1. General Experimental Procedures

All reactions were performed with the use of modified Schlenk techniques with additional manipulations using an inert atmosphere MBraun glovebox. All solvents were obtained from commercial providers and dried over sodium benzophenone or calcium hydride, distilled, and stored over 4 Å molecular sieves prior to use. Silicon tetrabromide, n-buthyllithium, 2,6-diisopropylaniline, and chloro(dimethyl)phenylsilane were purchased from Aldrich (Merck) and used without further purification. Ethene (2.5, 99.5%) was purchased from Westfalen AG and was used as received. 2,3-Dimethyl-1,3-butadiene was dried with CaH₂, vacuum distilled, and degassed (freeze-pump-thaw) three times prior to use. Activated magnesium (Mg*)S₁,S₂ and tribromosilane {N(SiMe₃)Dipp}SiBr₃S₃ were prepared according to literature procedures.

All NMR data were obtained on Bruker Avance I and III spectrometers. The spectra were referenced to deuterated solvents (C₆D₆ or d₈-THF), according to an IUPAC recommendation, or internally to residual solvent resonances at 300 K. ¹H, ¹³C and ²⁹Si NMR chemical shifts are reported with respect to tetramethylsilane (TMS, δ = 0 ppm), whereas ammonia (NH₃, δ = 0 ppm) is used as a reference for ¹⁵N. Further explanation of the ²⁹Si NMR experiments: ²⁹Si{¹H}-DEPT19.5 = ²⁹Si proton decoupled NMR measurement with Distortionless Enhancement Polarization Transfer method, pulse angle 19.5°, coupling to 9 protons as polarization source with coupling ²J_{Si-H} = 7 Hz; ²⁹Si DEPT 24.1-NMR = ²⁹Si NMR measurement with Distortionless Enhancement Polarization Transfer method, pulse angle 24.1°, coupling to 6 protons as polarization source with coupling ³J_{Si-H} = 7 Hz; ²⁹Si{¹H}-IG = ²⁹Si proton decoupled Inverse Gated NMR measurement.

IR spectra were recorded as KBr pellets on a Shimadzu IR PRESTIGE 21 spectrometer. UV-Visible spectra were recorded as dilute n-hexane solutions in 1 mL quartz cuvettes using an Agilent Cary 100 spectrometer. Mass spectrometry was performed with a Varian MAT 212 Micromass Quattro LC-Z device. Melting points were measured in glass capillaries sealed under argon gas by using a Stuart Melting Point Apparatus SMP3 and are uncorrected.

2.1. Synthesis and Characterization of 1

\[
\text{LiDippNH} \quad \xrightarrow{n\text{-BuLi, pentane}} \quad \text{LiDippNH}
\]

A solution of \(n\)-BuLi (1.6 M in \(n\)-hexane; 26 mL, 42 mmol, 1.0 equiv.) was added dropwise to a solution of DippNH\(_2\) (8.0 mL, 42 mmol, 1.0 equiv.) in pentane (50 mL) at 0 °C. The reaction mixture was allowed to warm to room temperature and was stirred for 16 h. The colourless precipitate, LiDippNH, was filtered off, dried \textit{in vacuo}, and used without further purification.

\[
\text{LiDippNH} \quad \xrightarrow{\text{PhSi(Me)\textsubscript{2}Cl, Et\textsubscript{2}O}} \quad \text{PhMe\textsubscript{2}Si\textsubscript{2}NHR}
\]

LiDippNH (7.0 g, 32 mmol, 1.0 eq.) was dissolved in \(\text{Et}_2\text{O}\) (150 mL) and cooled to 0 °C. Chloro(dimethyl)phenylsilane (6.4 mL, 32 mmol, 1.0 eq.) was added dropwise and the mixture was stirred overnight at 0 °C. The colourless precipitate was filtered off and the volatiles were removed \textit{in vacuo} to give \{N(SiMe\textsubscript{2}Ph)Dipp\}H as an orange oil that was used without further purification.

\[
\text{PhMe\textsubscript{2}Si\textsubscript{2}NHR} \quad \xrightarrow{n\text{-BuLi, } n\text{-hexane}} \quad \text{PhMe\textsubscript{2}Si\textsubscript{2}NLi}
\]

\{N(SiMe\textsubscript{2}Ph)Dipp\}H (15.840 g, 50.9 mmol, 1.0 equiv.) was dissolved in \(n\)-hexane (50 mL) and \(n\)-BuLi (1.6 M in \(n\)-hexane; 31.8 mL, 50.9 mmol, 1.0 equiv.) was added slowly at −78 °C. The reaction mixture was allowed to warm to room temperature and was stirred for 16 h. The colourless precipitate was isolated \textit{via} filtration and all volatile components are removed \textit{in vacuo} to obtain \{N(SiMe\textsubscript{2}Ph)Dipp\}Li \(1\) (14.882 g, 46.9 mmol, 92%) as a colourless precipitate. Single crystals of \(1\) were grown from a concentrated \(n\)-hexane solution at −32 °C.

