A DISPERSIVE APPROACH TO THE ARTIFICIAL
COMPRESSIBILITY APPROXIMATIONS OF THE NAVIER
STOKES EQUATIONS IN 3-D

DONATELLA DONATELLI AND PIERANGELO MARCATI

ABSTRACT. In this paper we study how to approximate the Leray weak
solutions of the incompressible Navier Stokes equation. In particular
we describe an hyperbolic version of the so called artificial compress-
ibility method investigated by J.L.Lions and Temam. By exploiting
the wave equation structure of the pressure of the approximating system we
achieve the convergence of the approximating sequences by means of dis-
persive estimate of Strichartz type. We prove that the projection of the
approximating velocity fields on the divergence free vectors is relatively
compact and converges to a Leray weak solution of the incompressible
Navier Stokes equation.

1. Introduction

This paper is concerned with the convergence of the artificial compress-
ibility approximation to the Leray weak solutions (“turbulent in the Leray
terminology”) of the 3−D Navier Stokes equation on the whole space. This
approximation was introduced by Chorin 2,3, Temam 30,31 and Oskolkov
21, in order to deal with the difficulty induced by the incompressibility con-
straints in the numerical approximations to the Navier Stokes equation. The
paper of Temam 30,31 and his book 32 discuss the convergence of these
approximations on bounded domains by using the classical Sobolev comp-
actness embedding and they recover compactness in time by the classical
Lions 17 method of fractional derivatives. This paper will take a differ-
ent point of view, namely we wish to exploit the underlying wave equation
structure and the presence of dispersive type estimates. In particular we
will consider the following system

\[
\begin{aligned}
\partial_t u^\varepsilon + \nabla p^\varepsilon &= \mu \Delta u^\varepsilon - (u^\varepsilon \cdot \nabla) u^\varepsilon - \frac{1}{2} (\text{div} u^\varepsilon) u^\varepsilon + f^\varepsilon \\
\varepsilon \partial_t p^\varepsilon + \text{div} u^\varepsilon &= 0,
\end{aligned}
\]

(1.1)

where \((x,t) \in \mathbb{R}^3 \times [0,T], u^\varepsilon = u^\varepsilon(x,t) \in \mathbb{R}^3 \) and \(p^\varepsilon = p^\varepsilon(x,t) \in \mathbb{R},
\)

\(f^\varepsilon = f^\varepsilon(x,t) \in \mathbb{R}^3\).

The system will be discussed as a semilinear wave type equation for the
pressure function and the dispersive estimates will be carried out by using
the \(L^p\)-type estimates due to Strichartz 10,13,29. The particular type of
Strichartz estimates that we are going to use here can be found in the book
of Sogge 27 or deduced by the so called bilinear estimates of Klainerman

1991 Mathematics Subject Classification. 35L65.

Key words and phrases. compressible Navier Stokes equation; hyperbolic equations;
wave equations.
and Machedon \cite{machedon} and Foschi Klainerman \cite{foschi_klainerman}. Our analysis can also be related to the convergence of the incompressible limit problem via a formal expansion (see for instance Temam \cite{temam}, Chapter 3). In particular a similar wave equation structure has been exploited in various way by the paper of P.L.Lions and Masmoudi \cite{lions_masmoudi}, Desjardin, Grenier, Lions, Masmoudi \cite{desjardin_grenier_lions_masmoudi}, Desjardin Grenier \cite{desjardin_grenier}.

In this paper we analyze the convergence problem in the case of the whole space but our method can be extended to exteriors domains which will be done in a forthcoming paper.

The interest into the artificial compressibility methods started with the previously mentioned results of Chorin and Temam and was later investigated by Ghidaglia and Temam \cite{ghidaglia_temam}. Later developments of numerical investigations in the directions of projections methods have been carried out by \cite{ghidaglia_temam}, \cite{ghidaglia_temam}, \cite{ghidaglia_temam}, \cite{ghidaglia_temam}, \cite{ghidaglia_temam}, \cite{ghidaglia_temam}, \cite{ghidaglia_temam}, \cite{ghidaglia_temam}.

This paper is organized as follows. In Section 2 we recall the mathematical tools needed in the paper and recall same basic definitions. In Section 3 we set up our problem, we explain our approximating system and we state our main result. The Section 4 is devoted to recover the a priori estimates needed to get the strong convergence of the approximating sequences and to prove the main theorem. Finally in Section 5 we give the proof of the main result.

\section{Preliminaries}

For convenience of the reader we establish some notations and recall some basic facts that will be useful in the sequel.

We will denote by $\mathcal{D}(\mathbb{R}^d \times \mathbb{R}_+)$ the space of test function $C_0^\infty(\mathbb{R}^d \times \mathbb{R}_+)$, by $\mathcal{D}'(\mathbb{R}^d \times \mathbb{R}_+)$ the space of Schwartz distributions and $\langle \cdot, \cdot \rangle$ the duality bracket between $\mathcal{D}'$ and $\mathcal{D}$ and by $\mathcal{M}_t X'$ the space $C_0^0([0,T]; X')$. Moreover $W^{k,p}(\mathbb{R}^d) = (I - \Delta)^{-k} L^p(\mathbb{R}^d)$ and $H^k(\mathbb{R}^d) = W^{k,2}(\mathbb{R}^d)$ denote the non-homogeneous Sobolev spaces for any $1 \leq p \leq \infty$ and $k \in \mathbb{R}$. $\dot{W}^{k,p}(\mathbb{R}^d) = (I - \Delta)^{-k/2} L^p(\mathbb{R}^d)$ and $\dot{H}^k(\mathbb{R}^d) = W^{k,2}(\mathbb{R}^d)$ denote the homogeneous Sobolev spaces. The notations $L^p_t L^q_x$ and $L^p_t W^{k,q}_x$ will abbreviate respectively the spaces $L^p([0,T]; L^q(\mathbb{R}^d))$, and $L^p([0,T]; W^{k,q}(\mathbb{R}^d))$.

