ABSTRACT

Introduction Incretin-based therapies exert anti-hyperglycemic effects in patients with type 2 diabetes (T2D) in a blood glucose concentration-dependent fashion. The first-in-class oral glucagon-like peptide-1 receptor agonist semaglutide has potent effects on glycemic and weight control, but little evidence has been published for the superiority of semaglutide for glycemic control in patients after switching from a dipeptidyl peptidase-4 (DPP-4) inhibitor. Therefore, we aim to verify the efficacy of oral semaglutide in patients with T2D being treated with a DPP-4 inhibitor.

Methods and analysis This study is a multi-center, prospective, randomized, open-label, parallel-group trial. In total, 172 participants with T2D who have been treated with a DPP-4 inhibitor for more than 12 weeks and who have a glycated hemoglobin (HbA1c) level of 7.0%–9.9% will be randomized to continue using their existing DPP-4 inhibitor or switch to oral semaglutide for 24 weeks. Biochemical analyses and physical assessment will be performed and adverse events will be recorded at baseline and at the end of the study. The primary endpoint will be the effect of oral semaglutide on the change in HbA1c. The secondary endpoints will be the mean changes in body mass, abdominal circumference, systolic and diastolic blood pressure, pulse rate, factors associated with
any improvements in HbA1c or secondary endpoints, side-effects, and other laboratory parameters.

**Ethics and dissemination** This will be the first study to compare the effects of switching from a DPP-4 inhibitor to oral semaglutide on glycemic control in patients with T2D. The results will be disseminated in peer-reviewed journals and at scientific conferences.

Hokkaido University Certified Review Board (CRB no.1180001) has approved the protocol (No.020-013).

**Trial registration number**

UMIN000045270 in the University Hospital Medical Information Network (UMIN);

jRCT1011210032 in the Japan Registry of Clinical Trials (jRCT)
66 **Strengths and limitations of this study**

67 - This randomized controlled study will be the first to directly compare the glycemic control of patients with type 2 diabetes who switch from a DPP-4 inhibitor to oral semaglutide administration.

68 - The study is a multi-center, prospective, randomized, parallel-group trial. Participants will not be blinded to their treatment.

70 - The study will be conducted in a standard clinical practice setting, at eight medical centers, and will include broad eligibility criteria, reflecting the real-world situation.
INTRODUCTION

A goal in the treatment of patients with diabetes is to reduce mortality by preventing diabetic macro- and microvascular complications. Strict glycemic control has been shown to reduce those complications \(^1\); however, intensive interventions can increase body mass as well as the risk of hypoglycemia \(^2\) \(^3\). Therefore, comprehensive interventions targeting multiple risks, including obesity, lipid metabolism, and blood pressure without causing hypoglycemia are required to achieve better outcomes \(^4\) \(^5\). As a consequence, treatment strategies that have potent anti-hyperglycemic effects without causing body mass gain and hypoglycemia are sought after.

Incretin-based therapies have been shown to have ideal glucose-lowering effects in patients with type 2 diabetes (T2D) because their effects are blood glucose concentration-dependent \(^6\). Currently, anti-hyperglycemic treatment regimens including a dipeptidyl peptidase-4 (DPP-4) inhibitor are well recognized for patients with T2D all over the world \(^7\). DPP-4 inhibitors are one of the most frequently prescribed anti-hyperglycemic drugs, especially in Japan, because of their safety and high efficacy in Asian populations \(^8\) \(^9\). Glucagon-like peptide-1 receptor agonists (GLP-1RAs) have stronger anti-hyperglycemic effects than conventional oral antihyperglycemic agents \(^10\).
and importantly, certain GLP-1RAs have been shown to have beneficial effects on cardiovascular outcomes in high-risk patients with T2D\(^{11-13}\), albeit that they require inconvenient parenteral administration.

Recently, oral semaglutide—the first-in-class oral GLP-1RA—has been approved with the report of its remarkable effects on hyperglycemia and body mass, compared with either placebo, once-weekly semaglutide\(^{14}\), or a DPP-4 inhibitor\(^{15}\).

