Implementation of Digital Literacy in Indonesia Early Childhood Education

Sri Tatminingsih

1Universitas Terbuka, Indonesia

Abstract
Digital literacy is a person's interests, attitudes, abilities, and skills in using digital technology-based devices. These skills are used to access, manage, integrate, analyze and evaluate the information needed and obtained, build new knowledge and create relationships or communication with others to participate effectively in society. This study aims to explore and explain the application of digital literacy in Early Childhood Education (ECE) institutions. The research method is descriptive and quantitative with a survey technique. The instrument used is a questionnaire in the form of a Google-Form (G-Form), which is distributed online via Instagram, WhatsApp, and email. The population is ECE teachers, and a sample of 318 ECE teachers from various provinces was collected randomly. The data collected were analyzed descriptively with simple quantification. The results of the study indicate that the application of digital literacy in ECE can be implemented in a limited way, and the implementation process must involve teachers and parents/guardians. The recommendation conveyed was the need for strict supervision for the implementation of digital literacy in early childhood.

Keywords: Digital Literacy; Early Childhood Education; Teachers.

INTRODUCTION
At the beginning of 2021, the Covid-19 pandemic has not yet passed. The whole community is getting used to various health rules and protocols. Although some people are against various regulations made by the government, in reality, they still adhere to health protocols, such as wearing masks, maintaining distance, avoiding crowds, and not visiting public areas (malls and entertainment venues). One of the rules applied is that it is not permitted to organize learning in schools or educational institutions (Lampiran SKB Tiga Menteri, 2021), including in early childhood education.

In line with these regulations, the learning process at ECE is also carried out online or online using the Zoom Meeting application, Google classroom, or Microsoft Teams. Thus the learning process requires children to use internet-based devices, whether computers, laptops, tablets, or mobile phones (cell phones) (Astuti & Harun, 2020). This requirement is a bit contrary to the opinion so far, which states that children should not be allowed to use internet-based devices (Takamatsu & Takai, 2018).

Takamatsu's opinion is somewhat less relevant to the current conditions known as the millennial era or the digital era. The era when almost all things and information spread very quickly through social media. Everyone can find the information they want and need with just the tap of a finger on an internet-based device (Fadlurrohim et al., 2020). Internet users, including children who are still at an early age at this time, cannot be stopped. The phenomenon in the field that we often see today, many small children are engrossed in playing with their cellphones. They sat quietly, silent, and focused on staring at their cellphone screens. However, when referring to the definition of digital literacy in general, these early childhood children may not be able to absorb and use digital information appropriately. This is in line with the opinion of Jati (2021) dan Sumarlan (2020), which state that
early childhood thinking is still concrete while the information contained and spread on internet-based platforms is abstract, virtual, or virtual data.

**LITERATURE REVIEW**

Digital literacy is an individual’s interest, attitude, and ability to use digital technology and communication tools to access, manage, integrate, analyze and evaluate information, build new knowledge, and create and communicate with others to participate effectively in society. (Macdonald et al., 2021). Efforts for digital-based community literacy are not limited to the introduction of digital media or internet-based digital devices but should strive to implement continuity between the daily activities carried out by individuals and the efforts of these individuals or communities in increasing their productivity. Digital literacy can also mean a person’s efforts to find, use and disseminate information effectively and efficiently (Yumiarty et al., 2021). Digital literacy is also known as computer literacy which means expertise or ability to use computers, the internet, and other digital tools and is an effort to know, search, understand, analyze, and use digital technology (Tatminingsih, 2020).

In general, there are seven elements of digital literacy contained in the digital literacy development guide in Jisc, 2014 (Rahmadi & Hayati, 2020), which include: (1) Information literacy is the ability to find, evaluate and use the information needed effectively, (2) Digital scholarship is an element that includes the active participation of digital media users in academic activities, (3) Learning skills is effective learning of various technologies which has complete features for formal and informal learning activities, (4) ICT literacy (literacy of information and communication technology) including the ability to use computers or digital devices (e.g., LCD) to communicate, (5) Career and identity management related to management online identity. (6) Communication and collaboration is a form of active participation in learning and research through digital networks, and (7) Media literacy includes critical reading and creative skills of academic and professional communication in various media. It is related to the seven elements of digital literacy that this research was carried out, namely to analyze its application to early childhood, especially in the learning process at ECE institutions. The literature review represents the theoretical core of an article. The purpose of a literature review is to “look again” what other researchers have done regarding a specific topic. A literature review is a means to an end, namely to provide background to and serve as motivation for the objectives and hypotheses that guide one’s research. A good literature review should not merely provide a summary of previous relevant research; the researcher is also expected to critically evaluate, re-organize and synthesize the work of others.