We shall denote by $Q$ and $P$ respectively the Leray’s projectors $Q$ on the space of gradients vector fields and $P$ on the space of divergence-free vector fields. Namely

\begin{equation}
Q = \nabla \Delta^{-1} \text{div} \quad P = I - Q. \tag{2.1}
\end{equation}

Let us remark that $Q$ and $P$ can be expressed in terms of Riesz multipliers, therefore they are bounded linear operators on every $W^{k,p}$ ($1 \leq p \leq \infty$) space (see \cite{ghidaglia_temam}).

Let us recall that if $w$ is a (weak) solution of the following wave equation in the space $[0,T] \times \mathbb{R}^d$

\[
\begin{cases}
\left(\frac{\partial^2}{\partial t^2} + \Delta\right) w(t,x) = F(t,x) \\
w(0,\cdot) = f, \quad \partial_t w(0,\cdot) = g,
\end{cases}
\]
for some data $f,g,F$ and time $0 < T < \infty$, then $w$ satisfies the following Strichartz estimates, (see [10], [13])

\[ \|w\|_{L^q_tL^r_x} + \|\partial_t w\|_{L^q_tW^{1,1}_x} \lesssim \|f\|_{\dot{H}^{1/2}_x} + \|g\|_{\dot{H}^{-1/2}_x} + \|F\|_{L^q_tL^r_x}, \]  

(2.2)

where $(q,r), (\tilde{q}, \tilde{r})$ are wave admissible pairs, namely they satisfy

\[ \frac{2}{q} \leq (d-1) \left( \frac{1}{2} - \frac{1}{r} \right), \quad \frac{2}{\tilde{q}} \leq (d-1) \left( \frac{1}{2} - \frac{1}{\tilde{r}} \right) \]

and moreover the following conditions holds

\[ \frac{1}{q} + \frac{d}{r} = \frac{d}{2} - \gamma = \frac{1}{q'} + \frac{d}{\tilde{r}} - 2. \]

Later on we shall use (2.2) in the case of $d = 3$, $(q', \tilde{r}) = (1, 3/2)$, then $\gamma = 1/2$ and $(q,r) = (4, 4)$, namely the following estimate

\[ \|w\|_{L^q_tL^r_x} + \|\partial_t w\|_{L^q_tW^{1,1}_x} \lesssim \|f\|_{\dot{H}^{1/2}_x} + \|g\|_{\dot{H}^{-1/2}_x} + \|F\|_{L^q_tL^r_x}. \]

(2.3)

Beside the Strichartz estimate (2.2) or (2.3) in the case of $d = 3$ (see [27]), a more refined estimate, related to an earlier linear Strichartz [29] estimate, can also be deduced by the bilinear estimates of Klainerman and Machedon [14], Foschi and Klainerman [8], namely

\[ \|w\|_{L^q_tL^r_x} + \|\partial_t w\|_{L^q_tW^{1,1}_x} \lesssim \|f\|_{\dot{H}^{1/2}_x} + \|g\|_{\dot{H}^{-1/2}_x} + \|F\|_{L^q_tL^r_x}. \]

(2.4)

3. APPROXIMATING SYSTEM AND MAIN RESULT

Let us consider the incompressible Navier Stokes equation

\[
\begin{cases}
\partial_t u + \nabla \cdot (u \otimes u) - \mu \Delta u = \nabla p + f \\
\text{div} u = 0 \\
u(x,0) = u_0,
\end{cases}
\]

(3.1)

where $(x,t) \in \mathbb{R}^3 \times [0,T]$, $u \in \mathbb{R}^3$ denotes the velocity vector field, $p \in \mathbb{R}$ the pressure of the fluid, $f \in \mathbb{R}^3$ is a given external force, $\mu$ is the kinematic viscosity. Let us recall (see P.L.Lions [19] and Temam [32]) the notion of Leray weak solution.

**Definition 3.1.** We say that $u$ is a Leray weak solution of the Navier Stokes equation if it satisfies (3.1) in the sense of distributions, namely

\[
\int_0^T \int_{\mathbb{R}^d} \left( \nabla u \cdot \nabla \varphi - u_i u_j \partial_i \varphi_j - u \cdot \frac{\partial \varphi}{\partial t} \right) dxdt
= \int_0^T \langle f, \varphi \rangle_{H^{-1} \times H^1_0} dxdt + \int_{\mathbb{R}^d} u_0 \cdot \varphi dx,
\]

for all $\varphi \in C_0^\infty(\mathbb{R}^d \times [0,T])$, $\text{div} \varphi = 0$ and

\[
\text{div} u = 0 \quad \text{ in } D'(\mathbb{R}^d \times [0,T])
\]

and the following energy inequality holds

\[
\frac{1}{2} \int_{\mathbb{R}^d} |u(x,t)|^2 dx + \mu \int_0^t \int_{\mathbb{R}^d} |\nabla u(x,t)|^2 dxds \\
\leq \frac{1}{2} \int_{\mathbb{R}^d} |u_0|^2 dx + \int_0^t \langle f, u \rangle_{H^{-1} \times H^1_0} ds, \quad \text{for all } t \geq 0.
\]
There exists in the mathematical literature several results concerning the existence of Leray weak solutions to the Navier Stokes equations, for example we can refer to books of P.L. Lions [19] and Temam [32]. The case $d = 3$ is a major open problem and a considerably more difficult case than the case $d = 2$, since the bound on the $L^2$ norm (kinetic energy) provides only a control on a supercritical norm and does not provide any information concerning the critical controlling (and scaling invariant) norm $L^3$. Hence we do not know (opposite to the case $d = 2$) whether or not the Leray weak solutions are unique, unless (see Serrin [24]) we assume a control on the $L^3$ norm. Some important regularity results can be found in [1].

