Abstract

Textile industry has been considered for years to be one of the major sources of worldwide pollution problems. Huge amount of wastewater is generated at different stages of textile manufacturing. These waste products are mostly released in the environment without prior consideration. In Fact, they are highly contaminated with lot of chemicals including dyes. For this reason, the investigation of the effects of those compounds over the environment and human health has become a great interest. This review outlines the chemical synonyms, molecular structure and the toxicological effects of 85 textile dyes. The potential fate and effect of those substances on aquatic, human health and ecosystem are discussed in this article.

Keywords: Textile industry; Synthetic dyes; Toxicity; Toxicological effects

Introduction

Since the discovery of the brilliant fuchsia color, or mauve in 1856, thousands of synthetic dyes have been manufactured all over the world [1]. Actually, there are approximately 10,000 different synthetic dyes available in the market [2] with a global annual production of almost 800,000 tons [3]. Such dyes may be defined as colored matters and when applied they are to substrates may provide them with a permanent color that by any means will not be affected by sun rays, soap and water [1,4]. Specifically, every dye stuff consists of a group of atoms, called ‘chromophore’ that is responsible for the substrates’ coloration by absorbing certain wavelengths of light from the nearby ultraviolet region. It also contains an ‘auxochrome’ which helps the chromophore attach to the fiber by means of stable chemical bonds. The most important chromophores are: N=O, -NO2, -N=N-, -C=O, C=O, -C= N and (CH-CH) and the compounds that bear them are known as chromogens [4].

These organic chemicals are usually classified as azo, anthraquinone, vat, phthalocyanine, indigo, polymethine, carbonium and nitro dyes [5-7]. Azo dyes which have an azo bond (R1−N=N−R2), where R1 and R2 are aromatic groups, can be substituted by sulphonated groups. R1 and R2 represents the biggest and most versatile group and composes about one-half of all dyes produced [8,9]. However, anthraquinone dyes constitute the second most important category of textile dyes and are often used for dyeing cellulosic fabric (such as cotton), wool and polyamide fibers. It is to be noted that a large diversity of chemical structures of anthraquinone colorants exist [10]. Concerning the nitro dyes, it was the first to be manufactured and rarely used. In terms of its atomic structure, the nitroso dyes consist on an NO2 group in ortho-position to an electron-donating substituent such as usually NH2 and an OH group [11].

Each year, nearly 140 000 tons of synthetic dyes are lost into the environment because of the dyeing process [11,12]. The discharge of dye-containing effluents has obvious negative effects. Those effluents are characterized by strong colors, high pH variations, high chemical oxygen demand (COD) and increased biotoxicity against bacteria [13]. Even at very low concentration (10−50 mg/L) water-soluble dyes may, intensively, affect the aquatic organisms [14-16] and interfere with the transmission of sun beams into streams and, therefore, reduce photosynthetic activity [17]. It is worth noting that these chemicals show high neutrality to light, temperature and microbial attacks [18]. They are also known to be persistent in the environment [15].

There has been increasing concern in recent years the occurrence, fate and toxicity of textile dyes products in the environment. This paper is a state of the art on the toxicological effects of those chemical substances.

Harmful Effects of Textile Dyes and their Metabolite

Textile dyes extensively used in several manufacturing process have been proved to be harmful to the human health as well as to the environment. Moreover, these chemicals, especially the azo dyes, could raise potential environmental concerns considering their toxic, mutagenic and carcinogenic effects [19-22].

As the discharge of azo dyes into water bodies presents human and ecological risks, a few synthetic dyes have been tested in order to evaluate their potential toxicity. The results have shown that these dyes have toxic effects on a variety of organisms such us aquatic animals [23]. Appendix1 displays about 85 toxic textile dyes.

Textile dyes and its metabolite carcinogenic effect, mutagenic effect and DNA damages

It has been reported that dyes toxicity may happen due to either the direct action of the original compound or its intermediate metabolites such as naphthalene, benzidine and other aromatic amines.

[24,25]. Those compounds are by-products of cleavage of azo bond by microorganisms, and reported to be carcinogenic and mutagenic [24,26]. They were proved to be more dangerous than the parent compound [27].