However, notably, these comparisons were performed during a phase III trial, and it is not known whether oral semaglutide administration is superior to that of a conventional DPP-4 inhibitor with respect to glycemic control in daily clinical practice, and especially in patients that were previously treated using a DPP-4 inhibitor. Therefore, in this prospective, randomized, open-label, parallel-group trial, we will compare the effects of oral semaglutide administration to that of a DPP-4 inhibitor with respect to glycemic control in Japanese patients with T2D.

METHODS

Study design

This is a multi-center, open-label prospective, randomized, parallel-group
comparison study that will compare the glycemic control of patients taking a DPP-4 inhibitor or the oral GLP-1RA semaglutide daily. Following enrollment and the provision of written informed consent, the participants will undergo serum and urine analyses and physical examination to obtain baseline data. At each study visit, clinic blood pressure (BP), pulse rate, body mass, and abdominal circumference will be measured. After the initial assessment, all the participants will be randomly assigned to continue their DPP-4 inhibitor or to switch to oral semaglutide at a ratio of 1:1, according to their age, body mass index (BMI), HbA1c, and institution. The randomization and allocation of the participants will be performed using a web-based automated system that is independent of the participating sites (NorthNet; https://crmic.huhp.hokudai.ac.jp/page/?content=31), as described previously. The glycemic target is to be determined for each patient based on the recommendations of the Japan Diabetes Society. Serum and urine metabolic parameters, clinic BP, pulse rate, body mass, and abdominal circumference will be measured at each study visit.

Oral semaglutide will be initiated at 3 mg once daily, which will be escalated to 7 mg after 4 weeks and then up to 14 mg if necessary. Participants will be instructed to take the oral semaglutide in the morning in a fasted state, with 120 mL of water, at least 30 min before breakfast and any other oral medication. They will also be encouraged to
continue their diet and exercise therapy during the study. The treatments will be supervised through the appropriate medical care center for 24 weeks, then the baseline serum and urine measurements and physical examination will be repeated (Figure 1). The doses of anti-hyperglycemic agents other than sulfonylureas, glinides, and insulin, and concomitant treatments for metabolic disorders, will not be adjusted during the study period. To avoid hypoglycemia, the doses of sulfonylureas, glinides, and insulin will be able to be adjusted, based on the recommendations of the Japan Diabetes Society. 

Participant enrollment will take place between 9th July 2021 and 31st December 2023 at eight medical centers and clinics located in Hokkaido, Japan.

**Sample selection**

The inclusion criteria are as follows: Japanese patients with T2D who are aged 20–89 years, with HbA1c 7.0%–9.9% and BMI ≥ 18.5 kg/m², and who have been treated with a DPP-4 inhibitor for at least 12 weeks before enrollment, without being discontinued for more than 1 week (see Box 1). The key exclusion criteria are as follows: 

1) treatment with any GLP-1RA, 2) allergy to semaglutide, 3) unstable diabetic retinopathy, 4) current severe liver dysfunction or nephropathy, 5) severe infection, trauma, and/or recent or planned surgery, 6) severe ketosis, 7) diabetic coma or pre-coma,
8) pregnancy, 9) poor compliance with medication, 10) inability to consume an appropriate diet and/or perform exercise, and 11) incompatibility with the trial for other reasons, as determined by a physician (see Box 2).

Physicians in the research team will obtain written informed consent from all the eligible participants. The written material, consisting of a participant information leaflet and consent documentation, has been approved by the Research Committee. There will be an opportunity for the participants to freely ask questions of members of the research team, and their consent will be able to be withheld at any time during the study period, should they so wish. Patients will be withdrawn from the trial if any of the following criteria apply: 1) withdrawal of consent, 2) physician’s decision, based on the patient’s condition, 3) discontinuation of the study, or 4) physician’s decision, based on another reason.