In order to approximate the system (3.1) we wish to use the system (1.1) where we introduce a “linearized” compressibility constraint given by the equation

$$\partial_t p^\varepsilon = -\frac{1}{\varepsilon} \text{div} u^\varepsilon.$$  

In order to avoid the paradox of increasing the kinetic energy along the motion we introduce the correction

$$-\frac{1}{2}(\text{div} u^\varepsilon)u^\varepsilon$$

into the momentum balance equation.

The limiting behaviour as $\varepsilon \downarrow 0$ of the initial data to (1.1) deserves a little discussion. Indeed (1.1) requires two initial conditions

$$u^\varepsilon(x, 0) = u^0_\varepsilon(x), \quad p^\varepsilon(x, 0) = p^0_\varepsilon(x),$$  

while the Navier Stokes equations require only one initial condition on the velocity $u$. Hence our approximation will be consistent if the initial datum on the pressure will be eliminated by an “initial layer” phenomenon. Since in the limit we have to deal with Leray solutions it is reasonable to require the finite energy constraint to be satisfied by the approximating sequences $(u^\varepsilon, p^\varepsilon)$. So we can deduce a natural behaviour to be imposed on the initial data $(u^0_\varepsilon, p^0_\varepsilon)$, namely

$$u^0_\varepsilon = u^\varepsilon(\cdot, 0) \rightarrow u_0 = u(\cdot, 0) \text{ strongly in } L^2(\mathbb{R}^3) \quad \text{(ID)}$$  

$$\sqrt{\varepsilon} p^0_\varepsilon = \sqrt{\varepsilon} p^\varepsilon(\cdot, 0) \rightarrow 0 \text{ strongly in } L^2(\mathbb{R}^3).$$

Let us remark that the convergence of $\sqrt{\varepsilon} p^0_\varepsilon$ to 0 is necessary to avoid the presence of concentrations of energy in the limit and it includes the Temam’s assumption that $\{p^0_{\varepsilon}\}$ is bounded in $L^2$.

Since it will not affect our approximation process, for simplicity from now on, we will take $\mu = 1$ and $f^\varepsilon = 0$. For convenience, let us now formulate an existence theorem concerning the approximating problem (1.1).

**Theorem 3.2.** Let $(u^0_\varepsilon, p^0_\varepsilon)$ satisfy the conditions (ID) for some $\varepsilon > 0$. Then the system (1.1) has a weak solution $(u^\varepsilon, p^\varepsilon)$ with the following properties

(i) $u^\varepsilon \in L^\infty([0, T]; L^2(\mathbb{R}^3)) \cap L^2([0, T]; \dot{H}^1(\mathbb{R}^3))$.

(ii) $\sqrt{\varepsilon} p^\varepsilon \in L^\infty([0, T]; L^2(\mathbb{R}^3))$.

for all $T > 0$.

The proof of this theorem will be omitted since it will be a consequence of all the “a priori bounds” that will be obtained in the sequel and it will follow
from the use of standard finite dimensional Galerkin type approximations. Let us now state our main result. The convergence of \{u^\varepsilon\} will be described by analyzing the convergence of the associated Hodge decomposition.

**Theorem 3.3.** Let \((u^\varepsilon, p^\varepsilon)\) be a sequence of weak solution in \(\mathbb{R}^3\) of the system (3.1), assume that the initial data satisfy (ID). Then

(i) There exists \(u \in L^\infty([0, T]; L^2(\mathbb{R}^3)) \cap L^2([0, T]; H^1(\mathbb{R}^3))\) such that

\[ u^\varepsilon \rightharpoonup u \text{ weakly in } L^2([0, T]; H^1(\mathbb{R}^3)). \]

(ii) The gradient component \(Qu^\varepsilon\) of the vector field \(u^\varepsilon\) satisfies

\[ Qu^\varepsilon \rightarrow 0 \text{ strongly in } L^2([0, T]; L^p(\mathbb{R}^3)), \text{ for any } p \in [4, 6). \]

(iii) The divergence free component \(Pu^\varepsilon\) of the vector field \(u^\varepsilon\) satisfies

\[ Pu^\varepsilon \rightarrow Pu \text{ strongly in } L^2([0, T]; L^2(\mathbb{R}^3)). \]

(iv) The sequence \(\{p^\varepsilon\}\) will converge in the sense of distribution (more precisely in \(H^{-1}_{t}W^{-2,4}_x + M_tW^{-1,4/3}_x + L^2_{t}H^{-1}_x\)) to

\[ p = \Delta^{-1} \text{div}((u \cdot \nabla)u) = \Delta^{-1} tr((Du)^2). \]

Moreover \(u = Pu\) is a Leray weak solution to the incompressible Navier Stokes equation

\[ P(\partial_t u - \Delta u + (u \cdot \nabla)u) = 0 \text{ in } \mathcal{D}'([0, T] \times \mathbb{R}^3), \]

and the following energy inequality holds

\[ \frac{1}{2} \int_{\mathbb{R}^3} |u(x, t)|^2 dx + \int_0^T \int_{\mathbb{R}^3} |\nabla u(x, t)|^2 dx dt \leq \frac{1}{2} \int_{\mathbb{R}^3} |u(x, 0)|^2 dx. \quad (3.3) \]

