Abstract

As all researchers know most of engineering system behavior in practical are nonlinear process and analytical solving (no numeric) these problems are difficult or sometime impossible. First of all, we introduce one great method in this article which we named it Akbari, Ganji, Method AGM "AGM" that could be helpful in engineering fields and basic science (special dynamical structures) that will be a phenomena in the engineering science and we going to present in this paper for the world researcher as well as our main purpose are information exchange in scientific findings to Engineering Society and so my opinion are cooperate and its share in the paper authors. To prove the accuracy of the method AGM, We investigate a sample of the couple nonlinear differential equations in the vibration (couple non-linear differential equations on Coupled Duffing-Van der Pol oscillators) which are presented in this paper.

Keywords: New approach AGM; Couple nonlinear vibrational system; Duffing-Van der Pol; Analytical solving

Introduction

In dynamics, the Van der Pol and Duffing oscillator is a non-conservative oscillator with non-linear damping so in this literature is solved complicate differential equation in the dynamic system by new approach AGM [1-11]. Therefore, most of the engineering problems are nonlinear so in most cases it is difficult to solve of analytically and analyze these equations. The equations governing on the motion of engineering systems lead to the ordinary or partial differential equations and among different fields of engineering problems, the equations governing on the oscillation systems are significantly nonlinear and as a result much attention has been devoted to this area and various researches have been done up to now [12]. Recently, many authors used various analytical methods for solving nonlinear oscillation systems. Some of these well-known methods are introduced for instance: bookkeeping parameter perturbation method [13], energy balance method [14], amplitude frequency formulation [15], max-min approach [16,17] and Mickens iteration procedure [18].

Some analytical methods like perturbation techniques are only applicable if small parameters exist in the nonlinear systems where this solution can analytically be expanded into a power series of parameters. Inasmuch as a lot of nonlinear problems do not contain such perturbation quantity and in order to overcome this shortcoming, many new approaches have been appeared for instance, harmonic balance method (HBM) [19,20], the elliptic Lindstedt-Poincare method (LP) [21], the Krylov Bogoliubov Mitropolsky method (KBM) [22], Adomian decomposition method [23] and homotopy perturbation method (HPM) [24]. Another powerful analytical method, called the variational iteration method (VIM) which was first proposed by He [25-27]). VIM has successfully been applied to solve various engineering applications. For example, the classical Blasius’ equation was solved by using VIM and also this method was utilized to give approximate solutions for some well-known non-linear problems. Furthermore, many authors [28] used VIM to solve nonlinear equations governing on the oscillating systems. Another analytical method called the He’s Amplitude Frequency Formulation method [29,30] which was first presented by Ji-Huan He. This method rapidly gives convergent successive approximations of the exact solution. He used HAFF to give approximate solutions for some well-known nonlinear problems.

The analytical method (Akbari-Ganji’s Method (AGM)).

A. Vibrational systems without any external force \( F(t) = 0 \)

\( f(\ddot{u}, \dot{u}, u) = 0 \) \hspace{1cm} (1)
The obtained Numerical Solution of Eqs (15) and initial phase (0.02, 0.1) are system physical constants.

Equations (2) and (4) rewritten as follows:

\[ u(t) = e^{-\beta t} \left[ \sum_{i=1}^{n} a_i \cos(k_i t + \phi_i) \right] \]  
\[ f(u, \dot{u}, F_\phi, \sin(\omega t)) = 0 \]  
\[ u(t) = e^{-\beta t} \left[ \sum_{i=1}^{n} a_i \cos(k_i t + \phi_i) \right] + d \cos(\omega t + \Phi) \]  

Initial Conditions (IC):

\[ \{ u(0) = u_0, \dot{u}(0) = 0 \} \]  

Note: At the vibration problems a sentence Eqs.(2) or (4) is sufficient accuracy so Eqs(3,4) rewritten as follows:

\[ u(t) = e^{-\beta t} \{ a \cos(\omega t + \phi) \} \]  
\[ u(t) = e^{-\beta t} \{ a \cos(\omega t + \phi) \} + d \cos(\omega t + \phi) \]  

Selecting the answer of the governing equation for solving differential equations by AGM

In AGM, a total answer with constant coefficients is required in order to solve differential equations. As it is shown in Table 1 or Eqs.(6) or (7).

