Supplemental Table 1 Epidemiological, clinical and histopathological statistics of the 40 patients undergoing nephrectomy for renal cell carcinoma in curative intent

| Variables                        | Mean, Median (min.-max.) or n (%) |
|----------------------------------|-----------------------------------|
| Age at nephrectomy (in years)    | 55.8, 54 (35-80)                  |
| Male gender                      |                                   |
| right                            | 16 (48.5)                         |
| left                             | 16 (48.5)                         |
| bilateral                        | 1 (3.0)                           |
| Localization RCC                 |                                   |
| T stadium                        |                                   |
| 1                                | 3 (12.5)                          |
| 2                                | 6 (25.0)                          |
| 3                                | 13 (54.2)                         |
| 4                                | 2 (8.3)                           |
| N stadium                        |                                   |
| 0                                | 5 (26.3)                          |
| 1                                | 10 (52.6)                         |
| 2                                | 4 (21.1)                          |
| M stadium                        |                                   |
| 0                                | 9 (42.9)                          |
| 1                                | 8 (38.1)                          |
| 2                                | 4 (19.0)                          |
| Clear cell renal carcinoma       | 16 (94.1)                         |
| Chemotherapy                     | 13 (59.1)                         |
| Radiotherapy                     | 5 (29.4)                          |