**Remark 3.4.** This theorem can be easily extended to the nonhomeogeneous equation (3.1), by assuming

\[ f^\varepsilon \rightarrow f \text{ strongly in } L^2([0, T]; H^{-1}(\mathbb{R}^3)). \]

**Remark 3.5.** Let us denote by \(R_j\) the Riesz transform. The Hardy space \(\mathcal{H}^1(\mathbb{R}^3)\) is a closed subspace of \(L^1(\mathbb{R}^3)\) defined by

\[ \mathcal{H}^1(\mathbb{R}^3) = \{ f \in L^1(\mathbb{R}^3) \mid R_j f \in L^1(\mathbb{R}^3), \text{for any } j = 1, \ldots 3 \}. \]

Then one has

\[ p \in L^1([0, T]; L^{3/2}(\mathbb{R}^3)) \cap L^1([0, T]; L^3(\mathbb{R}^3)), \quad (3.4) \]

and there exits \(c_1 > 0\), such that

\[ \|(tr(Du)^2)\|_{L^1([0, T]; \mathcal{H}^1(\mathbb{R}^3))} \leq c_1 \|u_0\|^2_{L^2(\mathbb{R}^3)}. \]

4. **A priori estimates**

In this section we wish to establish the a priori estimates, independent on \(\varepsilon\), for the solutions of the system (1.1) which are necessary to prove the Theorem 3.3. We will achieve this goal in two steps. First of all we will recover the a priori estimates that come from the classical energy estimates related to the system (1.1). Then we get stronger estimates by exploiting the structure of the system. In fact, as we will see later on, the sequence \(p^\varepsilon\) satisfies a wave type equation. This will allow us to apply to \(p^\varepsilon\) the Strichartz estimates (2.4), (2.2), and to get in this way dispersive bounds on \(p^\varepsilon\).
4.1. **Energy estimates.** The next results concerns the energy type estimate for the system (1.1).

**Theorem 4.1.** Let us consider the solution \((u^\varepsilon, p^\varepsilon)\) of the Cauchy problem for the system (1.1). Assume that the hypotheses (ID) hold, then one has

\[
E(t) + \int_0^t \int_{\mathbb{R}^3} |\nabla u^\varepsilon(x,s)|^2 dx ds = E(0),
\]

where we set

\[
E(t) = \int_{\mathbb{R}^3} \left( \frac{1}{2} |u^\varepsilon(x,t)|^2 + \frac{\varepsilon}{2} |p^\varepsilon(x,t)|^2 \right) dx.
\]

**Proof.** We multiply, as usual, the first equation of the system (1.1) by \(u^\varepsilon\) and the second by \(p^\varepsilon\), then we sum up and integrate by parts in space and time, hence we get (4.1).

**Corollary 4.2.** Let us consider the solution \((u^\varepsilon, p^\varepsilon)\) of the Cauchy problem for the system (1.1). Let us assume that the hypotheses (ID) hold, then it follows

\[
\sqrt{\varepsilon} p^\varepsilon \text{ is bounded in } L^\infty([0,T]; L^2(\mathbb{R}^3)),
\]

\[
\varepsilon p^\varepsilon_t \text{ is relatively compact in } H^{-1}([0,T] \times \mathbb{R}^3),
\]

\[
\nabla u^\varepsilon \text{ is bounded in } L^2([0,T] \times \mathbb{R}^3),
\]

\[
u^\varepsilon \text{ is bounded in } L^\infty([0,T]; L^2(\mathbb{R}^3)) \cap L^2([0,T]; L^6(\mathbb{R}^3)),
\]

\[
(u^\varepsilon \cdot \nabla) u^\varepsilon \text{ is bounded in } L^2([0,T]; L^1(\mathbb{R}^3)) \cap L^1([0,T]; L^{3/2}(\mathbb{R}^3)),
\]

\[
(div u^\varepsilon) u^\varepsilon \text{ is bounded in } L^2([0,T]; L^1(\mathbb{R}^3)) \cap L^1([0,T]; L^{3/2}(\mathbb{R}^3)).
\]

**Proof.** (4.3), (4.4), (4.5) follow from (4.1), while (4.6) follows from (4.1) and Sobolev embeddings theorems. Finally (4.7) and (4.8) come from (4.5), (4.6).

4.2. **Pressure wave equation.** In this section by using the Strichartz estimates (2.3), (2.4) we get a priori estimates on \(p^\varepsilon\). We will use a wave equation structure for \(p^\varepsilon\). First of all let us rescale the time variable, the velocity and the pressure in the following way

\[
\tau = \frac{t}{\sqrt{\varepsilon}}, \quad \tilde{u}(x,\tau) = u^\varepsilon(x, \sqrt{\varepsilon} \tau), \quad \tilde{p}(x, \tau) = p^\varepsilon(x, \sqrt{\varepsilon} \tau).
\]