**RESEARCH METHOD**

This study uses a quantitative descriptive method with a survey technique with the instrument in the form of a questionnaire. The research instrument includes indicators contained in digital literacy elements totaling 26 questions for application to early childhood and 24 statement items for application to teachers. Each indicator item in the instrument is measured by a Likert scale with a score of 1 = strongly disagree, 2 = disagree, 3 = agree, and 4 = strongly agree. The population is ECE teachers who were randomly selected using the Purposive Random Sampling Technique. The data collection process is carried out online via Google Form. Instrument links are distributed through social media such as WhatsApp (WA), Facebook, and Instagram, as well as via email. The distribution of the instruments was carried out from 28 May to 5 September 2021. The data collected was in the form of answers to the instruments obtained from 318 ECE teachers. After sorting the completeness of the contents of the answers, only 309
answers were eligible for further analysis. Nine answers could not be processed and analyzed further because they were incomplete or there were empty answers. The data was processed by simple quantification with the rounding up process and analyzed descriptively.

This study applies a research code of ethics, namely: all respondents are treated free from prejudice, meaning they are independent of culture, race and religious identity, politics, and gender discrimination. All respondents have the freedom to express opinions and have a fair and appropriate contribution to the research process, or their answers are processed without discrimination. Respondents also have the right to keep their identities confidential.

FINDINGS AND DISCUSSION

Finding
1. Description of Respondents

Respondents in this study totaled 309 people, all of whom were Kindergarten teachers. Respondents are predominantly female. This is very reasonable because, until now, ECE teachers are still identical to women, as stated by, who stated that the interest in entering the ECE Program was dominated by women (Siti Maulidan, 2021). In terms of age, the respondents in this study were ECE teachers, most of whom were aged 21-40 years, which was 77%. This may be because the instrument is distributed through online media, so those who have sufficient ICT skills. This is in line with data on internet users in Indonesia, namely the age group of 20-24 years with a penetration of 88.5% and the age group of 25-29 years with a penetration of 82.7%, the age group of 30-34 years with a penetration of 76.5%, and age group 35-39 years with a penetration of 68.5% (Haryanto, 2019). Regarding experience or length of teaching, respondents are quite evenly distributed in each range delivered, which is around 21-28%. Only about 4% of respondents have experienced or teaching length of less than one year. Data about the identity of the respondents are presented in Table 1. Interesting data related to the last education of the respondents showed that there were still 23% who did not have undergraduate academic qualifications. Another interesting thing is that respondents who have undergraduate academic qualifications are only 92 out of 199 or 46% whose qualifications are linear with their work, namely ECE Bachelor.

### Discussion

The implementation of digital literacy in children in early childhood education, which is presented in table 2, shows that in the elements: 1) information literacy, it appears that in ECE, children are not taught to open digital devices and how to find information through digital devices. But children are taught to sort and apply information from digital devices. Regarding the use of computers in schools, 69% said they did not agree. This is probably based on the availability of computers in institutions and the characteristics of children, including children who tend to like to move and tend to be careless; therefore, children are more directed to socialize and do physical activities. (Sheridan, 2011), (Yulindrasari et al. (eds), 2020); 2) digital scholarship, the results of the study show something somewhat contradictory, namely children are not allowed to access internet-based devices at school, but children are trained to find information according to
the theme being taught. This is done by the principle of learning in early childhood, which is holistic, integrative, and simultaneously strengthens all aspects of child development (Hadiansah et al., 2021); 3) learning skills, the results showed that respondents stated that they did not agree that their students had and used cellphones belonging to their family members, although respondents stated that their students on average had at least one device and could use cellphones.; (4) ICT literacy, 5) Career and identity management, 6) Communication and collaboration as well as 7) media literacy; the results of the study showed that all of the respondents stated that they disagreed and strongly disagreed with the indicators of these two elements, namely related to social media identity and the use of applications on internet-based devices. This is by various concepts which state that early childhood is not enough in terms of age, ability, maturity, thinking, and knowledge of children related to literacy and personal identity management. (Asmawati, 2021; Endarta, 2016; Hadiansah et al., 2021); (Chairilsyah, 2021; Darihastining et al., 2020; Fadlurrohim et al., 2020; Heri Budianto., Leila Mona Ganiem., n.d.; Ridlo et al., 2021; Sumarlan, 2020; Takamatsu & Takai, 2018).