In this context, the benzidine-based azo Direct Red 28 intermediate metabolites, the benzidine and 4-aminophenyl were reported to be the real causes of its toxicity [25]. The reduction of textile azo dyes may breed DNA binding motifs [28,29] and may cause multiple toxic effects.

Along with the aforementioned problems, some dyes have been shown to have a propensity to bio accumulate in fish [15,30]. Moreover heavy-metal ions that are originally present in textile effluents have been detected to be higher in algae and plants which are exposed to such effluents [15]. Some experiments have revealed that wastewater generated by textile industry has high amount of Total Organic Carbon (TOC), high salt content and extremes in pH [31,32]. It was reported that high pH values are registered in reactive dye baths and low ones in acid dye baths. Lastly, it was observed that colored effluents decrease soil fertility and inhibit several plants (Appendix 1).

Conclusion

Environmental textile dyes hazards are associated to alarming human and animal’s health side effects. Through this study we tried to highlight the fact that textile dyes discharged into the environment have alarming effects as both parent compound of dyes and their breaking-down products. They induce various cytotoxic, genotoxic, mutagenic and carcinogenic effects. Even at low concentration, these substances are proved to be responsible for harmful effects. Therefore, textile dyes treatment before eventual release in the environment has become a serious preoccupation. Several physical, chemical and biological processes are nowadays used in order to remove those compounds. However, their efficiency discussed as the danger associated to the treatment and unknown is of real concern.

### Disperse Blue 291

**Class:** Single azo  
**CAS No.** 56548-64-2  
**Synonyms:** C. I. 113395; Balicron Blue 6G; Hisperse Navy C-6G; Viosperse Blue 5G; Ambicon Blue SEGBL; Disperse Navy Blue 5G; Terenix Navy Blue F3GL; Kiwalon Polyester Blue 5G; Disperse Navy Blue S-BGF300  
**CB Number:** CB4798923  
**Molecular Formula:** C$_{19}$H$_{21}$BrN$_6$O$_6$  
**Formula Weight:** 509.31064  
**MOL File:** 56548-64-2 mol  

Induction of DNA breakage, induction of micronuclei, increase of apoptosis in human hepatoma cells HepG2 [35]. Mutagenic activity in the Salmonella assay [36,37].

### Disperse Red 1

**Class:** Single azo  
**CAS No.** 2872-52-8  
**Synonyms:** C. I. 11110; C.I. 11015; WO 4; Disperse Red ZH; Celliton Red B; Solvent Red 14; 2-(Ethyl[4-[(E)-(4-nitrophenyl) diazenyl phenyl]amino) ethanol  
**CB Number:** CB8135175  
**Molecular Formula:** C$_{16}$H$_{18}$N$_4$O$_3$  
**Formula Weight:** 314.34  
**MOL File:** 2872-52-8 mol  

DNA damage caused by Disperse Red 1 was demonstrated by the increase of the number of the micronuclei in human lymphocytes and in HepG2 cells at higher dose levels [38].
**Disperse Orange 1**

**Class:** Single azo  
**CAS No:** 2581-69-3  
**Synonyms:** C.I. 11080; C.I. Disperse Orange 1 (6CI,7CI,8CI); Voneryl Red 4G; Acetate Orange 5R; Palanil Orange 5R; Reliton Orange 5R; Resolin Orange 5R; Serisol Orange 5R; Disperse Orange 5R; Dispersol Orange A; Navilene Orange 5R; Acetate Orange 5R; Acetoquinone Light Orange 4RL; Celliton Discharge Orange 5RL; Celliton Fast Orange 5R; Cila Fast Orange 5R; Diacelliton Fast Orange R; Diacelliton Fast Orange RM/D; Disperse Orange 5R; Dispersol Fast Orange A; Dispersol Orange A; Dispersol Orange B-A; Dispersol Printing Orange A; Miketon Fast Orange 5R; Miketon Polyester Orange 5R; Navilene Orange 5R; Palanil Orange 5R; Reliton Orange 5R; Resolin Orange 5R; Seriline Orange 5R; Seriline Orange; Benzenamine,4-[(4-nitrophenyl)azo]-N-phenyl- (9CI); 4-(4-Nitrophenylazo)diphenylamine; 4-(p-Nitrophenylazo)diphenylamine;4-Anilino-4'-nitroazobenzene; 4-Nitro-4'-(phenylamino) azobenzene;  
**CB Number:** CB3144969  
**Molecular Formula:** C18H14N4O2  
**Formula Weight:** 318.33  
**MOL File:** 2581-69-3 mol