As a consequence of this scaling the system (1.1) becomes

\[
\begin{aligned}
&\partial_\tau \tilde{u} + \sqrt{\varepsilon} \nabla \tilde{p} = \sqrt{\varepsilon} \Delta \tilde{u} - \sqrt{\varepsilon} (\tilde{u} \cdot \nabla) \tilde{u} - \frac{\sqrt{\varepsilon}}{2} (div \tilde{u}) \tilde{u} \\
&\sqrt{\varepsilon} \partial_\tau \tilde{p} + div \tilde{u} = 0
\end{aligned}
\]

then, by differentiating with respect to time the equation (4.10) and by using (4.10)\(_1\), we get that \(\tilde{p}\) satisfies the following wave equation

\[
\partial_{\tau \tau} \tilde{p} - \Delta \tilde{p} + \Delta div \tilde{u} - div \left( (\tilde{u} \cdot \nabla) \tilde{u} + \frac{1}{2} (div \tilde{u}) \tilde{u} \right) = 0.
\]
Now we consider \( \tilde{\rho} = \tilde{\rho}_1 + \tilde{\rho}_2 \) where \( \tilde{\rho}_1 \) and \( \tilde{\rho}_2 \) solve the following wave equations:

\[
\begin{aligned}
&\partial_{\tau\tau}\tilde{\rho}_1 - \Delta\tilde{\rho}_1 = -\Delta \text{div} \tilde{u} = F_1 \\
&p_1(x,0) = \partial_\tau \tilde{p}_1(x,0) = 0,
\end{aligned}
\]  

(4.12)

\[
\begin{aligned}
&\partial_{\tau\tau}\tilde{\rho}_2 - \Delta\tilde{\rho}_2 = \text{div} \left( (\tilde{u} \cdot \nabla) \tilde{u} + \frac{1}{2} (\text{div} \tilde{u}) \tilde{u} \right) = F_2 \\
&p_2(x,0) = \tilde{\rho}(x,0) \quad \partial_\tau \tilde{p}_2(x,0) = \partial_\tau \tilde{p}(x,0).
\end{aligned}
\]  

(4.13)

Therefore we are able to prove the following theorem.

**Theorem 4.3.** Let us consider the solution \((u^\varepsilon, p^\varepsilon)\) of the Cauchy problem for the system (1.1). Assume that the hypotheses (ID) hold. Then we set the following estimate

\[
\varepsilon^{3/8} \| p^\varepsilon \|_{L^2_tW^{-2,4}_x} + \varepsilon^{7/8} \| \partial_\tau p^\varepsilon \|_{L^2_tW^{-3,4}_x} \lesssim \sqrt{\varepsilon} \| p_0^\varepsilon \|_{L^2_x} + \| \text{div} u^\varepsilon_0 \|_{H^{-1}_x} + \sqrt{T} \| \text{div} u^\varepsilon \|_{L^2_tL^4_x} + \| (u^\varepsilon \cdot \nabla) u^\varepsilon + \frac{1}{2} (\text{div} u^\varepsilon) u^\varepsilon \|_{L^1_tL^{3/2}_x}.
\]  

(4.14)

**Proof.** Since \( \tilde{\rho}_1 \) and \( \tilde{\rho}_2 \) are solutions of the wave equations (4.12), (4.13), we can apply the Strichartz estimates (2.3) and (2.4), with \((x,\tau) \in \mathbb{R}^3 \times (0,T/\sqrt{\varepsilon})\). Since \( \Delta^{-1}\tilde{\rho}_1 \) satisfies the equation

\[
\partial_{\tau\tau}(\Delta^{-1}\tilde{\rho}_1) - \Delta(\Delta^{-1}\tilde{\rho}_1) = \Delta^{-1} F_1,
\]  

(4.15)

then by using the Strichartz estimates (2.4) we get

\[
\| \Delta^{-1}\tilde{\rho}_1 \|_{L^1_{\tau,x}} + \| \partial_\tau \Delta^{-1}\tilde{\rho}_1 \|_{L^4_tW^{-1,4}_x} \lesssim \| \Delta^{-1} F_1 \|_{L^1_tL^2_x},
\]  

(4.16)

namely

\[
\| \tilde{\rho}_1 \|_{L^4_tW^{-2,4}_x} + \| \partial_\tau \tilde{\rho}_1 \|_{L^4_tW^{-3,4}_x} \lesssim \sqrt{\frac{T}{\varepsilon^{1/4}}} \| \text{div} \tilde{u} \|_{L^2_tL^2_x}.
\]  

(4.17)

In the same way we have that \( \Delta^{-1/2}\tilde{\rho}_2 \) satisfies the equation

\[
\partial_{\tau\tau}(\Delta^{-1/2}\tilde{\rho}_2) - \Delta(\Delta^{-1/2}\tilde{\rho}_2) = \Delta^{-1/2} F_2,
\]  

(4.18)

therefore by using the estimate (2.3) we get

\[
\| \Delta^{-1/2}\tilde{\rho}_2 \|_{L^1_{\tau,x}} + \| \partial_\tau \Delta^{-1/2}\tilde{\rho}_2 \|_{L^4_tW^{-1,4}_x} \lesssim \| \Delta^{-1/2} \tilde{\rho}(x,0) \|_{H^{1/2}_x} + \| \Delta^{-1/2} \partial_\tau \tilde{\rho}(x,0) \|_{H^{-1/2}_x} + \| \Delta^{-1/2} F_2 \|_{L^1_tL^3/2_x},
\]  

(4.19)

namely

\[
\| \tilde{\rho}_2 \|_{L^4_tW^{-1,4}_x} + \| \partial_\tau \tilde{\rho}_2 \|_{L^4_tW^{-2,4}_x} \lesssim \| \tilde{\rho}(x,0) \|_{H^{-1/2}_x} + \| \partial_\tau \tilde{\rho}(x,0) \|_{H^{-3/2}_x} + \| (\tilde{u} \cdot \nabla) \tilde{u} + \frac{1}{2} (\text{div} \tilde{u}) \tilde{u} \|_{L^1_tL^{3/2}_x},
\]  

(4.20)
Finally, since $f \in L^4([0, T]) \cap L^4([0, T]; W^{−2,4}(\mathbb{R}^3))$, we will show that the gradient part of the velocity field $\tilde{u}$ converges strongly to $0$, while the incompressible component of the velocity field $\tilde{u}$ converges strongly to $\tilde{u} \in \dot{H}^1(\mathbb{R}^d)$, such that $\tilde{u} \rightarrow 0$ as $\varepsilon \downarrow 0$. As we will see in the next proposition, this will be a consequence of the a priori estimates established in the previous section.

