Flavonoids Isolated from *Vitex grandifolia*, an Underutilized Vegetable, Exert Monoamine A & B Inhibitory and Anti-inflammatory Effects and Their Structure-activity Relationship

Objectives: *Vitex grandifolia* belongs to family Lamiaceae; it consists of flowering plants and it is also called the mint family. The Yoruba people of southwest Nigeria called it “Oriri” or “Efo oriri”. This plant is classified as an underutilized vegetable and little is known about its phytochemistry or its biological evaluations.

Materials and Methods: Methanol extracts of the dried leaves and stem of the plant were subjected to fractionation and isolation using vacuum layer and column chromatography methods. The structures of the compounds were elucidated using spectroscopic techniques including IR, 1D-, and 2D-NMR and by comparison with the data reported in the literature. They were evaluated *in vitro* for the inhibition of monoamine recombinant human MAO-A and -B, and anti-inflammatory activities.

Results: Three known flavonoids were isolated from the methanolic extract of the leaves of *V. grandifolia* for the first time to the best of our knowledge, i.e. isoorientin (1), orientin (2), and isovitexin (3). Most of the isolated compounds showed selective inhibition of monoamine oxidase B, inhibition of MAO-B by isoorientin (1) and orientin (2) were 9-fold more potent (IC$_{50}$ (µg/mL) of 11.08 and 11.04) compared to the inhibition of MAO-A (IC$_{50}$ (µg/mL) of >100), while clorgyline and deprenyl were used as positive standards. The isolated flavonoids displayed good activity against the NF-$κ$b assay with IC$_{50}$ (µg/mL) of 8.9, 12, and 18. This study establishes a link between the structure and the biological activities on the basis of the different patterns of substitution, particularly the C2=C3 double bond and the position of glucose moiety.

Conclusion: This study is the first to establish the phytochemistry of the polar part of *V. grandifolia* and the anti-inflammatory and neuroprotective role of these isolated compounds.

Key words: *Vitex grandifolia*, underutilized vegetable, lupeol, MAO-A and B, neurodegenerative
**INTRODUCTION**

Pathological and neurodegenerative paths, cancer, and Alzheimer, coronary and Parkinson diseases are the result of free radical-mediated reactions and reactive oxygen species from the human body. In the many epidemiological studies carried out, it was discovered that there is a strong connection between people whose diets are rich in fresh fruits and leafy vegetables and low incidence of cardiovascular diseases, neurodegenerative diseases, and some particular forms of cancer. Many studies and investigations have been dedicated to the antioxidant effects of compounds in fruits, medicinal plants, and vegetables so as to improve human health and regulate physiological functions. Monoamine oxidases (MAO-A and MAO-B) are mitochondrial enzymes that oxidatively deaminate monoaminergic neurotransmitters and (potentially harmful) MAO-B) are mitochondrial enzymes that oxidatively deaminate monoaminergic neurotransmitters and (potentially harmful) enzymes remove as well as catalyze exogenous amines. The MAO-B inhibitors are effective in inhibiting depression while the MAO-B inhibitors are effective in managing anxiety and treating Alzheimer and Parkinson diseases.

Medicinal plants, i.e. vegetables, botanical extracts, and herbal products from natural sources, have been viewed as an important and primary basis for MAOs’ inhibitors and this validates the cultural application of many botanicals as substitutes for the management of depression, Parkinson disease, and other neuropsychiatric as well as neurological disorders. Flavonoids as secondary metabolites are one of the most popular polyphenols present in medicinal plants, they are broadly distributed in many plant species, and they can be found in various parts of these plants, i.e. bark, flowers, fruits, leaves and stems. Flavonoids have been reported to display a large variety of biological activities; some of these are antioxidants and enzyme inhibitors, while others have anti-inflammatory, anticancer, antihyperglycemic, and hepatoprotective activities.