Increase the micronuclei frequencies in human lymphocytes and in HepG2 cells causing DNA damage at higher dose levels of this dye [38]. The dye showed genotoxic effects with respect to HepG2 cells at concentrations of 0.2, 0.4, 1.0, 2.0 and 4.0 μg/mL and induces DNA damage and cytotoxic effects but does not cause ecotoxic effects in *Daphnia similis* and *Vibrio fischeri* [39].

**Astrazon Blue FGRL**

**Class :** NA

Alterations of selected enzyme activities in practically, increase
| CAS No. 105953-73-9 | of glutathione reductase (GR) and glutathione s-transferase (GST) in *xenopus leavis* tadpoles at concentration 0.13 mg/L [40]. |

|   | Blue HFRL | Estrogenic potencies of the dye |
was evaluated by dose-response curves and compared to the dose-response curve of 17β-estradiol (E2), the reference compound. E2/dye competitive binding assays show activity of this dye indicating a mechanism of action common to E2. This result indicates that Blue HFRL is potential endocrine disrupting agents. The presence of some of this dye in textile industry wastewater may thus impact the aquatic ecosystem [2].

### Benzopurpurine 4B

| Class     | Azo                        |

Toxicity to *Allium cepa* signifies that dye Red 120 exerts oxidative stress and subsequently toxic effect on the root cells whereas biodegradation metabolites of the dye are relatively less toxic in nature. Phytotoxicity studies also indicated that microbial treatment favors detoxification of Red 120 [54].
Induction of DNA damages in human hepatoma cells HepG2 in a dose dependent manner [55]. Dye tested positive in the Salmonella assay, and the suggestion was made that the compound induce mainly frame-shift mutations and that the enzymes nitroreductase and O-acetyl transferase play an important role in the observed effect. In addition, it was shown that the presence of the chlorine substituent in Disperse Red 13 decreased the mutagenicity, which shows the same structure as
|   | **C.I. Basic red 18** | **Disperse Red 13, but without the chlorine substituent**[56]. |

the mouse lymphoma assay (MLA) (OECD 476), IR= 7.4 with 40 µg/mL without S9 [73].

| 66 | Direct Blue 297 |
| Class: | Double azo |
| CAS No. | 100358-00-7 |
| Synonyms: | C.I. Disperse Blue 297 ; 130640-96-9 |
| CB Number: | NA |
| Molecular Formula: | C_{54}H_{30}N_{10}Na_{8}O_{28}S_{8} |
| Formula Weight: | 1707.304354 |
| MOL File: | NA |

Direct Blue 297 at doses 40% and 80% LD_{50}/kg body weight, cause a significant decrease in the ratio of polychromatic to normochromatic erythrocytes in bone marrow of mice, which means that at the doses specified above they can affect the proliferation of the blood cells [74].

| 67 | Direct Green 98 |
| Class: | Azo |
| CAS No. | 101507-77-1 |
| Synonyms: | 2,7-Naphthalenedisulfonic acid,3,3'-[1,2-ethenediy]bis[(3-sulfo-4,1-phenylene)azo]]bis[5-amino-4-hydroxy-6-[(4-nitrophenyl)azo]~; hexasodium salt |
| CB Number: | NA |
| Molecular Formula: | NA |
| Formula Weight: | NA |
| MOL File: | NA |