Table 1: The obtained Numerical Solution of Eqs (15) based on the given physical values Eqs(29).

| t(s) | 0  | 12 | 24 | 36 | 48 | 60 |

| %error | 0  | 0  | 0  | 0  | 0  | 0  |

Application of initial conditions to compute constant coefficients is done in two steps by AGM

Apply initial conditions in AGM method for vibrational systems at case of generally can be divided in two parts as follows:

a. Applying the initial conditions on the answer of differential equations:

\[ u(t) = u(t) \]  

It is notable that IC is the abbreviation of introduced initial conditions of Eq.(5).

b. Applying the initial conditions on the main differential equation and its derivatives:

Assume the general equation of vibrational systems:

\[ f(u, \dot{u}, F_\phi, \sin(\omega t)) = 0 \]  

According to Table 1 the suitable answer can be chosen as follow:

\[ u = g(t) \]  

Afterwards Eq.(8) will be substituted into Eq.(9) instead of u as follows:

\[ f(t) = f(g^*(t), g'(t), g(t), F_\phi, \sin(\omega t)) \]  

Eventually, the application of initial conditions on Eq.(11) and it derivatives is expressed as follows:

\[ f(\text{IC}) = f(g^*(\text{IC}), g'(\text{IC}), g(\text{IC}), \ldots) \]  
\[ f'(\text{IC}) = f'(g^*(\text{IC}), g'(\text{IC}), g(\text{IC}), \ldots) \]  
\[ f''(\text{IC}) = f''(g^*(\text{IC}), g'(\text{IC}), g(\text{IC}), \ldots) \]  

Finally, after applying the initial conditions on answer function Eq.(8), and also the function differential equation and on its derivatives from Eqs.(12) a set of algebraic equations which is consisted of n equations with n unknowns is created. Therefore, the constant coefficients of Eq.(3) or (4) which are \{a_1, a_2, \ldots, a_n, \phi_1, \phi_2, \ldots, b, \alpha, d, \Phi\} or the constant coefficients \{a, b, d\} and angular frequency \omega and initial phase (\phi and \phi) at Eqs. (6) or (7) are will easily computed in AGM by applying the initial conditions of Eq.(5).

Application

According Figure 1 governing nonlinear differential equations which is shown by the Van der Pol and Duffing equation as follows:

\[ f(t) \frac{d^2u}{dt^2} - \varepsilon (1-u^2) \frac{du}{dt} + a u + \beta u^3 + \eta u v^2 = F_\phi \sin(\Omega t) \]  
\[ g(t) \frac{dv}{dt} - \lambda (1-v^2) \frac{dv}{dt} + \alpha v + \beta v^3 + \mu v^2 v = 0 \]  

Then, the initial conditions are expressed in the forms of:

\[ u(0)=0, \dot{u}(0)=0 \]  
\[ v(0)=v_0, \dot{v}(0)=0 \]  

Where (a, \beta, \lambda, \eta, \varepsilon, F_\phi) are system physical constants.

Solving the differential equation with AGM

On the basis of the given explanations in the previous section, the answer of Eq.(13) in AGM is considered as follows

\[ u = e^{-\alpha t} \{ b \cos(\omega t + \phi) \} + a_1 \sin(\Omega t + \Phi) \]  
\[ v = e^{-\alpha t} \{ d \cos(\omega t + \phi) \} \]  

How to cite this article: M Akbari, S Akbari, DD Ganji. Nonlinear Dynamical Structures on Coupled Duffing-Van der Pol Oscillators with Two Degrees of Freedom by New Approach AGM. Res Dev Material Sci. 7(4). RDMS.000670.2018. DOI: 10.31031/RDMS.2018.07.000670
The constant coefficients of Eqs.(15) which are \( \omega \) (angular frequency), \( \varphi \) (initial vibrational phase) \( a, b, c, d \) can easily be gained by applying the initial conditions or boundary conditions.