In recent times, research on medicinal plants has globally increased tremendously, and volumes of reputable evidence have been gathered to portray the enormous prospects of medicinal plants used in traditional systems. Many of these herbal plants have been identified and studied using current scientific methods, and the results revealed the immense promise of medicinal plants in the field of medical science. *Vitex grandifolia*, which belongs to the family Lamiaceae, bears fruit that is edible and used to make an alcoholic drink by the locals, while the bark is used to treat stomachache, diarrhea, bronchial complaints, rickets, sores, and fever. It is also used in the treatment of colic, infections of the umbilical cord, toothache, rheumatism, and orchitis. Epidi and Odili (2009) reported the biocidal effect of the powdered leaf of *V. grandifolia* against *Triatoma castaneum* in stored groundnut *Arachis hypogaea*. The plant is a shrub or small tree about 10-12 cm in length and 5-7 cm in width, trunk to 60 cm girth, bearing a spreading crown, in high deciduous forest or secondary jungle. Local names of this plant species are *Oori* in Yoruba (Nigeria), *ofonma* (Egun, Republic of Benin), and *ofotrin* (Setangun, Republic of Benin). Surprisingly, this plant’s phytochemistry has not being looked into although it is a vegetable. Thus, its study and that of the isolated compounds, i.e. biological activities from this plant, will be considered worthwhile. Hence, the present study reports the isolation, characterization, and *in vitro* inhibition of MAO-A and -B of the constituents from polar extract of *V. grandifolia*.

**MATERIALS AND METHODS**

*Collection of plant samples*

The leaves with the stem of *V. grandifolia* was collected in April-October 2015 from Ilorin metropolis, Kwara State, Nigeria. The collected plant was identified by a taxonomic botanist in the department of Plant Biology, University of Ilorin, Ilorin, where a voucher number was obtained after the deposit of the specimen. The leaves and stem were air dried, powdered, and stored for further analysis.

*Extraction of the plant materials*

The air-dried and powdered plant material was defatted with hexane and then was prepared by maceration (1.5 kg) with 7 L of methanol (MeOH) at ambient temperature for 24 h. The process was repeated three times, and the filtrates were combined and evaporated under vacuum to dryness.

*General experimental procedure*

Precoated TLC plates (AluO); Silica gel 60 F$_{254}$; layer thickness 0.25 mm (Merck). Precoated TLC plates (Glass); RP-18 F$_{254}$.
layer thickness 0.25 mm (Merck); Silica gel 60; 40-63 μm mesh size (Merck); RP-18; 40-63 μm mesh size; Sephadex LH 20; 25-100 μm mesh size (Merck). Silica gel 60 and RP C-18, Diaion HP-20 was used for column chromatography. 1H NMR, 13C NMR, and 2D NMR were recorded on 400, 500, and 600 (MHz) instruments (Agilent and Bruker Inc., California, USA). Chemical shifts were expressed in parts per million (δ) using TMS as internal standard. Values of coupling constant J are reported in Hz. Infrared spectroscopy was performed using a PerkinElmer FT-IR Spectrum Two spectrometer and the masses of the compounds were determined using an Agilent 1260 liquid chromatography system (Agilent, USA) equipped with a quaternary solvent delivery system and a Triple quad 6410 MS system and Agilent Technologies 6540 UHD Accurate Mass Q-TOF liquid chromatography-mass spectrometer (Agilent, USA).

Fractionation and isolation

The extract of V. grandifolia was defatted using hexane and then extracted with MeOH. MeOH extract of V. grandifolia was added to reverse phase silica gel (RP-18) using vacuum layer chromatography (VLC) for fractionation. Water with increasing MeOH was used as eluting solvent and the eluates were collected and concentrated on a Rotavapor. TLC was used to check and monitor the isolates and combine the eluates. Eleven fractions were obtained; the first fraction (H2O only) was picked for further fractionation because the TLC revealed promising compounds. This fraction was subjected to a Diaion HP-20 column for isolation. The column was eluted with water first and then with increasing MeOH and the eluates were collected and concentrated. Twelve fractions were obtained. All fractions were collected, concentrated, and monitored by TLC. The eighth fraction was loaded onto the column in CH3Cl using 65:35:10 (CH3Cl: MeOH: H2O) as eluting solvent. Six fractions were obtained; the third fraction gave compound 3, which was purified using CC in CH3Cl with 65:35:10 (CH3Cl: MeOH: H2O) as eluting solvent. Fractions 1 and 2 were combined using TLC and two compounds (1 and 2) were isolated from the first fraction after further purification with CC in CH3Cl with 8:2:0.5 (CH3Cl: MeOH: H2O) as eluting solvent. Compounds 1 (19 mg), 2 (14.7 mg) and 3 (10.5 mg) (Figure 1) were isolated in pure form after purification.

