Abstract. Let $X$ be an abstract compact orientable CR manifold of dimension $2n - 1$, $n \geq 2$, and let $L^k$ be the $k$-th tensor power of a CR complex line bundle $L$ over $X$. We assume that condition $Y(q)$ holds at each point of $X$. In this paper we obtain a scaling upper-bound for the Szegő kernel on $(0, q)$-forms with values in $L^k$, for large $k$. After integration, this gives weak Morse inequalities, analogues of the holomorphic Morse inequalities of Demailly. By a refined spectral analysis we obtain also strong Morse inequalities. We apply the strong Morse inequalities to the embedding of some convex-concave manifolds.

1. INTRODUCTION AND STATEMENT OF THE MAIN RESULTS

The purpose of this paper is to establish analogues of the holomorphic Morse inequalities of Demailly for CR manifolds. Demailly [16] proved remarkable asymptotic Morse inequalities for the \(\overline{\partial}\) complex constructed over the line bundle \(L^k\) as \(k \to \infty\), where \(L\) is a holomorphic hermitian line bundle. Shortly after, Bismut [8] gave a heat equation proof of Demailly's inequalities which involves probability theory. Later Demailly [17] and Bouche [11] replaced the probability technique by a classical heat kernel argument. The book [27] introduced an argument based on the asymptotic of the heat kernel of the Kodaira Laplacian by using rescaling of the coordinates and functional analytic techniques inspired by Bismut-Lebeau [9, §11] (see also Bismut-Vasserot [10]). A different approach was introduced by Berndtsson [7] and developed by Berman [5, 6]; they work with the Bergman kernel and use the mean value estimate for eigensections of the Kodaira Laplacian. The idea of all these proofs is localization of the analytic objects (eigenfunctions, kernels) and scaling techniques. See also Fu-Jacobowitz [22] for related results on domains of finite type.

Inspired by Bismut's paper, Getzler [23] gave an expression involving local data for the large \(k\) limit of the trace of heat kernel of the \(\overline{\partial}_b\)-Laplacian on \(L^k\), where \(L\) is a CR line bundle over a CR strongly pseudoconvex manifold. But Getzler didn't infer Morse inequalities for the \(\overline{\partial}_b\)-complex from these asymptotics.

In this paper we introduce a method that produces Morse inequalities with computable bounds for the growth of the \(\overline{\partial}_b\) cohomology and also allows more general CR manifolds to be considered. Our approach is related to the techniques of Berman [5] and Shaw-Wang [32].

In a project developed jointly with R. Ponge [31], we use the heat kernel asymptotics and Heisenberg calculus to prove holomorphic Morse inequalities for a line bundle endowed with the CR Chern connection. This method predicts similar results and applications as of the present paper.

For a complex manifold with boundary, the \(\overline{\partial}_b\)-cohomology of the boundary is linked to the \(\overline{\partial}\)-cohomology of the interior, cf. Kohn-Rossi [26], Andreotti-Hill [2, 3]. Stephen S.T. Yau [34] exhibited the relation between the \(\overline{\partial}_b\)-cohomology of the boundary of a strictly pseudoconvex Stein analytic space with isolated singularities and invariants of the singular points. Holomorphic Morse inequalities for manifolds with boundary were obtained by Berman [6] and in [29, 30] (cf. also [27, Ch. 3]). The bounds in the Morse inequalities appearing in this paper are similar to the boundary terms in Berman’s result [6]. For the relation between the boundary and interior cohomology of high tensor powers \(L^k\) see also [28].

On the other hand, the study of the \(\overline{\partial}_b\)-complex on an abstract CR manifold has important consequences for the embedability and deformation of the CR-structure, see the embedding theorem of Boutet de Monvel [13] for strictly pseudoconvex CR manifolds and the paper of Epstein-Henkin [20].

In this paper we will study the large \(k\) behavior of the Szegö kernel function \(\Pi_k^{(q)}(x)\), which is the restriction to the diagonal of the integral kernel of the projection \(\Pi_k^{(q)}\) on the harmonic \((0,q)\)-forms with values in \(L^k\). The Szegö kernel for functions on a strictly pseudoconvex CR manifold was studied by Boutet de Monvel [12] and Boutet de Monvel-Sjöstrand [14] and has important applications in complex analysis and geometry.
1.1. **Terminology and Notations.** Let \((X, T^{1,0}X)\) be a CR manifold of dimension \(2n - 1\), \(n \geq 2\), i.e. \(T^{1,0}X\) is a subbundle of rank \(n - 1\) of the complexified tangent bundle \(\mathbb{C}TX\) satisfying \(T^{1,0}X \cap T^{0,1}X = \{0\}\) and the integrability condition (see e.g. [15, Def. 7.1.1]). We shall always assume that \(X\) is compact, connected and orientable.

Fix a smooth Hermitian metric \(\langle \cdot, \cdot \rangle\) on \(\mathbb{C}TX\) so that \(T^{1,0}X\) is orthogonal to \(T^{0,1}X := \overline{T^{1,0}X}\) and \(\langle u, v \rangle\) is real if \(u, v\) are real tangent vectors. Then there is a real non-vanishing vector field \(T\) on \(X\) which is pointwise orthogonal to \(T^{1,0}X \oplus T^{0,1}X\).

Denote by \(T^{1,0}X\) and \(T^{0,1}X\) the dual bundles of \(T^{1,0}X\) and \(T^{0,1}X\), respectively. They can be identified with subbundles of the complexified cotangent bundle \(\mathbb{C}^*X\). Define the vector bundle of \((0,q)\) forms by \(\Lambda^{0,q}T^*X := \Lambda^q T^{\ast 0,1}X\). The Hermitian metric \(\langle \cdot, \cdot \rangle\) on \(\mathbb{C}TX\) induces, by duality, a Hermitian metric on \(\mathbb{C}^*X\) and also on the bundle of \((0,q)\) forms \(\Lambda^{0,q}T^*X\). We shall also denote all these induced metrics by \(\langle \cdot, \cdot \rangle\).

Let \(D \subset X\) be an open set. Let \(\Omega^0(D)\) denote the space of smooth sections of \(\Lambda^{0,q}T^*X\) over \(D\). Similarly, if \(E\) is a vector bundle over \(D\), then we let \(\Omega^0(D, E)\) denote the space of smooth sections of \(\Lambda^{0,q}T^*X \otimes E\) over \(D\). Let \(\Omega^e_0(D, E)\) be the subspace of \(\Omega^0(D, E)\) whose elements have compact support in \(D\).

If \(w \in T^{0,1}X\), let \((w \wedge)^* : \Lambda^{0,q+1}T^*_2X \to \Lambda^{0,q}T^*_2X\), \(q \geq 0\), be the adjoint of the left exterior multiplication \(w \wedge : \Lambda^{0,q}T^*_2X \to \Lambda^{0,q+1}T^*_2X\), \(u \mapsto w \wedge u\):

\[
\langle w \wedge u, v \rangle = \langle u, (w \wedge)^* v \rangle,
\]

for all \(u \in \Lambda^{0,q}T^*_2X\), \(v \in \Lambda^{0,q+1}T^*_2X\). Notice that \((w \wedge)^*\) depends \(\mathbb{C}\)-anti-linearly on \(w\).

In the sequel we will denote by \(\langle \cdot, \cdot \rangle\) both scalar products as well as the duality bracket between vector fields and forms.

Locally we can choose an orthonormal frame \(\omega_1, \ldots, \omega_{n-1}\) of the bundle \(T^{1,0}X\). Then \(\overline{\omega}_1, \ldots, \overline{\omega}_{n-1}\) is an orthonormal frame of the bundle \(T^{0,1}X\). The real \((2n - 2)\) form \(\omega = i^{n-1}\omega_1 \wedge \overline{\omega}_1 \wedge \cdots \wedge \omega_{n-1} \wedge \overline{\omega}_{n-1}\) is independent of the choice of the orthonormal frame. Thus \(\omega\) is globally defined. Locally there is a real \(1\)-form \(\omega_0\) of length one which is orthogonal to \(T^{1,0}X \oplus T^{0,1}X\). The form \(\omega_0\) is unique up to the choice of sign. Since \(X\) is orientable, there is a nowhere vanishing \((2n - 1)\) form \(Q\) on \(X\). Thus, \(\omega_0\) can be specified uniquely by requiring that \(\omega \wedge \omega_0 = fQ\), where \(f\) is a positive function. Therefore \(\omega_0\), so chosen, is globally defined. We call \(\omega_0\) the uniquely determined global real \(1\)-form. We choose a vector field \(T\) so that

\[
||T|| = 1, \quad \langle T, \omega_0 \rangle = -1.
\]

Therefore \(T\) is uniquely determined. We call \(T\) the uniquely determined global real vector field. We have the pointwise orthogonal decompositions:

\[
\mathbb{C}T^*X = T^{1,0}X \oplus T^{0,1}X \oplus \{\lambda \omega_0; \lambda \in \mathbb{C}\},
\]

\[
\mathbb{C}TX = T^{1,0}X \oplus T^{0,1}X \oplus \{\lambda T; \lambda \in \mathbb{C}\}.
\]

**Definition 1.1.** For \(p \in X\), the **Levi form** \(\mathcal{L}_p\) is the Hermitian quadratic form on \(T^{1,0}_pX\) defined as follows. For any \(U, V \in T^{1,0}_pX\), pick \(U, V \in C^\infty(X; T^{1,0}X)\) such that \(\mathcal{U}(p) = U\), \(\mathcal{V}(p) = V\). Set

\[
\mathcal{L}_p(U, \overline{V}) = \frac{1}{2i} \langle [U, \overline{V}](p), \omega_0(p) \rangle,
\]

where \([U, \overline{V}] = U \overline{V} - \overline{V} U\) denotes the commutator of \(U\) and \(\overline{V}\). Note that \(\mathcal{L}_p\) does not depend of the choices of \(U\) and \(\overline{V}\).
Consider an arbitrary Hermitian metric \( \langle \cdot , \cdot \rangle \) on \( T^{1,0}X \). Since \( L_p \) is a Hermitian form there exists a local orthonormal basis \( \{ U_1, \ldots , U_{n-1} \} \) of \( (T^{1,0}X, \langle \cdot , \cdot \rangle) \) such that \( L_p \) is diagonal in this basis, \( L_p(U_i, U_j) = \delta_{ij} \lambda_i(p) \). The diagonal entries \( \{ \lambda_1(p), \ldots , \lambda_{n-1}(p) \} \) are called the eigenvalues of the Levi form at \( p \in X \) with respect to \( \langle \cdot , \cdot \rangle \).

Given \( q \in \{ 0, 1, \ldots , n-1 \} \), the Levi form is said to satisfy condition \( Y(q) \) at \( p \in X \), if \( L_p \) has at least either \( \max(q+1, n-q) \) eigenvalues of the same sign or \( \min(q+1, n-q) \) pairs of eigenvalues with opposite signs. Note that the sign of the eigenvalues does not depend on the choice of the metric \( \langle \cdot , \cdot \rangle \).

For example, if the Levi form is non-degenerate of constant signature \( (n_-, n_+) \), where \( n_- \) is the number of negative eigenvalues and \( n_- + n_+ = n-1 \), then \( Y(q) \) holds if and only if \( q \neq n_- , n_+ \).

1.2. CR complex line bundles, Semi-classical \( \overline{\partial}_b \)-Complex and \( \Box_b \). Let
\[
(1.5) \quad \overline{\partial}_b : \Omega^{0,q}(X) \to \Omega^{0,q+1}(X)
\]
be the tangential Cauchy-Riemann operator. We say that a function \( u \in C^\infty(X) \) is Cauchy-Riemann (CR for short) if \( \overline{\partial}_b u = 0 \).

**Definition 1.2.** Let \( L \) be a complex line bundle over \( X \). We say that \( L \) is a Cauchy-Riemann (CR) complex line bundle over \( X \) if its transition functions are CR.

From now on, we let \( (L, h^L) \) be a CR Hermitian line bundle over \( X \), where the Hermitian fiber metric on \( L \) is denoted by \( h^L \). We will denote by \( \phi \) the local weights of the Hermitian metric. More precisely, if \( s \) is a local trivializing section of \( L \) on an open subset \( D \subset X \), then the local weight of \( h^L \) with respect to \( s \) is the function \( \phi \in C^\infty(D; \mathbb{R}) \) for which
\[
(1.6) \quad |s(x)|_{h^L}^2 = e^{-\phi(x)} , \quad x \in D .
\]

Let \( L^k, k > 0 \), be the \( k \)-th tensor power of the line bundle \( L \). The Hermitian fiber metric on \( L \) induces a Hermitian fiber metric on \( L^k \) that we shall denote by \( h^{L^k} \). If \( s \) is a local trivializing section of \( L \) then \( s^k \) is a local trivializing section of \( L^k \). For \( f \in \Omega^{0,q}(X, L^k) \), we denote the pointwise norm \( |f(x)|_{h^{L^k}}^2 := |f(x)|_{h^L}^2 |s(x)|_{h^L}^2 \). We write \( \overline{\partial}_{b,k} \) to denote the tangential Cauchy-Riemann operator acting on forms with values in \( L^k \), defined locally by:
\[
(1.7) \quad \overline{\partial}_{b,k} : \Omega^{0,q}(X, L^k) \to \Omega^{0,q+1}(X, L^k) , \quad \overline{\partial}_{b,k}(s^k u) := s^k \overline{\partial}_b u ,
\]
where \( s \) is a local trivialization of \( L \) on an open subset \( D \subset X \) and \( u \in \Omega^{0,q}(D) \). We obtain a \( \overline{\partial}_{b,k} \)-complex \( (\Omega^{0,*}(X, L^k), \overline{\partial}_{b,k}) \) with cohomology
\[
(1.8) \quad H^*_b(X, L^k) := \ker \overline{\partial}_{b,k} / \text{Im} \overline{\partial}_{b,k} .
\]
We denote by \( dw_X = dw_X(x) \) the volume form on \( X \) induced by the fixed Hermitian metric \( \langle \cdot , \cdot \rangle \) on \( CTX \). Then we get natural global \( L^2 \) inner products \( \langle \cdot | \cdot \rangle_k, \langle | \cdot \rangle \) on \( \Omega^{0,q}(X, L^k) \) and \( \Omega^{0,q}(X) \), respectively. We denote by \( L^2_{(0,q)}(X, L^k) \) the completion of \( \Omega^{0,q}(X, L^k) \) with respect to \( \langle | \cdot \rangle \). Let
\[
(1.9) \quad \overline{\partial}_{b,k}^* : \Omega^{0,q+1}(X, L^k) \to \Omega^{0,q}(X, L^k)
\]
be the formal adjoint of \( \overline{\partial}_{b,k} \) with respect to \( \langle | \cdot \rangle \). The **Kohn-Laplacian** with values in \( L^k \) is given by
\[
(1.10) \quad \Box_{b,k}^{(q)} = \overline{\partial}_{b,k}^* \overline{\partial}_{b,k} + \overline{\partial}_{b,k} \overline{\partial}_{b,k}^* : \Omega^{0,q}(X, L^k) \to \Omega^{0,q}(X, L^k) .
\]
We extend $\square_{b,k}^q$ to the $L^2$ space by $\square_{b,k}^q : \text{Dom} \, \square_{b,k}^q \subset L^2_{(0,q)}(X, L^k) \to L^2_{(0,q)}(X, L^k)$, where $\text{Dom} \, \square_{b,k}^q := \{ u \in L^2_{(0,q)}(X, L^k); \square_{b,k}^q u \in L^2_{(0,q)}(X, L^k) \}$. Consider the space of harmonic forms
\begin{equation}
\mathcal{H}^q_b(X, L^k) := \ker \square_{b,k}^q.
\end{equation}
Now, we assume that $Y(q)$ holds. By [25, 7.6-7.8], [21, 5.4.11-12], [15, Props. 8.4.8-9], condition $Y(q)$ implies that $\square_{b,k}^q$ is hypoelliptic, has compact resolvent and the strong Hodge decomposition holds. Hence
\begin{equation}
\dim \mathcal{H}^q_b(X, L^k) < \infty, \quad \mathcal{H}^q_b(X, L^k) \subset \mathcal{O}^\infty(X, L^k), \quad \mathcal{H}^q_b(X, L^k) \cong H^0_q(X, L^k).
\end{equation}

Let $f_j \in \mathcal{O}^\infty(X, L^k)$, $j = 1, \ldots, N$, be an orthonormal frame for the space $\mathcal{H}^q_b(X, L^k)$. The Szegő kernel function is defined by
\begin{equation}
\Pi_k^q(x) = \sum_{j=1}^N |f_j(x)|_{h^k}^2 =: \sum_{j=1}^N |f_j(x)|^2.
\end{equation}
It is easy to see that $\Pi_k^q(x)$ is independent of the choice of orthonormal frame and
\begin{equation}
\dim \mathcal{H}^q_b(X, L^k) = \int_X \Pi_k^q(x) dv_X(x).
\end{equation}

1.3. The main results. We will express the bound of the Szegő kernel with the help of the following Hermitian form.

**Definition 1.3.** Let $s$ be a local trivializing section of $L$ and $\phi$ the corresponding local weight as in (1.6). For $p \in D$ we define the Hermitian quadratic form $M^\phi_p$ on $T_p^{1,0} X$ by
\begin{equation}
M^\phi_p(U, V) = \frac{1}{2} \langle \partial_b \phi - \partial_b \phi \rangle(p), \quad U, V \in T_p^{1,0} X,
\end{equation}
where $d$ is the usual exterior derivative and $\partial_b \phi = \overline{\partial}_b \phi$.

In Proposition 6.1 we show that in the embedded case $M^\phi_p$ is the restriction of the Chern curvature of the holomorphic extension of $L$. But in the abstract case the definition of $M^\phi_p$ depends on the choice of local trivializations. However, set
\begin{equation}
\mathbb{R}_{\phi(p), q} = \{ s \in \mathbb{R}; M^\phi_p + s L_p \text{ has exactly } q \text{ negative eigenvalues and } n - 1 - q \text{ positive eigenvalues} \}.
\end{equation}
Note that, although the eigenvalues of the Hermitian quadratic form $M^\phi_p + s L_p$, $s \in \mathbb{R}$, are calculated with respect to some Hermitian metric $\langle \cdot, \cdot \rangle$, their sign does not depend on the choice of $\langle \cdot, \cdot \rangle$, cf. also Definition 1.1.

It is not difficult to see that if $Y(q)$ holds at each point of $X$ then
\begin{equation}
\mathbb{R}_{\phi(x), q} \text{ is locally uniformly bounded at each point } x \in X, \text{ for all local weights } \phi.
\end{equation}
Note that (4.11) implies that if $\mathbb{R}_{\phi(x), q}$ is bounded for one weight $\phi_0$ at $x$, then it is bounded for all weights $\phi$ at $x$.

Denote by $\det(M^\phi_p + s L_x)$ the product of all the eigenvalues of $M^\phi_p + s L_x$. It turns out (see Proposition 4.2) that the integral
\begin{equation}
\int_{\mathbb{R}_{\phi(x), q}} \left| \det(M^\phi_p + s L_x) \right| ds \in \mathbb{R}
\end{equation}
does not depend on the choice of \( \phi \). Assuming (1.17) holds, the function

\[
(1.19) \quad X \longrightarrow \mathbb{R}, \quad x \mapsto \int_{\mathbb{R} \cdot q} \left| \det (M^\phi_{x} + s L_x) \right| ds
\]

is well-defined. Since \( M^\phi_{x} \) and \( L_x \) are continuous functions of \( x \in X \), we conclude that the function (1.19) is continuous. One of the main results of this work is the following.

**Theorem 1.4.** Assume that condition \( Y(q) \) holds at each point of \( X \). Then

\[
(1.20) \quad \sup \left\{ k^{-n} \Pi^{(q)}_k (x) : k \in \mathbb{N}, x \in X \right\} < \infty.
\]

Furthermore, we have

\[
(1.21) \quad \limsup_{k \to \infty} k^{-n} \Pi^{(q)}_k (x) \leq \frac{1}{2(2\pi)^n} \int_{\mathbb{R} \cdot q} \left| \det (M^\phi_{x} + s L_x) \right| ds, \quad \text{for all } x \in X.
\]

From (1.14), Theorem 1.4 and Fatou’s lemma, we get weak Morse inequalities on CR manifolds.

**Theorem 1.5.** Assume that condition \( Y(q) \) holds at each point of \( X \). Then for \( k \to \infty \)

\[
(1.22) \quad \dim \mathcal{H}^q_b (X, L^k) \leq \frac{k^n}{2(2\pi)^n} \int_{X} \int_{\mathbb{R} \cdot q} \left| \det (M^\phi_{x} + s L_x) \right| ds \, dv_X (x) + o(k^n).
\]

By the classical work of Kohn [25, Th. 7.6], [21, Th. 5.4.11–12], [15, Cor. 8.4.7–8], we know that if \( Y(q) \) holds, then \( \square_{b, k}^{(q)} \) has a discrete spectrum, each eigenvalues occurs with finite multiplicity and all eigenforms are smooth. For \( \lambda \in \mathbb{R} \), let \( \mathcal{H}^q_{b, \leq \lambda} (X, L^k) \) denote the spectral space spanned by the eigenforms of \( \square_{b, k}^{(q)} \) whose eigenvalues are less than or equal to \( \lambda \). We denote by \( \Pi^{(q)}_{b, \leq \lambda} \) the restriction to the diagonal of the integral kernel of the orthogonal projector on \( \mathcal{H}^q_{b, \leq \lambda} (X, L^k) \) and call it the Szegö kernel function of the space \( \mathcal{H}^q_{b, \leq \lambda} (X, L^k) \). Then \( \Pi^{(q)}_{b, \leq \lambda} (x) = \sum_{j=1}^{M} |g_j(x)|^2 \), where \( g_j(x) \in \Omega^{0, q}(X, L^k) \), \( j = 1, \ldots, M \), is any orthonormal frame for the space \( \mathcal{H}^q_{b, \leq \lambda} (X, L^k) \).

**Theorem 1.6.** Assume that condition \( Y(q) \) holds at each point of \( X \). Then for any sequence \( \nu_k > 0 \) with \( \nu_k \to 0 \) as \( k \to \infty \), there is a constant \( C'_0 \) independent of \( k \), such that

\[
(1.23) \quad k^{-n} \Pi^{(q)}_{b, \leq \nu_k} (x) \leq C'_0
\]

for all \( x \in X \). Moreover, there is a sequence \( \mu_k > 0 \), \( \mu_k \to 0 \), as \( k \to \infty \), such that for any sequence \( \nu_k > 0 \) with \( \lim_{k \to \infty} \frac{\mu_k}{\nu_k} = 0 \) and \( \nu_k \to 0 \) as \( k \to \infty \), we have

\[
(1.24) \quad \lim_{k \to \infty} k^{-n} \Pi^{(q)}_{b, \leq \nu_k} (x) = \frac{1}{2(2\pi)^n} \int_{\mathbb{R} \cdot q} \left| \det (M^\phi_{x} + s L_x) \right| ds,
\]

for all \( x \in X \).