### Applying initial or boundary conditions in AGM

We consider the proposed physical model along dynamical system whith two Degrees of Freedom as follows: The constant coefficients of Eqs.(15) can be obtained by applying the initial or boundary conditions in two ways in AGM as follows:

Generally, the initial conditions are applied on Eqs.(15) in the forms of:

\[
\begin{align*}
  u &= u(t) = 0 \quad \text{so} \quad b\cos \varphi + a\sin \varphi = 0 \\
  u'(t) &= 0 \quad \text{so} \quad b\cos \varphi + a\sin \varphi = 0 \\
  v &= v(t) = 0 \quad \text{so} \quad d\cos \varphi = 0 \\
  v'(t) &= 0 \quad \text{so} \quad d\cos \varphi = 0
\end{align*}
\]

For simplicity, IC is considered as the abbreviation of the initial conditions. As a result, applying the initial conditions on Eqs.(15) is done as:

\[
\begin{align*}
  u(0) &= 0 \quad \text{so} \quad b\cos \varphi + a\sin \varphi = 0 \\
  u'(0) &= 0 \quad \text{so} \quad b\cos \varphi + a\sin \varphi = 0 \\
  v(0) &= 0 \quad \text{so} \quad d\cos \varphi = 0 \\
  v'(0) &= 0 \quad \text{so} \quad d\cos \varphi = 0
\end{align*}
\]

As well as:

\[
\begin{align*}
  u(t) &= 0 \quad \text{so} \quad b\cos \varphi + a\sin \varphi = 0 \\
  u'(t) &= 0 \quad \text{so} \quad b\cos \varphi + a\sin \varphi = 0 \\
  v(t) &= 0 \quad \text{so} \quad d\cos \varphi = 0 \\
  v'(t) &= 0 \quad \text{so} \quad d\cos \varphi = 0
\end{align*}
\]

The application of initial or boundary conditions on the main differential equation (1), (2) which in this case is Eqs.(13) and its derivatives \( f^m(t) \), \( g^n(t) \) is done in the following general form:

\[
\begin{align*}
  f(u) &= f(u(t)) = 0, f'(u(t)) = 0 \\
  g(v) &= g(v(t)) = 0, g'(v(t)) = 0
\end{align*}
\]

Therefore according to Eqs.(19), the initial conditions are applied after substituting Eqs.(15) which has been considered as the answer of the main differential equation into Eqs.(13) as follows:

\[
\begin{align*}
  f(u(t) &= 0) \\
  g(v(t) &= 0)
\end{align*}
\]

By substituting the above parameters into Eqs.(15), the answer of the coupled nonlinear differential Eqs.(13) is obtained in the form of:

\[
\begin{align*}
  u(t) &= 0.13854e^{-0.11450}(0.4231t - 1.4211) + 0.05861\sin(t - 2.7822) \\
  v(t) &= 0.1006e^{-0.04750}\cos(0.4467t - 0.1103) \\
  \omega_1 &= 0.4647
\end{align*}
\]

### Numerical Solution

With regard to the given physical values from Eq.(29) and the determined domain \( t \in [0, 60] \) which is defined in terms of second (sec), the solution of the differential equation is expressed numerically in the following Table 1:

\[
\begin{align*}
  \{u(t) &= 0.13854e^{-0.11450}(0.4231t - 1.4211) + 0.05861\sin(t - 2.7822) \\
  v(t) &= 0.1006e^{-0.04750}\cos(0.4467t - 0.1103) \\
  \omega_1 &= 0.4647
\end{align*}
\]

The following above parameters of Eqs. (27a,27b) are introduced as:

\[
\begin{align*}
  F &= \frac{1}{0.12}\sqrt{9x_0^2 - 2x^2 - 2\Omega^2(2\frac{x}{\Omega} + \frac{\Omega}{x} - 1)\cos(\Omega t) + \cos(\Omega t)(\Omega + 2\frac{x}{\Omega} + \frac{\Omega}{x} - 1)} \\
  a &= \frac{1}{0.12}\sqrt{9x_0^2 - 2x^2 - 2\Omega^2(2\frac{x}{\Omega} + \frac{\Omega}{x} - 1)\cos(\Omega t) + \cos(\Omega t)(\Omega + 2\frac{x}{\Omega} + \frac{\Omega}{x} - 1)} \\
  \lambda &= \lambda_{\text{crit}}
\end{align*}
\]