Monoamine oxidase inhibition assays (MAO)

To evaluate the outcome of the isolated compounds from V. grandifolia on MAO-A and MAO-B, the kynuramine deamination assay was used for 96-well plates as expressed previously.22 The method used was adapted from the reported literature.23,24 The isolated constituents did not display any interference with fluorescence measurement, but clorgyline and deprenyl were used as positive controls for the experiment.

Anti-inflammatory activity

Inhibition of iNOS activity

The assay was performed using mouse macrophages 915 (RAW 264.7, obtained from ATCC). Cells were cultured in phenol red free RPMI medium supplemented with 10% bovine calf serum, 100 U/mL penicillin G sodium, and 100 μg/mL streptomycin at 37°C in an atmosphere of 5% CO2 and 95% humidity. Cells were seeded in 96-well plates at 5×104 cells/well and incubated for 24 h. Test compounds diluted in serum-free medium were added to the cells. After 30 min of incubation, LPS (5 μg/mL) was added and the cells were further incubated for 24 h. The concentration of nitric oxide (NO) was determined by measuring the level of nitrate released in the cell culture supernatant using Griess reagent.25 Percent inhibition of nitrite production by the test compound was calculated in comparison to the vehicle control. IC50 values were obtained from dose curves. Parthenolide was used as a positive control.

Inhibition of NF-κB activity

The assay was performed in human chondrosarcoma (SW1353, obtained from ATCC) cells as described earlier. Cells were cultured in 1:1 mixture of DMEM/F12 supplemented with 10% FBS, 100 U/mL penicillin G sodium, and 100 μg/mL streptomycin at 37°C in an atmosphere of 5% CO2 and 95% humidity. Cells (1.2×107) were washed once in an antibiotic and FBS-free DMEM/F12, and then reintroduced in 500 μL of antibiotic-free DMEM/F12 containing 2.5% FBS. NF-κB luciferase plasmid construct was added to the cell suspension at a concentration of 50 μg/mL and incubated for 5 min at room temperature. The cells were electroporated at 160 V and one 70-ms pulse using BTX disposable cuvettes, model 640 (4-mm gap), in a BTX Electro Square Porator T 820 (BTX I, San Diego, CA, USA). After electroporation, cells were plated onto the wells of 96-well plates at a density of 1.25×105 cells per well. After 24 h, cells were treated with different concentrations of test compound for 30 min prior to the addition of PMA (70 ng/mL) and incubated for 8 h. Luciferase activity was measured using the Luciferase Assay kit (Promega). Light output was detected on a Spectra-Max plate reader. Percent inhibition of luciferase activity was calculated as compared to vehicle control and IC50 values were obtained from dose curves. Sp1 was used as a control transcription factor that is unresponsive to inflammatory mediators (such as PMA). This is useful in detecting agents that nonspecifically inhibit luciferase expression due to cytotoxicity or inhibition of luciferase enzyme activity.27

Figure 1. Basic skeleton or structure of flavonoids
RESULTS

MAO-A and -B
Most of the isolated compounds showed selective inhibition of either MAO-A or MAO-B as shown in Table 1. The inhibition of MAO-B by both isoorientin (1) and orientin (2), two of the flavonoids isolated from *V. grandifolia*, was 9-fold more potent (IC$_{50}$ (µg/mL) of 8.4 and 11.0) compared to the inhibition of MAO-A (IC$_{50}$ (µg/mL) of >100). Isovitexin (3), a flavonoid isolated from this wild vegetable for the first time displayed fair selective activity against MAO-A (IC$_{50}$ (µg/mL) of >100) to MAO-B (IC$_{50}$ (µg/mL) of 21.3) like the other two flavonoids, while clorgyline and deprenyl were used as positive standards.