**5. Strong convergence**

In this section we conclude the proof of the Theorem 3.3. In particular we will show that the gradient part of the velocity $Qu^\varepsilon$ converges strongly to $0$, while the incompressible component of the velocity field $Pu^\varepsilon$ converges strongly to $Pu = u$, where $u$ is the limit profile as $\varepsilon \downarrow 0$ of $u^\varepsilon$.

### 5.1. Strong convergence of $Qu^\varepsilon$ and $Pu^\varepsilon$

We start this section with some easy consequences of the a priori estimates established in the previous section.

**Corollary 5.1.** Let us consider the solution $(u^\varepsilon, p^\varepsilon)$ of the Cauchy problem for the system (1.1). Assume that the hypotheses (ID) hold. Then, as $\varepsilon \downarrow 0$, one has

$$
\varepsilon p^\varepsilon \longrightarrow 0 \quad \text{strongly in } L^\infty([0, T]; L^2(\mathbb{R}^3)) \cap L^4([0, T]; W^{−2,4}(\mathbb{R}^3)),
$$

(5.1)

$$
div u^\varepsilon \longrightarrow 0 \quad \text{strongly in } W^{−1,\infty}([0, T]; L^2(\mathbb{R}^3)) \cap L^4([0, T]; W^{−3,4}(\mathbb{R}^3)).
$$

(5.2)

**Proof.** (5.1), (5.2) follow from the estimates (4.13), (4.14) and the second equation of the system (1.1). \(\square\)

Now, we wish to show that the gradient part of the velocity field $Qu^\varepsilon$ goes strongly to $0$ as $\varepsilon \downarrow 0$. As we will see in the next proposition, this will be a consequence of the estimate (4.14) and of the following auxiliary result.

**Lemma 5.2.** Let us consider a smoothing kernel $\psi \in C_0^\infty(\mathbb{R}^d)$, such that $\psi \geq 0$, $\int_{\mathbb{R}^d} \psi dx = 1$, and define

$$
\psi_\alpha(x) = \alpha^{-d} \psi \left( \frac{x}{\alpha} \right).
$$

Then for any $f \in \dot{H}^1(\mathbb{R}^d)$, one has

$$
\|f - f \ast \psi_\alpha\|_{L^p(\mathbb{R}^d)} \leq C_p \alpha^{1−\sigma} \|\nabla f\|_{L^2(\mathbb{R}^d)},
$$

(5.3)

where

$$
p \in [2, \infty) \quad \text{if } d = 2, \quad p \in [2, 6] \quad \text{if } d = 3 \quad \text{and} \quad \sigma = d \left( \frac{1}{2} - \frac{1}{p} \right).
$$
Moreover the following Young type inequality hold
\[ \| f * \psi_\alpha \|_{L^p(\mathbb{R}^d)} \leq C\alpha^{s-d\left(\frac{1}{p} - \frac{1}{q}\right)} \| f \|_{W^{s,q}(\mathbb{R}^d)}, \]

for any \( p, q \in [1, \infty], q \leq p, s \geq 0, \alpha \in (0, 1). \)

**Proposition 5.3.** Let us consider the solution \((u^\varepsilon, p^\varepsilon)\) of the Cauchy problem (1.1). Assume that the hypotheses (ID) hold. Then as \( \varepsilon \downarrow 0 \),
\[
Q u^\varepsilon \rightarrow 0 \quad \text{strongly in} \quad L^2([0, T]; L^p(\mathbb{R}^3)) \quad \text{for any} \quad p \in [4, 6]. \tag{5.5}
\]

**Proof.** In order to prove the Proposition 5.3, we split \(Q u^\varepsilon\) as follows
\[
\| Q u^\varepsilon \|_{L^1_{\varepsilon} L_x^p} \leq \| Q u^\varepsilon - Q u^\varepsilon \ast \psi_\alpha \|_{L^1_{\varepsilon} L_x^p} + \| Q u^\varepsilon \ast \psi_\alpha \|_{L^1_{\varepsilon} L_x^p} = J_1 + J_2,
\]
where \(\psi_\alpha\) is the smoothing kernel defined in Lemma 5.2. Now we estimate separately \(J_1\) and \(J_2\). For \(J_1\) by using (5.3) we get
\[
J_1 \leq \alpha^{1-3\left(\frac{1}{p} - \frac{1}{q}\right)} \left( \int_0^T \| \nabla Q u^\varepsilon(t) \|_{L_x^2}^2 dt \right) \leq \alpha^{1-3\left(\frac{1}{p} - \frac{1}{q}\right)} \| \nabla u^\varepsilon \|_{L^1_{\varepsilon} L_x^2}. \tag{5.6}
\]
Hence from the identity \(Q u^\varepsilon = -\varepsilon^{1/8} \nabla \Delta^{-1} \varepsilon^{7/8} \partial_t p\) and by the inequality (5.4) we get \(J_2\) satisfies the following estimate
\[
J_2 \leq \varepsilon^{1/8} \| \nabla \Delta^{-1} \varepsilon^{7/8} \partial_t p \ast \psi \|_{L^1_{\varepsilon} L_x^p} \leq \varepsilon^{1/8} \alpha^{-2-3\left(\frac{1}{p} - \frac{1}{q}\right)} \| \varepsilon^{7/8} \partial_t p \|_{L^1_{\varepsilon} W_x^{-3,4}}
\]
\[
\leq \varepsilon^{1/8} \alpha^{-2-3\left(\frac{1}{p} - \frac{1}{q}\right)} T^{1/4} \| \varepsilon^{7/8} \partial_t p \|_{L^1_{\varepsilon} W_x^{-3,4}}. \tag{5.7}
\]
Therefore, summing up (5.6) and (5.7), and by using (4.5) and (4.11), we conclude for any \(p \in [4, 6]\) that
\[
\| Q u^\varepsilon \|_{L^1_{\varepsilon} L_x^p} \leq C\varepsilon^{1-3\left(\frac{1}{p} - \frac{1}{q}\right)} + C_T \varepsilon^{1/8} \alpha^{-2-3\left(\frac{1}{p} - \frac{1}{q}\right)} \tag{5.8}
\]
Finally we choose \(\alpha\) in terms of \(\varepsilon\) in order that the two terms in the right hand side of the previous inequality have the same order, namely
\[
\alpha = \varepsilon^{1/18}. \tag{5.9}
\]
Therefore we obtain
\[
\| Q u^\varepsilon \|_{L^1_{\varepsilon} L_x^p} \leq C_T \varepsilon^{6-p} \quad \text{for any} \quad p \in [4, 6].
\]