**Patient and public involvement statement**

Participants were not directly involved in the design nor development of the study, and will not be involved in the recruitment nor conduct of the trial. The results of their investigations will be provided to the participants after the study, during a medical consultation in their participating center.
TRIAL ENDPOINT

Primary and secondary endpoints

The primary endpoint of the study is the change in HbA1c from baseline to week 24, which will be compared between the semaglutide group and control group. The secondary endpoints are as follows: the mean changes in 1) body mass, 2) abdominal circumference, 3) systolic and diastolic BP, 4) pulse rate, 5) laboratory parameters reflecting glucose and lipid metabolism, and liver and renal function, 6) factors associated with any improvement of HbA1c or secondary endpoints, and 7) any side-effects. We will prepare a time-course sheet for each study visit to minimize the risk of participants dropping out.

Sample size calculation

The sample size was calculated on the basis that oral semaglutide (3–14 mg/day) will improve HbA1c by at least a further 0.70% (SD 1.585%), compared with sitagliptin (100 mg/day), as shown in a phase III trial conducted in patients with T2D. A power calculation determined that a sample size of 82 individuals per group would be required.
to achieve a power of at least 80% for the detection of a difference between treatments. $P < 0.05$ will be considered to represent statistical significance and all tests will be two-sided. On the basis of an assumption that four participants (5%) will drop out from each group, the sample size has been set at 86 participants per group. To ensure that enough participants enroll to achieve the target sample size, we will conduct the study at eight medical centers in Hokkaido.

**Data analysis**

Analysis of the primary and secondary endpoint data will be principally performed using the full analysis set (FAS), which will comprise the participants who are enrolled in the study and assigned to treatment groups. Patients who do not meet the inclusion criteria, those with insufficient primary endpoint data, or those appreciably deviated from the study protocol will be excluded from the FAS. Differences between the two groups will be analyzed using the unpaired $t$-test or Mann–Whitney U-test for continuous data, and Pearson’s chi-square test or Fisher’s exact test for categorical data. The factors associated with any improvements in HbA1c or other metabolic parameters will be identified using analysis of covariance and multivariate analysis. We will analyze the data using JMP Pro (SAS Institute, Cary, NC, USA), BellCurve for Excel (Social...
Survey Research Information Co., Ltd., JP), and GraphPad Prism (GraphPad Software, Inc. San Diego, CA, USA).

ETHICS AND DISSEMINATION

Ethics approval

The trial was registered with the Japan Registry of Clinical Trials (jRCT1011210032) and the University Hospital Medical Information Network (UMIN) Center (UMIN000045270) before enrollment commenced. The study protocol was approved by the Hokkaido University Certified Review Board (CRB no. 1180001; approval number 020-013), and the current version is 1.5 (approved on August 3, 2021).

The study will be carried out in accordance with the principles of the Declaration of Helsinki and its amendments.

Data protection and management

Data management, including coding, security, storage, and cleaning, will be performed by researchers throughout the trial. The study data will be archived at Hokkaido University for 5 years after study completion. The participants will also be able
to obtain the final results of the study. The UMIN and jRCT databases will contain
detailed information regarding the study. Study conduct will be evaluated by a monitor
who will be independent of the investigators. Monitoring will be performed on the first
and fifth participants at Hokkaido University Hospital, and the first participant at each of
the other study sites. In line with the provisions of the Clinical Trials Act in Japan, adverse
events and other information, including modifications to the trial, will be disclosed
publicly.

227 Availability of data and materials

The data analyzed during this study will be available from the corresponding
author of this article upon reasonable request.

231 DISCUSSION

To our knowledge, this will be the first prospective clinical trial to be
conducted in a real-world setting, comparing the efficacy of oral semaglutide after
switching from DPP-4 inhibitors with respect to glycemic control in Asian patients with
T2D. Oral semaglutide has been shown to exert a potent anti-hyperglycemic effect. A
recent network meta-analysis that compared the relative efficacy of oral semaglutide and injectable GLP-1RAs revealed that 14 mg/day oral semaglutide was associated with a significantly larger reduction in HbA1c than most of the comparators, with the exception of weekly semaglutide. Furthermore, a previous phase III trial showed that the administration of oral semaglutide at 7 mg or 14 mg/day resulted in a larger reduction in HbA1c than sitagliptin at 100 mg/day. Because it has been demonstrated that DPP-4 inhibitors have potent anti-hyperglycemic effects in Asian populations, however, it is important to confirm that similar differences exist in the Japanese population.

