ABSTRACT

Background: Unintended pregnancy is a worldwide problem that affects women, their families, and society. Unintended pregnancy can result from early marriage, contraceptive failure, non-use of contraceptive services, and, less commonly, rape. Consequences of unintended pregnancy include abortion with its long-term negative health effects including infertility and maternal death. This study aimed to examine the determinants of unwanted pregnancy among adolescents in Madiun, East Java, using path analysis model.

Subjects and Method: This was a case control study conducted in Madiun, East Java, from April 4 to May 14, 2018. A sample of 150 adolescents was selected by fixed disease sampling, comprising 30 adolescents with and 120 adolescents without unwanted pregnancy. The dependent variable was unwanted pregnancy. The independent variables were knowledge, attitude, religiosity, sexual behavior, media exposure, parental role, and peer role. The data were collected by questionnaire and analyzed by path analysis run on Stata 13.

Results: Unwanted pregnancy was directly determined by negative sexual behavior (b = 4.14; 95% CI= 2.83 to 5.45; p<0.001). It was indirectly determined by negative peer role, negative media exposure, negative attitude, parental role, better knowledge, and religiosity.

Conclusion: Unwanted pregnancy is directly determined by negative sexual behavior. It is indirectly determined by negative peer role, negative media exposure, negative attitude, parental role, better knowledge, and religiosity.

Keywords: unwanted pregnancy, determinants, adolescents, path analysis

BACKGROUND

Landry et al. (2017); Unicef (2016); WHO (2017a) defines teenagers as someone between the ages of 10-19. The adolescent phase is a transition from the childhood phase to the adult phase both physically and psychologically. Therefore, a safe, healthy and productive process in transition is very important.

WHO (2017a) and WHO (2017b) describes that teenagers around the world facing quite a number of challenges related to their sexual and reproductive health, including lack of education and information about unwanted pregnancies, lack of access to health services especially for contraception and safe abortion and risk of sexually transmitted infections.

Darroch et al., (2016); Woog V et al., (2017) mentions that pregnancies among 15-19 year old girls in developing countries by 2016 amounted to 21 million. At least, more than a third of young mothers are born from 15 developing countries are unplanned (43% in Asia, 45% in Africa and 74% in Latin America and the Caribbean).

Health Research and Development office, (2013) reported that there are pregnancies in adolescents aged 15-19 years of age.
1.97%. Pranata et al. (2012) also mentioned that the unplanned pregnancy rate in East Java was 12.2%.

WHO (2018) describes that teenage pregnancy is at risk of maternal death. Exavery et al., (2014); WHO, (2018); Darroch et al. (2016) mention that about half of teenage pregnancies aged 15-19 years in developing countries end up with unsafe abortions.

Health Research and Development Office, (2013); Exavery et al., (2014); WHO, (2018); Exavery et al., (2014); WHO, (2018); Pranata et al. (2012) also mentioned that the unplanned pregnancy that occurs outside the plan whether physically or psychologically the couple is unprepared and/or does not want a pregnancy incident. The measurement scale was categorical, coded 0 for no and 1 for yes.

Parental role was defined as the participation, involvement, behavior and supervision of parents with or the children whether it is at home, school and everything related to the future of the child. It was measured by questionnaire. The measurement scale was continuous, but for the purpose data analysis, it was transformed into dichotomous, coded 0 for weak and 1 for strong.

Peer role was defined as a group of individual who have the same aspects as age, feeling, level of development and experience. It was measured by questionnaire. The measurement scale was continuous, but for the purpose data analysis, it was transformed into dichotomous, coded 0 for weak and 1 for strong.

Access to porn media was defined as a site that provides sexual information in the form of video or audio. It was measured by questionnaire. The measurement scale was continuous, but for the purpose data analysis, it was transformed into dichotomous, coded 0 for low and 1 for high.

Religiosity was defined as the values in a person including the level of knowledge, beliefs and religious beliefs and then the actualization in everyday life. It was measured by questionnaire. The measurement scale was continuous, but for the purpose data analysis, it was transformed into dichotomous, coded 0 for low and 1 for high.

Knowledge was defined as all that teenagers know about reproductive and sexual health. It was measured by questionnaire. The measurement scale was continuous, but for the purpose data analysis, it was transformed into dichotomous, coded 0 for low and 1 for high.