It remains to prove the strong compactness of the incompressible component of the velocity field. To achieve this goal we need to recall here, the following theorem (see [23]).

**Theorem 5.4.** Let be \(\mathcal{F} \subset L^p([0, T]; B)\), \(1 \leq p < \infty\), \(B\) a Banach space. \(\mathcal{F}\) is relatively compact in \(L^p([0, T]; B)\) for \(1 \leq p < \infty\), or in \(C([0, T]; B)\) for \(p = \infty\) if and only if
\[
\begin{align*}
(i) \quad & \left\{ \int_{t_1}^{t_2} f(t) dt, \ f \in B \right\} \text{ is relatively compact in } B, \ 0 < t_1 < t_2 < T, \\
(ii) \quad & \lim_{h \to 0} \| f(x + h) - f(x) \|_{L^p([0, T-h]; B)} = 0 \text{ uniformly for any } f \in \mathcal{F}.
\end{align*}
\]

The compactness can be obtained by looking at some time regularity properties of $Pu^\varepsilon$ and by using the Theorem 5.4 but before we need to prove the following lemma.

**Lemma 5.5.** Let us consider the solution $(u^\varepsilon, p^\varepsilon)$ of the Cauchy problem for the system (1.1). Assume that the hypotheses (ID) hold. Then for all $h \in (0,1)$, we have

$$\|Pu^\varepsilon(t + h) - Pu^\varepsilon(t)\|_{L^2([0,T] \times \mathbb{R}^3)} \leq C_T h^{1/5}.$$  \hfill (5.10)

**Proof.** Let us set $z^\varepsilon = u^\varepsilon(t + h) - u^\varepsilon(t)$, we have

$$\|Pu^\varepsilon(t + h) - Pu^\varepsilon(t)\|_{L^2([0,T] \times \mathbb{R}^3)}^2 = \int_0^T \int_{\mathbb{R}^3} dt dx \left( Pu^\varepsilon(t) \cdot (Pz^\varepsilon - Pz^\varepsilon \ast \psi_\alpha) \right)$$

$$+ \int_0^T \int_{\mathbb{R}^3} dt dx \left( Pu^\varepsilon(t) \cdot (Pz^\varepsilon \ast \psi_\alpha) \right) = I_1 + I_2.$$  \hfill (5.11)

By using \textit{5.3} we can estimate $I_1$ in the following way

$$I_1 \leq \|z^\varepsilon\|_{L^\infty_t L^2_x} \int_0^T \|z^\varepsilon(t) - (Pz^\varepsilon \ast \psi_\alpha)(t)\|_{L^2_x} dt$$

$$\lesssim \alpha T^{1/2} \|u^\varepsilon\|_{L^\infty_t L^2_x} \|\nabla u^\varepsilon\|_{L^2_t L^1_x}.$$  \hfill (5.12)

Let us reformulate $Pz^\varepsilon$ in integral form by using the equation (1.1), hence

$$I_2 \leq \left| \int_0^T \int_{\mathbb{R}^3} dt dx \int_t^{t+h} ds \left( \Delta u^\varepsilon - (u^\varepsilon \cdot \nabla) u^\varepsilon - \frac{1}{2} u^\varepsilon (\text{div} u^\varepsilon)(s,x) \cdot (Pz^\varepsilon \ast \psi_\alpha)(t,x) \right) \right|.$$  \hfill (5.13)

Then integrating by parts and by using (5.4), with $p = \infty$ and $q = 2$, we deduce

$$I_2 \leq h \|\nabla u^\varepsilon\|_{L^2_t L^1_x}^2 + C\alpha^{-3/2} T^{1/2} \|u^\varepsilon\|_{L^\infty_t L^2_x} \left( h \int_t^{t+h} \| (u^\varepsilon \cdot \nabla) u^\varepsilon - \frac{1}{2} (\text{div} u^\varepsilon) u^\varepsilon \|_{L^2_x}^2 ds \right)^{1/2}$$

$$\leq h \|\nabla u^\varepsilon\|_{L^2_t L^1_x}^2 + C\alpha^{-3/2} T^{1/2} h \|u^\varepsilon\|_{L^\infty_t L^2_x} \| (u^\varepsilon \cdot \nabla) u^\varepsilon - \frac{1}{2} (\text{div} u^\varepsilon) u^\varepsilon \|_{L^2_t L^1_x}^2.$$  \hfill (5.14)

Summing up $I_1$, $I_2$ and by taking into account (4.5), (4.6), (4.7), (4.8), we have

$$\|Pu^\varepsilon(t + h) - Pu^\varepsilon(t)\|_{L^2([0,T] \times \mathbb{R}^3)} \leq C(\alpha T^{1/2} + h\alpha^{-3/2} T^{1/2} + h),$$  \hfill (5.15)

by choosing $\alpha = h^{2/5}$, we end up with (5.10).