The management of obesity during the treatment of diabetes is important but presents a difficult challenge. A treatment strategy not causing body mass gain would be ideal. DPP-4 inhibitors have no effect on body mass, whereas other insulin secretagogues tend to cause body mass gain. One of the advantages of using a GLP-1RA would be related with appetite. Notably, a phase III trial that assessed the dose-response and efficacy of oral semaglutide in Japanese patients showed that the weight loss induced by semaglutide was greater than that induced by liraglutide at 0.9 mg/day, although the incidence of gastrointestinal events was comparable between the groups.
A switch from a DPP-4 inhibitor to oral semaglutide may represent a promising “step-up” therapeutic strategy. However, most patients being treated in routine clinical practice who are receiving a DPP-4 inhibitor are also taking other oral anti-hyperglycemic agents. Because semaglutide must be taken at least 30 min before breakfast and any other oral medication, a switch to oral semaglutide forces patients to take their medication at two separate times, leading to poorer compliance and diminished efficacy of the therapy. Therefore, it is important to confirm the efficacy and safety of oral semaglutide in a study conducted in a real-world clinical practice setting.

In conclusion, the present study will be the first clinical trial to evaluate the efficacy of oral semaglutide for glycemic control in patients with T2D who were previously being treated using a DPP-4 inhibitor in a real-world clinical practice setting. Therefore, the results should provide new insights into the efficacy of oral semaglutide in patients with T2D.

Figure legends

Figure 1. Patient recruitment scheme

Participants will be randomly assigned to either continue to use their existing DPP-4 inhibitor or to be switched to oral semaglutide (starting dose 3 mg/day). All the participants will undergo physical and biochemical examinations at baseline and at the end of the study. DPP-4, dipeptidyl peptidase-4 inhibitor; GLP-1, glucagon-like peptidase-1; T2D, type 2 diabetes.
Box 1. Inclusion criteria

- Japanese patients with T2D
- Age 20–89 years
- HbA1c 7.0%–9.9%
- Body mass index $\geq$ 18.5 kg/m$^2$
- Treatment with a DPP-4 inhibitor for at least 12 weeks before enrollment, without discontinuation for more than 1 week
Box 2. Exclusion criteria

Exclusion criteria

- Treatment with any GLP-1 receptor agonist within the 12 weeks prior to enrollment
- Allergy to semaglutide
- Unstable diabetic retinopathy
- Current severe liver dysfunction or nephropathy
- Severe infection, trauma, and/or recent or planned surgery
- Severe ketosis
- Diabetic coma or pre-coma
- Pregnancy
- Low drug compliance rate
- Inability to consume an appropriate diet and/or perform exercise
- Incompatibility with the trial for other reasons, as determined by the physician
Assessment for Eligibility
Patients with T2D being treated with a DPP-4 inhibitor

Enrollment and First Examination
- Informed consent
- Height
- Body mass
- Abdominal circumference
- Blood pressure and pulse rate
- Laboratory data assessment

Randomization (1:1)

Once-daily Semaglutide
- Switch from current DPP-4 inhibitor to once-daily semaglutide (starting at 3 mg/day and increasing up to 14 mg/day)

Continue DPP-4 inhibitor
- Continue current DPP-4 inhibitor

Period 2
12 (± 5) weeks

Second Examination
- Body mass
- Abdominal circumference
- Blood pressure and pulse rate
- Laboratory data assessment

Period 3
24 (± 5) weeks

Final Examination
- Body mass
- Abdominal circumference
- Blood pressure and pulse rate
- Laboratory data assessment