By integrating (1.24) we obtain the following semi-classical Weyl law:

**Theorem 1.7.** Assume that condition \( Y(q) \) holds at each point of \( X \). Then there is a sequence \( \mu_k > 0 \), \( \mu_k \to 0 \), as \( k \to \infty \), such that for any sequence \( \nu_k > 0 \) with \( \lim_{k \to \infty} \frac{\mu_k}{\nu_k} = 0 \) and \( \nu_k \to 0 \) as \( k \to \infty \), we have

\[
\dim \mathcal{H}^q_{b, \leq \nu_k} (X, L^k) = \frac{k^n}{2(2\pi)^n} \int_{X} \int_{\mathbb{R} \cdot q} \left| \det (M^\phi_{x} + s L_x) \right| ds \, dv_X (x) + o(k^n).
\]
From Theorem 1.7 and the linear algebra argument from Demailly [16] and [28], we obtain strong Morse inequalities on CR manifolds (see §6):

**Theorem 1.8.** Let \( q \in \{0, \ldots, n-1\} \). If \( Y(j) \) holds for all \( j = 0, 1, \ldots, q \), then as \( k \to \infty \)
\[
\sum_{j=0}^{q} (-1)^{q-j} \dim H^j_0(X, L^k) \leq \frac{k^n}{2(2\pi)^n} \sum_{j=0}^{q} (-1)^{q-j} \int_X \int_{\mathbb{R}_x^{\phi(1)},j} \left| \det(M^\phi_x + sL_x) \right| ds \, dv_X(x) + o(k^n).
\]
(1.25)

If \( Y(j) \) holds for all \( j = q, q+1, \ldots, n-1 \), then as \( k \to \infty \)
\[
\sum_{j=q}^{n-1} (-1)^{q-j} \dim H^j_0(X, L^k) \leq \frac{k^n}{2(2\pi)^n} \sum_{j=q}^{n-1} (-1)^{q-j} \int_X \int_{\mathbb{R}_x^{\phi(1)},j} \left| \det(M^\phi_x + sL_x) \right| ds \, dv_X(x) + o(k^n).
\]
(1.26)

**Remark 1.9.** (i) Assume that the Levi form of \( X \) has at least \( q + 1 \) negative and \( q + 1 \) positive eigenvalues, \( q \in \{0, \ldots, n-2\} \). Then \( Y(j) \) holds for all \( j = 0, 1, \ldots, q \) and \( j = n - q - 1, \ldots, n - 1 \).

(ii) Let \( n_+, n_0, n_- \in \{0, 1, \ldots, n-1\} \) with \( n_+ + n_0 + n_- = n-1 \). Assume that the Levi form of \( X \) has \( n_- \) everywhere negative eigenvalues, \( n_+ \) everywhere positive eigenvalues and \( n_0 \) eigenvalues which vanish at some point on \( X \). (The Levi form is non-degenerate if and only if \( n_0 = 0 \).) Then \( Y(j) \) holds for all \( j \leq \min\{n_-, n_+\} - 1 \) and \( j \geq \max\{n_-, n_+\} + n_0 + 1 \). Thus Theorem 1.8 shows that (1.25) holds for all \( q \leq \min\{n_-, n_+\} - 1 \) and (1.26) holds for all \( q \geq \max\{n_-, n_+\} + n_0 + 1 \).

(iii) Theorems 1.4–1.8 have straightforward generalizations to the case when the forms take values in \( L^k \otimes E \), for a given CR vector bundle \( E \) over \( X \). In this case the right side gets multiplied by \( \text{rank}(E) \). For example, (1.21) becomes
\[
\limsup_{k \to \infty} k^{-n} \Pi^{(q)}_k(x) \leq \frac{1}{2(2\pi)^n} \text{rank}(E) \int_{\mathbb{R}_x^{\phi(1)},q} \left| \det(M^\phi_x + sL_x) \right| ds, \quad \text{for all } x \in X,
\]
and similarly for other results.

In section 6.1, we will state our main results in the embedded case, that is, when \( X \) is a real hypersurface of a complex manifold \( M \) and the bundle \( L \) is the restriction of a holomorphic line bundle over \( M \). In this case the form \( M^p_\phi \) is the restriction to \( T^{1,0}_p X \) of the curvature form \( R^L \). To wit, we deduce from the weak Morse inequalities (Theorem 1.4):

**Corollary 1.10.** Let \( M \) be a complex manifold of dimension \( n \) and let \( D = \{ p \in M : \tau(p) < 0 \} \) be a strongly pseudoconvex compact domain with smooth definition function \( \tau : M \to \mathbb{R} \) which is strictly plurisubharmonic in a neighbourhood of \( X = \partial D \). Let \( (L, h^L) \) be a Hermitian holomorphic line bundle whose curvature is proportional to the Levi form of \( D \) on \( X \), i.e. there exists a smooth function \( \lambda : X \to \mathbb{R} \) such that \( R^L = \lambda L \) on the holomorphic tangent bundle of \( X \). Then \( \text{dim} H^q_0(X, L^k) = o(k^n) \) as \( k \to \infty \) for all \( 1 \leq q \leq n-2 \).

**Example 1.11.** Let \( N \) be a compact complex manifold of dimension \( n \) and \( (E, h^E) \) be a positive line bundle on \( N \). Let \( D = \{ v \in E^* : |v|_{h^E} < 1 \} \) be the Grauert tube, set
Let \( \pi : X \rightarrow N \) be the canonical projection. Then we can apply Corollary 1.10 and we obtain that the \( \partial_b \)-cohomology of the CR line bundle \( L := \pi^*E \) satisfies 
\[
\dim H^q_b(X, L^k) = o(k^{n+1}) \text{ as } k \to \infty \text{ for all } 1 \leq q \leq n - 1.
\]

To exemplify the use of the strong Morse inequalities on CR manifolds, we formulate a condition to guarantee that high tensor powers of a CR line bundle have many CR sections in the embedded case.

**Theorem 1.12.** Let \( M' \) be a complex manifold and let \( X \subset M' \) be a compact real hypersurface, \( X = \rho^{-1}(0) \) for some \( \rho \in C^\infty(M') \), \( d\rho|_X \neq 0 \). We assume that the Levi form \( \mathcal{L}_x \) of \( X \) has at least two negative and two positive eigenvalues everywhere. Furthermore, let \( L \) be a Hermitian holomorphic line bundle over \( M' \) with curvature \( R^L \). We denote by \( R^L_X \) the restriction of \( R^L \) to \( T^{1,0}X \). Assume that 
\[
(1.27) \quad \int_X \int_{ \mathbb{R} \varphi(z), \partial } \left| \det(R^L_X + s\mathcal{L}_x) \right| dsd\nu_X(z) > \int_X \int_{ \mathbb{R} \varphi(z), 1 } \left| \det(R^L_X + s\mathcal{L}_x) \right| dsd\nu_X(z).
\]

Then there is a positive constant \( c \) independent of \( k \), such that \( \dim H^0_b(X, L^k) \geq ck^n \).

When \( R^L \) is positive we formulate a condition to guarantee that (1.27) is satisfied:

**Theorem 1.13.** With the same notations as in Theorem 1.12. We assume that the Levi form of \( X \) has at least two negative and two positive eigenvalues everywhere and \( R^L > 0 \). Let \( \lambda_1 \leq \ldots \leq \lambda_{n-1} \) be the eigenvalues of the Levi form with respect to \( R^L_X \). Assume that \( \lambda_{n-1} = \lambda_n < 0 < \lambda_{n+1} = \lambda_{n+2} \) on \( X \). Then there is a positive constant \( c \) independent of \( k \), such that \( \dim H^0_b(X, L^k) \geq ck^n \).

In §6, we will give examples which satisfy the assumptions of Theorem 1.13. Now we wish to give an application in the context of pseudoconvex-pseudoconcave manifolds. Keeping in mind the notion of \( q \)-pseudoconvexity and \( q \)-pseudoconcavity of Andreotti-Grauert [1] we introduce the following.

**Definition 1.14.** A complex manifold \( M \) with \( \dim \mathbb{C} M = n \) is called a \((n-2)\)-convex-concave strip if there exists a smooth proper map \( \rho : M \rightarrow \mathbb{R} \) whose Levi form \( \partial \overline{\partial} \rho \) has at least three negative and three positive eigenvalues on \( M \). The function \( \rho \) is called an exhaustion function.

In particular an \((n-2)\)-convex-concave strip is \((n-2)\)-concave in the sense of Andreotti-Grauert, thus Andreotti-pseudoconcave (see [27, Def.3.4.3]). For such manifolds one can extend the concept of big line bundle, well-known in the case of compact manifolds (e. g. [27, Def.2.2.5]). Let \( L \) be a holomorphic line bundle over an Andreotti-pseudoconcave manifold. By [27, Th.3.4.5] there exists \( C > 0 \) such that 
\[
(1.28) \quad \dim H^0(M, L^k) \leq Ck^\varphi, \quad \text{for } k \geq 1,
\]
where \( \varphi_k = \max_{M \setminus B_k} \text{rank } \Phi_k \) is the maximum rank of the Kodaira map 
\[
(1.29) \quad \Phi_k : M \setminus B_k \rightarrow \mathbb{P}(H^0(M, L^k)^*), \quad \Phi_k(p) = \{ s \in H^0(M, L^k) : s(p) = 0 \},
\]
and \( B_k \) is the base locus of \( H^0(M, L^k) \). We can thus define the Kodaira-Iitaka dimension of \( L \) by \( \kappa(L) := \max\{ \varphi_k : k \in \mathbb{N} \} \). The line bundle is called big if \( \kappa(L) = \dim M \).

If \( M \) is connected we can consider the field of meromorphic functions \( \mathcal{M}_M \) on \( M \). Also by [27, Th.3.4.5] this is an algebraic field of transcendence degree \( a(M) \) over \( \mathbb{C} \) and \( \kappa(L) \leq a(M) \leq \dim M \).
Theorem 1.15. Let $M$ be a connected $(n-2)$-convex-concave strip with exhaustion function $\rho$. Let $a \in \mathbb{R}$ be a regular value of $\rho$ and set $X := \{\rho = a\}$. Assume that there exists a holomorphic line bundle $L \to M$ whose curvature form $\mathcal{R}^L$ satisfies \eqref{1.27}. Then the line bundle $L$ is big. Therefore, the transcendence degree of the meromorphic function field $\mathcal{M}_M$ equals $n = \dim_C M$ and the Kodaira map $\Phi_k: M \cdots \to \mathbb{P}(H^0(M, L^k)^*)$ is an immersion outside a proper analytic set.

1.4. Sketch of the proof of Theorem 1.4. To simplify the exposition we consider only the case $q = 0$, i.e. we show how to pointwise estimate the function $\limsup_{k \to \infty} H_k^{(0)}$. It is easy to see that for all $x \in X$ we have

$$H_k^{(0)}(x) = S_k^{(0)}(x) := \sup_{\alpha \in \mathcal{H}_k^0(X, L^k), \|\alpha\| = 1} |\alpha(x)|^2,$$

where $S_k^{(0)}(x)$ is the extremal function. For a given point $p \in X$, by definition, there is a sequence $u_k \in \mathcal{H}_k^0(X, L^k)$, $\|u_k\| = 1$, such that $\limsup_{k \to \infty} k^{-n} S_k^{(0)}(p) = \lim_{k \to \infty} k^{-n} |u_k(p)|^2$. Near $p$, take local coordinates $(x, \theta) = (z, \theta) = (x_1, \ldots, x_{2n-2}, \theta)$, $z_j = x_{2j-1} + ix_{2j}$, $j = 1, \ldots, n - 1$, such that $\frac{\partial}{\partial z_j} = \frac{1}{2}(\frac{\partial}{\partial x_{2j-1}} - i \frac{\partial}{\partial x_{2j}})$, $j = 1, \ldots, n - 1$, is an orthonormal basis for $T_p^1 X$ and the Levi form and local weight are given by $L_p = \sum_{j=1}^{n-1} \lambda_j dz_j \otimes d\bar{z}_j$ and

$$\phi = \beta \theta + \sum_{j=1}^{n-1} \mu_j \lambda_j z_j + R(z) + O(|\theta|) + O(|\theta|^2) + O((|z, \theta|^2),$$

where $R(z) = O(|\theta|^2)$, $\frac{\partial}{\partial \bar{z}_j} R = 0$, $j = 1, \ldots, n - 1$. Let $F_k(z, \theta) := (\frac{z, \theta}{k, \theta})$ be the scaling map. For $r > 0$, let $D_r = \{(z, \theta) = (x, \theta); |x_j| < r, |\theta| < r, j = 1, \ldots, 2n - 2\}$. Now, we consider the restriction of $u_k$ to the domain $F_k(D_{\log k})$. The function $\alpha_k := k^{-\frac{r}{2}} F_k^* (e^{-r F_k u_k}) \in C^\infty(D_{\log k})$, satisfies $\limsup_{k \to \infty} k^{-n} S_k^{(0)}(p) = \lim_{k \to \infty} |\alpha_k(0)|^2$, where $F_k^* f \in C^\infty(D_{\log k})$ denotes the scaled function $f(\frac{z, \theta}{k, \theta})$, $f \in C^\infty(F_k(D_{\log k}))$. Moreover, $\alpha_k$ is harmonic with respect to the scaled Kohn-Laplacian $\Box_k^{(0)}$ (cf. \eqref{2.21}). The point is that $\Box_k^{(0)}$ converges in some sense to the model Laplacian $\Box_{b,H_n}$ on $H_n := \mathbb{C}^{n-1} \times \mathbb{R}$ (cf. \eqref{2.33}). In fact, $\Box_{b,H_n}$ is the Kohn-Laplacian defined with respect to the CR structure $\mathcal{U}_j, \mathcal{H}_n := \frac{\partial}{\partial z_j} - \frac{i}{\sqrt{2}} \lambda_j \bar{z}_j \frac{\partial}{\partial \bar{z}_j}$, $j = 1, \ldots, n - 1$, and the weight $e^{-q_0 \psi_0}, \psi_0 = \beta \theta + \sum_{j=1}^{n-1} \mu_j \lambda_j z_j$. Since $Y(q)$ holds, $\Box_{k,(k)}$ is hypoelliptic with loss of one derivative. Thus, the standard techniques for partial differential operators (Rellich’s theorem and Sobolev embedding theorem) yield a subsequence $\alpha_{k_j}$ converging uniformly on all the derivatives on any compact subset of $H_n$ to a smooth function $\alpha$, which is harmonic with respect to $\Box_{b,H_n}$. This implies that

$$\limsup_{k \to \infty} k^{-n} S_k^{(0)}(p) = |\alpha(0)|^2 \leq S_{H_n}^{(0)}(0) := \sup_{\mathcal{H}_{b,H_n}} |f(0)|^2.$$

Computing the extremal function in the model case explicitly (see §4) finishes the proof of \eqref{1.21}.

This paper is organized as follows. In §2 we first introduce the extremal function and we relate it to the Szegö kernel function. Then we introduce the scaled Kohn-Laplacian $\Box_{s,(k)}^{(q)}$ and prove the rough upper-bound for the Szegö kernel function \eqref{1.20} (cf. Theorem
2.7). Moreover, by comparing the scaled operator \( \Box_{s(k)}^{[q]} \) to the Kohn-Laplacian \( \Box_{b,H_n}^{[q]} \) on the Heisenberg group we estimate in Theorem 2.9 the Szegö kernel function on \( X \) in terms of the extremal function on the Heisenberg group. The latter is computed explicitly in §3. In §4 we use this information in order to prove the local Morse inequalities (1.21) and by integration the weak Morse inequalities (1.22). In §5 we analyse the spectral function of \( \Box_{s(k)}^{[q]} \) and deduce the semi-classical Weyl law, thus proving Theorems 1.6–1.8. In §6 we specialize the previous results to the case of an embedded CR manifold and prove Theorems 1.12 and 1.15. Moreover, we exemplify our results in two concrete examples, one of a Grauert tube over the torus and the other of a quotient of the Heisenberg group.

2. The estimates of the Szegö kernel function \( \Pi_k^{[q]}(x) \)

In this section, we assume that condition \( Y(q) \) holds at each point of \( X \).

2.1. The Szegö kernel function \( \Pi_k^{[q]}(x) \) and the extremal function \( S_{k,j}^{[q]}(x) \).

We first introduce some notations. For \( p \in X \), we can choose a smooth orthonormal frame \( e_1, \ldots, e_{n-1} \) of \( T^{\ast 0,1}X \) over a neighborhood \( U \) of \( p \). We say that a multiindex \( J = (j_1, \ldots, j_q) \in \{1, \ldots, n-1\}^q \) has length \( q \) and write \( |J| = q \). We say that \( J \) is strictly increasing if \( 1 \leq j_1 < j_2 < \cdots < j_q \leq n-1 \). For \( J = (j_1, \ldots, j_q) \) we define \( e_J := e_{j_1} \wedge \cdots \wedge e_{j_q} \).

Then \( \{e_J : |J| = q, J \text{ strictly increasing}\} \) is an orthonormal frame for \( \Lambda^{\ast q} T^*X \) over \( U \).

For \( f \in \mathcal{O}^{\ast q}(X, L^k) \), we may write

\[
f|_U = \sum'_{|J| = q} f_J e_J, \quad \text{with } f_J = \langle f, e_J \rangle \in C^\infty(U; L^k),
\]

where \( \sum' \) means that the summation is performed only over strictly increasing multi-indices. We call \( f_J \) the component of \( f \) along \( e_J \). It will be clear from the context what frame is being used. The extremal function \( S_{k,j}^{[q]} \) along the direction \( e_J \) is defined by

\[
S_{k,j}^{[q]}(y) = \sup_{\alpha \in \mathcal{H}^q_0(X, L^k), \|\alpha\| = 1} |\alpha_J(y)|^2.
\]

**Lemma 2.1.** For every local orthonormal frame \( \{e_J(y) : |J| = q, J \text{ strictly increasing}\} \) of \( \Lambda^{\ast q} T^*X \) over an open set \( U \subset X \), we have \( \Pi_k^{[q]}(y) = \sum_{|J| = q} S_{k,j}^{[q]}(y) \), for every \( y \in U \).

**Proof.** Let \( (f_j)_{j=1,\ldots,N} \) be an orthonormal frame for the space \( \mathcal{H}^q_0(X, L^k) \). On \( U \) we write

\[
\Pi_k^{[q]}(y) = \sum_{|J| = q} \Pi_k^{[q]}(y), \quad \text{where } \Pi_k^{[q]}(y) := \sum_{J} |f_J(y)|^2.
\]

It is easy to see that \( \Pi_k^{[q]}(y) \) is independent of the choice of the orthonormal frame \( (f_j) \). Take \( \alpha \in \mathcal{H}^q_0(X, L^k) \) of unit norm. Since \( \alpha \) is contained in an orthonormal base, obviously \( |\alpha_J(y)|^2 \leq \Pi_k^{[q]}(y) \). Thus,

\[
S_{k,j}^{[q]}(y) \leq \Pi_k^{[q]}(y), \quad \text{for all strictly increasing } J, |J| = q.
\]

Fix a point \( p \in U \) and a strictly increasing multiindex \( J \) with \( |J| = q \). For simplicity, we may assume that \( \phi(p) = 0 \). Put

\[
u(y) = \left( \sum_{j=1}^N |f_{J,j}(p)|^2 \right)^{-1/2} \cdot \sum_{j=1}^N \overline{f_{J,j}(p)} f_{J,j}(y).
\]
We can easily check that \( u \in H^S_\theta(X, L^k) \) and \( \| u \| = 1 \). Hence, \( | u, J(p) |^2 \leq S_{k, J}^{(q)} (p) \), therefore

\[
\Pi^{(q)}_{k, J} (p) = \sum_{j=1}^{N} | f_{j, J} (p) |^2 \leq | u, J(p) |^2 \leq S_{k, J}^{(q)} (p).
\]

By (2.2), \( \Pi_{k, J}^{(q)} = S_{k, J}^{(q)} \) for all strictly increasing multiindices \( J \) with \( | J | = q \), so the lemma follows. \( \square \)

2.2. The scaling technique. For a given point \( p \in X \), let \( U_1(y), \ldots, U_{n-1}(y) \) be an orthonormal frame of \( T^0_{\theta} \) \( X \) varying smoothly with \( y \) in a neighborhood of \( p \), for which the Levi form is diagonal at \( p \). Furthermore, let \( s \) be a local trivializing section of \( L \) on an open neighborhood of \( p \) and \( | s|^2_{tn} = e^{-\phi} \). We take local coordinates \( (x, \theta) = (z, \theta) = (x_1, \ldots, x_{2n-2}, \theta), z_j = x_{2j-1} + i x_{2j}, j = 1, \ldots, n - 1 \), defined on an open set \( D \) of \( p \) such that

\[
\omega_0(p) = \sqrt{2} d\theta, \quad (x(p), \theta(p)) = 0,
\]

\[
\langle \frac{\partial}{\partial x_j} (p), \frac{\partial}{\partial x_t} (p) \rangle = 2 \delta_{j,t}, \quad \langle \frac{\partial}{\partial x_j} (p), \frac{\partial}{\partial \theta} (p) \rangle = 0, \quad \langle \frac{\partial}{\partial \theta} (p), \frac{\partial}{\partial \theta} (p) \rangle = 2,
\]

for \( j, t = 1, \ldots, 2n - 2 \),

\[
U_j = \frac{\partial}{\partial x_j} - \frac{1}{\sqrt{2}} i \lambda_j z_j \frac{\partial}{\partial \theta} - \frac{1}{\sqrt{2}} c_j \theta \frac{\partial}{\partial \theta} + O(|(z, \theta)|^2), \quad j = 1, \ldots, n - 1,
\]

and

\[
\phi = \sum_{j=1}^{n-1} (\alpha_j z_j + \alpha_j \bar{z}_j) + \beta \theta + \sum_{j,t=1}^{n-1} (a_{j,t} z_j z_t + \bar{a}_{j,t} \bar{z}_j \bar{z}_t) + \sum_{j,t=1}^{n-1} \mu_{j,t} z_j \bar{z}_t
\]

\[
+ O(|z| |\theta|) + O(|\theta|^2) + O(|(z, \theta)|^3),
\]

where \( \beta \in \mathbb{R}, c_j, \alpha_j, a_{j,t}, \mu_{j,t} \in \mathbb{C}, \delta_{j,t} = 1 \) if \( j = t \), \( \delta_{j,t} = 0 \) if \( j \neq t \), \( \frac{\partial}{\partial x_j} = \frac{1}{2} (\frac{\partial}{\partial z_{2j-1}} - i \frac{\partial}{\partial z_{2j}}) \), for \( j, t = 1, \ldots, n - 1 \) and \( \lambda_j, j = 1, \ldots, n - 1 \), are the eigenvalues of \( L_\theta \). This is always possible, see [4, p. 157–160]. In this section, we work with this local coordinates and we identify \( D \) with some open set in \( \mathbb{R}^{2n-1} \). Put

\[
R(z, \theta) = \sum_{j=1}^{n-1} \alpha_j z_j + \sum_{j,t=1}^{n-1} a_{j,t} z_j z_t,
\]

\[
\phi_0 = \phi - R(z, \theta) = \beta \theta + \sum_{j,t=1}^{n-1} \mu_{j,t} z_j \bar{z}_t + O(|z| |\theta|) + O(|\theta|^2) + O(|(z, \theta)|^3).
\]

Let \( (|)_{k, \phi} \) and \( (|)_{k, \phi_0} \) be the inner products on the space \( \Omega_{c}^{0,q}(D) \) defined as follows:

\[
(f | g)_{k, \phi} = \int_D \langle f, g \rangle e^{-k \phi} dv_X, \quad (f | g)_{k, \phi_0} = \int_D \langle f, g \rangle e^{-k \phi_0} dv_X,
\]

where \( f, g \in \Omega_{c}^{0,q}(D) \). We denote by \( L^2_{(0,q)}(D, k \phi) \) and \( L^2_{(0,q)}(D, k \phi_0) \) the completions of \( \Omega_{c}^{0,q}(D) \) with respect to \( (|)_{k, \phi} \) and \( (|)_{k, \phi_0} \), respectively. We have the unitary identification

\[
\begin{align*}
L^2_{(0,q)}(D, k \phi) & \leftrightarrow L^2_{(0,q)}(D, k \phi) \\
u & \mapsto \tilde{u} = e^{kR} u, \\
u & = e^{-kR} \tilde{u} \mapsto \tilde{u}.
\end{align*}
\]
Let $\bar{\partial}^*, k^\phi : \Omega^0q^1(D) \to \Omega^0q(D)$ be the formal adjoint of $\partial_b$ with respect to $(\mid)_{k^\phi}$. Put

$$\square_{b,k^\phi} = \bar{\partial}_b \bar{\partial}_b^* + \bar{\partial}_b^* k^\phi \bar{\partial}_b : \Omega^0q(D) \to \Omega^0q(D).$$

Let $u \in \Omega^0q(D, L^k)$. Then there exists $\tilde{u} \in \Omega^0q(D)$ such that $u = s^k \tilde{u}$ and we have $\square_{b,k^\phi} u = s^k \square_{b,k^\phi} \tilde{u}$. In this section, we identify $u$ with $\tilde{u}$ and $\square_{b,k^\phi}$ with $\square_{b,k^\phi}$. Note that $|u(0)|^2 = |\tilde{u}(0)|^2 e^{-k^\phi(0)} = |\tilde{u}(0)|^2$.