[N(PhDMS)Dipp]SiBr₃ (2) (1.157 g, 2.0 mmol, 1.0 equiv.) was dissolved in THF (15 ml) and slowly added to a suspension of Mg⁺ (0.073 g, 3.0 mmol, 1.5 equiv.) in THF (15 ml) at −78 °C. The reaction mixture was allowed to warm to room temperature and stirred for 16 h. After addition of 1,4-dioxane (0.66 ml, 7.5 mmol, 3.75 equiv.), the deep yellow suspension was stirred for one hour and was filtrated. All volatile components were removed in vacuo and the yellow residue was extracted with n-hexane (50 ml) and filtrated. Compound 3 was obtained from a concentrated solution in n-hexane after storage at −32 °C for 16 h. Single crystals of 3 were obtained from a concentrated solution in toluene at room temperature. Yield: 0.170 g, 0.16 mmol, 23%

[N{SiMe$_2$Ph}Dipp]Br$_3$ 2 (2.000 g, 3.5 mmol, 1.0 equiv.) was dissolved in THF (30 ml) and slowly added to a suspension of Mg* (0.126 g, 5.2 mmol, 1.5 equiv.) in THF (20 ml) at −78 °C. 2,3-Dimethyl-1,3-butadiene (dmbd; 1.95 ml, 1.422 g, 17.3 mmol, 5.0 equiv.) was then added via syringe. The reaction mixture was allowed to warm to room temperature and stirred for 16 h. After addition of 1,4-dioxane (3.0 ml, 33.4 mmol, 9.5 equiv.), the solution was stirred for 1 h at room temperature. The suspension was filtered, and all volatiles were removed in vacuo. The bright yellow residue was extracted with n-hexane (3 x 20 ml) and filtrated to obtain 9 (0.491 g, 0.98 mmol, 28%) in form of a colourless powder.

{N(SiMe$_3$)}Dipp$\text{SiBr}_3$ (2.000 g, 3.87 mmol, 1.0 equiv.) was dissolved in THF (370 mL) and slowly added to a suspension of Mg* (0.141 g, 5.81 mmol, 1.5 equiv.) in THF (15 mL) at $-78 \degree \text{C}$. The reaction mixture was stirred for 16 h and allowed to warm to room, whereupon it turned red. 1,4-Dioxane (1.3 mL, 1.30 mmol, 2.5 equiv.) was added and the mixture was stirred at room temperature for one hour. The red suspension was filtrated, and all volatile components were removed \textit{in vacuo}. The obtained red powder was suspended in \textit{n}-hexane (10 mL) and filtrated. The red solution was stored at room temperature for 16 hours to yield Si$_4${N(SiMe$_3$)}Dipp$_4$ (0.268 g, 0.24 mmol, 25%) as red crystals. The orange red supernatant solution was separated from the crystals using a cannula. After further storage at room temperature of this solution for two weeks [Si$_3${N(SiMe$_3$)}Dipp$_3$]Br 19’ (0.045 g, 0.05 mmol, 4%) was obtained as orange crystals.

{N(SiMe₂Ph)Dipp}SiBr₃ (2) (1.157 g, 2.0 mmol, 1.0 equiv.) was dissolved in THF (185 ml) and slowly added to a suspension of Mg* (0.073 g, 3.0 mmol, 1.5 equiv.) in THF (15 ml) at −78 °C. The reaction mixture was allowed to warm to room temperature and stirred for 16 h. After addition of 1,4-dioxane (0.66 ml, 7.5 mmol, 3.75 equiv.), the deep yellow suspension was stirred for one hour and was filtrated. All volatile components were removed in vacuo and the yellow residue was extracted with n-hexane (50 ml) and filtrated. Storage of a concentrated solution at −32 °C yielded 3 (0.094 g, 0.09 mmol, 13%). Crystallization attempts of 19 were met with failure. The orange solution was evaporated to dryness and redissolved in C₆D₆ as well as d₈-THF to obtain NMR spectra.

3. Details of Single Crystal X-ray Diffraction Analyses

Crystals of 1, 2, 3-(1.5 PhMe), 8, and 19’ were removed from a Schlenk tube under an argon atmosphere and covered with a layer of hydrocarbon oil. A suitable crystal was selected, attached to a glass fiber, and quickly placed in a low temperature argon stream. The data were collected\(^{S4}\) at 100 K on a Bruker Venture with Mo K\(_\alpha\) radiation (\(\lambda = 0.71073 \text{ Å}\)) and corrected for Lorentz and polarization effects with SAINT\(^{S4}\) and absorption using Blessing’s method\(^{S5}\) as incorporated into the program SADABS.\(^{S6,S7}\) Crystal structures were solved by using the SHELXTL program package to determine the space group based upon intensity statistics.\(^{S8}\) The structure was determined by direct methods with a majority of the non-hydrogen atoms from the molecule of interest being located directly using the program SHELXS.\(^{S9}\) Refinement of the structure was achieved using the program SHELXL with all non-hydrogen atoms refined anisotropically.\(^{S10}\) Difference-Fourier least-squares refinement cycles were required to locate all non-hydrogen atoms.

3.1. Refinement Details

For compounds 1, 2, 8, and 19’, no constraints or restraints were used in the refinement. However, compound 3 co-crystallises with the solvent toluene (PhMe). One of the solvent molecules is located next to a symmetry element and was treated with PART-1, SIMU, and DELU instructions. In addition, three reflexes were omitted because they were affected by the beam stopper.

4. Computational Details

The geometries of compounds 5–7 and 10–19 along with those of the associated transition states, were optimised in the gas phase with density functional theory using the PBE1PBE functional, def2-TZVP basis sets, and Grimme’s D3 dispersion correction with Becke-Johnson damping and employing the Gaussian 16-C.01 program suite. The structures were confirmed to be either minima or first order transition states on the potential energy hypersurface via calculation of the associated vibrational frequencies (all positive or one imaginary, respectively). The nature of all transition states found was further confirmed by following the reaction coordinate to both forward and reverse directions. Table S3 includes the Gibbs free energies of all investigated species, while their structures are provided in a separate coordinate file in standard xyz-format.