Attitude was defined as adolescent behavior, thought, feeling, and belief in responding to an incentive or a problem encountered. It was measured by questionnaire.

SUBJECTS AND METHOD

1. Study Design
This was a case control study conducted in Madiun District, East Java, from April 4 to May 14, 2018.

2. Population and Sample
The target population in the study was all adolescents aged 10-19 years with unwanted pregnancies and desirable pregnancies in Madiun District. A sample of 150 study subjects was selected by fixed disease sampling.

3. Study Variables
The dependent variable was unwanted pregnancy in adolescent, while the independent variables were the determinant of parental role, peer role, religiosity, the access of porn media, knowledge, attitude, and sexual behavior.

4. Operational Definition of Variables
The operational definition of unwanted pregnancy variables was a pregnancy that occurs outside the plan whether physically or psychologically the couple is unprepared and/or does not want a pregnancy incident. The measurement scale was categorical, coded 0 for no and 1 for yes.
naire. The measurement scale was continuous, but for the purpose data analysis, it was transformed into dichotomous, coded 0 for negative and 1 for positive.

Sexual behavior was defined as the behavior involving physical touch between men and women who have reached the stage of intercourse. It was measured by questionnaire. The measurement scale was continuous, but for the purpose data analysis, it was transformed into dichotomous, coded 0 for no and 1 for yes.

5. Data Instrument
Data on unwanted pregnancy obtained from Madiun District Religious Office. The other variables were measured by questionnaire. The questionnaires were first tested for its validity and reliability before distributed. The reliability test was performed on 30 respondents and using SPSS 13 program to calculate alpha Cronbach.

6. Data Analysis
Data analysis techniques used were univariate, bivariate, and multivariate analyzes. Univariate analysis aims to explain each characteristic data. Bivariate analysis aims to analyze the relationship of two variables using SPSS with chi square test. Path analysis model was run on Stata 13 program.

7. Research Ethics
The research ethics of this study included informed consent, anonymity, confidentiality, and ethical clearance that have been obtained from ethical committees of Moewardi hospital, Surakarta, Central Java with Number: 375 / III / HREC / 2018.

RESULTS
1. Univariate Analysis
Table 1 shows that adolescents who received strong parental roles were 108 (72%) and weak (42%). Adolescents with negative peer role amounted to 41 (27.3%) and the positive one were 109 (72.7%). Adolescents with high religiosity were 106 (70.7%) and those with low religiosity were 44 (29.3%).

| Table 1. Univariate analysis |
|-----------------------------|
| Variables                    | n   | %    |
| Pregnancy Status             |     |      |
| Normal                       | 120 | 80   |
| Premature rupture of membrane| 30  | 20   |
| Parental role                |     |      |
| Strong                       | 108 | 72   |
| Weak                         | 42  | 28   |
| Peer role                    |     |      |
| Yes                          | 41  | 27.3 |
| No                           | 109 | 72.7 |
| Religiousity                 |     |      |
| High                         | 106 | 70.7 |
| Low                          | 44  | 29.3 |
| Access to porn               |     |      |
| Yes                          | 43  | 28.7 |
| No                           | 107 | 71.3 |
| Knowledge                    |     |      |
| High                         | 101 | 67.3 |
| Low                          | 49  | 32.7 |
| Attitude                     |     |      |
| Positive                     | 106 | 70.7 |
| Negative                     | 44  | 29.3 |
| Sexual Behaviour             |     |      |
| Negative                     | 42  | 28   |
| Positive                     | 108 | 72   |
Table 2. Bivariate analysis influence of independent variables with unwanted pregnancy in adolescents

| Variable         | KD n=120 | %   | KTD n=30 | %   | Total n=150 | %   | OR   | 95% CI       | p    |
|------------------|----------|------|----------|------|-------------|------|-------|--------------|------|
| **Parental role**|          |      |          |      |             |      |       |              |      |
| Strong           | 103      | 85.8 | 5        | 16.7 | 108         | 100  | 0.33  | 0.01 to 0.10 | <0.001|