Recall that $\alpha \wedge$ is the operator of left exterior multiplication with a form $\alpha$. The adjoint of this operator is denoted by $(\alpha \wedge)^*$ (cf. (1.1)).

If $u \in \Omega^0q(D) \cap \Omega^{0,q}_\phi(D, k^\phi_0)$, using (2.7), we have $\bar{\partial}_b \tilde{u} = \bar{\partial}_b = e^{k^\phi} \bar{\partial}_b u$, where

$$(2.8) \quad \bar{\partial}_s = \bar{\partial}_b + k(\bar{\partial}_b R) \wedge.$$ 

Let $(e_j(z, \theta))_{j=1, \ldots, n-1}$ denote the basis of $T^{0,1}_\phi X$, dual to $(U_j(z, \theta))_{j=1, \ldots, n-1}$. Then $\bar{\partial}_b = \sum_{j=1}^{n-1} (e_j \wedge U_j + (\bar{\partial}_b e_j \wedge (e_j \wedge)^*)$. Note that $(e_j \wedge)^*$ equals the interior product $i_{\nu_j}$ with $U_j$. Thus,

$$(2.9) \quad \bar{\partial}_s = \sum_{j=1}^{n-1} e_j \wedge (U_j + k(U_j R)) + \sum_{j=1}^{n-1} (\bar{\partial}_b e_j \wedge (e_j \wedge)^*$$

and correspondingly

$$(2.10) \quad \bar{\partial}_s^* = \sum_{j=1}^{n-1} (e_j \wedge)^* (U_j^*, k^\phi_0 + k(U_j R)) + \sum_{j=1}^{n-1} e_j \wedge (\bar{\partial}_b e_j \wedge)^*,$$

where $\bar{\partial}_b^* \bar{\partial}_s^* = e^{k^\phi} \bar{\partial}_b^* u$ and $U_j^*, k^\phi_0$ is the formal adjoint of $U_j$ with respect to $(\mid)_{k^\phi_0}$, $j = 1, \ldots, n-1$. We can check that

$$(2.11) \quad U_j^*, k^\phi_0 = -U_j + k(U_j R) + s_j(z, \theta),$$

where $s_j \in C^\infty(D)$, $s_j$ is independent of $k$, $j = 1, \ldots, n-1$. Put

$$(2.12) \quad \square_{b,k^\phi} = \bar{\partial}_s \bar{\partial}_s^* + \bar{\partial}_s^* \bar{\partial}_s : \Omega^0q(D) \to \Omega^0q(D).$$

We have

$$(2.13) \quad \square_{b,k^\phi} u = e^{k^\phi} \square_{b,k^\phi} u.$$

**Proposition 2.2** ([24, Prop. 2.3]). We have

$$(2.14) \quad \square_{b,k^\phi} = \sum_{j=1}^{n-1} (U_j^*, k^\phi_0 + k(U_j R))(U_j + k(U_j R)) + \sum_{j=1}^{n-1} e_j \wedge (e_j \wedge)^* [U_j + k(U_j R), U_j^*, k^\phi_0 + k(U_j R)]$$

$$+ e(U + k(U R)) + e(U^*, k^\phi_0 + k(U R)) + f(z, \theta),$$

where $e(U + k(U R))$ denotes remainder terms of the form $\sum a_j(z, \theta)(U_j + k(U_j R))$ with $a_j$ smooth, matrix-valued and independent of $k$, for all $j$, and similarly for $e(U^*, k^\phi_0 + k(U R))$ and $f(z, \theta) \in C^\infty$ independent of $k$. 

12
For the convenience of the reader we recall some notations we used before. For \( r > 0 \), let \( D_r = \{(z, \theta) = (x, \theta) \in \mathbb{R}^{2n-1}; |x_j| < r, |\theta| < r, j = 1, \ldots, 2n - 2\} \). Let \( F_k \) be the scaling map: \( F_k(z, \theta) = (\frac{z}{\sqrt{k}}, \frac{\theta}{k}) \). From now on, we assume that \( k \) is large enough so that \( F_k(D_{\log k}) \subset D \). We define the scaled bundle \( F_k^* \Lambda^0 a T^* X \) on \( D_{\log k} \) to be the bundle whose fiber at \((z, \theta) \in D_{\log k}\) is
\[
F_k^* \Lambda^0 a T^*_{(z, \theta)} X := \left\{ \sum_{|J| = q} a_J e_J\left(\frac{z}{\sqrt{k}}, \frac{\theta}{k}\right); a_J \in \mathbb{C}, |J| = q \right\}.
\]
We take the Hermitian metric \((\cdot, \cdot)_{F_k^*}\) on \( F_k^* \Lambda^0 a T^* X \) so that at each point \((z, \theta) \in D_{\log k}\),
\[
\left\{ e_J\left(\frac{z}{\sqrt{k}}, \frac{\theta}{k}\right); |J| = q, J \text{ strictly increasing} \right\},
\]
is an orthonormal basis for \( F_k^* \Lambda^0 a T^*_{(z, \theta)} X \). For \( r > 0 \), let \( F_k^* \Omega^0 a(D_r) \) denote the space of smooth sections of \( F_k^* \Lambda^0 a T^* X \) over \( D_r \). Let \( F_k^* \Omega^0 a(D_r) \) be the subspace of \( F_k^* \Omega^0 a(D_r) \) whose elements have compact support in \( D_r \). Given \( f \in \Omega^0 a(F_k(D_{\log k})) \) we write \( f = \sum_{|J| = q} f_J e_J \). We define the scaled form \( F_k^* f \in F_k^* \Omega^0 a(D_{\log k}) \) by:
\[
F_k^* f = \sum_{|J| = q} f_J \left(\frac{z}{\sqrt{k}}, \frac{\theta}{k}\right) e_J\left(\frac{z}{\sqrt{k}}, \frac{\theta}{k}\right).
\]
Let \( P \) be a partial differential operator of order one on \( F_k(D_{\log k}) \) with \( C^\infty \) coefficients. We write \( P = a(z, \theta) \frac{\partial}{\partial \theta} + \sum_{j=1}^{2n-2} a_j(z, \theta) \frac{\partial}{\partial x_j} \), \( a, a_j \in C^\infty(F_k(D_{\log k})), j = 1, \ldots, 2n - 2 \). The partial differential operator \( P_{(k)} \) on \( D_{\log k} \) is given by
\[
P_{(k)} = \sqrt{k} F_k^* a \frac{\partial}{\partial \theta} + \sum_{j=1}^{2n-2} F_k^* a_j \frac{\partial}{\partial x_j} = \sqrt{k} a \left(\frac{z}{\sqrt{k}}, \frac{\theta}{k}\right) \frac{\partial}{\partial \theta} + \sum_{j=1}^{2n-2} a_j \left(\frac{z}{\sqrt{k}}, \frac{\theta}{k}\right) \frac{\partial}{\partial x_j}.
\]
Let \( f \in C^\infty(F_k(D_{\log k})) \). We can check that
\[
P_{(k)}(F_k^* f) = \frac{1}{\sqrt{k}} F_k^* (P f).
\]
The scaled differential operator \( \overline{\partial}_{s,(k)} : F_k^* \Omega^0 a(D_{\log k}) \rightarrow F_k^* \Omega^0 a^1(D_{\log k}) \) is given by (compare to the formula (2.9) for \( \overline{\partial}_s \)):
\[
\overline{\partial}_{s,(k)} = \sum_{j=1}^{n-1} e_j \left(\frac{z}{\sqrt{k}}, \frac{\theta}{k}\right) \wedge \left( U_{j(k)} + \sqrt{k} F_k^* (U_j R) \right)
\]
\[
+ \sum_{j=1}^{n-1} \frac{1}{\sqrt{k}} (\overline{\partial}_b e_j) \left(\frac{z}{\sqrt{k}}, \frac{\theta}{k}\right) \wedge \left( e_j \left(\frac{z}{\sqrt{k}}, \frac{\theta}{k}\right) \right).
\]
From (2.9) and (2.16), we can check that if \( f \in \Omega^0 a(F_k(D_{\log k})) \), then
\[
\overline{\partial}_{s,(k)} F_k^* f = \frac{1}{\sqrt{k}} F_k^* (\overline{\partial}_s f).
\]
Let \((|\cdot|)_{F_k^* \phi_0}\) be the inner product on the space \( F_k^* \Omega^0 a_c(D_{\log k}) \) defined as follows:
\[
(f | g)_{F_k^* \phi_0} = \int_{D_{\log k}} \langle f, g \rangle_{F_k^* e^{-kF_k^* \phi_0}}(F_k^* m)(z, \theta) d\nu(z) d\nu(\theta),
\]
where \( d\nu_X = m d\nu(z) d\nu(\theta) \) is the volume form, \( d\nu(z) = 2^{n-1} dx_1 \cdots dx_{2n-2} \), \( d\nu(\theta) = \sqrt{2} d\theta \). Note that \( m(0, 0) = 1 \). Let \( \overline{\partial}_{s,(k)}^* : F_k^* \Omega^0 a^1(D_{\log k}) \rightarrow F_k^* \Omega^0 a(D_{\log k}) \) be the formal
adjoint of $\overline{\delta}_{s(k)}$ with respect to $(\mid )_{kF^*_s\phi_0}$. Then, we can check that (compare the formulas for $\overline{\delta}^*_s$, see (2.10) and (2.11))

\begin{equation}
\overline{\delta}^*_s(k) = \sum_{j=1}^{n-1} \left( e_j \left( \frac{z}{\sqrt{k}} , \frac{\theta}{k} \right) \right)^* \left( -U_{j(k)} + \sqrt{k} F^*_k(U_j R) + \sqrt{k} F^*_k(U_j \phi_0) + \frac{1}{\sqrt{k}} F^*_k s_j \right) \\
+ \sum_{j=1}^{n-1} \frac{1}{\sqrt{k}} e_j \left( \frac{z}{\sqrt{k}} , \frac{\theta}{k} \right) \wedge \left( (\partial_k e_j) \left( \frac{z}{\sqrt{k}} , \frac{\theta}{k} \right) \right)^* ,
\end{equation}

where $s_j \in C^\infty (D_{log} k), j = 1, \ldots, n - 1$, are independent of $k$. We also have

\begin{equation}
\overline{\delta}^*_s(k) F^*_k f = \frac{1}{\sqrt{k}} F^*_k (\overline{\delta}^*_s f), \quad f \in \Omega^{0,q+1}(D_{log} k).
\end{equation}

We define now the scaled Kohn-Laplacian:

\begin{equation}
\Box^{[q]}_{s(k)} := \overline{\delta}^*_s(k) \overline{\delta}_{s(k)} + \overline{\delta}^*_s(k) \overline{\delta}^*_s(k) : F^*_k \Omega^{0,q}(D_{log} k) \rightarrow F^*_k \Omega^{0,q}(D_{log} k).
\end{equation}

From (2.18) and (2.20), we see that if $f \in \Omega^{0,q}(F_k(D_{log} k))$, then

\begin{equation}
(\Box^{[q]}_{s(k)} f = \frac{1}{k} F^*_k (\Box^{[q]}_{s(k)} f).
\end{equation}

From (2.3) and (2.5), we can check that

\begin{equation}
\mathcal{U}_{j(k)} + \sqrt{k} F^*_k \left( \mathcal{U}_j R \right) = \frac{\partial}{\partial z_j} + \frac{1}{\sqrt{2}} i \lambda_j z_j \frac{\partial}{\partial \theta} + \epsilon_k Z_{j,k}, \quad j = 1, \ldots, n - 1,
\end{equation}

on $D_{log} k$, where $\epsilon_k$ is a sequence tending to zero with $k \rightarrow \infty$ and $Z_{j,k}$ is a first order differential operator and all the derivatives of the coefficients of $Z_{j,k}$ are uniformly bounded in $k$ on $D_{log} k, j = 1, \ldots, n - 1$. Similarly, from (2.5) and (2.6), we can check that

\begin{equation}
- \mathcal{U}_{t(k)} + \sqrt{k} F^*_k \left( \mathcal{U}_t R \right) = \frac{\partial}{\partial z_t} + \frac{1}{\sqrt{2}} i \lambda_t z_t \frac{\partial}{\partial \theta} - \frac{1}{\sqrt{2}} i \lambda_t z_t \beta + \sum_{j=1}^{n-1} \mu_{j,t} z_j + \delta_k V_{t,k}, \quad t = 1, \ldots, n - 1,
\end{equation}

on $D_{log} k$, where $\delta_k$ is a sequence tending to zero with $k \rightarrow \infty$ and $V_{t,k}$ is a first order differential operator and all the derivatives of the coefficients of $V_{t,k}$ are uniformly bounded in $k$ on $D_{log} k, t = 1, \ldots, n - 1$. From (2.23), (2.24) and (2.17), (2.19), (2.21), it is straightforward to obtain the following.

**Proposition 2.3.** We have that

\begin{equation}
\Box^{[q]}_{s(\ell)} = \sum_{j=1}^{n-1} \left[ \left( - \frac{\partial}{\partial z_j} + \frac{i}{\sqrt{2}} \lambda_j z_j \frac{\partial}{\partial \theta} - \frac{i}{\sqrt{2}} \lambda_j z_j \beta + \sum_{t=1}^{n-1} \mu_{j,t} z_t \right) \left( \frac{\partial}{\partial z_j} + \frac{i}{\sqrt{2}} \lambda_j z_j \frac{\partial}{\partial \theta} \right) \right] \\
+ \sum_{j,t=1}^{n-1} e_j \left( \frac{z}{\sqrt{k}} , \frac{\theta}{k} \right) \wedge \left( e_t \left( \frac{z}{\sqrt{k}} , \frac{\theta}{k} \right) \right)^* \left( \left( \mu_{j,t} - \frac{i}{\sqrt{2}} \lambda_j z_j \beta \right) + \sqrt{2} i \lambda_j z_j \beta + \epsilon_k P_k \right),
\end{equation}

on $D_{log} k$, where $\epsilon_k$ is a sequence tending to zero with $k \rightarrow \infty$, $P_k$ is a second order differential operator and all the derivatives of the coefficients of $P_k$ are uniformly bounded in $k$ on $D_{log} k$. 

Let $D \subset D_{\log k}$ be an open set and let $W_{kF^*\phi_0}^s(D; F_k^*\Lambda^0\Theta^sX)$, $s \in \mathbb{N}_0 := \mathbb{N} \cup \{0\}$, denote the Sobolev space of order $s$ of sections of $F_k^*\Lambda^0\Theta^sX$ over $D$ with respect to the weight $e^{-kF^*\phi_0}$. The Sobolev norm on this space is given by

$$
\|u\|_{kF^*\phi_0,D}^2 = \sum_{|\alpha| \leq s} \int_{|z| = \varepsilon} \left| \partial_z^\alpha u_j \right|^2 e^{-kF^*\phi_0}(F_k^*m)(z,\theta) du(z) d\theta,
$$

where $u = \sum_{|\alpha| = q} u_j \eta_j \left( \frac{z}{\sqrt[k]{k}}, \frac{\theta}{k} \right) \in W_{kF^*\phi_0}^s(D; F_k^*\Lambda^0\Theta^sX)$ and $m$ is the volume form. If $s = 0$, we write $\|\|_{kF^*\phi_0,D}$ to denote $\|\|_{kF^*\phi_0,D}$. We need the following

**Proposition 2.4.** For every $r > 0$ with $D_{2r} \subset D_{\log k}$ and $s \in \mathbb{N} \cup \{0\}$, there is a constant $C_{r,s} > 0$ independent of $k$, such that

$$
\|u\|_{kF^*\phi_0,r+1,D}^2 \leq C_{r,s} \left( \|u\|_{kF^*\phi_0,D_{2r}}^2 + \left\| \Box^{(q)}_{s,k} u \right\|_{kF^*\phi_0,s,D_{2r}}^2 \right), \quad u \in F_{kF^*\phi_0}^s(D_{\log k}).
$$

**Proof.** Since $Y(q)$ holds, we see from the classical work of Kohn ([25, Th. 7.7], [21, Prop. 5.4.10], [15, Th. 8.4.3]), that $\Box^{(q)}_{s,k}$ is hypoelliptic with loss of one derivative and we have (2.26). Since all the derivatives of the coefficients of the operator $\Box^{(q)}_{s,k}$ are uniformly bounded in $k$, if we go through the proof of [15, pp. 193–199] (see also Remark 2.5 below), it is straightforward to see that $C_{r,s}$ can be taken to be independent of $k$. \qed

**Remark 2.5.** Put

$$
A = \{ \text{all the coefficients of } \Box^{(q)}_{s,k}, \sigma^j_{s,k}, \sigma^*_j_{s,k}, \left[ U_j(k), U_l(k) \right], \left[ U_j(k), U_l(k) \right], \left[ U_j(k), U_l(k) \right], \\
j, j \leq 1, \ldots, n - 1 \text{ and of } kF^*\phi_0, F_k^*m\}
$$

and $B = \{ \text{all the eigenvalues of } \mathcal{L}_p \}$. From the proof of Kohn, we see that for $r > 0$, $s \in \mathbb{N}_0$, there exist a semi-norm $P$ on $C^\infty(D_{2r})$ and a strictly positive continuous function $F : \mathbb{R} \to \mathbb{R}_+$ such that

$$
\|u\|^2_{kF^*\phi_0,r,D} \leq \left( \sum_{f \in A} F(P(f)) + \sum_{\lambda \in B} F(\lambda) \right) \left( \|u\|^2_{kF^*\phi_0,D_{2r}} + \left\| \Box^{(q)}_{s,k} u \right\|^2_{kF^*\phi_0,s,D_{2r}} \right),
$$

where $u \in F_{kF^*_k}^s(D_{\log k})$. Roughly speaking, the constant $C_{r,s}$ in (2.26) depends continuously on the eigenvalues of $\mathcal{L}_p$ and the elements of $A$ in the $C^\infty(D_{2r})$ topology. (See also the proof of [32, Lemma 4.1].)

**Lemma 2.6.** Let $\alpha_k \in F^s_{kF^*_k}D_{\log k}$ with $\Box^{(q)}_{s,k} \alpha_k = 0$ and $\|\alpha_k\|_{kF^*_k, D_{\log k}} \leq 1$. Then, there is a constant $C > 0$ such that for all $k$ we have $|\alpha_k(0)|^2 \leq C$.

**Proof.** Fix $r > 0$, $r$ small and let $\chi \in C^\infty_0(D_r)$, $\chi = 1$ on $D_{2r}$. Identify $\alpha_k$ with a form in $\mathbb{R}^{2n-1}$ by extending with zero. Then

$$
|\chi(0)\alpha_k(0)| = \int_{\mathbb{R}^{2n-1}} \chi \overline{\alpha_k}(\xi) d\xi = \int_{\mathbb{R}^{2n-1}} \left( 1 + |\xi|^{2} \right)^{-\frac{r}{2}} \left( 1 + |\xi|^{2} \right)^{\frac{r}{2}} \chi \overline{\alpha_k}(\xi) d\xi \leq \left( \int_{\mathbb{R}^{2n-1}} \left( 1 + |\xi|^{2} \right)^{-n} d\xi \right)^{\frac{1}{2}} \left( \int_{\mathbb{R}^{2n-1}} \left( 1 + |\xi|^{2} \right)^{n} |\chi \overline{\alpha_k}(\xi)|^2 d\xi \right)^{\frac{1}{2}} \leq C \|\alpha_k\|_{kF^*_k, D_r}^2,
$$

where
where \( \hat{\chi} \hat{\alpha}_k \) denotes the Fourier transform of \( \chi \alpha_k \). From (2.26) and using induction, we get

\[
||\alpha_k||_{kF^*_k \Phi_0, D_r}^2 \leq C \left( ||\alpha_k||_{kF^*_k \Phi_0, D_r}^2 + \sum_{m=1}^{n} \left( \left( \square_s(k) \right)^m u \right)^2 \right)
\]

for some \( r' > 0 \), where \( C > 0 \) is independent of \( k \). Since \( \square_s(k) u = 0 \), we conclude that \( ||\alpha_k||_{kF^*_k \Phi_0, D_r} \leq C \). The lemma follows. \( \square \)

Now, we can prove the first part of Theorem 1.4 (estimate (1.20)).

**Theorem 2.7.** There is a constant \( C_0 > 0 \) such that for all \( k \) and all \( x \in X \) we have

\[
k^{-n} H_k^{[q]}(x) \leq C_0
\]

**Proof.** Let \( u_k \in H^q_k(X, L^k) \), \( ||u_k|| = 1 \). Set \( \alpha_k := k^{-\frac{n}{2}} F_k^s(e^{-kR} u_k) \in F_k^s \Omega^q(D_{\log k}) \). We recall that \( R \) is given by (2.5). (See also (2.7).) We check that \( ||\alpha_k||_{kF^*_k \Phi_0, D_{\log k}} \leq 1 \).