Anti-inflammatory
The isolated flavonoids, i.e. isoorientin (1), orientin (2), and isovitexin (3), from *V. grandifolia* displayed good activity against the NF-κB assay (IC$_{50}$ (µg/mL) of 8.9, 12, and 18), although orientin (2) showed moderate activity against the Sp-1 assay with IC$_{50}$ of 23 µg/mL, while the others displayed poor activity when compared with the positive standard with IC$_{50}$ of 8 µg/mL as shown in Table 2. Isovitexin (3) exhibited moderate activity against the iNOS assay, while the others, i.e. isoorientin (1) and orientin (2), displayed poor activity with IC$_{50}$ of 48 and 54 µg/mL. The positive standard used in this study was parthenolide.

Isolated compounds

**Compound 1**
Compound 1 (Figure 1) (19 mg) was isolated as a yellow solid. Its molecular formula was deduced to be C$_{21}$H$_{20}$O$_{11}$ from a combination of $^1$H NMR and $^{13}$C NMR data. $^1$H NMR (600 MHz, DMSO-d$_6$) δ: 13.2 (1H, brs, 9.0, 50-H), 7.45 (1H, J=2.5 Hz, 20-H), 6.85 (1H, d, J=9.0 Hz, 50-H), 6.63 (1H, s, 3-H), 4.7 (1H, d, J=9.7 Hz, 100-H). $^{13}$C NMR (150 MHz, DMSO-d$_6$) δ: 164.36 (C-2), 104.25 (C-3), 161.52 (C-4), 109.73 (C-5), 164.17 (C-7), 94.48 (C-8), 157.08 (C-9), 103.65 (C-10), 121.96 (C-1'), 129.34 (C-2', 6'), 116.84 (C-3', 5'), 162.04 (C-7), 73.91 (C11), 71.47 (C-2'), 79.80 (C-3'), 71.06 (C-4'), 82.46 (C-5'), 62.34 (C-6'). Compound 1 was identified as orientin by NMR analysis and comparison with its literature data.$^{28}$

**Compound 2**
Compound 2 (Figure 1) was obtained as a yellow solid. Its molecular formula was deduced to be C$_{21}$H$_{20}$O$_{11}$ from a combination of $^1$H NMR and $^{13}$C NMR data. $^1$H NMR (400 MHz, DMSO-d$_6$) δ: 3.22-3.38 (6H, m, glucosyl-H), 4.69 (1H, d, J=9.9 Hz, H-1'), 6.25 (1H, s, H-6), 6.64 (1H, s, H-3), 6.86 (1H, d, J = 8.4 Hz, H-5'), 7.54 (1H, dd, J=2.0, 8.4 Hz, H-6'), 13.20 (1H, s, 5-OH). $^{13}$C NMR (100 MHz, DMSO-d$_6$) δ: 164.4 (C-2), 102.7 (C-3), 182.3 (C-4), 160.7 (C-5), 98.53 (C-6), 163.2 (C-7), 104.9 (C-8), 156.8 (C-9), 104.2 (C-10), 122.4 (C-1'), 114.3 (C-2'), 146.2 (C-3'), 150.1 (C-4'), 150.16 (C-5'), 119.7 (C-6'), 73.7 (C-1'), 71.13 (C-2'), 79.12 (C-3'), 71.06 (C-4'), 82.35 (C-5'), 62.04 (C-6'). Compound 2 was identified as orisoverin by NMR analysis and comparison with its literature data.$^{29}$

**Compound 3**
Compound 3 (Figure 1) (19 mg) was isolated as a yellow amorphous powder and the melting point is 219-221°C; IR ν max (cm$^{-1}$): 3320 (-OH), 1697 (C=O), 1645 (C=O); the molecular formula was deduced to be C$_{20}$H$_{20}$O$_{11}$ from a combination of $^1$H NMR and $^{13}$C NMR data. As shown in Table 2. Isovitexin (3) was identified as isovitexin 3 by NMR analysis and comparison with its literature data.$^{30-32}$

