modification. 1ml of 0.1mM DPPH solution in methanol was mixed with 1ml of plant extract solution of varying concentrations (10, 100, 500 and 1000 μg/ml). Blank samples were prepared and L-Ascorbic acid was used as standard. These tubes were thoroughly mixed and kept in the dark for 30 min and their absorbance was measured at 517 nm using UV-Visible spectrophotometer. The inhibition % was calculated using the following formula:

\[
\text{Inhibition} \% = \frac{A_{c} - A_{s}}{A_{c}} \times 100
\]

RESULTS AND DISCUSSION

Analytical Data
The elemental analysis (C, H, N) of the Schiff base and its complex is shown in Table-1, the data which are in good agreement with calculated values. Based on the metal estimation of complex the stoichiometry and molecular formulae of the Schiff base and its complex are assessed as [Zn(SB)(SCN)₂]. The molar conductance of 10⁻³ M Zn(II) complex shows the non-electrolytic (1:0 type) nature and no more anion and cations are present on its coordination sphere outside.₁³

ESI Mass Spectra
ESI mass spectrum of Schiff base recorded at room temperature. It is proposed that the empirical formula of the Schiff base and also support the stability of them. From the data of m/z the value at 222 confirmed the molecular formulae of Schiff base (C₁₅H₁₄N₂) but the fragments at 105 and 117 correspond to the C₆H₆N₂⁻ and C₉H₈⁺ respectively.₁⁴

| Table-1: Physico-chemical Data of Schiff Base Complex |
|---|
| S. No. | Schiff base/ Complex | Molecular Weight (g/mol) | MP (°C) | Color | Elemental Analysis | Molar Conductance (Ohm⁻¹cm²mol⁻¹) |
|---|---|---|---|---|---|---|
| 1 | Schiff base | 222.30 | 117 | Shiny yellow | 80.97 (80.19) | 6.29 (6.30) | 12.59 (12.52) | - | - | 20.00 |
| 2 | [Zn(SB)(SCN)₂] | 403.83 | 230 | Pale Yellow | 50.51 (50.10) | 3.46 (3.19) | 13.86 (13.50) | 15.84 (15.19) | 16.18 (16.90) | 14.28 |

UV Spectra
The electronic spectra of Schiff base exhibit one broadband at the transition of 25,575cm⁻¹ shows the π→π* whereas in the complex this transition present with related values confirming the imine bond of the Schiff base. The Zn(II) complex is diamagnetic its filled ‘d’ shell shows only n→π* transition is also as being due to C=N bond which is C-T (charge transfer) band at 27,397 cm⁻¹ confirming the square planar geometry.₁⁵

IR and Far-IR Spectra
IR spectra are the main tool to find out the functional group present in the ligand and its entry into the coordination sphere. Determine the binding site of Schiff base to the metal ion in the complex. IR spectrum of the free ligand was compared with the spectrum of the metal complex (Fig.-1). The spectral data of the Schiff base showed the appearance of a new band at 1595cm⁻¹ due to the Schiff base azomethine linkage formation. In Zn(II) complex the v(C=N) stretching frequency shifted to higher values at 1628 cm⁻¹ indicate the metal ions are coordinate with the free Schiff base through an azomethine nitrogen atom. There are two aromatic rings v(C-H) are present in the Schiff base at 3371 and 3142 cm⁻¹. In complexes, one of the values are shifted to the lower region at 3206 cm⁻¹ but the other frequencies were also changed at 3186 cm⁻¹ due to the effective coordination through the imine nitrogen atom which is attached in one aromatic ring, the other amine group chelated to metal ions is confirmed by the v(N-H) at 3500 cm⁻¹ which is further evidence of coordination of metal ion through imine nitrogen. The mixed anionic ligand thiocyanate ion coordinated through nitrogen or Sulphur to the metal ion. If it is coordinated through “N” it is N-bonded at below 2100 cm⁻¹ whereas through “S” it is above 2100cm⁻¹. In metal complexes, the v(SCN) stretching frequency at 2068 cm⁻¹ was confirmed by the coordination of metal ions through the ‘N’ atom of thiocyanate ion and not from its Sulphur atom.₁⁸ In far-IR spectra, the low frequencies at 419 cm⁻¹ and 526 cm⁻¹ corresponding to the M-N coordination bonds of imine and amino group of Schiff base to the metal complex. The frequency at 489 cm⁻¹ shows the M-N coordination bond of thiocyanate additional ligand in the complex.₁⁹