Using (2.22) and (2.13), it is not difficult to see that \( \square_{s(k)} \alpha_k = 0 \) on \( D_{\log k} \). From this and Lemma 2.6, we see that there exists \( C(0) > 0 \) such that for all \( k \) we have \( |\alpha_k(0)|^2 = k^{-n} |u_k(0)|^2 \leq C(0) \). We can apply this procedure for each point \( x \in X \), so we can replace \( 0 \) by \( x \) in the previous estimate. In view of Remark 2.5, we see that we can find \( C(x) > 0 \) and a neighborhood \( D_x \) of \( x \) such that for all \( k \) and all \( y \in D_x \) we have \( k^{-n} |u_k(y)|^2 \leq C(x) \). Since \( X \) is compact we infer that

\[
C_0 = \sup \{ k^{-n} |u_k(x)|^2 : k \in \mathbb{N}, x \in X \} < \infty
\]

Thus, for a local orthonormal frame \( \{e_j; |J| = q, J \text{ strictly increasing} \} \) we have

\[
\sup \{ k^{-n} S_{k,J}^{[q]}(x) : k \in \mathbb{N}, x \in X \} \leq C_0
\]

(see (2.1) for the definition of \( S_{k,J}^{[q]} \)). From this and Lemma 2.1, the theorem follows. \( \square \)

### 2.3. The Heisenberg group \( H_n \)

We pause and introduce some notations. We identify \( \mathbb{R}^{2n-1} \) with the Heisenberg group \( H_n := \mathbb{C}^{n-1} \times \mathbb{R} \). We also write \( (z, \theta) \) to denote the coordinates of \( H_n, z = (z_1, \ldots, z_{n-1}) \in \mathbb{C}^{n-1}, z_j = x_{2j-1} + i x_{2j}, j = 1, \ldots, n-1, \) and \( \theta \in \mathbb{R} \). Then

\[
\begin{cases}
U_{j,H_n} = \frac{\partial}{\partial z_j} - \frac{1}{\sqrt{2}} i \lambda_j z_j \frac{\partial}{\partial \theta}; j = 1, \ldots, n-1 \\
\overline{U}_{j,H_n}, \ U_{j,H_n}, T = -\frac{1}{\sqrt{2}} \frac{\partial}{\partial \theta}; j = 1, \ldots, n-1
\end{cases}
\]

are orthonormal bases for the bundles \( T^{1,0} H_n \) and \( \mathcal{C}TH_n \), respectively. Then

\[
\{ dz_j, dz_j, \omega_0 = \sqrt{2} d\theta + \sum_{j=1}^{n-1} (i \lambda_j z_j dz_j - i \lambda_j z_j dz_j); j = 1, \ldots, n-1 \}
\]

is the basis of \( \mathcal{C}T^* H_n \) which is dual to \( \{ U_{j,H_n}, \overline{U}_{j,H_n}, -T; j = 1, \ldots, n-1 \} \). We take the Hermitian metric \( \langle \cdot, \cdot \rangle \) on \( \Lambda^a T^* H_n \) such that \( \{ dz_j : |J| = q, J \text{ strictly increasing} \} \) is an orthonormal basis of \( \Lambda^a T^* H_n \). The Cauchy-Riemann operator \( \delta_{b,H_n} \) on \( H_n \) is given by

\[
\delta_{b,H_n} = \sum_{j=1}^{n-1} dz_j \wedge U_{j,H_n} : \Omega^p(H_n) \to \Omega^{p+1}(H_n)
\]
Put $\psi_0(z, \theta) = \beta \theta + \sum_{j,t=1}^{n-1} \mu_{j,t} z_j \theta^t \in C^\infty(H_n, \mathbb{R})$, where $\beta$ and $\mu_{j,t}, j, t = 1, \ldots, n-1$, are as in (2.4). Note that

$$\sup_{(z, \theta) \in D_{log}k} |k F_k^* \phi_0 - \psi_0| \to 0, \text{ as } k \to \infty.$$  \hspace{1cm} (2.30)

Let $\langle \cdot | \cdot \rangle_{\psi_0}$ be the inner product on $\Omega_c^{0,q}(H_n)$ defined as follows:

$$\langle f | g \rangle_{\psi_0} = \int_{H_n} \langle f, g \rangle e^{-\psi_0} dv(z) dv(\theta), \quad f, g \in \Omega_c^{0,q}(H_n),$$

where $dv(z) = 2^{n-1} dx_1 dx_2 \cdots dx_{2n-2}, dv(\theta) = \sqrt{2} d\theta$. Let $\overline{\partial}^* : \Omega^{0,q+1}(H_n) \to \Omega^{0,q}(H_n)$ be the formal adjoint of $\partial b_{H_n}$ with respect to $\langle \cdot | \cdot \rangle_{\psi_0}$. We have

$$\overline{\partial}^* \psi_0 = \sum_{t=1}^{n-1} (dz_t \wedge)^* \overline{U}_{t,H_n}^{*,*} \psi_0 : \Omega^{0,q+1}(H_n) \to \Omega^{0,q}(H_n),$$

where

$$\overline{U}_{t,H_n}^{*,*} = -U_{t,H_n} + U_{t,H_n} \psi_0 = -U_{t,H_n} + \sum_{j=1}^{n-1} \mu_{j,t} z_j - \frac{1}{\sqrt{2}} \bar{\lambda}_j z_t \beta.$$  \hspace{1cm} (2.31)

The Kohn-Laplacian on $H_n$ is given by

$$\square^{(q)}_{b,H_n} = \partial_{b,H_n} \partial^*_{b,H_n} + \overline{\partial}^*_{b,H_n} \partial b_{H_n} : \Omega^{0,q}(H_n) \to \Omega^{0,q}(H_n).$$

From (2.29), (2.31) and (2.32), we can check that

$$\square^{(q)}_{b,H_n} = \sum_{j=1}^{n-1} \overline{U}_{j,H_n}^{*,*} (dz_j \wedge)^* \left[ \left( \mu_{j,t} - \frac{i}{\sqrt{2}} \lambda_j \delta_{j,t} \beta \right) + \frac{i}{\sqrt{2}} \bar{\lambda}_j \delta_{j,t} \frac{\partial}{\partial \theta} \right].$$

(2.34)

2.4. The estimates of the Szegö kernel function $\Pi_k^{(q)}$. We need the following

**Proposition 2.8.** For each $k$, pick an element $\alpha_k \in F_k^{*} \Omega^{0,q}(D_{log}k)$ with $\square^{(q)}_{s, \alpha_k} \alpha_k = 0$ and $\| \alpha_k \|_{kF_k^{*} \Omega^{0,q}(D_{log}k)} \leq 1$. Identify $\alpha_k$ with a form on $H_n$ by extending it with zero and write $\alpha_k = \sum_{|J|=q} \alpha_k r \in \mathbb{R}^q \frac{\xi}{r^q}$). Then there is a subsequence $\{ \alpha_{k_j} \}$ of $\{ \alpha_k \}$ such that for each strictly increasing multiindex $J$, $|J| = q$, $\alpha_{k_j}$ converges uniformly with all its derivatives on any compact subset of $H_n$ to a smooth function $\alpha_J$. Furthermore, if we put $\alpha = \sum_{|J|=q} \alpha_J d\xi_J$, then $\square^{(q)}_{b,H_n} \alpha = 0$.

**Proof.** Fix a strictly increasing multiindex $J$, $|J| = q$, and $r > 0$. From (2.26) and Remark 2.5, we see that for all $s > 0$, there is a constant $C_{r,s}$, is independent of $k$, such that $\| \alpha_{k,J} \|_{s, D_r} \leq C_{r,s}$ for all $k$. Rellich’s compactness theorem [35, p. 281] yields a subsequence $\{ \alpha_{k_j,J} \}$, which converges in all Sobolev spaces $W^s(D_r)$ for $s > 0$. From the Sobolev embedding theorem [35, p. 170], we see that the sequence converges in all $C^l(D_r), l \geq 0, l \in \mathbb{Z}$, locally uniformly. Choosing a diagonal sequence, with respect
to a sequence of $D_r$ exhausting $H_n$, we get a subsequence $\{\alpha_{k,j}\}$ of $\{\alpha_{k,j}^0\}$ such that $\alpha_{k,j}$ converges uniformly with all derivatives on any compact subset of $H_n$ to a smooth function $\alpha_j$.

Let $J'$ be another strictly increasing multiindex, $|J'| = q$. We can repeat the procedure above and get a subsequence $\{\alpha_{k,j,J'}\}$ of $\{\alpha_{k,j}^0\}$ such that $\alpha_{k,j,J'}$ converges uniformly with all derivatives on any compact subset of $H_n$ to a smooth function $\alpha_{J'}$. Continuing in this way, we get the first statement of the proposition.

Now, we prove the second statement of the proposition. Let $P = (p_1, \ldots, p_q)$, $R = (r_1, \ldots, r_q)$ be multiindices, $|P| = |R| = q$. Define

$$e_R^P = \begin{cases} 
0, & \text{if } \{p_1, \ldots, p_q\} \neq \{r_1, \ldots, r_q\}, \\
\text{the sign of permutation } (P R), & \text{if } \{p_1, \ldots, p_q\} = \{r_1, \ldots, r_q\}.
\end{cases}$$

For $j, t = 1, \ldots, n - 1$, define

$$\sigma_{R}^{j P} = \begin{cases} 
0, & \text{if } d\bar{z}_j \wedge (d\bar{z}_t)^* (d\bar{z}_P) = 0, \\
e_R^Q, & \text{if } d\bar{z}_j \wedge (d\bar{z}_t)^* (d\bar{z}_P) = d\bar{z}_Q, |Q| = q.
\end{cases}$$

We may assume that $\alpha_{k,j}$ converges uniformly with all derivatives on any compact subset of $H_n$ to a smooth function $\alpha_j$, for all strictly increasing $J$, $|J| = q$. Since $\Box_{b,H_n}^q \alpha_k = 0$, from the explicit formula of $\Box_{b,H_n}^q$ (see Prop. 2.3), it is not difficult to see that for all strictly increasing $J$, $|J| = q$, we have

$$\sum_{j=1}^{n-1} \sum_{1 \leq j, t \leq n-1} \sigma_{R}^{j P} \left( \left( \mu_{j,t} - \frac{i}{\sqrt{2}} \lambda_j \delta_{j,t} \beta \right) + \sqrt{2} \delta_{j,t} \beta \frac{\partial}{\partial \theta} \right) \alpha_{k,P} + \epsilon_k P_{k,J} \alpha_k$$

(2.35)

on $D_{\log k}$, where $\epsilon_k$ is a sequence tending to zero with $k \to \infty$ and $P_{k,J}$ is a second order differential operator and all the derivatives of the coefficients of $P_{k,J}$ are uniformly bounded in $k$ on $D_{\log k}$. By letting $k \to \infty$ in (2.35) we get

$$\sum_{j=1}^{n-1} \sum_{1 \leq j, t \leq n-1} \sigma_{R}^{j P} \left( \left( \mu_{j,t} - \frac{i}{\sqrt{2}} \lambda_j \delta_{j,t} \beta \right) + \sqrt{2} \delta_{j,t} \beta \frac{\partial}{\partial \theta} \right) \alpha_P$$

(2.36)

on $H_n$, for all strictly increasing $J$, $|J| = q$. From this and the explicit formula of $\Box_{b,H_n}^q$ (see (2.34)), we conclude that $\Box_{b,H_n}^q \alpha = 0$. The proposition follows. \hfill \Box

Now, we can prove the main result of this section. In analogy to (2.1) we define the extremal functions $S_{J,H_n}^q$ on the Heisenberg group along the direction $d\bar{z}_j$ is defined by

$$S_{J,H_n}^q(0) = \sup \{ |\alpha_J(0)|^2 ; \Box_{b,H_n}^q \alpha = 0, \|\alpha\|_{H_0} = 1 \}.$$ (2.37)

where $\alpha = \sum_{|J| = q} \alpha_J d\bar{z}_J$.

**Theorem 2.9.** We have

$$\limsup_{k \to \infty} k^{-n} \Pi_{k}^{q}(0) \leq \sum_{|J| = q} S_{J,H_n}^q(0).$$
Proof. Fix a strictly increasing \( J, |J| = q \). We claim that
\[
(2.38) \quad \limsup_{k \to \infty} k^{-n} S_{k,J}^{[q]}(0) \leq S_{J,H_n}^{[q]}(0).
\]
The definition (2.1) of the extremal function yields a sequence \( \alpha_{k,j} \in H^q_k(X, L^k) \), \( k_1 < k_2 < \ldots \), such that \( \|\alpha_{k,j}\| = 1 \) and
\[
(2.39) \quad \lim_{j \to \infty} k^{-n} \left| \alpha_{k,j}(0) \right|^2 = \limsup_{k \to \infty} k^{-n} S_{k,J}^{[q]}(0),
\]
where \( \alpha_{k,j} \) is the component of \( \alpha_{k,j} \) in the direction of \( e_j \). On \( D_{\log k_j} \), put
\[
\beta_{k, j} = k_j^{-\frac{n}{2}} F_{k_j}^* \left( e^{-k_j R} \alpha_{k,j} \right) \in F_{k,j}^* \Omega^{0,q}(D_{\log k_j}).
\]
It is easy to see that
\[
\|\beta_{k, j}\|_{k_j, F_{k,j}^* P_{s(k,j)}} \leq 1 \quad \text{and} \quad \Box_{k, j}^{(q)} \beta_{k, j} = 0 \quad \text{on} \quad D_{\log k_j}.
\]
Proposition 2.8 yields a subsequence \( \{\beta_{k,j}\} \) of \( \{\beta_{k,j}\} \) such that for each \( J, \beta_{k,j} \) converges uniformly with all derivatives on any compact subset of \( H_n \) to a smooth function \( \beta_{J} \). Set \( \beta = \sum_{|J|=q} \beta_{J} d\bar{z}^p \). Then we have \( \Box_{b,H_n} \beta = 0 \) and, by (2.30), \( \|\beta\|_{\psi_0} \leq 1 \). Thus,
\[
(2.40) \quad |\beta_{J}(0)|^2 \leq \frac{|\beta_{J}(0)|^2}{\|\beta\|_{\psi_0}^2} \leq S_{J,H_n}^{[q]}(0).
\]
Note that
\[
(2.41) \quad \lim_{j \to \infty} k^{-n} \left| \alpha_{k,j}(0) \right|^2 = \lim_{j \to \infty} |\beta_{k,j}(0)|^2 = |\beta_{J}(0)|^2.
\]
The estimate (2.38) follows from (2.39), (2.40) and (2.41). Finally, Lemma 2.1 and (2.38) imply the conclusion of the theorem. \( \square \)

3. The Szegő kernel function on the Heisenberg group \( H_n \)

In this section, we will use the same notations as in section 2.3 and we work with the assumption that condition \( Y(\theta) \) holds at each point of \( X \). The main goal of this section is to compute \( \sum_{|J|=q} S_{J,H_n}^{[q]}(0) \).

3.1. The partial Fourier transform. Let \( u(z, \theta) \in \Omega^{0,q}(H_n) \) with \( \|u\|_{\psi_0} = 1 \) and \( \Box_{b,H_n}^{[q]} u = 0 \). Put \( \psi(z, \theta) = u(z, \theta) e^{-\frac{c}{2} \theta} \) and set \( \Phi_0 = \sum_{j=1}^{n-1} \mu_j, t \), \( \zeta_j \). We have
\[
\int_{H_n} |\psi(z, \theta)|^2 e^{-\phi_0(z)} \psi(z) d\psi(\theta) = 1.
\]
Let us denote by \( L^2_{\Omega^{0,q}}(H_n, \Phi_0) \) the completion of \( \Omega^{0,q}(H_n) \) with respect to the norm
\[
\| \cdot \|_{\Phi_0}^2 = \int_{H_n} |u|^2 e^{-\Phi_0(z)} \psi(z) d\psi(\theta), \quad u \in \Omega^{0,q}(H_n).
\]
Choose \( \chi(\theta) \in C_0^{\infty}(\mathbb{R}) \) so that \( \chi(\theta) = 1 \) when \( |\theta| < 1 \) and \( \chi(\theta) = 0 \) when \( |\theta| > 2 \) and set \( \chi_j(\theta) = \chi(\theta/j), j \in \mathbb{N} \). Let
\[
(\psi_j(z, \eta) = \int_{\mathbb{R}} \psi(z, \theta) \chi_j(\theta) e^{-\theta \eta} d\psi(\theta) \in \Omega^{0,q}(H_n), j = 1, 2, \ldots.
\]
From Parseval’s formula, we have
\[
\int_{H_n} |\hat{v}_j(z, \eta) - \hat{v}_i(z, \eta)|^2 e^{-\Phi_0(z)} \, dv(\eta) \, dv(z) = 4\pi \int_{H_n} |u(z, \theta)|^2 |\chi_j(\theta) - \chi_i(\theta)|^2 e^{-\Phi_0(z)} \, dv(\theta) \, dv(z) \to 0, \quad j, t \to \infty.
\]

Thus, there is \( \hat{v}(z, \eta) \in L^2_{(0, q)}(H_n, \Phi_0) \) such that \( \hat{v}_j(z, \eta) \to \hat{v}(z, \eta) \) in \( L^2_{(0, q)}(H_n, \Phi_0) \). We call \( \hat{v}(z, \eta) \) the Fourier transform of \( u(z, \theta) \) with respect to \( \theta \). Formally,
\[
(3.2) \quad \hat{v}(z, \eta) = \int_{\mathbb{R}} e^{-i\theta \eta} u(z, \theta) \, d\theta.
\]

Moreover, we have
\[
\int_{H_n} |\hat{v}(z, \eta)|^2 e^{-\Phi_0(z)} \, dv(\eta) \, dv(z) = \lim_{j \to \infty} \int_{H_n} |\hat{v}_j(z, \eta)|^2 e^{-\Phi_0(z)} \, dv(\eta) \, dv(z) = 4\pi < \infty.
\]

From Fubini’s theorem, \( \int_{\mathbb{R}^{n-1}} |\hat{v}(z, \eta)|^2 e^{-\Phi_0(z)} \, dv(\eta) < \infty \) for almost all \( \eta \in \mathbb{R} \). More precisely, there is a negligible set \( A_0 \subset \mathbb{R} \) such that \( \int_{\mathbb{R}^{n-1}} |\hat{v}(z, \eta)|^2 e^{-\Phi_0(z)} \, dv(\eta) < \infty \), for every \( \eta \notin A_0 \).

Let \( s \in L^2_{(0, q)}(H_n, \Phi_0) \). Assume that \( \int |s(z, \eta)|^2 \, dv(\eta) < \infty \) and \( \int |s(z, \eta)| \, dv(\eta) < \infty \) for all \( z \in \mathbb{C}^{n-1} \). Then, from Parseval’s formula, we can check that
\[
(3.4) \quad \int \int \langle \hat{v}(z, \eta), s(z, \eta) \rangle e^{-\Phi_0(z)} \, dv(\eta) \, dv(z) = \int \int \langle u(z, \theta) e^{-\frac{\theta}{2}}, e^{i\theta} \eta s(z, \eta) \rangle e^{-\Phi_0(z)} \, dv(\theta) \, dv(z).
\]

We pause and introduce some notations. For fixed \( \eta \in \mathbb{R} \), put
\[
\Phi_\eta = -\sqrt{2} \eta \sum_{j=1}^{n-1} \lambda_j |z_j|^2 + \sum_{j,t=1}^{n-1} \mu_{j,t} z_j z_t \in C^\infty(\mathbb{C}^{n-1}; \mathbb{R}).
\]

We take the Hermitian metric \( \langle \cdot, \cdot \rangle \) on the bundle \( \Lambda^0, q T^* \mathbb{C}^{n-1} \) of \( (0, q) \) forms of \( \mathbb{C}^{n-1} \) so that \( \{ dz_j; |J| = q, J \text{ strictly increasing} \} \) is an orthonormal basis. We also let \( \Omega^0, q(\mathbb{C}^{n-1}) \) denote the space of smooth sections of \( \Lambda^0, q T^* \mathbb{C}^{n-1} \) over \( \mathbb{C}^{n-1} \). Let \( \Omega^0, q_c(\mathbb{C}^{n-1}) \) be the subspace of \( \Omega^0, q(\mathbb{C}^{n-1}) \) whose elements have compact support in \( \mathbb{C}^{n-1} \) and let \( \langle \cdot, \cdot \rangle_{\Phi_\eta} \) be the inner product on \( \Omega^0, q_c(\mathbb{C}^{n-1}) \) defined by
\[
(f, g)_{\Phi_\eta} = \int_{\mathbb{C}^{n-1}} \langle f, g \rangle e^{-\Phi_\eta(z)} \, dv(z), \quad f, g \in \Omega^0, q_c(\mathbb{C}^{n-1}).
\]

Let
\[
(3.6) \quad \Box^{(q)}_{\Phi_\eta} = \overline{\partial}^{(q)} \Phi_\eta \overline{\partial} + \overline{\partial}^{(q)} \Phi_\eta : \Omega^0, q(\mathbb{C}^{n-1}) \to \Omega^0, q(\mathbb{C}^{n-1})
\]

20
be the complex Laplacian with respect to \(( | )_{\Phi_n}\), where \(\overline{\partial}^{*} \Phi_n\) is the formal adjoint of \(\overline{\partial}\) with respect to \(( | )_{\Phi_n}\). We can check that

\[
\Box_{\Phi_n}^{(q)} = \sum_{t=1}^{n-1} \left(-\frac{\partial}{\partial z_t} - \sqrt{2} \lambda_t z_t \eta + \sum_{j=1}^{n-1} \mu_{j,t} z_j\right) \frac{\partial}{\partial z_t} + \sum_{j,t=1}^{n-1} (dz_j \wedge (dz_t \wedge)^{*} (\mu_{j,t} - \sqrt{2} \lambda_j \eta \delta_{j,t}).
\]

(3.7)

Now, we return to our situation. We identify \(\Lambda^{0,\sigma} T^{*} \mathbb{C}^{n-1}\) with respect to \(\Phi_n\).

\[
\Box_{\Phi_n}^{(q)} \alpha(z, \eta) = \Box_{\Phi_n}^{(q)} \alpha(z, \eta) = 0
\]

in the sense of distributions. Thus \(\alpha(z, \eta) \in \Omega^{0,\sigma}(\mathbb{C}^{n-1})\) for almost all \(\eta \in \mathbb{R}\).

**Proof.** Let \(A_0 \subset \mathbb{R}\) be as in the discussion after (3.3). Thus, for all \(\eta \notin A_0\),

\[
\int_{\mathbb{C}^{n-1}} |\Box_{\Phi_n}^{(q)} \alpha(z, \eta)|^2 e^{-\Phi_0(z)} dv(z) = \int_{\mathbb{C}^{n-1}} |\Box_{\Phi_n}^{(q)} \alpha(z, \eta)|^2 e^{-\Phi_0(z)} dv(z) < \infty.
\]

(3.8)

We remind that \(\Box_{\Phi_n}^{(q)} \alpha(z, \eta)\) is given by (3.2).