Structure–activity relationship

**Anti-inflammatory activity**
The following preliminary structure–activity relationship (SAR) for the isolated flavonoids that were isolated from *V. grandifolia* was deduced to be C$_{21}$H$_{20}$O$_{11}$ from a combination of $^1$H NMR and $^{13}$C NMR data. $^1$H NMR (600 MHz, DMSO-d$_6$) δ: 13.2 (1H, brs, 5-0H), 7.55 (1H, d, J=2.5, 9.0 Hz, 60-H), 7.45 (1H, J=2.5 Hz, 20-H), 6.85 (1H, d, J=9.0 Hz, 50-H), 6.63 (1H, s, 3-H), 4.7 (1H, d, J=9.7 Hz, 100-H). $^{13}$C NMR (150 MHz, DMSO-d$_6$) δ: 164.36 (C-2), 104.25 (C-3), 161.52 (C-4), 109.73 (C-5), 164.17 (C-7), 94.48 (C-8), 157.08 (C-9), 103.65 (C-10), 121.96 (C-1'), 129.34 (C-2', 6'), 116.84 (C-3', 5'), 162.04 (C-7), 73.91 (C11), 71.47 (C-2'), 79.80 (C-3'), 71.06 (C-4'), 82.46 (C-5'), 62.34 (C-6'). Compound 3 was identified as orisoverin by NMR analysis and comparison with its literature data.$^{30-32}$

Table 2. IC$_{50}$ values of isolated compounds as anti-inflammatory agents

| Test compounds | NF-κB | SP-1 | iNOS | % Cell death at the highest conc (100 µg/mL) |
|----------------|-------|------|------|------------------------------------------|
| 1 Isoorientin (1) | 8.9 | 63 | 48 | 63.89 |
| 2 Orientin (2) | 12 | 23 | 54 | |
| 3 Isovitexin (3) | 18 | 41 | 21 | |
| 4 Parthenolide | 0.9 | 6.5 | 0.18 | |
| 5 Parthenolide | 0.6 | 8 | 0.15 | |

Table 1. IC$_{50}$ values of isolated compounds as MAO-A and -B inhibitory agents

| Sample name | MAO-A (IC$_{50}$) | MAO-B (IC$_{50}$) |
|-------------|------------------|-----------------|
| 1 Isoorientin (1) | >100 | 11.08 |
| 2 Orientin (2) | >100 | 11.04 |
| 3 Isovitexin (3) | >100 | 21.3 |
| 4 Clorgyline | 1.6 | NT |
| 5 Deprenyl | NT | 0.48 |
the case of fisetin and 5-hydroxylation in the case of isoflavones gives significant effects for inducing cell delineation (apigenin vs. chrysirin) especially ring B moiety;\(^4\) (c) the position of the sugar moiety and glycosides on ring A gives better anti-inflammatory activity than on rings B and C; Isoda et al. gave an assessment that glycosides with significant hydrophilicity displayed lower anti-inflammatory activity, which may be due to lower hydrophobicity as well as steric interference, lessening membrane permeability.\(^5\)

**MAO-A and -B**

The following preliminary SAR profile is proposed based on the inhibitory effects of the flavonoids against MAO-A and -B isolated from *V. grandifolia*; these are summarized as follows:

(a) Hydroxylation substitution pattern (-OH) noted at both C-3’ and 4’, i.e. tertiary increases inhibitory activity of MAO-A and -B mostly at ring B moiety, i.e. isoorientin (1) and orientin (2) (Figure 2) but reduced activity was noted in isovitexin (3) (Figure 2), although Spencer et al. attested to the fact that both unsaturation degree of the \(\text{C}_2=\text{C}_3\) double bond and the hydroxylation pattern on ring B moiety have great significant on the anti-neurodegenerative effects on flavonoids in general.\(^6\)

