The data article *ex vitro* (vegetative plant propagation) culture techniques are sustainable alternatives to the large-scale production of economically important plant species. *Morus alba* is an essential species that is mainly considered to be economically important due to their potential use as silk production, medicine and food. In this work, we evaluated the data of effects of different concentration of Waste Tea Residue Carbon Dots (WTR-CDs) on the *ex vitro* growth of morus. This dataset can be beneficial for researchers finding alternative eco-friendly, biodegradable and cost-friendly substitute for plant growth stimulator that are helpful for plant propagation during plant production program. Time consuming and low germination ratio of seeds are the most restricting triggers for commercial use for large-scale cultivation of plant species. Use of WTR-CDs in *ex vitro* culture technology is an...
1. Data description

Dataset in figures (Figs. 1–5) display the effect of WTR-CDs treatment on number of sterilized nodal explant shoot regeneration of *M. alba* nodal explant after 35 days of Propagation. In Figs. 1–3 the different concentration effect of WTR-CDs on number of bud formation and growth of bud was displayed. From this Figs. 1–3 it is seen that the lowest level of bud expression in explant nodal growth at the control, 50, 100, 200 and 250 mg/L treatment while it is the fastest and significant growth rate of explants treated with 150 mg/L. At the high concentration of WTR-CDs shows negative effect on shoot formation [2]. Fig. 4 showed the comparison between control and optimized concentration of WTR-CDs as well as statistical analysis data which shown in Table 1. Figs. 5 and 6 discovered the shoot growth length, number of roots and root length of nodal explant of *M. alba*.

2. Experimental design, materials, and methods

2.1. Materials and methods

Mulberry plants (*M. alba*) were taken from a single mother plant in the Shivaji University, Kolhapur (Maharashtra) campus. Around 60 healthy nodal explants cutting in the form of pencil size diameter
and 5–6 cm length for plant propagation. Those nodal explants were cut near about 45° angle from the base side of plant stick stem with one bud. Instead, 0.1% (w/v) mercury chloride was used for surface sterilized for 30 min after that treatment rinsing them with sterile distilled water for five times.

2.2. Preparation and characterization of WTR-CDs

The synthesis and characterization of WTR-CDs is discussed in the article: ‘Sustainable carbon nanodots synthesized from kitchen derived waste tea residue for highly selective fluorimetric

Fig. 1. (a) Treatment of different concentration of WTR-CDs and (b) Effect of different concentration of WTR-CDs on bud growth. (n = 10).
Sterilized nodal explant of *M. alba* were equally distributed (10 per set) in set II, III, IV, V and VI was dipped in 20 mL of 50, 100, 150, 200 and 250 mg/L WTR-CDs solutions respectively for 7 days in beaker (Fig. 1a). Similarly another set (I) was dipped in the water (control).

**2.3. WTR-CDs treatment**

Sterilized nodal explant of *M. alba* were equally distributed (10 per set) in six set, set II, III, IV, V and VI was dipped in 20 mL of 50, 100, 150, 200 and 250 mg/L WTR-CDs solutions respectively for 7 days in beaker (Fig. 1a). Similarly another set (I) was dipped in the water (control).
Fig. 4. Effect of optimized concentration of WTR-CDs on bud formation (After 15 days) (n = 25).

Fig. 5. Effect of optimized concentration of WTR-CDs on rooting (After 35 days).
2.4. Optimized concentration treatment of WTR-CDs

The plan of the experimentation was a Randomized Complete Block Design (RCBD) where five cuttings of nodal explant were exposed to two treatments (control and optimized concentration of WTR-CDs) and five times replicate. After bud formation, some bud formed M. alba explant samples were subjected to the plantation in the plastic trays. One set was kept in test tube under observation to check the root formation. The following observations data were given at the end of the experiment; Number of bud formation, growth of bud, number of roots and root length of explant.

2.5. Statistical analysis

The dataset collected was examined using Analysis of Variance (Single factor ANOVA) and the means were using t-Test: Paired Two Sample for Means.

**Table 1**

| Groups     | Count | Sum  | Average |
|------------|-------|------|---------|
| 0 (Control)| 25    | 55.8 | 2.232   |
| 150 mg/L   | 25    | 98.5 | 3.94    |

**Fig. 6.** Effect of optimized concentration of WTR-CDs on rooting (After 35 days).