**Theorem 3.1.** For almost all \(\eta \in \mathbb{R}\), we have \(\int_{\mathbb{C}^{n-1}} |\alpha(z, \eta)|^2 e^{-\Phi_0(z)} dv(z) < \infty\) and

\[
\Box_{\Phi_n}^{(q)} \alpha(z, \eta) = 0
\]

in the sense of distributions. Thus \(\alpha(z, \eta) \in \Omega^{0,\sigma}(\mathbb{C}^{n-1})\) for almost all \(\eta \in \mathbb{R}\).

\[
\int_{\mathbb{C}^{n-1}} \Box_{\Phi_n}^{(q)} f(z) e^{-\Phi_0(z)} dv(z) = 0
\]

if \(\eta \notin A_0\), \(h(\eta) = 0\) if \(\eta \in A_0\). We can check that

\[
|h(\eta)|^2 \leq \int_{\mathbb{C}^{n-1}} |\alpha(z, \eta)|^2 e^{-\Phi_0(z)} dv(z) \int_{\mathbb{C}^{n-1}} |\Box_{\Phi_n}^{(q)} f|^2 e^{-\Phi_0(z)} dv(z).
\]

(3.10)

For \(R > 0\), put \(\varphi_R(\eta) = I_{[-R,R]}(\eta) \overline{h}(\eta)\), where \(I_{[-R,R]}(\eta) = 1\) if \(-R \leq \eta \leq R\), \(I_{[-R,R]}(\eta) = 0\) if \(\eta < -R\) or \(\eta > R\). From (3.10), we have

\[
\int_{-R}^{R} \varphi_R(\eta) dv(\eta) = \int_{-R}^{R} |h(\eta)|^2 dv(\eta)
\]

\[
\leq C \int_{\mathbb{C}^{n-1}} |\alpha(z, \eta)|^2 e^{-\Phi_0(z)} dv(\eta) dv(z) = C \int_{\mathbb{C}^{n-1}} \Box_{\Phi_n}^{(q)} f e^{-\Phi_0(z)} dv(\eta) dv(z) < \infty,
\]

where \(C > 0\). Thus, \(\varphi_R(\eta) \in L^2(\mathbb{R}) \cap L^1(\mathbb{R})\). Set \(\lambda |z|^2 := \sum_{j=1}^{n-1} \lambda_j |z_j|^2\). We have

\[
\int_{-R}^{R} h(\eta) \varphi_R(\eta) dv(\eta) = \int_{-R}^{R} |h(\eta)|^2 dv(\eta)
\]

\[
= \int_{\mathbb{C}^{n-1}} \overline{\alpha(z, \eta)} \Box_{\Phi_n}^{(q)} f(z) e^{-\Phi_0(z)} \varphi_R(\eta) dv(\eta) dv(z)
\]

\[
= \int_{\mathbb{C}^{n-1}} \overline{\Box_{\Phi_n}^{(q)} f(z)} \varphi_R(\eta) e^{-\Phi_0(z)} dv(\eta) dv(z)
\]

\[
= \int_{\mathbb{C}^{n-1}} u(\eta, \theta) e^{-\left(\frac{\theta}{2} - \frac{1}{2} \eta \right)} \int_{\mathbb{C}^{n-1}} \Box_{\Phi_n}^{(q)} e^{-\Phi_0(z)} dv(\eta) dv(z)
\]

\[
= \int_{\mathbb{C}^{n-1}} \overline{u}(\eta, \theta) e^{-\left(\frac{\theta}{2} - \frac{1}{2} \eta \right)} \int_{\mathbb{C}^{n-1}} \Box_{\Phi_n}^{(q)} e^{-\Phi_0(z)} dv(\eta) dv(z).
\]

(3.12)
From Lemma 3.2 below, we know that
\[
\int e^{i\varphi_\eta}e^{-\left(\frac{1}{2\sigma^2}-\frac{1}{2\sigma^2}\right)\lambda|\eta|^2+\frac{2}{\sigma^2}\varphi_\eta} f(z)\varphi_R(\eta) dv(\eta) \\
\begin{align*}
&= \Box_{b,H_n}^{(q)} \left( \int e^{i\varphi_\eta}e^{-\left(\frac{1}{2\sigma^2}-\frac{1}{2\sigma^2}\right)\lambda|\eta|^2+\frac{2}{\sigma^2}\varphi_\eta} f(z)\varphi_R(\eta) dv(\eta) \right).
\end{align*}
\]
(3.13)

Put
\[
S(z,\theta) = \int e^{i\varphi_\eta}e^{-\left(\frac{1}{2\sigma^2}-\frac{1}{2\sigma^2}\right)\lambda|\eta|^2+\frac{2}{\sigma^2}\varphi_\eta} f(z)\varphi_R(\eta) dv(\eta).
\]
(3.14)

From (3.13) and (3.14), (3.12) becomes
\[
\int_{-R}^{R} |h(\eta)|^2 dv(\eta) = \int \langle u(z,\theta), \Box_{b,H_n}^{(q)} S(z,\theta) \rangle e^{-\varphi_\eta(z,\theta)} dv(\theta) dv(z).
\]
(3.15)

Choose \( \chi(\theta) \in C^\infty_0(\mathbb{R}) \) so that \( \chi(\theta) = 1 \) when \( |\theta| < 1 \) and \( \chi(\theta) = 0 \) when \( |\theta| > 2 \). Then,
\[
\int_{-R}^{R} |h(\eta)|^2 dv(\eta) = \lim_{j \to \infty} \int \langle u(z,\theta), \chi(\theta) \Box_{b,H_n}^{(q)} S(z,\theta) \rangle e^{-\varphi_\eta(z,\theta)} dv(\theta) dv(z)
\]
\[
= \lim_{j \to \infty} \left( \int \langle \Box_{b,H_n}^{(q)} u(z,\theta), \chi(\theta) S(z,\theta) \rangle e^{-\varphi_\eta(z,\theta)} dv(\theta) dv(z) \right)
\]
\[
+ \int \langle u(z,\theta), [\chi(\theta), \Box_{b,H_n}^{(q)}] S(z,\theta) \rangle e^{-\varphi_\eta(z,\theta)} dv(\theta) dv(z)
\]
(3.16)

We can check that \( [\chi(\theta), \Box_{b,H_n}^{(q)}] \) is a first order partial differential operator and all the coefficients of \( [\chi(\theta), \Box_{b,H_n}^{(q)}] \) converge to 0 as \( j \to \infty \) uniformly in \( \theta \) and locally uniformly in \( z \). Moreover, from Parseval’s formula, (3.11) and (3.14), we can check that
\[
\sum_{|\alpha| \leq 1} \int |\partial_{x,z}^\alpha S|^2 e^{-\varphi_\eta} dv(\theta) dv(z)
\]
\[
\leq C \sum_{|\alpha| \leq 1} \int (1 + |\eta| + |z| |\eta|)^2 |\partial_{x,z}^\alpha f|^2 |\varphi_R(\eta)|^2 e^{-\varphi_\eta(z)} dv(z) dv(\eta)
\]
\[
\leq \tilde{C} \int |\varphi_R(\eta)|^2 dv(\eta) < \infty,
\]
whit constants \( C > 0, \tilde{C} > 0 \). Thus,
\[
\lim_{j \to \infty} \int \langle u(z,\theta), [\chi(\theta), \Box_{b,H_n}^{(q)}] S(z,\theta) \rangle e^{-\varphi_\eta(z,\theta)} dv(\theta) dv(z) = 0.
\]

From this and (3.16), we conclude that \( \int_{-R}^{R} |h(\eta)|^2 dv(\eta) = 0 \). Letting \( R \to \infty \), we get \( h(\eta) = 0 \) almost everywhere. We have proved that for a given \( f(z) \in \mathcal{C}_0^\infty(\mathbb{C}^{n-1}) \), \( f_{C_{\varphi,\varphi}}(\alpha(\varphi_\eta, \varphi_R)) \Box_{b,H_n}^{(q)} f(z) e^{-\varphi_R(z)} dv(z) = 0 \) almost everywhere.

Let us consider the Sobolev space \( W^2(\mathbb{C}^{n-1}) \) of distributions in \( \mathbb{C}^{n-1} \) whose derivatives of order \( \leq 2 \) are in \( L^2 \). The space of forms of type \( (0, q) \) with coefficients in this space is accordingly denoted \( W^2_{(0,q)}(\mathbb{C}^{n-1}) \). Since \( W^2_{(0,q)}(\mathbb{C}^{n-1}) \) is separable and \( \mathcal{C}_0^\infty(\mathbb{C}^{n-1}) \) is dense in \( W^2_{(0,q)}(\mathbb{C}^{n-1}) \), we can find \( f_j \in \mathcal{C}_0^\infty(\mathbb{C}^{n-1}) \), \( j = 1, 2, \ldots \), such that \( \{ f_1, f_2, \ldots \} \) is a dense subset of \( W^2_{(0,q)}(\mathbb{C}^{n-1}) \). Moreover, we can take \( \{ f_1, f_2, \ldots \} \) so that for all \( g \in \mathcal{C}_0^\infty(\mathbb{C}^{n-1}) \) with \( \text{supp} \ g \subset B_r := \{ z \in \mathbb{C}^{n-1}; |z| < r \} \), \( r > 0 \), we can find \( f_{j_1}, f_{j_2}, \ldots, \text{supp} \ f_{j_t} \subset B_r, t = 1, 2, \ldots \), such that \( f_{j_t} \to g \) for \( t \to \infty \) in \( W^2_{(0,q)}(\mathbb{C}^{n-1}) \).
Lemma 3.2. \[ (3.17) \]

Now, \( f = j \) for \( j = 0 \). Let \( f \in \Omega^0 (\mathbb{C}^{n-1}) \) with \( \supp f \subset \mathcal{B} \). From the discussion above, we can find \( f_{j_1}, f_{j_2}, \ldots, \supp f_{j_t} \subset \mathcal{B} \), \( t = 1, 2, \ldots \), such that \( f_{j_t} \to f \) in \( W_{1,0}^2 (\mathbb{C}^{n-1}) \), \( t \to \infty \). Then, for \( \eta \notin A \),

\[
(\alpha (z, \eta) | \Box_{\phi_n} (q) g \phi_n) = (\alpha (z, \eta) | \Box_{\phi_n} (g - f_{j_t}) \phi_n) + (\alpha (z, \eta) | \Box_{\phi_n} f_{j_t} \phi_n).
\]

Now,

\[
| (\alpha (z, \eta) | \Box_{\phi_n} (g - f_{j_t}) \phi_n) | = \left| \int_{\mathcal{B}_c} \langle \alpha (z, \eta), \Box_{\phi_n} (g - f_{j_t}) \rangle e^{-\phi_n (z)} dv(z) \right|
\]

\[
\leq C \sum_{|\lambda| = 1} \int | \Box_{\phi_n} (g - f_{j_t}) |^2 dv(z) \to 0, \quad t \to \infty.
\]

Thus, for \( \eta \notin A, (\alpha (z, \eta) | \Box_{\phi_n} (q) g \phi_n) = 0 \) for all \( g \in \Omega^0_c (\mathbb{C}^{n-1}) \). The theorem follows. \( \square \)

Lemma 3.2. Let \( f \in \Omega^0_c (\mathbb{C}^{n-1}) \). Let \( \varphi (\eta) \in L^2 (\mathbb{R}) \) with compact support. Then, we have

\[
\int e^{i\theta} e^{-\left( \frac{i \theta}{2 |z|^2} - \frac{1}{2 |z|^2} \right) \lambda |z|^2 + \frac{\rho}{2} |g|} \Box_{\phi_n} f (z) \varphi (\eta) dv(\eta)
\]

\[
= \Box_{\phi_n} \left( \int e^{i\theta} e^{-\left( \frac{i \theta}{2 |z|^2} - \frac{1}{2 |z|^2} \right) \lambda |z|^2 + \frac{\rho}{2} g (z) \varphi (\eta) dv(\eta) \right),
\]

where \( \lambda |z|^2 = \sum_{j=1}^{n-1} \lambda_j |z_j|^2 \).

Proof. For any \( g \in \Omega^0_c (\mathbb{C}^{n-1}) \), we can check that

\[
\mathcal{U}_{t, \eta} \left( \int e^{i\theta} e^{-\left( \frac{i \theta}{2 |z|^2} - \frac{1}{2 |z|^2} \right) \lambda |z|^2 + \frac{\rho}{2} g (z) \varphi (\eta) dv(\eta) \right)
\]

\[
= \left( \frac{\partial}{\partial z_t} + \frac{1}{\sqrt{2}} i \lambda_t z_t \frac{\partial}{\partial \theta} \right) \left( \int e^{i\theta} e^{-\left( \frac{i \theta}{2 |z|^2} - \frac{1}{2 |z|^2} \right) \lambda |z|^2 + \frac{\rho}{2} g (z) \varphi (\eta) dv(\eta) \right)
\]

\[
= \int e^{i\theta} e^{-\left( \frac{i \theta}{2 |z|^2} - \frac{1}{2 |z|^2} \right) \lambda |z|^2 + \frac{\rho}{2} \frac{\partial g}{\partial z_t} \varphi (\eta) dv(\eta),
\]

where \( t = 1, \ldots, n-1 \),

\[
\mathcal{U}_{t, \eta} \left( \int e^{i\theta} e^{-\left( \frac{i \theta}{2 |z|^2} - \frac{1}{2 |z|^2} \right) \lambda |z|^2 + \frac{\rho}{2} g (z) \varphi (\eta) dv(\eta) \right)
\]

\[
= \left( - \frac{\partial}{\partial z_t} + \frac{1}{\sqrt{2}} i \lambda_t z_t \frac{\partial}{\partial \theta} + \sum_{j=1}^{n-1} \mu_j t \frac{z_j}{z_t} - \frac{1}{\sqrt{2}} \lambda_t \frac{z_t}{z_j} \beta_j \right) \left( \int e^{i\theta} e^{-\left( \frac{i \theta}{2 |z|^2} - \frac{1}{2 |z|^2} \right) \lambda |z|^2 + \frac{\rho}{2} g (z) \varphi (\eta) dv(\eta) \right)
\]

\[
= \int e^{i\theta} e^{-\left( \frac{i \theta}{2 |z|^2} - \frac{1}{2 |z|^2} \right) \lambda |z|^2 + \frac{\rho}{2} \left( - \frac{\partial g}{\partial z_t} + \sum_{j=1}^{n-1} \mu_j t \frac{z_j}{z_t} g - \sqrt{2} \lambda_t \frac{z_t}{z_j} \eta \right) \varphi (\eta) dv(\eta),
\]

23
where \( t = 1, \ldots, n - 1 \), and
\[
(3.20) \quad B^{(q)}_{\eta}(z, w) = \int_{\Omega^0_\eta} B^{(q)}_{\eta}(z, w) u(w) e^{-\Phi_{\eta}(w)} dv(w), \quad u \in L^2_{(0,q)}(\mathbb{C}^{n-1}, \Phi_{\eta})
\]
be the distribution kernel of \( B^{(q)}_{\eta} \) with respect to \( ( | )_{\Phi_{\eta}} \). We take the Hermitian metric \( \langle \cdot, \cdot \rangle \) on \( T^1_{z,0}\mathbb{C}^{n-1} \), \( z \in \mathbb{C}^{n-1} \), so that \( \frac{\partial}{\partial z_j}, j = 1, \ldots, n - 1 \), is an orthonormal basis. Let
\[
(3.21) \quad M_{\Phi_{\eta}} : T^1_{z,0}\mathbb{C}^{n-1} \rightarrow T^1_{z,0}\mathbb{C}^{n-1}, \quad z \in \mathbb{C}^{n-1}
\]
be the linear map defined by \( \langle M_{\Phi_{\eta}} U, V \rangle = \langle \partial \overline{\partial} \Phi_{\eta}, U \wedge \overline{V} \rangle, U, V \in T^1_{z,0}\mathbb{C}^{n-1} \). Put
\[
(3.22) \quad \mathbb{R}_{q} := \{ \eta \in \mathbb{R}; M_{\Phi_{\eta}} \text{ has exactly } q \text{ negative eigenvalues} \}
\]
and \( n - 1 - q \) positive eigenvalues\}. The following result is essentially well-known (see Wu-Zhang [33], Berman [5] and Marinescu [27, §8.2]).

**Theorem 3.3.** If \( \eta \notin \mathbb{R}_{q} \), then \( B^{(q)}_{\Phi_{\eta}}(z, z) = 0 \), for all \( z \in \mathbb{C}^{n-1} \). If \( \eta \in \mathbb{R}_{q} \), let \( (Z_{j}^{(q)}(\eta))_{j=1}^{n-1} \) be an orthonormal frame of \( T_{z,0}\mathbb{C}^{n-1} \), for which \( M_{\Phi_{\eta}} \) is diagonal. We assume that \( M_{\Phi_{\eta}} Z_{j}^{(q)}(\eta) = \nu_{j}(\eta) Z_{j}^{(q)}(\eta) \) for \( j = 1, \ldots, n - 1 \), with \( \nu_{j}(\eta) < 0 \) for \( j = 1, \ldots, q \) and \( \nu_{j}(\eta) > 0 \) for \( j = q + 1, \ldots, n - 1 \). Let \( (T_{j}(\eta))_{j=1}^{n-1} \), denote the basis of \( T_{z,0}\mathbb{C}^{n-1} \), which is dual to \( (Z_{j}^{(q)}(\eta))_{j=1}^{n-1} \). Then,
\[
(3.23) \quad B^{(q)}_{\Phi_{\eta}}(z, z) = e^{\Phi_{\eta}(z)}(2\pi)^{-n+1} |\nu_{1}(\eta)||\cdots||\nu_{n-1}(\eta)|| \prod_{j=1}^{q} T_{j}(\eta) \wedge (T_{j}(\eta) \wedge)^{\ast}.
\]
In particular,
\[
\text{Tr } B^{(q)}_{\Phi_n}(z,z) := \sum_{|J|=q} \langle B^{(q)}_{\Phi_n}(z,z) dz_J, dz_J \rangle \\
= e^{\Phi_n(z) (2\pi)^{-n+1}} |\nu_1(\eta)| \cdots |\nu_{n-1}(\eta)| 1_{\mathbb{R}_q}(\eta) \\
= e^{\Phi_n(z) (2\pi)^{-n+1}} |\det M_{\Phi_n}| 1_{\mathbb{R}_q}(\eta),
\]
(3.24)
where $1_{\mathbb{R}_q}(\eta)$ is the characteristic function of $\mathbb{R}_q$.

Remark 3.4. We recall that $\Phi_n = -\sqrt{2} \eta \sum_{j=1}^{n-1} \lambda_j |z_j|^2 + \sum_{j,t=1}^{n-1} \mu_{j,t} z_j \bar{z}_t$. Since $Y(q)$ holds, we conclude that $\mathbb{R}_q \subset [-R, R]$ for some $R > 0$.

We return to our situation. Let $u(z,\theta) \in \Omega^{0,q}(H_n)$, $\|u\|_{\psi_0} = 1$, $\square_{\Phi_n}^{(q)} u = 0$. As before, let $\hat{u}(z,\eta)$ be the Fourier transform of $u(z,\theta)e^{-\frac{\theta^2}{4}}$ with respect to $\theta$. From Theorem 3.1, we know that for $\alpha$ defined in (3.8) we have
\[
\alpha(z, \eta) \in \ker \square_{\Phi_n}^{(q)} \cap L^2_{(0,q)}(\mathbb{C}^{n-1}, \Phi_n) \cap \Omega^{0,q}(\mathbb{C}^{n-1})
\]
for almost all $\eta \in \mathbb{R}$. Thus, $\alpha(z, \eta) = \int_{\mathbb{C}^{n-1}} B^{(q)}_{\Phi_n}(z,w) \alpha(w, \eta) e^{-\Phi_n(w)} dv(w)$ for almost all $\eta \in \mathbb{R}$. Put $\hat{v}(z, \eta) = \int_{|J|=q} \hat{v}_j(z, \eta) dz_j$.

Lemma 3.5. Let $J$ be a strictly increasing index, $|J| = q$, and $z \in \mathbb{C}^{n-1}$. Then, for almost all $\eta \in \mathbb{R}$, the following estimate holds:
\[
|\hat{v}_j(z, \eta)|^2 \leq e^{2\sqrt{2} \eta \sum_{j=1}^{n-1} \lambda_j |z_j|^2} \langle B^{(q)}_{\Phi_n}(z,z) dz_J, dz_J \rangle \int_{\mathbb{C}^{n-1}} |\hat{v}(w, \eta)|^2 e^{-\Phi_n(w)} dv(w).
\]
(3.26)
Proof. Let $\varphi \in C_0^\infty(\mathbb{C}^{n-1})$ such that $\int_{\mathbb{C}^{n-1}} \varphi(z) dv(z) = 1$, $\varphi \geq 0$, $\varphi(z) = 0$ if $|z| > 1$. Put $f_j(z) = j^{2n-2} \varphi(jz) e^{\Phi_n(z)}$, $j = 1, 2, \ldots$. Then,
\[
\int_{\mathbb{C}^{n-1}} f_j(z) e^{-\Phi_n(z)} dv(z) = 1, \quad f_j(z) \to \delta_0
\]
in the sense of distributions with respect to $\langle \varphi_z \rangle$, that is, $(h(z) | f_j(z))_{\Phi_n} \to h(0)$, $j \to \infty$, for all $h \in C^\infty(\mathbb{C}^{n-1})$. Thus, for almost all $\eta \in \mathbb{R}$,
\[
\left| e^{\frac{\eta}{2} \sum_{j=1}^{n-1} \lambda_j |z_j|^2} \hat{v}_j(z_0, \eta) \right| = |\alpha_j(z_0, \eta)| = \lim_{j \to \infty} \left| (\alpha(z, \eta) | f_j(z-z_0) dz_J)_{\Phi_n} \right|
\]
\[
= \lim_{j \to \infty} \left| (B^{(q)}_{\Phi_n} | f_j(z-z_0) dz_J)_{\Phi_n} \right| = \lim_{j \to \infty} \left| (\alpha | B^{(q)}_{\Phi_n}(f_j(z-z_0) dz_J))_{\Phi_n} \right|,
\]
(3.27)
for all $z_0 = (z_0,1, z_0,2, \ldots, z_0, n-1) \in \mathbb{C}^{n-1}$. Now,
\[
|(\alpha(z, \eta) | B^{(q)}_{\Phi_n}(f_j(z-z_0) dz_J))_{\Phi_n}|^2 \leq |\alpha|_{\Phi_n}^2 \| B^{(q)}_{\Phi_n}(f_j(z-z_0) dz_J) \|_{\Phi_n}^2
\]
and
\[
|\alpha|_{\Phi_n}^2 \| B^{(q)}_{\Phi_n}(f_j(z-z_0) dz_J) \|_{\Phi_n}^2 = |\hat{v}|_{\Phi_n}^2 B^{(q)}_{\Phi_n}(f_j(z-z_0) dz_J)_{\Phi_n}
\]
\[
(3.28)
\]
(3.29)
From (3.27), (3.28) and (3.29), we get for all $z_0 \in \mathbb{C}^{n-1}$,
\[
\left| e^{\frac{\eta}{2} \sum_{j=1}^{n-1} \lambda_j |z_j|^2} \hat{v}_j(z_0, \eta) \right|^2 \leq |\hat{v}|_{\Phi_n}^2 \langle B^{(q)}_{\Phi_n}(z_0, z_0) dz_J, dz_J \rangle
\]
(3.24)
for almost all \( \eta \in \mathbb{R} \). The lemma follows. \( \square \)

Put \( u(z, \theta) = \sum_{|J|=q} u_J(z, \theta) d\mathbb{Z}_J \).