| **Religiousity** |          |      |          |      |             |      |       |              |      |
| High             | 103      | 85.8 | 3        | 10   | 106         | 100  | 0.18  | 0.01 to 0.07 |      |
| Low              | 17       | 14.2 | 27       | 90   | 44          | 100  | 0.07  |              |      |
| **Access to porn**|        |      |          |      |             |      |       |              |      |
| Yes              | 19       | 15.8 | 24       | 80   | 43          | 100  | 21.2  | 7.66 to 58.97| <0.001|
| No               | 101      | 84.2 | 6        | 20   | 107         | 100  | 58.97 |              |      |
| **Knowledge**    |          |      |          |      |             |      |       |              |      |
| High             | 98       | 81.7 | 3        | 10   | 101         | 100  | 0.25  | 0.1 to 0.09  | <0.001|
| Low              | 22       | 18.3 | 27       | 90   | 49          | 100  | 0.09  |              |      |
| **Attitude**     |          |      |          |      |             |      |       |              |      |
| Positive         | 103      | 85.8 | 3        | 10   | 106         | 100  | 54.5  | 14.8 to 199.7| <0.001|
| Negative         | 17       | 14.2 | 27       | 90   | 44          | 100  | 199.7 |              |      |
| **Sexual Behaviour** |      |      |          |      |             |      |       |              |      |
| Negative         | 15       | 12.5 | 27       | 90   | 42          | 100  | 63    | 17 to 233   | <0.001|
| Positive         | 105      | 87.5 | 3        | 10   | 108         | 100  | 233   |              |      |

3. The results of path analysis

Table 3 showed that there was a relationship between sexual behavior and unwanted pregnancy (b= 4.14; 95% CI= 2.83 to 5.45; p<0.001). Adolescents with negative sexual behavior had higher risk to unwanted pregnancy compared to adolescents who have positive sexual behavior.

There was a relationship between attitude and unwanted pregnancy (b= 5.59; 95% CI= 7.08 to 4.11; p<0.001). Adolescents with negative attitude were more likely to have negative sexual behaviors which lead to unwanted pregnancy than adolescents who have positive attitude.

There was a relationship between peer role and knowledge (b= 1.87; 95% CI= 0.02 to 3.72; p= 0.047).

There was a relationship between religiosity and attitude (b= 2.32; 95% CI= 0.31 to 4.34; p= 0.024). Adolescents with high religiosity level were more likely to have positive attitude.

There was a relationship between knowledge and attitude (b= 3.14; 95% CI= 1.43 to 4.84; p<0.001). Adolescents with higher knowledge were more likely to have positive attitude.

There was a relationship between access to porn media and knowledge (b= -2.76; CI 95%=- -4.28 to -1.25; p<0.001). Adolescent who accessed porn media would get basic informations about reproduction health without knowing the negative impact that would happen, therefore, adolescents with low level of knowledge were more likely to have negative attitude which lead to negative sexual behavior and increased the
risk of unwanted pregnancy compared to those who did not access porn media.

There was a relationship between parents role and knowledge ($b=3.98; 95\% CI=2.47\text{ to }5.49; p<0.001$). Adolescents with strong parents role would get adequate instructions, supervision, and education about reproduction health, and they were more likely to be protected from negative attitude which lead to negative sexual behavior and increased the risk of unwanted pregnancy compared to weak parents role.

There was a relationship between parental role and the level of religiosity ($b=5.59; 95\% CI=4.11\text{ to }7.08; p<0.001$). Adolescent with strong parental role would get religious education and they were more likely to be protected from negative attitude which lead to negative sexual behavior and the risk of unwanted pregnancy.

| Knowledge          | Access to Porn Media | -2.76 | -4.28 | -1.25 | <0.001 |
| Religiosity        | Parents Role         | 5.59 | 4.11 | 7.07 | <0.001 |

**DISCUSSION**

1. The effect of parental role on unwanted pregnancy

The result of analysis showed that there was a relationship between parental role and unwanted pregnancy in adolescents and it was statistically significant.

The result of this study was in line with a study by Ramadani et al. (2014), which stated that there was a relationship between
parents role and unwanted pregnancy in adolescents and it was statistically significant (OR= 1.43; 95% CI= 1.23 to 9.61; p= 0.025). Lambani (2015); Oluwafemi (2017), also stated that girl adolescents were tend to get pregnant if they did not get the guidance and supervision from their parents. Many parents were busy with their careers so that their time was limited. Adolescents need direction and support to make good decisions on issues such as sex. If an adolescent cannot talk to his or her parents about sex either because they forbid sex or because they were not around, adolescents would come to their friends in order to find out about sex that lead to misinformation and the likelihood of pregnancy in adolescents was higher.

