Abstract: 2,4,5-Trisubstituted thiazole derivatives can be prepared conveniently by condensation of methyl 3-bromo-3-aroyl propionates with thiourea and (un)substituted phenyl thiourea under microwave irradiation in good yields. The structures of the newly synthesized compounds are characterized by spectral data and elemental analysis.

Keywords: Microwave irradiation, thiazole, thiourea.

Thiazole derivatives are reported to show a broad spectrum of biological activity, which includes antimicrobial1, antidiabetic2, analgesic and anti-inflammatory3 activities. The introduction of thiazole ring improved the activity as in meloxicam in the oxicam series of anti-inflammatory drugs4. Thiazoles are easily metabolized by routine biochemical reactions and are noncarcinogenic in nature5. In view of their safety and importance, there is a continuing interest in developing versatile synthetic routes. Generally, 2-aminothiazoles are synthesized by the condensation of a halo carbonyl compound with thiourea, known as Hantzsch synthesis6 and has a wide scope, permitting the synthesis of a variety of thiazole derivatives.

In this paper, we wish to report a novel synthesis of methyl 5-(2-amino 4-arylthiazolyl) acetates (4a-r) from methyl 3-bromo-3-aroylpropionates (2) and (un)substituted phenyl thioureas (3a-i) (Scheme 1) by MORE chemistry9 using PEG-400 as a solvent. PEG-400 is miscible with water thereby simplifying the workup. Furthermore it is inexpensive and readily available in bulk quantities.

Results and discussion

The methyl 3-aroylpropionates 1e-d were prepared in better yields by irradiating a mixture of 3-aroylpropionic acids 1a-b, concentrated sulphuric acid and methanol in open glass containers using unmodified household microwave oven in 1.5 min. This procedure considerably reduces the longer reaction time (7 hours of refluxing10) usually encountered in traditional ester synthesis. The acid is then brominated to methyl 3-bromo-3-aroylpropionate 2a-b. The reaction of 3-bromo-3-aroylpropionate with (un)substituted phenyl thiourea 3a-i in methanol at reflux resulted in the formation of thiazoles acetates 4a-i and 4j-r with 65–78% yield in 60–75 min. However, when the reaction was performed in PEG-400 in microwave oven the reaction time was reduced to 0.5–1.5 min and the yield rose to 85–95%. The reaction mixture was exposed to the microwave irradiation in an open vessel covered with stemless glass funnel at lower power (540 W). The long neck of glass vessel remains cool since glass is transparent to microwaves. A beaker of water was kept near the reaction vessel to serve as “heat sink” to provide fine control of the temperature of the reaction mixture11.

We have also attempted the above reaction in PEG-200, ethylene glycol, diethylene glycol, DMSO, isopropyl alcohol and without any solvent (Table 1). The maximum yield of the desired product was obtained when the reaction was performed in PEG-400.

To test the generality of the reaction a variety of phenyl thioureas (3a-i) were condensed with bromo propionates in PEG-400 under microwave irradiation to form the corresponding methyl 4-aroyl-2-arylamino thiazolyl acetates (Table 2). When two electron withdrawing groups were placed in phenyl thiourea 3 the yields of substituted thiazolyl acetates 4g-h and 4p-q were slightly less and the rate of reaction was also slower.
Table 1. Reaction of methyl 3-bromo-3-(4-chlorobenzoyl)propionate with 2-chlorophenyl thiourea in various solvents under microwave irradiation for 1 min at 540 W

| Entry | Solvent    | Yield % (4b) |
|-------|------------|--------------|
| 1.    | PEG-400    | 92           |
| 2.    | PEG-200    | 82           |
| 3.    | Ethylene glycol | 71   |
| 4.    | Diethylene glycol | 65   |
| 5.    | Isopropyl alcohola | 80   |
| 6.    | DMSO       | 74           |
| 7.    | Without solvent | 45           |

*a*Carefully irradiated in long neck open vessel covered with stemless glass funnel to avoid the evaporation of IPA.

**Experimental**

Melting points are uncorrected and were recorded in liquid paraffin bath using open end capillaries. Thin layer chromatography was performed on silica gel G. A simple household microwave (BPL Sanyo India) oven (900 W) equipped with a turntable was used for irradiation. The IR spectra were run on Shimadzu FT IR spectrophotometer in KBr pellets. \(^1\)H NMR spectra were obtained using Jeol GSX-400 FT NMR 400 MHz in CDCl\(_3\)/DMSO-
\(d_6\) solvent using TMS as internal reference. Mass spectra were recorded by Jeol-JMS-300 spectrometer at 70 eV.

**Note**

*Methyl 3-(4-chlorobenzoyl)propionate* (1c): 3-(4-Chlorobenzoyl)propionic acid 1a (2.1 g, 10 mmol), dry methanol (20 ml) and concentrated sulphuric acid (0.5 ml) were taken in a long neck conical flask covered with stemless funnel to avoid excessive evaporation. The resulting mixture was irradiated in a domestic microwave oven at 200 W for 1.5 min. After that the reaction mixture was cooled to room temperature and poured into ice cold water. The ester 1c was extracted into ether and washed with water, sodium bicarbonate solution and the ether layer was separated, dried and distilled off to get methyl 3-(4-chlorobenzoyl)propionate 1c (m.p. 62–63 °C, 96%, lit.\(^{12}\) m.p. 63 °C, 75%).

*Methyl 3-bromo-3-(4-chlorobenzoyl)propionate* (2a): Methyl 3-(4-chlorobenzoyl)propionate 1c (2.2 g, 10 mmol) was benzoinated in warm chloroform (20 ml) by addition of bromine (1.7 g, 11 mmol) dropwise with stirring over 30 min, stirring was continued for another 2 h. The reaction mixture was washed with water and then chloroform layer was dried over sodium sulphate and distilled to get methyl 3-bromo-3-(4-chlorobenzoyl)propionate 2a as viscous oil which was used as such for the next step. Yield: 95% (Scheme 1).

*Methyl 2-phenylamino-4-(4-chlorophenyl)thiazole-5-acetate* (4a): A slurry of bromo propionate 2a (900 mg, 3 mmol) and phenyl thiourea 3a (450 mg, 3 mmol) in PEG-400 (10 ml) was irradiated at 540 W for 1 min.

**Table 2. Physical data of compounds**

| Compd. | Substituted thiazole | Time (min) | M.p. (°C) | Yield (%) |
|--------|----------------------|------------|-----------|-----------|
| 4a     | Cl                   | H          | 1.0       | 119-120   | 93        |
| 4b     | Cl                   | 2-Cl       | 0.5       | 97-98     | 92        |
| 4c     | Cl                   | 4-Br       | 1.0       | 147-148   | 89        |
| 4d     | Cl                   | 2-CH\(_3\) | 1.0       | 125-126   | 85        |
| 4e     | Cl                   | 4-CH\(_3\) | 1.0       | 152-153   | 91        |
| 4f     | Cl                   | 4-CH\(_3\)CO | 1.5     | 160-161   | 95        |