**Proposition 3.6.** For \( |J| = q \), \( J \) is strictly increasing, we have

\[
|u_J(0, 0)|^2 \leq \frac{1}{4\pi} \int_{\mathbb{R}} (B_{\Phi_j}(0, 0) d\mathbb{Z}_J, d\mathbb{Z}_J) d\nu(\eta).
\]

**Proof.** Let \( \chi \in C_0^\infty(\mathbb{R}), \int_{\mathbb{R}} \chi d\nu(\theta) = 1, \chi \geq 0 \) and \( \chi_\varepsilon \in C_0^\infty(\mathbb{R}), \chi_\varepsilon(\theta) = \frac{1}{\varepsilon} \chi(\frac{\theta}{\varepsilon}) \). Then, \( \chi_\varepsilon \to \delta_0, \varepsilon \to 0^+ \) in the sense of distributions. Let \( \tilde{\chi}_\varepsilon := \int e^{-it\eta} \chi_\varepsilon(\theta) d\nu(\theta) \) be the Fourier transform of \( \chi_\varepsilon \). We can check that \( |\tilde{\chi}_\varepsilon(\eta)| \leq 1 \) for all \( \eta \in \mathbb{R} \), \( \tilde{\chi}_\varepsilon(\eta) = \chi(\varepsilon \eta) \) and \( \lim_{\varepsilon \to 0} \tilde{\chi}_\varepsilon(\eta) = \chi(0) = 1 \). Let \( \varphi(z) \) be as in the proof of Lemma 3.5. Put \( g_j(z) = j^{2n-2} \varphi(jz) e^{\Phi_0(z)}, j = 1, 2, \ldots \). Then, for \( J \) is strictly increasing, \( |J| = q \), we have

\[
u_J(0, 0) = \lim_{j \to \infty} \lim_{\varepsilon \to 0^+} \int_{\mathcal{H}_n} \langle u(z, \theta), e^{-\frac{\theta}{\varepsilon}}, \chi_\varepsilon(\theta) g_j(z) d\mathbb{Z}_J \rangle e^{-\Phi_0(z)} d\nu(z) d\nu(\theta).
\]

From (3.4), we see that

\[
\int_{\mathcal{H}_n} \langle u(z, \theta), e^{-\frac{\theta}{\varepsilon}}, \chi_\varepsilon(\theta) g_j(z) d\mathbb{Z}_J \rangle e^{-\Phi_0(z)} d\nu(z) d\nu(\theta)
= \frac{1}{4\pi} \int_{\mathcal{H}_n} \langle \psi(z, \eta), \tilde{\chi}_\varepsilon(\eta) g_j(z) d\mathbb{Z}_J \rangle e^{-\Phi_0(z)} d\nu(z) d\nu(\theta).
\]

From (3.26) and Theorem 3.3, we see that

\[
|\psi_j(z, \eta)|^2 \leq e^{2\Phi_0} \left( \sum_{j=0}^{\infty} |e_j| \right)^2 \int_{\mathbb{R}} (B_{\Phi_j}(z, \eta) d\mathbb{Z}_J, d\mathbb{Z}_J) \int_{\mathbb{R}} (B_{\Phi_j}(w, \eta) d\mathbb{Z}_J, d\mathbb{Z}_J) d\nu(\eta)
\]

for almost all \( \eta \in \mathbb{R} \). Thus, for fixed \( j \), \( \int \langle \psi, g_j d\mathbb{Z}_J \rangle |e^{-\Phi_0(z)} d\nu(\eta) d\nu(z) < \infty \). From this and Lebesgue dominated convergence theorem, we conclude that

\[
\lim_{\varepsilon \to 0^+} \int \langle \psi(z, \eta), \chi_\varepsilon(\eta) g_j(z) d\mathbb{Z}_J \rangle e^{-\Phi_0(z)} d\nu(z) d\nu(\theta)
= \int \langle \psi(z, \eta), g_j(z) d\mathbb{Z}_J \rangle e^{-\Phi_0(z)} d\nu(z) d\nu(\theta).
\]

From (3.32) and (3.33), (3.31) becomes

\[
u_J(0, 0) = \lim_{j \to \infty} \frac{1}{4\pi} \int \langle \psi(z, \eta), g_j(z) d\mathbb{Z}_J \rangle e^{-\Phi_0(z)} d\nu(\eta) d\nu(z).
\]
Put \( f_j(\eta) = \frac{1}{4\pi} \int \hat{\psi}(z, \eta), g_j(z) dz_j e^{-\Phi_0(z)} dv(z) \). Since \( \hat{\psi}(z, \eta) \in \Omega^{0,q}(\mathbb{C}^{n-1}) \) for almost all \( \eta \), we have \( \lim_{j \to \infty} f_j(\eta) = \frac{1}{4\pi} \hat{\psi}(0, \eta) \) almost everywhere. Now,

\[
(3.35) \quad |f_j(\eta)| \leq \frac{1}{4\pi} \left| \int \langle \hat{\psi}(z, \eta), g_j(z) dz_j e^{-\Phi_0(z)} dv(z) \rangle \right|
\]

\[
= \frac{1}{4\pi} \left| \int_{|z| \leq \frac{1}{2}} \langle \hat{\psi}(z, \eta), j^{2n-2} \phi(jz) dz_j \rangle dv(z) \right|
\]

\[
\leq \frac{1}{4\pi} \left( \int_{|z| \leq \frac{1}{2}} |\hat{\psi}(z, \eta)|^2 e^{-\Phi_0(z)} j^{2n-2} dv(z) \right)^{\frac{1}{2}} \left( \int_{|z| \leq \frac{1}{2}} |\phi(jz)|^2 e^{\Phi_0(z)} j^{2n-2} dv(z) \right)^{\frac{1}{2}}
\]

\[
\leq C_1 \left( \int_{|z| \leq 1} |\hat{\psi}(\frac{z}{j}, \eta)|^2 e^{-\Phi_0(z/j)} dv(z) \right)^{\frac{1}{2}}
\]

\[
\leq C_2 \left( \int_{|z| \leq 1} e^{\nu_0 \sum_{j=1}^{n-1} \lambda_j} |z|^2 | \text{Tr} B_{\Phi_0}(\frac{z}{j}, \frac{z}{j}) | 1_{\mathbb{R}_q}(\eta) dv(z) \right)^{\frac{1}{2}}
\]

\[
\times \left( \int_{\mathbb{C}^{n-1}} |\hat{\psi}(w, \eta)|^2 e^{-\Phi_0(w)} dv(w) \right)^{\frac{1}{2}} \quad \text{(here we used (3.26) and Theorem 3.3)}
\]

\[
\leq C_3 \left( \int_{\mathbb{C}^{n-1}} |\hat{\psi}(w, \eta)|^2 e^{-\Phi_0(w)} dv(w) \right)^{\frac{1}{2}} 1_{\mathbb{R}_q}(\eta),
\]

where \( C_1, C_2, C_3 \) are positive constants. From this and the Lebesgue dominated convergence theorem, we conclude that

\[
u_j(0, 0) = \lim_{j \to \infty} \int f_j(\eta) dv(\eta) = \int \lim_{j \to \infty} f_j(\eta) dv(\eta) = \frac{1}{4\pi} \int \hat{\psi}(0, \eta) dv(\eta).
\]

Thus,

\[
(3.36) \quad |\nu_j(0, 0)| \leq \frac{1}{4\pi} \int |\hat{\psi}(0, \eta)| dv(\eta).
\]

Since \( \int |\hat{\psi}(w, \eta)|^2 e^{-\Phi_0(w)} dv(\eta) dv(w) = 4\pi \) we obtain from Lemma 3.5 that

\[
(3.37) \quad \left| \int |\hat{\psi}(0, \eta)| dv(\eta) \right|^2 \leq 4\pi \int \frac{|\hat{\psi}(0, \eta)|^2}{\int |\hat{\psi}(w, \eta)|^2 e^{-\Phi_0(w)} dv(w)} dv(\eta)
\]

\[
\leq 4\pi \left( \int B_{\Phi_0}(0, 0) dz_j, dz_j \right) dv(\eta).
\]

Estimates (3.36) and (3.37) yield the conclusion. \( \square \)

From Proposition 3.6, we know that for all \( u(z, \theta) = \sum_{|J|=q} u_j(z, \theta) dz_j \in \Omega^{0,q}(H_n) \), satisfying \( \|u\|_{\Phi_0} = 1, \sum_{|J|=q} B_{\Phi_0}(0, 0) dz_j, dz_j \) for all strictly increasing \( J, |J| = q \). Hence \( \sum_{|J|=q} S_{J,H_n}^{(q)}(0) \leq \frac{1}{4\pi} \int \text{Tr} B_{\Phi_0}(0, 0) dv(\eta) \). From this and Theorem 3.3, we get

**Theorem 3.7.** We have \( \sum_{|J|=q} S_{J,H_n}^{(q)}(0) \leq \frac{1}{4\pi} \int_{\mathbb{R}_q} |\det M_{\Phi_0}| dv(\eta) \), where \( M_{\Phi_0} \) is as in (3.21) and \( \mathbb{R}_q \) is as in (3.22).
3.3. **The Szegö kernel function on the Heisenberg group.** In the rest of this section, we calculate the extremal function for the Heisenberg group (see Theorem 3.10). For \( \eta \in \mathbb{R} \), we can find \( z_j(\eta) = \sum_{i=1}^{n-1} a_{ji}(\eta) z_i, j = 1, \ldots, n-1 \), such that \( \Phi_\eta = \sum_{j=1}^{n-1} \nu_j(\eta) |z_j(\eta)|^2 \), where \( \nu_1(\eta), \ldots, \nu_{n-1}(\eta) \), are the eigenvalues of \( M_{\Phi_\eta} \), \( a_{ji}(\eta) \in \mathbb{C}, j, t = 1, \ldots, n-1 \). If \( \eta \in \mathbb{R}_q \), we assume that \( \nu_1(\eta) < 0, \ldots, \nu_q(\eta) < 0, \nu_{q+1}(\eta) > 0, \ldots, \nu_{n-1}(\eta) > 0 \). The following is essentially well-known (see [5]).

**Proposition 3.8.** Put

\[
(3.38) \quad \alpha(z, \eta) = \frac{1}{\sqrt{2}} C_0 \det M_{\Phi_\eta} \left| \frac{1}{\mathbb{R}_q(\eta)} e^{\nu_1(\eta) \int_{\mathbb{R}_q} |z_1(\eta)|^2 + \cdots + \nu_q(\eta) |z_q(\eta)|^2 \, d\bar{z}_1(\eta) \wedge \cdots \wedge d\bar{z}_q(\eta)} \right|
\]

where \( C_0 = (2\pi)^{1-q} \left( \int_{\mathbb{R}_q} \det M_{\Phi_\eta} \left| d\nu(\eta) \right| \right)^{-\frac{1}{2}} \). Then, \( \Box^{(q)}_{\Phi_\eta} \alpha(z, \eta) = 0 \) and

\[
(3.39) \quad \int_{\mathbb{C}^{n-1}} (1 + |z|^2)^{m'} |\partial^m \alpha(z, \eta)|^2 e^{-\Phi_\eta(z)} \, dv(z) < \infty
\]

and the value \( \int_{\mathbb{C}^{n-1}} (1 + |z|^2)^{m'} |\partial^m \alpha(z, \eta)|^2 e^{-\Phi_\eta(z)} \, dv(z) \) can be bounded by some positive continuous function of the eigenvalues of \( M_{\Phi_\eta}, \eta \in \mathbb{R}_q \), for all \( m \in \mathbb{N}_0^{n-2}, m' \in \mathbb{N}_0 \). Moreover, we have

\[
(3.40) \quad \int_{\mathbb{C}^{n-1}} |\alpha(z, \eta)|^2 e^{-\Phi_\eta(z)} \, dv(z) = \pi \left( \int_{\mathbb{R}_q} \det M_{\Phi_\eta} \left| d\nu(\eta) \right| \right)^{-1} \left| \det M_{\Phi_\eta} \left| \frac{1}{\mathbb{R}_q(\eta)} \right| \right|
\]

Set

\[
(3.41) \quad u(z, \theta) = \frac{1}{2\pi} \int e^{i \theta \eta + \frac{2}{5} \lambda \eta |z|^2} \alpha(z, \eta) \, dv(\eta) \in \Omega_0^{a}(H_n),
\]

where \( \alpha(z, \eta) \) is as in (3.38) and \( \lambda |z|^2 := \sum_{j=1}^{n-1} \lambda_j |z_j|^2 \).

**Proposition 3.9.** We have that

\[
(3.42) \quad \Box^{(q)}_{\mathfrak{h}_n} u = 0,
\]

\[
(3.43) \quad \|u\|_{\mathfrak{h}_0} = 1
\]

and

\[
(3.44) \quad |u(0, 0)|^2 = \frac{1}{2(2\pi)^n} \int_{\mathbb{R}_q} \left| \frac{1}{\mathbb{R}_q(\eta)} \right| \left| \det M_{\Phi_\eta} \right| d\nu(\eta).
\]

Moreover, we have

\[
(3.45) \quad \int_{H_n} \left| \partial^m \alpha^{\prime m} u(z, \theta) \right|^2 e^{-\nu_0(z, \theta)} \, dv(z) \, dv(\theta) < \infty
\]

and \( \int_{H_n} \left| \partial^m \alpha^{\prime m} u(z, \theta) \right|^2 e^{-\nu_0(z, \theta)} \, dv(z) \, dv(\theta) \) is bounded above by some positive continuous function of the eigenvalues of \( M_{\Phi_\eta}, \eta \in \mathbb{R}_q, \beta \) and \( \lambda_j, j = 1, \ldots, n-1 \), for all \( m \in \mathbb{N}_0^{n-2}, m' \in \mathbb{N}_0 \).

**Proof.** In view of the proof of Lemma 3.2, we see that

\[
\Box^{(q)}_{\mathfrak{h}_n} u(z, \theta) = \frac{1}{2\pi} \int e^{i \theta \eta + \frac{2}{5} \lambda \eta |z|^2} \left( \Box^{(q)}_{\Phi_\eta} \right) \alpha(z, \eta) \, dv(\eta) = 0,
\]

28
which implies (3.42). Now,

\[
\int |u(z, \theta)|^2 e^{-\varphi_0(z, \theta)} \, dv(z) \, dv(\theta)
\]

(3.46)

\[
= \frac{1}{(2\pi)^2} \int \int e^{i\theta_0 + \frac{\varphi_0}{2} + \left( \frac{\gamma}{\sqrt{2}} - \frac{\varphi_0}{2\sqrt{2}} \right) \lambda \bar{\lambda} z} \alpha(z, \eta) \, dv(\eta) \, \left| e^{-\beta \theta - \Theta_0(z)} \, dv(\theta) \right| \, dv(z).
\]

From Parseval’s formula, we have

(3.47)

\[
\frac{1}{(2\pi)^2} \int \int e^{i\theta_0 + \frac{\varphi_0}{2} + \left( \frac{\gamma}{\sqrt{2}} - \frac{\varphi_0}{2\sqrt{2}} \right) \lambda \bar{\lambda} z} \alpha(z, \eta) \, dv(\eta) \, \left| e^{-\beta \theta - \Theta_0(z)} \, dv(\theta) \right| \, dv(z).
\]

In view of (3.47), (3.46) becomes

\[
\int |u(z, \theta)|^2 e^{-\varphi_0(z, \theta)} \, dv(z) \, dv(\theta) = \frac{1}{\pi} \int \int \left| \alpha(z, \eta) \right|^2 e^{-\phi(z)} \, dv(\eta) \, dv(\theta).
\]

From (3.40), we can check that \( \frac{1}{\pi} \int \int \left| \alpha(z, \eta) \right|^2 e^{-\phi(z)} \, dv(\eta) \, dv(\theta) = 1 \) so we infer (3.43).

We obtain (3.44) from the following

\[
|u(0, 0)|^2 = \frac{1}{(2\pi)^2} \int \alpha(0, \eta) \, dv(\eta) \right|^2 = \frac{1}{2(2\pi)^2} C_0^2 \left( \int_{\mathbb{R}_q} |\text{det } M_{\Phi_s}| \, dv(\eta) \right)^2
\]

\[
= \frac{1}{2(2\pi)^2} \int_{\mathbb{R}_q} |\text{det } M_{\Phi_s}| \, dv(\eta).
\]

Finally, from (3.39), (3.41), Parseval’s formula and the statement after (3.39), we get (3.45) and the last statement of this proposition.

From Proposition 3.9 and Theorem 3.7, we get the main result of this section:

**Theorem 3.10.** We have \( \sum_{|J|=q} b_J^{H_n}(0) = \frac{1}{2(2\pi)^2} \int_{\mathbb{R}_q} |\text{det } M_{\Phi_s}| \, dv(\eta) \), where \( M_{\Phi_s} \) is as in (3.21) and \( \mathbb{R}_q \) is as in (3.22).

**4. Szegö kernel asymptotics and weak Morse inequalities on CR manifolds**

In this section we first study the properties of the Hermitian form \( M_p^\phi \) introduced in Definition 1.3, especially its dependence of local trivializations. We then prove (2.11), i.e. the second part of Theorem 1.4 (cf. Theorem 4.4). Finally, we prove Theorem 1.5.

We assume that condition \( Y(q) \) holds. Let \( s \) be a local trivializing section of \( L \) on an open subset \( D \subset X \). Let \( \phi \in C^\infty(D; \mathbb{R}) \) be the weight of the Hermitian metric \( h^\phi \) relative to \( s \), that is, the pointwise norm of \( s \) is \( |s(x)|^2 = e^{-\phi(x)}, \) for \( x \in D \). Until further notice, we work on \( D \). Recall that \( M_p^\phi, p \in D \), is the Hermitian quadratic form on \( T_p^{1,0} X \) defined by

\[
M_p^\phi(U, V) = \frac{1}{2} \left\langle U \wedge V, d(\partial_\phi - \partial_\phi)(p) \right\rangle, \quad U, V \in T_p^{1,0} X.
\]

**Lemma 4.1.** For any \( U, V \in T_p^{1,0} X \), pick \( U, V \in C^\infty(D; T^{1,0} X) \) that satisfy \( U(p) = U, V(p) = V \). Then,

(4.1)

\[
M_p^\phi(U, \bar{V}) = -\frac{1}{2} \left\langle [U, \bar{V}](p), \partial_\phi(p) - \partial_\phi(p) \right\rangle + \frac{1}{2} (U\bar{V} + \bar{V}U) \phi(p).
\]
Proof. Recall that for a 1-form $\alpha$ and vector fields $V_1, V_2$ we have
\begin{equation}
\langle V_1 \wedge V_2, d\alpha \rangle = V_1(\langle V_2, \alpha \rangle) - V_2(\langle V_1, \alpha \rangle) - \langle [V_1, V_2], \alpha \rangle,
\end{equation}
Taking $V_1 = U, V_2 = V$ and $\alpha = \overline{b}_\phi - \partial_b \phi$ in (4.2), we get
\begin{equation}
\langle \mathcal{U} \wedge \nabla, d(\overline{b}_\phi - \partial_b \phi) \rangle
\end{equation}
\begin{equation}
= \mathcal{U}(\langle 
abla, (\overline{b}_\phi - \partial_b \phi) \rangle) - \nabla(\langle \mathcal{U}, (\overline{b}_\phi - \partial_b \phi) \rangle) - \langle [\mathcal{U}, \nabla], (\overline{b}_\phi - \partial_b \phi) \rangle.
\end{equation}
Note that $\langle \nabla, (\overline{b}_\phi - \partial_b \phi) \rangle = \langle \nabla, \overline{b}_\phi \rangle = \overline{\phi}$ and $\langle \mathcal{U}, (\overline{b}_\phi - \partial_b \phi) \rangle = \langle \mathcal{U}, -\partial_b \phi \rangle = -\mathcal{U} \phi$. From this observation, (4.3) becomes $\langle \mathcal{U} \wedge \nabla, d(\overline{b}_\phi - \partial_b \phi) \rangle = (\mathcal{U} \nabla + \nabla \mathcal{U}) \phi - \langle [\mathcal{U}, \nabla], (\overline{b}_\phi - \partial_b \phi) \rangle$. The lemma follows. \qed

The definition of $M_p^\phi$ depends on the choice of local trivializations. Let $\overline{D}$ be another local trivialization with $D \cap \overline{D} \neq \emptyset$. Let $\overline{s}$ be a local trivializing section of $L$ on the open subset $\overline{D}$ and the pointwise norm of $\overline{s}$ is $|\overline{s}(x)|_{h^L}^2 = e^{-\overline{g}(x)}, \overline{g} \in C^\infty(\overline{D}; \mathbb{R})$. Since $\overline{s} = \overline{g} s$ on $D \cap \overline{D}$, for some non-zero CR function $g$, we can check that
\begin{equation}
\overline{g} = \phi - 2 \log |g| \text{ on } D \cap \overline{D}.
\end{equation}

**Proposition 4.2.** For $p \in D \cap \overline{D}$, we have
\begin{equation}
M_p^\phi = M_p^{\overline{g}} + i \left( \frac{Tg}{g} - \frac{T \overline{g}}{\overline{g}} \right) (p) \mathcal{L}_p.
\end{equation}
where $T$ is the real vector field on $X$ defined by (1.2).

**Proof.** From (4.4), we can check that $\partial_b \overline{g} = \overline{b}_\phi - \frac{\partial \overline{g}}{\overline{g}}$ and $\partial_b \phi = \partial \phi - \frac{\partial g}{g}$ on $D \cap \overline{D}$. From above, we have
\begin{equation}
\langle [U, \nabla], (\overline{b}_\phi - \partial_b \phi) \rangle = \langle [U, \overline{\nabla}], (\overline{b}_\phi - \partial_b \phi) \rangle + \langle [U, \nabla], \overline{b}_\phi - \frac{\partial g}{g} \rangle,
\end{equation}
where $U, \nabla \in C^\infty(D \cap \overline{D}; T^{1,0}X)$. From (4.4), we have
\begin{equation}
(U \overline{\nabla} + \overline{\nabla} U) \phi = (U \nabla + \nabla U) \phi + 2 \log |g|
\end{equation}
\begin{equation}
= (U \overline{\nabla} + \overline{\nabla} U) \phi + \overline{\nabla} U g - \overline{\nabla} \frac{U g}{g} \quad \text{(since } \overline{\nabla} g = 0, U g = 0)\end{equation}
\begin{equation}
= (U \nabla + \nabla U) \phi = \overline{\nabla} U g - \overline{\nabla} \frac{U g}{g}.
\end{equation}
From (4.6), (4.7) and (4.1), we see that
\begin{equation}
M_p^\phi(U(p), \overline{V}(p)) - M_p^{\overline{g}}(U(p), \overline{V}(p)) - \langle [U, \overline{\nabla}(p), \overline{\nabla} g(p) \rangle - \overline{\nabla} \frac{U g(p)}{g(p)}\rangle
\end{equation}
\begin{equation}
- \overline{\nabla} \frac{U g(p)}{g(p)} - \overline{\nabla} \frac{U g(p)}{g(p)}.
\end{equation}
We write $[U, \overline{V}] = Z + \overline{W} + \alpha(x) T$, where $Z, W \in C^\infty(D \cap \overline{D}; T^{1,0}X)$ and $\alpha(x) \in C^\infty(D \cap \overline{D}; \mathbb{C})$. We can check that $\alpha(p) = -2i \mathcal{L}_p(U(p), \overline{V}(p))$. Since $\overline{W} g = 0$ and $Z g = \langle Z, \partial_b g \rangle = \langle [U, \overline{V}], \partial_b g \rangle$, we have
\begin{equation}
[U, \overline{V}] g(p) = Z g(p) + \alpha(p) T g(p) = \langle [U, \overline{V}] g(p), \partial_b g(p) \rangle - 2i \mathcal{L}_p(U(p), \overline{V}(p)) T g(p).
\end{equation}
Similarly, we have
\begin{equation}
\label{eq:4.10}
[U, \nabla]g(p) = \langle [U, \nabla](p), \bar{\partial}_b g(p) \rangle - 2i\mathcal{L}_p(U(p), \nabla(p))Tg(p).
\end{equation}
Combining (4.9), (4.10) with (4.8), we get
\begin{equation}
M^\phi_p(U(p), \nabla(p)) = M^{\bar{\partial}}_p(U(p), \nabla(p)) + i\mathcal{L}_p(U(p), \nabla(p))\left(\frac{Tg}{g} - \frac{T\bar{g}}{\bar{g}}\right)(p).
\end{equation}
The proposition follows. \hfill \Box

Recall that $\mathbb{R}_{\phi(p),q}$ was defined in (1.16). From (4.5), we see that
\begin{equation}
\label{eq:4.11}
\mathbb{R}_{\phi(p),q} = \mathbb{R}_{\phi(p),q} + i\left(\frac{Tg}{g} - \frac{T\bar{g}}{\bar{g}}\right)(p)
= \left\{s + i\left(\frac{Tg}{g} - \frac{T\bar{g}}{\bar{g}}\right); \ s \in \mathbb{R}_{\phi(p),q}\right\}.
\end{equation}
Recall that $\det(M^\phi_{\alpha} + s\mathcal{L}_{\alpha})$ denotes the product of all the eigenvalues of $M^\phi_{\alpha} + s\mathcal{L}_{\alpha}$. From (4.5) and (4.11), we see that the function $x \mapsto \int_{\mathbb{R}_{\phi(p),q}} \det(M^\phi_{\alpha} + s\mathcal{L}_{\alpha}) ds$ does not depend on the choice of $\phi$. Thus, the function $x \mapsto \int_{\mathbb{R}_{\phi(p),q}} \det(M^\phi_{\alpha} + s\mathcal{L}_{\alpha}) ds$ is well-defined. Since $M^\phi_{\alpha}$ and $\mathcal{L}_{\alpha}$ are continuous functions of $x$, we conclude that $x \mapsto \int_{\mathbb{R}_{\phi(p),q}} \det(M^\phi_{\alpha} + s\mathcal{L}_{\alpha}) ds$ is a continuous function of $x$.