2. The effect of peer role on unwanted pregnancy
The result of analysis showed that there was a relationship between peer role and unwanted pregnancy.

The result of this study is consistent with a study by Azinar (2013), which stated that there was a relationship between permissive peer role and unwanted pregnancy in adolescent. Azinar (2013) and Mumah et al. (2014) stated that the effect of peers on unwanted pregnancies was probably because in the teenage stage, they would feel that the most comfortable place to share, communicate, and interact was to a friend than to his or her own parents. Therefore, the information and behavior of peers can be the cause or factor of unwanted pregnancy. During adolescence, adolescents would adjust to their peers.

3. The effect of religiosity on unwanted pregnancy
The result of analysis showed that there was a relationship between religiosity and unwanted pregnancy in adolescent.

The result of this study was in line with a study by Azinar (2013), which stated that there was a relationship between religiosity and unwanted pregnancy and it was statistically significant. Azinar (2013); Mumah et al. (2014), stated that experts argued that there was a relationship between religion and premarital sex which was on deviant behavior. Religion established morale and belief in an individual so that it could became a good society. A person who lived his/her religion well would tend to behave according to the norms. Reza (2013); Aviyah and Farid, (2014) stated that the religious values were expected to control the adolescents self-control and guide them to live physically and mentally healthy and also have healthy soul according to moral rules of their religion.

4. The effect of negative media exposure on unwanted pregnancy
The result of analysis showed that there was a relationship between negative media exposure and unwanted pregnancy in adolescent.

The result of this study was in line with the idea of Haidah et al. (2017), which stated that there was a relationship between negative media exposure and unwanted pregnancy in adolescent and it was statistically significant. Azinar (2013); Coggingham and Ryan (2015); Alabi and Oni (2017) stated that adolescent who were exposed to social media that contain porn materials in it whether it was video, audio or message would tend to do sexual activity in the real life by two times. Access to porn media information could also lead to unwanted pregnancies, adolescents who were exposed to porn media without knowing the negative impact that would occur so that it encouraged them to conduct experiments by having sex at a very young age.
5. The effect of knowledge on unwanted pregnancy
The result of analysis showed that there was a relationship between knowledge and unwanted pregnancy in adolescent and it was statistically significant.

The result of this study was in line with a study by Ramadani et al. (2014), which stated that there was a relationship between knowledge and unwanted pregnancy in adolescents (OR= 2.38; 95% CI= 1.16 to 5.29; p= 0.002). Saptarini and Suparmi (2016); WHO (2016) stated that knowledge can affect adolescent sexual behavioral. Therefore, to prevent and to ensure that adolescents were not affected by adverse reproductive health and sexual health, adequate knowledge of sexual and reproductive health was essential.

6. The effect of attitude on unwanted pregnancy
The result of analysis showed that there was a relationship between attitude and unwanted pregnancy in adolescent, and it was statistically significant.

The result of this study is consistent with a study by Azinar (2013), which stated that there was relationship between attitude and unwanted pregnancy in adolescent and it was statistically significant. Therefore, adolescent attitudes toward sexuality affected how they would behave or respond to stimulation of sexual behavior that could lead to unwanted pregnancy.

7. The effect of sexual behavior on unwanted pregnancy
The result of analysis showed that there was a relationship between sexual behavior and unwanted pregnancy in adolescent.

The result of this study is consistent with a study by Pradhan et al. (2018), which stated that there was a relationship between sexual behavior and unwanted pregnancy in adolescent and it was statistically significant (OR= 0.68; 95% CI= 0.64 to 0.73; p<0.001). Adogu et al. (2014); Pringle et al. (2017), stated that sexual development was increased during adolescence period so that it can lead to sexual behavior that can also be harmful and give negative impact if it was done at an early age and without any knowledge. The risks that may occur from risky sexual behavior were the transmission of sexually transmitted diseases and unwanted pregnancies.

The conclusion of this study was that there was a positive relationship between parental role, peer role, religiosity, negative media exposure, knowledge, attitude, sexual behavior, and unwanted pregnancy.