The implementation of literacy in early childhood education teachers presented in table 3 shows that in the elements: 1) information literacy, it appears that ECE teachers can search for, choose, and utilize various materials from various learning sources through online searches. (Tatminingsih, 2020); 2) digital scholarship, the results of the study show that most PAUD teachers are not people who are active in social media. Even during this pandemic, many teachers suddenly become influencers who upload learning materials and processes on social media platforms such as YouTube and others (Eka Fajar Rahmani, 2021; Sum & Taran, 2020; Wiyono, 2000); 3) learning skills, the results showed that respondents stated that they did not agree that their students had and used cellphones belonging to their family members, although respondents stated that their students on average had at least one device and could use cellphones.; the data shows that the ability of early childhood teachers to learn and take advantage of features on their digital devices (e.g., mobile phones or computers) is very limited. Most of the teachers stated that they did not try to learn or use it either in their daily life or in their learning process. The reason given was because they were technologically savvy, and no one could help them learn it. These results contradict (Keller & Hrastinski, 2009), which states that teachers and students of higher education have a desire to learn digital literacy in their learning and learning. These results contradict which states that teachers and students of higher education have a desire to learn digital literacy in their learning and learning. However, this result is supported by research that states that teachers have busy jobs, so they do not have the opportunity to develop themselves (Mohamed Taher, 2022); 4) ICT literacy; in this element, respondents stated that they needed other people who were more skilled in operating the applications used for teaching. They can only operate the basic features of each application, but if they experience the slightest problem. They will look to someone else to help. This makes a lot of sense considering they are busy preparing for learning, so they don't have time to learn the features in the applications they use (Mohamed Taher, 2022); 5) Career and identity management, 6) Communication and collaboration, and 7) media literacy, each teacher has a personal account for each social media they have. Some teachers use these accounts in learning, but others prefer to use accounts provided by the school. This helps make teaching easier and makes them more confident in developing learning content. Each teacher has a personal account for each social media they have. Some teachers use these accounts in learning, but others prefer to use accounts provided by the school. This helps make teaching easier and makes them more confident in developing learning content. They are also
more confident in communicating and collaborating with fellow teachers and parents (Karimov, 2022; Keller & Hrastinski, 2009; Walsh, 2009; Wordu et al., 2021).

CONCLUSION
The application of digital literacy in early childhood, especially in kindergarten children, has not been implemented effectively because early childhood is still concrete. The application carried out in the learning process is limited to the knowledge that is appropriate to the child’s developmental age. The application is very limited, considering the ability of children to use internet-based devices is still very minimal. Children also cannot sort the appropriate material for themselves. The role of teachers and parents is needed in controlling the use and utilization of digital communication and information tools. The recommendation that can be conveyed is that in implementing digital literacy, parents and teachers must play an active role in controlling the use of devices used by children, and children must be given intensive direction regarding the content that can be selected and when to use internet-based media devices both for learning and as a source of information. Entertainment tool.

LIMITATIONS & FURTHER RESEARCH
The limitations of this study lie in the limited number of samples that can be collected through the online platform and the use of online instruments, so it is difficult to detect whether the respondents answered according to the actual conditions or provided they were filled in. Therefore, further research can collect data with a larger sample and is equipped with direct observation instruments so that the data obtained is more in-depth and detailed.