**Remark 4.3.** We take local coordinates $(x, \theta) = (z, \theta) = (x_1, \ldots, x_{2n-3}, \theta)$, $z_j = x_{2j-1} + ix_{2j}$, $j = 1, \ldots, n-1$, as in (2.3) and (2.4) defined on some neighborhood of $p$. Then, it is straightforward to see that $\mathcal{L}_p = \sum_{j=1}^{n-1} \lambda_j d\bar{x}_j \otimes dx_j$ and $M^\phi_p = \sum_{j,t=1}^{n-1} \mu_{j,t} d\bar{x}_j \otimes dx_j$. Thus,
\begin{equation}
\label{eq:4.12}
\int_{\mathbb{R}_{\phi(p),q}} \left|\det(M^\phi_{\alpha} + s\mathcal{L}_{\alpha})\right| ds = \int_{\mathbb{R}_{\phi(p),q}} \left|\det(\mu_{j,t} + s\delta_{j,t} \lambda_j)\right| ds
\end{equation}
and
\begin{equation}
\label{eq:4.13}
\mathbb{R}_{\phi(p),q} = \left\{s \in \mathbb{R}; \text{ the matrix } (\mu_{j,t} + s\delta_{j,t} \lambda_j)_{j,t=1}^{n-1} \text{ has q negative eigenvalues and } n-1-q \text{ positive eigenvalues}\right\}.
\end{equation}
We prove now the precise bound (1.21) which is one of the main results of this work.

**Theorem 4.4.** We have for all $p \in X$
\begin{equation}
\limsup_{k \to \infty} k^{-n} \Pi_k^{(q)}(p) \leq \frac{1}{2(2\pi)^n} \int_{\mathbb{R}_{\phi(p),q}} \left|\det(M^\phi_{\alpha} + s\mathcal{L}_{\alpha})\right| ds.
\end{equation}

**Proof.** For $p \in X$, let $(x, \theta) = (z, \theta) = (x_1, \ldots, x_{2n-1})$, $z_j = x_{2j-1} + ix_{2j}$, $j = 1, \ldots, n-1$, be the coordinate as in (2.3) and (2.4) defined on some neighborhood of $p$. From Theorem 2.9, we have that $\limsup_{k \to \infty} k^{-n} \Pi_k^{(q)}(0) \leq \sum_{j=1}^{n-1} s_j^{(q)}(0)$. From Theorem 3.10, we know that $\sum_{j=1}^{n-1} s_j^{(q)}(0) = \frac{1}{2(2\pi)^n} \int_{\mathbb{R}_{\phi}} \left|\det M_{\phi_{\eta}}\right| d\nu(\eta)$, where $M_{\phi_{\eta}}$ is as in (3.21) and $\mathbb{R}_{\phi}$ is as in (3.22). Thus,
\begin{equation}
\limsup_{k \to \infty} k^{-n} \Pi_k^{(q)}(0) \leq \frac{1}{2(2\pi)^n} \int_{\mathbb{R}_{\phi}} \left|\det M_{\phi_{\eta}}\right| d\nu(\eta).
\end{equation}
From (3.21), (3.22) and the definition of $\Phi_{\eta}$ (see (3.5)), we see that
\begin{equation}
\label{eq:4.15}
\det M_{\phi_{\eta}} = \det (\mu_{j,t} - \sqrt{2\eta} \lambda_j \delta_{j,t})_{j,t=1}^{n-1}
\end{equation}

31
and
\[ R_q = \{ \eta \in \mathbb{R} ; \text{the matrix } (\mu_j , t - \sqrt{2} \eta \delta _{j } , \lambda _{j } )_{j , t = 1}^{n - 1} \text{ has } q \text{ negative eigenvalues} \} . \]

(4.16)

and \( n - 1 - q \) positive eigenvalues\).

Note that \( dv(\eta ) = \sqrt{2} \eta - \eta \). From this and (4.15), (4.16), (4.12), (4.13), it is easy to see that \( \int _{R_q} | \det M_{\phi _q} | dv(\eta ) = \int _{R_{\phi (p), q} } | \det ( M_\phi ^* + s L_\mu ) | ds \). From this and (4.14), the theorem follows.

\[ \square \]

Proof of Theorem 1.5. By (1.12)-(1.14) we have \( \dim H_0^L (X , L^k ) = \int _X \Pi _k ^{[q]} (x ) dv_X (x ) \). In view of Theorem 2.7, \( \sup _k k^{-n} \Pi _k ^{[q]} (\cdot ) \) is integrable on \( X \). Thus, we can apply Fatou’s lemma and we get by using Theorem 4.4:

\[
\limsup _{k \to \infty } k^{-n} \dim H_0^L (X , L^k ) \leq \int _X \limsup _{k \to \infty } k^{-n} \Pi _k ^{[q]} (x ) dv_X (x ) \leq \frac{1}{2(2 \pi )^n} \int _X \left( \int _{R_{\phi (p), q} } | \det ( M_\phi ^* + s L_\mu ) | ds \right) dv_X (x ).
\]

The theorem follows.

\[ \square \]

5. Strong Morse inequalities on CR manifolds

In this section, we will establish the strong Morse inequalities on CR manifolds. We first recall some well-known facts. Until further notice, we assume that \( Y(q) \) holds. We know [25, Th. 7.6], [21, Th. 5.4.11–12], [15, Cor. 8.4.7–8] that if \( Y(q) \) holds, then \( \square ^{[q]} \) has a discrete spectrum, each eigenvalue occurs with finite multiplicity and all eigenforms are smooth. For \( \lambda \in \mathbb{R} \), let \( \mathcal{H}^{q , \leq}_b (X, L^k ) \) denote the space spanned by the eigenforms of \( \square ^{[q]} \) whose eigenvalues are bounded by \( \lambda \) and denote by \( \Pi _k ^{[q]} (\cdot ) \) the Szegö kernel function of the space \( \mathcal{H}^{q , \leq}_b (X, L^k ) \). Similarly, let \( \mathcal{H}^{q , >}_b (X, L^k ) \) denote the space spanned by the eigenforms of \( \square ^{[q]} \) whose eigenvalues are \( > \lambda \).

Let \( Q_b \) be the Hermitian form on \( \Omega ^{0 , q} (X, L^k ) \) defined for \( u , v \in \Omega ^{0 , q} (X, L^k ) \) by

\[
Q_b (u , v ) = ( \partial _b , u | \partial _b , v ) _k + ( \partial _b ^* , u | \partial _b ^* , v ) _k + ( u | v ) _k = ( \square ^{[q]} _b u | v ) _k + ( u | v ) _k .
\]

Let \( \Omega ^{q} (X, L^k ) \) be the completion of \( \Omega ^{0 , q} (X, L^k ) \) under \( Q_b \) in \( L^2 _{[0 , q]} (X, L^k ) \). For \( \lambda > 0 \), we have the orthogonal spectral decomposition with respect to \( Q_b \):

(5.1)

\[
\overline{\Omega }^{q} (X, L^k ) = \mathcal{H}^{q , \leq}_b (X, L^k ) \oplus \mathcal{H}^{q , >}_b (X, L^k ) ,
\]

where \( \mathcal{H}^{q , >}_b (X, L^k ) \) is the completion of \( \mathcal{H}^{q , \leq}_b (X, L^k ) \) under \( Q_b \) in \( L^2 _{[0 , q]} (X, L^k ) \).

Let \( u \in \mathcal{H}^{q , >}_b (X, L^k ) \cap \Omega ^{q} (X, L^k ) \). There are \( f_j \in \mathcal{H}^{q , >}_b (X, L^k ) , j = 1, 2, \ldots \), such that \( Q_b (f_j - u ) \to 0 \), as \( j \to \infty \). From this, we can check that \( ( \square ^{[q]} _b f_j | f_j ) _k \to ( \square ^{[q]} _b u | u ) _k \), as \( j \to \infty \), and

(5.2)

\[
\| u \|^2 = \lim _{j \to \infty } \| f_j \|^2 = \lim _{j \to \infty } ( f_j | f_j ) _k \leq \lim _{j \to \infty } \frac{1}{\lambda } ( ( \square ^{[q]} _b f_j | f_j ) _k = \frac{1}{\lambda } ( ( \square ^{[q]} _b u | u ) _k .
\]

We return to our situation. We will use the same notations as in section 3. For a given point \( p \in X \), let \( s \) be a local trivializing section of \( L \) on an open neighborhood of \( p \) and \( | s |^2 = e^{- \phi } \). Let \( ( x , \theta ) = ( z , \theta ) = ( x_1 , \ldots , x_{m-2} , \theta ) \), \( z_j = x_{2j-1} + i x_{2j} , j = 1, \ldots , n - 1 \), be the local coordinates as in (2.3) and (2.4) defined on an open set \( D \) of \( p \). Note that \( ( x(p) , \theta (p) ) = 0 \). We identify \( D \) with some open set of \( H_n \).
Let \( u(z, \theta) = \sum_{j=0}^{n} \sum_{l=0}^{m} u_j(z, \theta) d\bar{z}_j \in \Omega^q(H_n) \) be as in (3.41) and Proposition 3.9. From (3.45) and the statement after (3.45), we know that the value

\[
\int |\partial^m_x \partial^m_y u|^2 e^{-\psi_0} dv(\theta)
\]

is finite and can be bounded by some positive continuous function of the eigenvalues of \( M_{\eta}, \eta \in \mathbb{R}_q, \beta \) and \( \lambda_j, j = 1, \ldots, n-1 \), for all \( m' \in \mathbb{N}_0, m \in \mathbb{N}_0^{\mathbb{N}} \). Since \( X \) is compact, we deduce that for every \( m \in \mathbb{N}_0^{\mathbb{N}}, m' \in \mathbb{N}_0 \), we can find \( M_{m,m'} > 0 \) independent of the point \( \theta \), such that

\[
(5.3) \quad \int_{H_n} |\partial_x^m \partial_y^{m'} u|^2 e^{-\psi_0} dv(\theta) < M_{m,m'}.
\]

Set \( \beta_k(z, \theta) = \chi_k(\sqrt{k}z, k\theta) \sum_{j=0}^{n} \sum_{l=0}^{m} u_j(\sqrt{k}z, k\theta) e_j(z, \theta) \in \Omega^q(D_n) \). Here \( \chi \) is a smooth function, \( 0 \leq \chi \leq 1 \), supported on \( D_1 \) which equals one on \( D_2 \) and

\[
\chi_k(z, \theta) = \chi \left( \frac{z}{\log k}, \frac{\theta}{\sqrt{k} \log k} \right).
\]

We remind that \( (e_j)_{j=1, \ldots, n-1} \) denotes the basis of \( T^{\alpha,1}X \), which is dual to \( (\bar{U}_j)_{j=1, \ldots, n-1} \), where \( (U_j)_{j=1, \ldots, n-1} \) are as in (2.3). We notice that for \( k \) large, \( \text{Supp} \beta_k \subset D_{\sqrt{k}^\alpha} \). From Proposition 2.3 and (2.34), we have

\[
(5.4) \quad \hat{(\square^{[q]}_{\zeta(k)})(P^*_k \beta_k)} = \hat{\square^{[q]}_{\beta_k}} \left( \chi_k(z, \theta) u(z, \theta) \right) + \varepsilon_k P_k(F^*_k \beta_k),
\]

where \( \varepsilon_k \) is a sequence tending to zero with \( k \to \infty \) and \( P_k \) is a second order differential operator and all the derivatives of the coefficients of \( P_k \) are uniform bounded in \( \hat{k} \). Note that \( \square^{[q]}_{\beta_k} u = 0 \) and \( \text{sup} \left| (\hat{z}, \hat{\theta}) \in D_{\sqrt{k}^\alpha} \right| k \phi_k^* \phi_0 - \psi_0 \to 0 \) as \( k \to \infty \) (\( \phi_0 \) is as in (2.6)). From this, (5.4) and (5.3), we deduce that there is a sequence \( \delta_k > 0 \), independent of the point \( \theta \) and tending to zero such that

\[
(5.5) \quad \| \hat{\square^{[q]}_{\zeta(k)}(P^*_k \beta_k)} \|_{k \phi_k^* \phi_0} \leq \delta_k.
\]

Similarly, we have for all \( m \in \mathbb{N} \)

\[
(5.6) \quad \| (\square^{[q]}_{\zeta(k)})^m (P^*_k \beta_k) \|_{k \phi_k^* \phi_0} \to 0 \quad \text{as} \quad k \to \infty.
\]

Now define \( \alpha_k \in \Omega^q(X, L^k) \) by

\[
(5.7) \quad \alpha_k(z, \theta) = s^k \chi_k\varepsilon^{kR} \beta_k(z, \theta),
\]

where \( R(z, \theta) \) is as in (2.5). We can check that

\[
(5.8) \quad k^{-n} |\alpha_k(0,0)|^2 = |\beta_k(0,0)|^2 = |u(0,0)|^2 = \frac{1}{2(2\pi)^n} \int_{\mathbb{R}^{q(p)},q} \left| \det(M_{\theta}^p + sL_p) \right| ds
\]

for all \( k \), and

\[
|\alpha_k|^2 = \int k^n e^{k(R+R)} |\beta_k|^2 e^{-k\phi} m(z, \theta) dv(z) dv(\theta)
\]

\[
= \int k^n e^{-k\phi} |\beta_k|^2 m(z, \theta) dv(z) dv(\theta)
\]

\[
= \int e^{-kF_{\theta}^* \phi_0} |\chi_k(z, \theta)|^2 |u(z, \theta)|^2 m(\frac{\varepsilon}{\sqrt{k}}, \frac{\theta}{k}) dv(z) dv(\theta)
\]

\[
\to \int |u|^2 e^{-\psi_0(\varepsilon, \theta)} dv(z) dv(\theta) = 1, \quad \text{as} \quad k \to \infty,
\]
Moreover, from (2.26) and using induction, we get

\[
\frac{1}{k} \begin{bmatrix} \alpha_k \mid \alpha_k \end{bmatrix}_k = \int k^n \left( \frac{1}{k} \begin{bmatrix} \alpha_k \mid \alpha_k \end{bmatrix}_k \right) e^{-k\delta_0} m(z, \theta) dv(z) dv(\theta) \quad \text{(by (2.13))}
\]

(5.10)

\[
= \int \left( \frac{1}{k} \begin{bmatrix} \alpha_k \mid \alpha_k \end{bmatrix}_k \right) (F^*_k \beta_k) F^*_k e^{-kF^*_k \delta_0} (F^*_k m) dv(z) dv(\theta)
\]

\[
= \int \left( \begin{bmatrix} \alpha_k \mid \alpha_k \end{bmatrix}_k \right) (F^*_k \beta_k) F^*_k e^{-kF^*_k \delta_0} (F^*_k m) dv(z) dv(\theta) \quad \text{(by (2.22)).}
\]

From (5.5) and the fact that \(|F^*_k \beta_k|_{F^*_k \delta_0} \leq 1\), we deduce that there is a sequence \(\mu_k > 0\), independent of the point \(p\) and tending to zero such that

\[
\frac{1}{k} \begin{bmatrix} \alpha_k \mid \alpha_k \end{bmatrix}_k \leq \mu_k.
\]

(5.11)

Similarly, from (5.6), we can repeat the procedure above with minor changes and get

\[
\left( \frac{1}{k} \begin{bmatrix} \alpha_k \mid \alpha_k \end{bmatrix} \right)^m_k \rightarrow 0 \quad \text{as} \quad k \rightarrow \infty,
\]

(5.12)

for all \(m \in \mathbb{N}\). Now, we can prove

**Proposition 5.1.** Let \(\nu_k > 0\) be any sequence with \(\lim_{k \to \infty} \frac{\mu_k}{\nu_k} = 0\), where \(\mu_k\) is as in (5.11). Then, \(\liminf_{k \to \infty} k^{-n} D_{\beta_k}^{(q)}(0) \geq \frac{1}{2(2\pi)^n} \int_{\mathbb{R}^{2n+1}} \det(M^q_p + sL_p) ds\).

**Proof.** Let \(\alpha_k\) be as in (5.7). By (5.1), we have \(\alpha_k = \alpha_k^1 + \alpha_k^2\), where \(\alpha_k^1 \in \mathcal{H}_{b, \leq k\nu_k}(X, L^k)\), \(\alpha_k^2 \in \mathcal{H}_{b, > k\nu_k}(X, L^k)\). From (5.2), we have

\[
\|\alpha_k^2\|^2 \leq \frac{1}{\nu_k} \left( \begin{bmatrix} \alpha_k^1 \mid \alpha_k^1 \end{bmatrix}_k \right) \left( \begin{bmatrix} \alpha_k^2 \mid \alpha_k^2 \end{bmatrix}_k \right) \leq \frac{1}{\nu_k} \left( \begin{bmatrix} \alpha_k \mid \alpha_k \end{bmatrix}_k \right) \leq \frac{\mu_k}{\nu_k} \rightarrow 0,
\]

as \(k \rightarrow \infty\). Thus, \(\lim_{k \to \infty} \|\alpha_k^2\| = 0\). Since \(\|\alpha_k\| \rightarrow 1\) as \(k \to \infty\), we get

\[
\lim_{k \to \infty} \|\alpha_k^1\| = 1.
\]

(5.13)

Now, we claim that

\[
\lim_{k \to \infty} k^{-n} \left| \alpha_k^2(0) \right|^2 = 0.
\]

(5.14)

On \(D\), we write \(\alpha_k^2 = s^k k^{\frac{3}{2}} e^{kR} \beta^2_k\), \(\beta_k \in \Omega^{q, \alpha}(D)\). From (2.26) and the proof of Lemma 2.6, we see that

\[
\left| F^*_k \beta_k^2(0) \right|^2 \leq C_{n-1, r} \left( \left\| F^*_k \beta_k^2 \right\|_{kF^*_k \delta_0, D_r}^2 + \left\| \left( \begin{bmatrix} \beta_k \mid \beta_k \end{bmatrix}_k \right) F^*_k \beta_k^2 \right\|_{kF^*_k \delta_0, D_r}^2 \right),
\]

(5.15)

for some \(r > 0\). Now, we have

\[
\left| F^*_k \beta_k^2 \right|_{kF^*_k \delta_0, D_r}^2 \leq \|\alpha_k^2\|^2 \rightarrow 0, \quad \text{as} \quad k \to \infty.
\]

(5.16)

Moreover, from (2.26) and using induction, we get

\[
\left\| \left( \begin{bmatrix} \beta_k \mid \beta_k \end{bmatrix}_k \right) \right\|_{kF^*_k \delta_0, D_r}^2 \leq C' \sum_{m=1}^{n} \left\| \left( \begin{bmatrix} \beta_k \mid \beta_k \end{bmatrix}_k \right) \right\|_{kF^*_k \delta_0, D_r}^2,
\]

(5.17)

for some \(r' > 0\), where \(C' > 0\) is independent of \(k\). We can check that for all \(m \in \mathbb{N}\),

\[
\left\| \left( \begin{bmatrix} \beta_k \mid \beta_k \end{bmatrix}_k \right) \right\|_{kF^*_k \delta_0, D_r}^2 \leq \left( \frac{1}{k} \begin{bmatrix} \beta_k \mid \beta_k \end{bmatrix}_k \right) \leq \left( \frac{1}{k} \begin{bmatrix} \beta_k \mid \beta_k \end{bmatrix}_k \right) \rightarrow 0, \quad \text{as} \quad k \to \infty.
\]

(5.18)
Here we used (5.12). Combining (5.18), (5.17), (5.16) with (5.15), we get
\[
\lim_{k \to \infty} F^k h^2 \beta_k^2(0) = \lim_{k \to \infty} \beta_k^2(0) = \lim_{k \to \infty} k^{-n} |\alpha_k^2(0)|^2 = 0.
\]
Hence (5.14) follows. From this and (5.8), we conclude
\[
\lim_{k \to \infty} k^{-n} \left| \alpha_k^2(0) \right|^2 = \frac{1}{2(2\pi)^n} \int_{\mathbb{R}^n} \left| \det (M^\phi + sL_p) \right| ds.
\]
Now,
\[
k^{-n} \Pi_{k, < b, s}^q(0) \geq k^{-n} \left| \alpha_k^2(0) \right|^2 \geq \frac{1}{2(2\pi)^n} \int_{\mathbb{R}^n} \left| \det (M^\phi + sL_p) \right| ds, \text{ as } k \to \infty.
\]
The proposition follows.

**Proposition 5.2.** Let \( \nu_k > 0 \) be any sequence with \( \nu_k \to 0 \), as \( k \to \infty \). Then,
\[
\limsup_{k \to \infty} k^{-n} \Pi_{k, < b, s}^q(0) \leq \frac{1}{2(2\pi)^n} \int_{\mathbb{R}^n} \left| \det (M^\phi + sL_p) \right| ds.
\]

**Proof.** The proof is a simple modification of the proof of Theorem 4.4 and in what follows these modifications will be presented. Let \( \alpha_k \in \mathcal{H}_{b, < b, s}^q (X, L^k) \) with \( \|\alpha_k\| = 1 \). On \( D \), we write \( \alpha_k = s^k \tilde{Z} e^{-\psi B} \), \( \beta_k \in \Omega^{0, q}(D) \). From (2.26) and using induction, we get
\[
\| F^k_{\beta_k^2} \|_{kF^k_{\phi_0}, D^r, x_0}^2 \leq C_{r, s} \left( \| F^k_{\beta_k^2} \|_{kF^k_{\phi_0}, D^r, x_0}^2 + \sum_{m=1}^{s+1} \| (\Box_{k, (k)}^{(q)})^m F^k_{\beta_k^2} \|^2 \right).
\]
We can check that \( \| (\Box_{k, (k)}^{(q)})^m F^k_{\beta_k^2} \|_{kF^k_{\phi_0}, D^r, x_0}^2 \leq \| (\Box_{k, (k)}^{(q)})^m \alpha_k \| \leq \nu_k^n \to 0 \). Thus, the conclusion of Proposition 2.8 is still valid and the rest of the argument goes through word by word.

**Proof of Theorems 1.6, 1.7 and 1.8.** We can repeat the proof of Theorem 2.7 and conclude that for any sequence \( (\nu_k) \) with \( \nu_k \to 0 \), as \( k \to \infty \), there is a constant \( C_0 \) independent of \( k \), such that \( k^{-n} \Pi_{k, < b, s}^q (x_0) \leq C_0 \) for all \( x_0 \in X \). From this, Proposition 5.1 and Proposition 5.2 and the fact that the sequence \( (\mu_k) \) in (5.11) is independent of the point \( p \), we get Theorem 1.6. By integrating Theorem 1.6 we obtain Theorem 1.7. By applying the algebraic Morse inequalities [27, Lemma 3.2.12] to the \( \partial, \bar{\partial} \)-complex (1.7) we deduce in view of Theorem 1.7 the strong Morse inequalities of Theorem 1.8. 