NMR Spectra of Ligand and Zn(II) Complex
Proton NMR
Proton NMR spectrum of Schiff base was carried out in DMSO they appeared signal of the aromatic proton was found to be in the expected region of them. The azomethine N=C-H proton shows the chemical shift.
value at 8.42 to 8.43 ppm and NH₂ proton appeared at 5.05 ppm. The aromatic chemical shift values of Schiff base are 7.44 ppm (C--H₁), 7.38 ppm (C--H₂), 7.65 -7.66ppm (C--H₃) 7.17 ppm (C--H₄) 7.11ppm (C--H₅) 6.69-6.70 ppm (C--H₆) 6.57-6.58 ppm (C--H₇) 6.97 -6.98ppm (C--H₈) and 7.0-7.03 ppm (C--H₉). In Zn(II) complex all the chemical shift values of the proton slightly shifted to a down or up-field (Fig.-2 and 4) due to the de-shielding and increasing the conjugation in the chelates ring.²⁰

¹³C-NMR

¹³C-NMR spectrum of Schiff base gives the chemical shift values of different carbon atoms. Azomethine carbon atom found at 158.79 ppm whereas Zn(II) complex is slightly shifted to 158.93 ppm, the N⁺H₂ carbon atom chemical shift value in Schiff base is 144.02 ppm in Zn(II) complex it is shifted to upfield region at 143.84 ppm. (Fig.-3 and 5) All the other chemical shift values of carbon atom slightly shifted to down or upfield.²¹

Antibacterial and Antifungal Activities
The synthesized Schiff base metal(II) complex were subjected to in-vitro biological activities viz., antibacterial and antifungal using bacterial and fungal strains viz., *S. Aureus* and *Enterococcus*, three-gram negative bacteria such as *E.coli, Vibrio parahaemolyticus* and *P.aeruginosa* and *C. albicans* by Agar well diffusion method (Fig.-6). The MIC values (Table-2) of the microorganisms predicted which indicating the Schiff base and its Zn(II) complex exhibit bio-potential activity. The antibacterial and antifungal activity of the Zn(II) complex is highly active for *S. Aureus* and *C. albicans* but moderately active for the other microorganisms than the Schiff base. The increased activity of the metal chelates may be explained on basis of Tweedy chelation theory. The chelation of metal complexes acts as a powerful and bactericidal agent. That chelation killing more bacteria, the positive charge on the metal ion is partially shared with the ligand. There may be a π electron delocalization in the chelates ring is present which increase the lipophilicity which increases the enhanced bio-potential activities, solubility, conductivity and bond parameters are also increase the activity of metal complexes.

Antioxidant Activity
Antioxidant activity of Schiff base and Zn(II) complex was determined by DPPH free radical scavenging method. The free radical scavenging activity of compounds was carried out at different concentrations (10-1000µg/ml). L-Ascorbic acid is used as a standard. The percentage inhibition was measured from the absorption of control and samples. The result of scavenging activity shows the maximum free radical scavenging activity at 74.10% and 72.30%. The IC50 value of the Schiff base is 359.3 but in Zn(II) complex it is 357.0 (Fig.-7) which is higher than the standard. Comparing the standard Schiff base and complex shows antioxidant activity at higher concentrations. It is observed that they have 50% scavenging activity.

Physico-chemical and General Computational Methodology
The SMILES for Schiff base and Zn(II) complex generate structure file generator from online tool Swiss ADME web page. Using the web tool the physicochemical descriptors, such as the molecular weight (MW), density, melting point, etc., were calculated. These descriptors provide insights into the drug's biological activity and can help in drug design and development.
molecular refractivity (MR), count of specific atom types and the topological polar surface area (TPSA), the latter proven as a useful descriptor in many models for estimation of membrane diffusion, ADME and pharmacokinetic behavior. The lipophilicity was assessed using five alternative predictive models; i.e. XlogP; WlogP; MlogP; SILICOS-IT, ilogP, together with a consensus logP estimation, based on the average value of the different computational parameters (Table-3,4 and 5).

The medicinal chemistry and drug properties of the compounds were also assessed and the results indicating the Schiff base and its complex are used as a drug in the field of medicinal chemistry. In Pharmacokinetics study the blood-brain barrier is absent but GI absorption is high which leads to high lipophilicity of the compounds shows high Pharmacokinetics and drug likeliness properties. 25-27

Table-5: Pharmacokinetics

CONCLUSION

The Schiff base (E)-N1[(E)-3-phenylallylidene]benzene-1,2-diamine and Zn(II) complex was synthesized by high efficient green route method with a higher yield. The Schiff base coordinated to the metal ion through its imine and amino nitrogen by bidentate mode to form metal chelates, based on the analytical and spectral data (UV-Visible, IR, Far-IR, Mass spectra and NMR) reports confirmed the mononuclear, non-electrolytic and square planar geometry of Zn(II) complex. The Schiff base is high potential to the screened microorganisms but the complexes are highly active for some microorganisms and moderately active against the growth of other microorganisms. The antioxidant activity of the Schiff base and Zn(II) complex shows 50% scavenging activity.

ACKNOWLEDGMENT

The authors are very much grateful to the Principal, and Head Department of Chemistry, Govt. Arts College, Ariyalur for providing facilities available at the Department. We are indebted to the Head and Staff members of SAIF Chennai, Mumbai, STIC Cochin, Harman Research Institute, for providing spectral and biological activities of compounds.