**DISCUSSION**

Compounds 1-3 (Figure 2) were known based on their 1D and 2D NMR and by comparison of their NMR data with those reported in the literature.\(^2\) Isoorientin (1), orientin (2), and isovitexin (3) were isolated from *V. grandifolia* for the first time to the best of our knowledge. The observation in the UV spectrum was an indication of the presence of hydroxyl groups at C-4’, C-5, and C-7. Compound 1 showed hydroxyl (3376 cm\(^{-1}\)), carbonyl (1660 cm\(^{-1}\)), and aromatic groups \(\text{C} = \text{C}\), \(\text{CH}_2\), and \(\text{C}-\text{H}\) bending at 1561, 1446, 845, and 800 cm\(^{-1}\) absorptions in its IR spectrum. The \(^1\)H NMR spectrum of compound 1 showed the AA’BB’ proton signals at \(\delta 7.62 (2\text{H}, \text{d, } J=8 \text{ Hz}, \text{H-2’}\text{ and H-6’})\) and 6.84 (2H, d, \(J=8 \text{ Hz, H-3’}, \text{H-5’}\)) were located on ring B, and H-8 and H-3 protons were observed as singlets at \(\delta 6.5\) (1H) and 6.25 (1H), respectively. The anomic proton showed a doublet at 4.88 ppm (1H, \(H, J=8 \text{ Hz, glucosyl H-1’}\)). Sugar proton signals overlapped at 3.5-4.7 ppm. This ion was formed by the loss of \(\text{C}_9\text{H}_8\text{O}_5\) from the molecular ion. On the basis of UV, IR, NMR, and EI mass data, which correlated with the literature, compound 3 was identified as isovitexin.

Extracts and concoctions from medicinal plants still play vital functions in managing primary health requirements in most developing countries. Most of the world’s population (80%) depends on these herbs and botanicals as reported by the World Health Organization, and there are active chemical constituents present in these plants responsible for the biological activity.\(^4\) It is therefore of immense concern to evaluate these plants in order to validate their employment in old-age medicine and to reveal the secondary metabolites responsible for pharmacological activity. Most of these medicinal plants reportedly contain flavonoids. Various flavonoids have been isolated from such, i.e. apigenin, galangin, kaempferol, quercetin, luteolin, naringenin, and other flavonoids, and many

**Figure 2.** Isolated flavonoids from *Vitex grandifolia*
are MAO inhibitors.\textsuperscript{42} Zarmouh et al.\textsuperscript{45} reported the selective MAO-B inhibitors of isolated compounds from the ethanolic extract of \textit{Psoralea corylifolia} seeds, a medicinal plants known for its antiaging effects. In that work, human recombinant MAO-B and MAO-A iso-enzymes were employed for the inhibition of enzymes studies. The authors discovered that, out of the eight compounds isolated, only two flavonoids, i.e. bavachinin and genistein, showed significant selectivity of MAO-B inhibition; these two flavonoids showed significant reduction in $\text{H}_2\text{O}_2$ produced by MAO-B as compared to MAO-A.\textsuperscript{46} Lee et al.\textsuperscript{45} isolated four flavonoids, namely isoquercitrin, quercitrin, quercetin, and rutin from the leaves of \textit{Melastoma candidum} D. Don for the first time. These flavonoids displayed selective inhibitory activity against MAO-B with IC\textsubscript{50} values of 19.06, 11.64, 3.89, and 10.89 µM, respectively.\textsuperscript{47} Monoamine oxidase inhibitors (MAOIs) differ by their selectivity of the MAO receptor. Some MAOIs inhibit both MAO-A and MAO-B equally. Other MAOIs have been developed and found to target one over the other.\textsuperscript{48} Some studies here corroborate our work that some flavonoids from natural sources can selectively inhibit MAO-B.

**CONCLUSION**

There is growing attention on the assessment of medicinal plants especially for inhibition of MAO, owing to the likely daily and cultural use as food and vegetables. Chemical constituents in medicinal plants help in the management of disorders associated with the nervous system together with their likely connections with medicines and the diet abundant in dietary monamines. The present study ascertained that the isolated compounds from \textit{V. grandifolia} are moderate MAO-B inhibitors, and this result could be of importance for better application of this wild vegetable in traditional neuropharmacological use. The use of \textit{V. grandifolia} as a vegetable is widely accepted although tagged as a “poor man’s” food, and this study hopes to promote its pivotal role as a source for the development of nutraceutical products. No work or study has reported the inhibition of MAO-A and -B by constituents of this plant with anti-inflammatory activity.