Direct Green 98 at dose 80% LD_{50}/kg body weight, cause a significant decrease in the ratio of polychromatic to normochromatic erythrocytes in bone marrow of mice, which means that at the doses specified above they can affect the proliferation of the blood cells [74].
| 68 | Rhodamine 6G | Caused mutagenic effects in *Salmonella typhimurium* strains TA1538, TA98, TA1537 and TA100 with metabolic activation S9, and single-strand breaks in Chinese hamster ovary cells at concentration of $9 \times 10^{-5}$ M, as detected by alkaline sucrose sedimentation [75]. |
|---|---|---|
| Class: Azo | Molecular Formula: $C_{28}H_{31}N_2O_3Cl$ | |
| CAS No. 989-38-8 | Formula Weight: 479.01 | |
| Synonyms: Basic Red 1 | MOL File: NA | |
| CB Number: NA | \[\text{\includegraphics[width=0.3\textwidth]{rhodamine6g.png}}\] | |
| 69 | Rhodamine B | Rhodamine B induce His* reversion mutations in *Salmonella* strains TA1538 and TA98 with doses ranging from 0.25 to 2.0 mg/plate and single-strand breaks in Chinese hamster ovary cells, as detected by alkaline sucrose sedimentation [75]. |
| Class: Azo | Molecular Formula: $C_{28}H_{31}ClN_2O_3$ | |
| CAS No. 81-88-9 | Formula Weight: 479.01034 | |
| Synonyms: Basic Violet 10; Brilliant Pink B; Tetraethylrhodamine; Rhodamine O; Rhodamine; Rheonine B; Rhodamine B; Rhodamine B acetate; Rhodamine B chloride; Rhodamine B dihydride; Basic Violet 10; Brilliant Pink B; 9-(2-Carboxyphenyl)-6-(diethylamino)-N,N-diethyl-3H-xanthen-3-iminium chloride; | MOL File: NA | |
| CB Number: CB7485569 | \[\text{\includegraphics[width=0.3\textwidth]{rhodamineb.png}}\] | |
| 70 | Sulphur Red Brown 360 | Mutagenic effects for dose ranges |
| NA | | |
| Class: NA | CAS No. NA | of 50–250 µg/zone without metabolic activation (S9-mix) and 25–50 µg/zone with metabolic activation (S9-mix). Genotoxic effects were determined by *Bacillus subtilis* spore Rec assay in the presence and absence of metabolizing activation mixture (S9-mix) [76]. |

**CB Number:** CB2853385

**Molecular Formula:** C$_{20}$H$_{13}$N$_2$NaO$_5$S

**Formula Weight:** 416.39

Toxicity was investigated to freshwater shrimp (*Desmocaris trispinosa*) exposed to various concentrations (0.1 mg/L-1000 mg/L) of Mordant Black 17. The 96h LC$_{50}$ for this dye obtained from the concentration-mortality probit graphs was 2.48 mg/L. The 96h LT$_{50}$ of the dyes were also determined from the time-mortality probit graphs. The toxicity of the dyes was ranked as: Mordant Black 17>Direct Red 2>Direct Blue 14>Reactive Red 4>Reactive Yellow 2 [79].
Toxicity was investigated to freshwater shrimp (*Desmocaris trispinosa*) exposed to various concentrations (0.1 mg/L-1000 mg/L) of Direct Red 2. The 96h LC₅₀ for this dye obtained from the concentration-mortality probit graphs was 4.96 mg/L. The 96h LT₅₀ of the dyes were also determined from the time-mortality probit graphs. The toxicity of the dyes was ranked as: Mordant Black 17>Direct Red 2>Direct Blue 14>Reactive Red 4>Reactive Yellow 2 [79].
| Direct Blue 14 | Toxicity was investigated to freshwater shrimp (*Desmocaris trispinosa*) exposed to various concentrations (0.1 mg/L-1000 mg/L) of Direct Blue 14. The 96h LC$_{50}$ for this dye obtained from the concentration-mortality probit graphs was 11.33 mg/L. The 96h LT$_{50}$ of the dyes were also determined from the time-mortality probit graphs. The toxicity of the dyes was ranked as: Mordant Black 17 > Direct Red |

The 96h LC$_{50}$ for this dye obtained from the concentration-mortality probit graphs was 11.47 mg/L. The 96 h LT$_{50}$ of the dyes were also determined from the time-mortality probit graphs. The toxicity of the dyes was ranked as: Mordant Black 17>Direct Red 2>Direct Blue 14>Reactive Red 4>Reactive Yellow 2 [79]. |
| **Molecular Formula:** C$_{32}$H$_{19}$ClN$_8$Na$_4$O$_{14}$S$_4$