\begin{align*}
\psi_1 &= 4\eta_0^2 - \varepsilon^2 + 4\alpha \\
\psi_2 &= 4\eta_0^4 - 8\Omega^2 \eta_0^2 + 4\Omega^4 + 4\Omega^2 \varepsilon^2 + 8\alpha \eta_0^2 - 8\Omega^2 \alpha + 4\alpha^2 \\
\psi_3 &= \eta_0^2 - 2\Omega^2 \eta_0^2 + \Omega^4 + \Omega^2 \varepsilon^2 + 2\alpha \eta_0^2 - 2\Omega^2 \alpha \\
\psi_4 &= \eta_0^4 - 2\Omega^2 \eta_0^4 + \Omega^4 + \Omega^2 \varepsilon^2 + 2\alpha \eta_0^4 - 2\Omega^2 \alpha + \alpha^2 \\
\psi_5 &= 4\eta_0^2 - \varepsilon^2 + 4\alpha \\
A_1 &= 2\lambda v_0^2 - \lambda^3 v_0 + 4\mu v_0^2 - \lambda^2 + 4\alpha \\
A_2 &= \frac{1}{2}(\lambda - \lambda v_0) \\
A_3 &= 4\mu v_0^2 + 4\alpha \\
(28)
\end{align*}

By selecting the physical values of vibration below:
\begin{align*}
\eta_0 = 0, \varepsilon = 0.1, \varepsilon_0 = 0.3, \alpha = 0.2, \beta = 0.2 \\
\mu = 0.1, \lambda = 0.1, \eta = 0.15, \Omega_0 = 0.05, \Omega = 1 \\
(29)
\end{align*}

According to physical values Eqs.(29) the solution of Eqs. (27a, 27b) and the angular frequency Eqs.(26) are rewritten as follows:

Comparing the achieved solutions by numerical method and AGM

Due to the obtained results from solving Eqs.(15) by AGM, which is expressed by Eqs.(27a,27b), and the obtained Numerical Solution which its results have been presented in Table 1, we will have the following comparisons: With regard to Figure 2-8, it is obvious that AGM is an accurate and acceptable method for solving nonlinear differential equations and so it is obviously that the charts of AGM and Numerical solutions are overlapped, this overlap represents precision of the AGM method at the solution of nonlinear equations.
Conclusion and Discussion

The displacement vibration amplitude (\(\nu\)) from Eqs.(27a) in terms of angular frequency of external force (\(\Omega\)) of vibration is illustrated as follows: As regards Fig.8, it is resulted that by increasing the parameter of the angular frequency of external force (\(\Omega\)), the amount of the displacement vibration amplitude is significantly decreased. At the above Figure 9, the effect of the parameter of damping coefficient (\(\varepsilon\)) on the amount of the displacement vibration amplitude has been significantly decreased. Eventually based on the achieved observation from Figure 10, it is clear that by choosing specified values of the damping coefficient (\(\varepsilon\)) and angular frequency of external force (\(\Omega\)) can be make vibrational system into the resonance state.

The difference between obtained solutions by AGM and numerical method

The following charts indicate the difference between the obtained solutions by AGM and Numerical Method as follows: In
In accordance with Figure 11 and Figure 12, the difference between the obtained solution by AGM and numerical method (rkt-45) is very negligible which proves the reliability of this technique.

Conclusion

In this paper, one complicated nonlinear vibrational partial differential equations have been introduced and analyzed completely by Algebraic Method (AGM) and also the obtained results have been compared with Numerical Method (Runge-Kutte 4th). The above process has been done in order to show the ability of AGM for solving a broad range of differential equations in different fields of study particularly in vibrations. Consequently, it is concluded that AGM is a reliable and precise approach for solving miscellaneous differential equations. Moreover, a summary of the AGM excellence and benefits is explained as: By solving a set of algebraic equations with constant coefficients, we are able to obtain the solution of nonlinear differential equation along with the related angular frequency simultaneously very easily which applying this procedure is possible even for students with intermediate mathematical knowledge. On the other hand, it is better to say that AGM is able to solve linear and nonlinear differential equations(ODE , PDE) directly. Therefore, AGM can be considered as a significant progress in nonlinear sciences. Inasmuch as the shortage of boundary condition(s) in this method for solving differential equation(s) is completely terminated, AGM is operational for miscellaneous nonlinear differential equations especially for the vibrations of civil engineering and Mechanical machinery and we are hopeful this method will be applied by enthusiastic young researchers in the near future.

Acknowledgment

AGM method has invented by Mohamadreza Akbari in 2014 and I am hope it will be serviced to all researchers in the engineering world, and as well as I am grateful to all everyone who helped me in any way possible in development this creation. We can certainly claim which AGM method can be very beneficial and high efficiency for analytical solving the set of coupled nonlinear differential equations (ODE, PDE) at the practical field in engineering industries and basic sciences.