**Corollary 5.6.** Let us consider the solution $(u^\varepsilon, p^\varepsilon)$ of the Cauchy problem for the system (1.1). Assume that the hypotheses (ID) hold. Then as $\varepsilon \downarrow 0$

$$Pu^\varepsilon \longrightarrow Pu,$$

strongly in $L^2(0,T; L^2_{\text{loc}}(\mathbb{R}^3)).$   \hfill (5.16)

**Proof.** By using the Lemma 5.5 and the Theorem 5.4 and the Proposition 5.3 we get (5.16). \hfill \Box
5.2. **Proof of the Theorem 5.3.**

(i) It follows from the estimate (4.6).

(ii) It is a consequence of the Proposition 5.3.

(iii) By taking into account the decomposition \( u^\varepsilon = Pu^\varepsilon + Qu^\varepsilon \), by the Corollary 5.6 and the Proposition 5.3 we have that

\[ \text{Pu}^\varepsilon \longrightarrow u \quad \text{strongly in } L^2([0,T];L^2_{loc}(\mathbb{R}^3)). \]

(iv) Let us apply the Leray projector \( Q \) to the equation (1.11), then it follows

\[ \nabla p^\varepsilon = \Delta Qu^\varepsilon - Q \left( \text{div}(u^\varepsilon \otimes u^\varepsilon) + \frac{3}{2} u^\varepsilon \text{div}Qu^\varepsilon \right). \]  

(5.17)

Now by choosing a test function \( \varphi \in H^1_1 W^{2,4/3}_x \cap C^0 W^{1,4}_x \cap L^2_2 H^2_x \) and by taking into account (4.5), (5.5), (5.16), we get, as \( \varepsilon \downarrow 0 \),

\[ \langle u^\varepsilon \text{div}Qu^\varepsilon, Q\varphi \rangle \leq \|Q u^\varepsilon\|_{L^2_2 L^2_4} \|Q \varphi\|_{L^\infty L^2_4} + \|Q u^\varepsilon\|_{L^2_2 L^2_4} \|u^\varepsilon\|_{L^\infty L^2_4} \|\nabla Q\varphi\|_{L^2_2 L^4_2} \rightarrow 0, \]  

(5.18)

\[ \langle \text{div}(u^\varepsilon \otimes u^\varepsilon), Q\varphi \rangle = \langle \text{div}(Pu^\varepsilon \otimes Pu^\varepsilon), Q\varphi \rangle + \langle \text{div}(Qu^\varepsilon \otimes Qu^\varepsilon), Q\varphi \rangle + \langle \text{div}(Pu^\varepsilon \otimes Qu^\varepsilon), Q\varphi \rangle + \langle \text{div}(Qu^\varepsilon \otimes Qu^\varepsilon), Q\varphi \rangle \]  

\[ \rightarrow \langle \text{div}(Pu \otimes Pu), Q\varphi \rangle = \langle Q \text{div}((Pu \cdot \nabla)Pu), \varphi \rangle. \]  

(5.19)

So as \( \varepsilon \downarrow 0 \) we have,

\[ \langle \nabla p^\varepsilon, \varphi \rangle \longrightarrow \langle \nabla \Delta^{-1} \text{div}((u \cdot \nabla)u), \varphi \rangle. \]  

(5.20)

Now we can pass into the limit inside the system (1.11) and we get \( u \) satisfies the following equation in \( D'([0,T] \times \mathbb{R}^3) \)

\[ P(\partial_t u - \Delta u + (u \cdot \nabla)u) = 0. \]  

(5.21)

Finally we prove the energy inequality. By using the weak lower semicontinuity of the weak limits, the hypotheses (ID) and denoting by \( \chi \) the weak-limit of \( \sqrt{\varepsilon} p^\varepsilon \), we have

\[ \int_{\mathbb{R}^3} \frac{1}{2} |\chi|^2 \, dx + \int_{\mathbb{R}^3} \frac{1}{2} |u(x,t)|^2 \, dx + \int_0^T \int_{\mathbb{R}^3} |\nabla u(x,t)|^2 \, dx \, dt \]

\[ \leq \liminf_{\varepsilon \to 0} \left( \int_{\mathbb{R}^3} \frac{1}{2} |u^\varepsilon(x,t)|^2 \, dx + \int_{\mathbb{R}^3} \frac{\varepsilon}{2} |p^\varepsilon|^2 + \int_0^T \int_{\mathbb{R}^3} |\nabla u^\varepsilon(x,t)|^2 \, dx \, dt \right) \]

\[ = \liminf_{\varepsilon \to 0} \int_{\mathbb{R}^3} \frac{1}{2} \left( |u_0|^2 - \varepsilon |p_0|^2 \right) \, dx \]

\[ \leq \int_{\mathbb{R}^3} \frac{1}{2} |u_0|^2 \, dx. \]