**Class:** Single azo

**CAS No.** 50662-99-2

**Synonyms:** C.I.18972; C.I. Reactive Yellow 2; Reactive Brilliant Yellow K-4GL; Reactive Yellow P-5G; Reactive Brilliant Yellow K-6G; Cibacron Brilliant Yellow 3G-P; Benzenesulfonic acid, 4-((4-chloro-6-((4-sulfophenyl)amino)-1,3,5-triazin-2-yl)amino)-2-(2-(1-(2,5-dichloro-4-sulfophenyl)-4,5-dihydro-3-methyl-5-oxo-1H-pyrrozol-4-yl)diazenyl)-, sodium salt (1:3); Benzenesulfonic acid, 4-((4-chloro-6-((4-sulfophenyl)amino)-1,3,5-triazin-2-yl)amino)-1,3,5-triazin-2-yl)amino)-2-(1-(2,5-dichloro-4-sulfophenyl)-4,5-dihydro-3-methyl-5-oxo-1H-pyrrozol-4-yl)azo), trisodium salt; Benzenesulfonic acid, 4-((4-chloro-6-((4-sulfophenyl)amino)-1,3,5-triazin-2-yl)amino)-2-(1-(2,5-dichloro-4-sulfophenyl)-4,5-dihydro-3-methyl-5-oxo-1H-pyrrozol-4-yl)azo), trisodium salt; Benzenesulfonic acid, 4-((4-chloro-6-((4-sulfoeph
| CB Number: CB2383501 | 4,5-dihydro-1H-pyrazol-1-yl]benzenesulfonate | Aquatic toxicity of Remazol Parrot Green was evaluated in an acute toxicity study using Daphnia magna as an aquatic experimental animal model. The 48 h EC$_{50}$ value for this azo dye was 55.32 mg/L. The general criteria of toxicity classification showed that dye was minor acutely toxic having 48 h EC$_{50}$ in between 10 and 100 mg/L [80]. |

Aquatic toxicity of Remazol Golden Yellow was evaluated in an acute toxicity study using Daphnia magna as an aquatic experimental animal model. The 48h EC$_{50}$ value for this azo dye was 46.84 mg/L. The general criteria of toxicity classification showed that dye was minor acutely toxic having 48 h EC$_{50}$ in between 10 and 100 mg/L [80].
Disperse Blue 1
Class: Anthraquinone
CAS No. 2475-45-8
Synonyms: C.I. 64500; NCI-C54900; Oracet Blue; Acetate Blue G; Acetate Blue 6; Amacel Blue GG; Fenacet Blue G; Nacelan Blue G; Celliton Blue G; Grasol Blue 2GS; 1,4,5,8-Tetraaminoanthraquinone
CB Number: CB9133956
Molecular Formula: C_{14}H_{12}N_{4}O_{2}
Formula Weight: 268.30
MOL File: 2475-45-8.mol

Disperse Blue 1, produces bladder tumors in rats. This compound is also a bacterial mutagen and thus a potential genotoxic [81].

Complication with human serum albumin (HAS) was unmasked by means of circular dichroism (CD), molecular modeling, steady state and time-resolved fluorescence, and UV/vis absorption measurements in aqueous solution at physiological at pH=7.4 [82,83].

Alizarin Complex one
Class: Anthraquinone
CAS No. 3952-78-1
Synonyms: Alizarin Fluorine Blue; Alizarin complexon; Alizarine complexon; Alizarine complexone; Alizarinkomplexon; Alizarine Fluorine Blue; 3-Aminomethylalizarin-N,N-diacetic acid; ((3,4-Dihydroxy-2-anthraquinonyl)methyl)iminodiacetic acid dihydrate; 1,2-Dihydroxy-anthrachinon-3-methyleniminodiessigsaeure; Alizarin complexon; Alizarinkomplexon; 3-Aminomethylalizarin-N,N-diacetic acid; Alizarin Fluorine Blue dihydrate; N-(Carboxymethyl)-N-(9,10-dihydro-3,4-dihydroxy-9,10-dioxo-2-anthracenyl) methyl)glycine; 2-[Carboxymethyl][3,4-dihydroxy-9,10-dioxoanthracen-2-yl] methyl]amino] acetic acid