6. Examples

In this section, some examples are collected. The aim is to illustrate the main results in some simple situations. First, we state our main results in the embedded case.

6.1. The main results in the embedded cases. Let \( M \) be a relatively compact open subset with \( C^\infty \) boundary \( X \) of a complex manifold \( M' \) of dimension \( n \) with a smooth Hermitian metric \( \langle \cdot, \cdot \rangle \). Furthermore, let \( (L, h^L) \) be a Hermitian holomorphic line bundle over \( M' \) and let \( \phi \) be a local weight of the metric \( h^L \), i.e. for a local trivializing section \( s \) of \( L \) on an open subset \( D \subset M' \), \( |s(x)|^2_{h^L} = e^{-\phi} \). If we restrict \( L \) on the boundary \( X \), then \( L \) is a CR line bundle over the CR manifold \( X \). For \( p \in X \), let \( M^\phi_p \) be as in Definition 1.3.

**Proposition 6.1.** For \( U, V \in T^*_p \partial X \), we have \( M^\phi_p (U, V) = \langle \partial \bar{\partial} \phi(p), U \wedge V \rangle \).
Proof. Let \( r \in C^\infty(X; \mathbb{R}) \) be a defining function of \( X \). For \( U, V \in T^1_0 X \), pick \( U, V \in C^\infty(M'; T^1_0 M') \) that satisfy \( U(p) = U, V(p) = V \) and \( U(r) = V(r) = 0 \) in a neighborhood of \( p \) in \( M' \). From (4.2), we have
\[
2 \langle U \wedge \nabla, \partial \bar{\partial} \phi \rangle = \langle U \wedge \nabla, d(\partial \bar{\phi} - \partial \phi) \rangle
\]
\[
= U(\langle \nabla, \partial \bar{\phi} - \partial \phi \rangle) - \nabla(\langle U, \partial \bar{\phi} - \partial \phi \rangle) - \langle [U, \nabla], \partial \bar{\phi} - \partial \phi \rangle.
\]
Note that \( \langle \nabla, \partial \bar{\phi} - \partial \phi \rangle = \langle \nabla, \partial \bar{\phi} \rangle = \nabla \phi \) and \( \langle U, \partial \bar{\phi} - \partial \phi \rangle = \langle U, -\phi \rangle = -U \phi \). From this observation, (6.1) becomes
\[
2 \langle U \wedge \nabla, \partial \bar{\phi} \rangle = (U \nabla + \nabla U) \phi - \langle [U, \nabla], \partial \bar{\phi} - \partial \phi \rangle.
\]
Since \( U(r) = V(r) = 0 \) in a neighborhood of \( p \) in \( M' \), we have
\[
(U \nabla + \nabla U) \phi(p) = (U|_X \nabla|_X + \nabla|_X U|_X) \phi|_X(p)
\]
and
\[
\langle [U, \nabla], \partial \bar{\phi} - \partial \phi \rangle(p) = \langle [U|_X, \nabla|_X], \partial \bar{\phi}|_X - \partial \phi|_X \rangle(p),
\]
where \( U|_X \) is the restriction to \( X \) of \( U \) and similarly for \( V \) and \( \phi \). From this observation and (6.2), we conclude that
\[
2 \langle U \wedge \nabla, \partial \bar{\phi} \rangle(p) = (U|_X \nabla|_X + \nabla|_X U|_X) \phi|_X(p) - \langle [U|_X, \nabla|_X], \partial \bar{\phi}|_X - \partial \phi|_X \rangle(p).
\]
From (6.3) and Lemma 4.1, the proposition follows. \( \square \)

We denote by \( R^L_X \) the restriction of \( R^L \) to \( T^1_0 X \). As before, let \( \mathcal{L}_p \) be the Levi form of \( X \) at \( p \in X \). We define the set \( \mathbb{R}_{\phi(p), q} \) as in (1.16). Set
\[
I^q(X, L) := \int_X \int_{\mathbb{R}_{\phi(p), q}} \left| \det \left( R^L_X + s \mathcal{L}_a \right) \right| ds \, dv_X(x).
\]
Now, we can reformulate Theorem 1.5 and Theorem 1.8:

**Theorem 6.2.** If condition \( Y(q) \) holds, then
\[
\dim H^q_\phi(X, L^k) \leq \frac{k^n}{2(2\pi)^n} I^q(X, L) + o(k^n),
\]
If condition \( Y(j) \) holds, for all \( j = 0, 1, \ldots, q \), then
\[
\sum_{j=0}^q (-1)^{q-j} \dim H^j_\phi(X, L^k) \leq \frac{k^n}{2(2\pi)^n} \sum_{j=0}^q (-1)^{q-j} I^j(X, L) + o(k^n).
\]
If condition \( Y(j) \) holds, for all \( j = q, q+1, \ldots, n-1 \), then
\[
\sum_{j=q}^{n-1} (-1)^{q-j} \dim H^j_\phi(X, L^k) \leq \frac{k^n}{2(2\pi)^n} \sum_{j=q}^{n-1} (-1)^{q-j} I^j(X, L) + o(k^n).
\]

**Proof of Theorem 1.13.** Since \( L \) is positive, \( R^L_X + s \mathcal{L}_a \) is positive if \( |s| \) small, so \( \left| \mathbb{R}_{\phi(p), 0} \right| > 0 \) for all \( p \in X \). By the hypothesis of Theorem 1.13 we have \( \lambda_{n-1} = \lambda_{n} < 0 < \lambda_{n+1} = \lambda_{n+2} \) at each point of \( X \). This implies, that if \( R^L_X + s \mathcal{L}_a \) cannot have exactly one negative eigenvalue at any point of \( X \) (note that \( s \) takes both negative and positive values). Thus, \( \mathbb{R}_{\phi(p), 1} = 0 \) for all \( p \in X \). Hence, the strong Morse inequalities (6.6) for \( q = 1 \) imply the conclusion. \( \square \)
Proof of Theorem 1.15. Note that $X$ and $L$ satisfy the conditions of Theorem 1.12. Hence there exists $c > 0$ such that $\dim H^0_b(X, L^k) \geq ck^n$, for $k$ sufficiently large.

On the other hand, every CR function on $X$ extends locally to a holomorphic function in a small open set of $M$. For $b < c$, set $M_b = \{b < \rho < c\}$. Thus, there exist $b < a < c$ such that the restriction morphism $H^0(M_b, E) \to H^0(X, E)$ is an isomorphism for any holomorphic line bundle $E \to M$. Moreover, we know by the Andreotti-Grauert isomorphism theorem [1] that the restriction $H^0(M, E) \to H^0(M_b, E)$ is an isomorphism. Thus there exist $C, c > 0$ and $k_0 \in \mathbb{N}$ such that

$$ck^n \leq \dim H^0(M, L^k) \leq Ck^n, \quad \text{for } k \geq k_0,$$

which we write

$$\dim H^0(M, L^k) \sim k^n, \quad k \to \infty.$$

Now, $M$ is a $(n-2)$-concave manifold in the sense of [1], in particular Andreotti-pseudoconcave (see [27, Def. 3.4.3]). By (6.7) and (1.28) we obtain that $\varrho_k = n$ for large $k$ and the desired conclusions follow. \hfill $\square$

Theorem 1.15 is a consequence of Theorem 1.12 and of the fact that CR section extend to a $(n-2)$-convex-concave strip around the given CR manifold. By extending the sections as far as possible we obtain the following results.

Corollary 6.3. Let $M$ be a projective manifold, $n = \dim_c M$, and let $X$ be a compact hypersurface, such that there exist an open set $U \subset M$ and $\rho \in C^\infty(U, \mathbb{R})$ with $X = \rho^{-1}(0) \subset U$ and $d\rho|_X \neq 0$. Let $L \to M$ be a holomorphic line bundle over $M$. We assume that the curvature form $R_L$ of $L$ and the Levi form $\partial \bar{\partial} \rho|_X$ satisfy the assumptions of Theorem 1.12. Then there exist a branched covering $\pi : \tilde{M} \to M$, a divisor $H \subset \tilde{M}$ and an integer $d = d(L)$ such that for $\tilde{L} := \pi^*L$ holds:

$$\dim H^0(\tilde{M} \setminus H, \tilde{L}^k) = \dim H^0(\tilde{M}, \tilde{L}^k \otimes [kdH]) \sim k^n, \quad k \to \infty.$$

Proof. Let us first observe that under the given hypotheses, there exist $b < 0 < c$ such that $M' = \{b < \rho < c\}$ is a $(n-2)$-convex-concave strip which fulfills the assumptions of Theorem 1.15. By (6.7), $\dim H^0(M', L^k) \sim k^n, \quad k \to \infty$. Since $M'$ is Andreotti-pseudoconcave, a theorem of Dingoyan [18, 19] shows that there exist a branched covering $\pi : \tilde{M} \to M$ with a section $S$ on $M$, a divisor $H \subset \tilde{M}$ and an integer $d$ such that holomorphic sections of $\pi^*L^k$ over $S(M')$ extends to a holomorphic section of $\pi^*L^k$ over $\tilde{M} \setminus H$ or of $\tilde{L}^k \otimes [kdH]$ over $\tilde{M}$. Thus, the restriction morphisms $H^0(\tilde{M} \setminus H, \tilde{L}^k) \to H^0(S(M'), \tilde{L}^k)$ and $H^0(\tilde{M}, \tilde{L}^k \otimes [kdH]) \to H^0(S(M'), \tilde{L}^k)$ are isomorphisms. On the other hand, $\dim H^0(S(M'), \tilde{L}^k) \sim k^n, \quad k \to \infty$ and the assertion follows. \hfill $\square$

Remark 6.4. There are several criteria for a line bundle on a compact manifold to be big (Siu, Ji-Shiffman, Bonavero see e. g. [27, Ch. 2]). Corollary 6.3 asserts roughly that if a line bundle $L$ is positive along a well-chosen hypersurface then by passing to a branched covering there exist a divisor $H$ and an integer $d$ such that $L \otimes [dH]$ is big.

If one knows that $X$ has a neighbourhood $M'$, which is a $(n-2)$-convex-concave strip such that any meromorphic function on $M'$ is rational, then [18, 19] shows that there is no need to pass to a covering.

37
Corollary 6.5. Assume the same hypotheses as in Corollary 6.3 for $M$, $X$ and $L$. Assume moreover, that there exists a $(n - 2)$-convex-concave strip $M' = \{ b < r < c \}$ such that any meromorphic function on $M'$ is rational. Then there exists a divisor $H \subset M$ and an integer $d$ such that

$$\dim H^0(M \setminus H, L^k) = \dim H^0(M, L^k \otimes [kdH]) \sim k^n, \quad k \to \infty.$$ 

6.2. Holomorphic line bundles over a complex torus. Let

$$T_n := \mathbb{C}^n / (\sqrt{2\pi} \mathbb{Z}^n + i\sqrt{2\pi} \mathbb{Z}^n)$$

be the flat torus and let $L_\lambda$ be the holomorphic line bundle over $T_n$ with curvatures the $(1,1)$-form $\Theta_\lambda = \sum_{j=1}^n \lambda_j dz_j \wedge d\bar{z}_j$, where $\lambda_j$, $j = 1, \ldots, n$, are given non-zero integers. More precisely, $L_\lambda := (\mathbb{C}^n \times \mathbb{C}) / \sim$, where $(z, \theta) \sim (\tilde{z}, \tilde{\theta})$ if

$$z - \tilde{z} = (\alpha_1, \ldots, \alpha_n) \in \sqrt{2\pi} \mathbb{Z}^n + i\sqrt{2\pi} \mathbb{Z}^n, \quad \tilde{\theta} = \exp \left( \sum_{j=1}^n \lambda_j (z_j \bar{\alpha}_j + \frac{1}{2} |\alpha_j|^2) \right).$$

We can check that $\sim$ is an equivalence relation and $L_\lambda$ is a holomorphic line bundle over $T_n$. For $[(z, \theta)] \in L_\lambda$ we define the Hermitian metric by

$$\left||[(z, \theta)]\right|^2 := |\theta|^2 \exp(-\sum_{j=1}^n |\lambda_j z_j|^2)$$

and it is easy to see that this definition is independent of the choice of a representative $(z, \theta)$ of $[(z, \theta)]$. We denote by $\phi_z(z)$ the weight of this Hermitian fiber metric. Note that $\partial \bar{\partial} \phi_z = \Theta_\lambda$. From now on, we assume that $\lambda_j < 0$, for $j = 1, \ldots, n_-$ and $\lambda_j > 0$, for $j = n_- + 1, \ldots, n$.

Let $L_\lambda^*$ be the dual bundle of $L_\lambda$ and let $\| \cdot \|_{L_\lambda^*}$ be the norm of $L_\lambda^*$ induced by the Hermitian fiber metric on $L_\lambda$. Consider the compact CR manifold of dimension $2n + 1$

$$X = \{ \nu \in L_\lambda^* : \|\nu\|_{L_\lambda^*} = 1 \};$$

this is the boundary of Grauert tube of $L_\lambda^*$.

Let $\pi : L_\lambda^* \to T_n$ be the natural projection from $L_\lambda^*$ onto $T_n$. Let $L_\mu$ be another holomorphic line bundle over $T_n$ determined by the constant curvature form $\Theta_\mu = \sum_{j=1}^n \mu_j dz_j \wedge d\bar{z}_j$, where $\mu_j$, $j = 1, \ldots, n$, are given non-zero integers. The pullback line bundle $\pi^* L_\mu$ is a holomorphic line bundle over $L_\lambda^*$. The Hermitian fiber metric $\phi_z$ on $L_\mu$ induces a Hermitian fiber metric on $\pi^* L_\mu$ that we shall denote by $\psi$. If we restrict $\pi^* L_\mu$ on $X$, then $\pi^* L_\mu$ is a CR line bundle over the CR manifold $X$.

The part of $X$ that lies over a fundamental domain of $T_n$ can be represented in local holomorphic coordinates $(z, \xi)$, where $\xi$ is the fiber coordinates, as the set of all $(z, \xi)$ such that $r(z, \xi) := |\xi|^2 \exp(\sum_{j=1}^n \lambda_j |z_j|^2) - 1 = 0$ and the fiber metric $\psi$ may be written as $\psi(z, \xi) = \sum_{j=1}^n \mu_j |z_j|^2$. We can identify $L_\mu$ with $\frac{1}{|dr|} \sum_{j=1}^n \lambda_j dz_j \wedge d\bar{z}_j$. It is easy to see that $\partial \bar{\partial} \psi(p)|_{\pi^1 oX} = \sum_{j=1}^n \mu_j dz_j \wedge d\bar{z}_j$. We get for all $p \in X$, $s \in \mathbb{R}$,

$$\partial \bar{\partial} \psi(p)|_{\pi^1 oX} + sL_\mu = \sum_{j=1}^n \left( \mu_j + \frac{s}{|dr|} \lambda_j \right) dz_j \wedge d\bar{z}_j.$$ 

Thus, if $\mu_j = \lambda_j$, $j = 1, \ldots, n$, and $q \neq n_- - n_-$, then $\mathbb{R}_{\phi(p), q} = \emptyset$, for all $p \in X$. From this and Theorem 6.2, we obtain

Theorem 6.6. If $\mu_j = \lambda_j$, $j = 1, \ldots, n$, and $q \neq n_- - n_-$, then

$$\dim H^0(X, (\pi^* L_\mu)^k) = o(k^{n+1}), \quad \text{as } k \to \infty.$$
If $\mu_j = |\lambda_j|$, $j = 1, \ldots, n$, we can check that $R_{\phi(p), 0} > 0$, for all $p \in X$, where $R_{\phi(p), 0}$ denotes the Lebesgue measure of $R_{\phi(p), 0}$. Moreover, if $q > 0$ and $q \neq n_-, n - n_-$, then $R_{\phi(p), q} = 0$, for all $p \in X$. From this observation, (6.5) for $q = 0$ and (6.6) for $q = 1$, we obtain

**Theorem 6.7.** If $\mu_j = |\lambda_j|$, $j = 1, \ldots, n$, and $Y(0)$, $Y(1)$ hold, then

$$\dim H^{n}_b(X, (\pi^* L_\mu)^k) \sim k^{n+1}, \quad \text{as } k \to \infty.$$ 

6.3. **Compact Heisenberg groups: non-embedded cases.** Next we consider compact analogues of the Heisenberg group $H_n$. Let $\lambda_1, \ldots, \lambda_{n-1}$ be given non-zero integers. Let $\mathcal{H}_n = (\mathbb{C}^{n-1} \times \mathbb{R})/\sim$, where $(z, \theta) \sim (z, \tilde{\theta})$ if

$$z - \tilde{z} = \alpha \in \sqrt{2\pi} \mathbb{Z}^{n-1} + i \sqrt{2\pi} \mathbb{Z}^{n-1}, \quad \tilde{\theta} - \theta + i \sum_{j=1}^{n-1} \lambda_j (z_j \alpha_j - z_j \alpha_j) \in \pi \mathbb{Z}.$$ 

We can check that $\sim$ is an equivalence relation and $\mathcal{H}_n$ is a compact manifold of dimension $2n - 1$. The equivalence class of $(z, \theta) \in \mathbb{C}^{n-1} \times \mathbb{R}$ is denoted by $[(z, \theta)]$. For a given point $p = [(z, \theta)]$, we define $T^1.0_p \mathcal{H}_n$ to be the space spanned by

$$\left\{ \frac{\partial}{\partial z_j} - i \lambda_j z_j \frac{\partial}{\partial \tilde{z}}, \ j = 1, \ldots, n - 1 \right\}.$$

It is easy to see that the definition above is independent of the choice of a representative $(z, \theta)$ for $[(z, \theta)]$. Moreover, we can check that $T^{1.0}_p \mathcal{H}_n$ is a CR structure. Thus, $(\mathcal{H}_n, T^{1.0}_p \mathcal{H}_n)$ is a compact CR manifold of dimension $2n - 1$. We take a Hermitian metric $\langle \cdot, \cdot \rangle$ on the complexified tangent bundle $\mathbb{C} T \mathcal{H}_n$ such that

$$\left\{ \frac{\partial}{\partial z_j} - i \lambda_j z_j \frac{\partial}{\partial \tilde{z}}, \frac{\partial}{\partial \tilde{z}} + i \lambda_j z_j \frac{\partial}{\partial \tilde{z}}, \ j = 1, \ldots, n - 1 \right\}$$

is an orthonormal basis. The dual basis of the complexified cotangent bundle is

$$\left\{ dz_j, dz_j, \omega_0 := d\theta + \sum_{j=1}^{n-1} (i \lambda_j z_j dz_j - i \lambda_j z_j dz_j); \ j = 1, \ldots, n - 1 \right\}.$$

The Levi form $L_p$ of $\mathcal{H}_n$ at $p \in \mathcal{H}_n$ is given by $L_p = \sum_{j=1}^{n-1} \lambda_j dz_j \wedge dz_j$. From now on, we assume that $\lambda_1 < 0, \ldots, \lambda_{n-1} < 0, \lambda_{n-1} > 0, \ldots, \lambda_{n-1} > 0$. Thus, the Levi form has constant signature $(n_-, n - n_-)$.

Now, we construct a CR line bundle over $\mathcal{H}_n$. Let $L = (\mathbb{C}^{n-1} \times \mathbb{R} \times \mathbb{C})/\equiv$ where $(z, \theta, \eta) \equiv (\tilde{z}, \tilde{\theta}, \tilde{\eta})$ if

$$(z, \theta) \sim (\tilde{z}, \tilde{\theta}), \quad \tilde{\eta} = \eta \exp(\sum_{j=1}^{n-1} \mu_j (z_j \alpha_j + \frac{1}{2} |\alpha_j|^2)), \quad \text{for } \alpha = \tilde{z} - z.$$ 

where $\mu_1, \ldots, \mu_{n-1}$, are given non-zero integers. We can check that $\equiv$ is an equivalence relation and $L$ is a CR line bundle over $\mathcal{H}_n$. For $(z, \theta, \eta) \in \mathbb{C}^{n-1} \times \mathbb{R} \times \mathbb{C}$ we denote $[(z, \theta, \eta)]$ its equivalence class. It is easy to see that the pointwise norm

$$|[(z, \theta, \eta)]| := |\eta| \exp \left( - \sum_{j=1}^{n-1} \mu_j |z_j|^2 \right)$$

is well-defined. In local coordinates $(z, \theta, \eta)$, the weight function of this metric is $\phi = \sum_{j=1}^{n-1} \mu_j |z_j|^2$. Note that

$$\overline{\partial} b = \sum_{j=1}^{n-1} dz_j \wedge (\frac{\partial}{\partial \tilde{z}} + i \lambda_j z_j \frac{\partial}{\partial \tilde{z}}), \quad \partial b = \sum_{j=1}^{n-1} dz_j \wedge (\frac{\partial}{\partial \tilde{z}} - i \lambda_j z_j \frac{\partial}{\partial \tilde{z}}).$$

Thus $d(\overline{\partial} b - \partial b) = 2 \sum_{j=1}^{n-1} \mu_j dz_j \wedge dz_j$ and $M^\phi_p = \sum_{j=1}^{n-1} \mu_j dz_j \wedge dz_j$. Hence

$$M^\phi_p = s L_p = \sum_{j=1}^{n} (\mu_j + s \lambda_j) dz_j \wedge dz_j,$$

for all $p \in \mathcal{H}_n$, $s \in \mathbb{R}$. 

39
Thus, if \( \mu_j = \lambda_j \), for all \( j \), and \( q \neq n_-, n - 1 - n_- \), then \( \mathbb{R}_{\Phi(p), q} = 0 \), for all \( p \in X \). From this and Theorem 1.5, we obtain

**Theorem 6.8.** If \( \mu_j = \lambda_j \), \( j = 1, \ldots, n - 1 \), and \( q \neq n_-, n - 1 - n_- \), then \[
\dim \mathcal{H}_k^q(\mathcal{C} H_n, L^k) = o(k^n), \quad \text{as } k \to \infty.
\]

If \( \mu_j = |\lambda_j| \) for all \( j \), we can check that \( \mathbb{R}_{\Phi(p), 0} > 0 \), for all \( p \in X \), where \( \mathbb{R}_{\Phi(p), 0} \) denotes the Lebesgue measure of \( \Phi(p), 0 \). Moreover, if \( q > 0 \) and \( q \neq n_-, n - 1 - n_- \), then \( \mathbb{R}_{\Phi(p), q} = 0 \), for all \( p \in X \). From this observation, the weak Morse inequalities (Theorem 1.5) for \( q = 0 \) and the strong Morse inequalities (Theorem 1.8), we obtain

**Theorem 6.9.** If \( \mu_j = |\lambda_j| \), \( j = 1, \ldots, n - 1 \), and \( Y(0), Y(1) \) hold, then \[
\dim \mathcal{H}_k^q(\mathcal{C} H_n, L^k) \sim k^n, \quad \text{as } k \to \infty.
\]

**Acknowledgements.** The first-named author is grateful to Bo Berndtsson and Robert Berman for several useful conversations and to the Department of Mathematics, Chalmers University of Technology and the University of Göteborg for offering excellent working conditions during December 2008–December 2010. We would like to thank P. Dingoyan for discussions about the extension of holomorphic sections [18]. We also thank the referee for many detailed remarks that have helped to improve the presentation.