End of Study
SPIRIT 2013 Checklist: Recommended items to address in a clinical trial protocol and related documents*

| Section/item          | Item No | Description                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Administrative information |         |                                                                                                                                                                                                                                                                                                                                                   |
| Title                 | 1       | Descriptive title identifying the study design, population, interventions, and, if applicable, trial acronym                                                                                                                                                                                                                                 |
|                       |         | Answer: p.1                                                                                                                                                                                                                                                                                                                                  |
| Trial registration    | 2a      | Trial identifier and registry name. If not yet registered, name of intended registry                                                                                                                                                                                                                                                        |
|                       | 2b      | All items from the World Health Organization Trial Registration Data Set                                                                                                                                                                                                                                                                       |
|                       |         | Answer: p.4                                                                                                                                                                                                                                                                                                                                  |
| Protocol version      | 3       | Date and version identifier                                                                                                                                                                                                                                                                                                                   |
|                       |         | Answer: p.13                                                                                                                                                                                                                                                                                                                                  |
| Funding               | 4       | Sources and types of financial, material, and other support                                                                                                                                                                                                                                                                                   |
|                       |         | Answer: p.18                                                                                                                                                                                                                                                                                                                                  |
| Roles and responsibilities | 5a  | Names, affiliations, and roles of protocol contributors                                                                                                                                                                                                                                                                                       |
|                       | 5b      | Name and contact information for the trial sponsor                                                                                                                                                                                                                                                                                             |
|                       |         | Answer: pp.18-19                                                                                                                                                                                                                                                                                                                              |
|                       | 5c      | Role of study sponsor and funders, if any, in study design; collection, management, analysis, and interpretation of data; writing of the report; and the decision to submit the report for publication, including whether they will have ultimate authority over any of these activities                                                                                                                                                   |
|                       |         | Answer: p.18                                                                                                                                                                                                                                                                                                                                  |
|                       | 5d      | Composition, roles, and responsibilities of the coordinating centre, steering committee, endpoint adjudication committee, data management team, and other individuals or groups overseeing the trial, if applicable (see Item 21a for data monitoring committee)                                                                                                                                                 |
|                       |         | Answer: Not applicable                                                                                                                                                                                                                                                                                                                          |

Introduction
Background and rationale 6a Description of research question and justification for undertaking the trial, including summary of relevant studies (published and unpublished) examining benefits and harms for each intervention

Answer: pp.6-7

6b Explanation for choice of comparators

Answer: pp.6-7

Objectives 7 Specific objectives or hypotheses

Answer: pp.6-7

Trial design 8 Description of trial design including type of trial (eg, parallel group, crossover, factorial, single group), allocation ratio, and framework (eg, superiority, equivalence, noninferiority, exploratory)

Answer: pp.7-9

Methods: Participants, interventions, and outcomes

Study setting 9 Description of study settings (eg, community clinic, academic hospital) and list of countries where data will be collected. Reference to where list of study sites can be obtained

Answer: pp.7-8, UMIN and jRCT web site

Eligibility criteria 10 Inclusion and exclusion criteria for participants. If applicable, eligibility criteria for study centres and individuals who will perform the interventions (eg, surgeons, psychotherapists)

Answer: pp.9-10

Interventions 11a Interventions for each group with sufficient detail to allow replication, including how and when they will be administered

11b Criteria for discontinuing or modifying allocated interventions for a given trial participant (eg, drug dose change in response to harms, participant request, or improving/worsening disease)

11c Strategies to improve adherence to intervention protocols, and any procedures for monitoring adherence (eg, drug tablet return, laboratory tests)

11d Relevant concomitant care and interventions that are permitted or prohibited during the trial

Answer: pp.7-10
Outcomes 12
Primary, secondary, and other outcomes, including the specific measurement variable (eg, systolic blood pressure), analysis metric (eg, change from baseline, final value, time to event), method of aggregation (eg, median, proportion), and time point for each outcome. Explanation of the clinical relevance of chosen efficacy and harm outcomes is strongly recommended

Answer: p.11

Participant timeline 13
Time schedule of enrolment, interventions (including any run-ins and washouts), assessments, and visits for participants. A schematic diagram is highly recommended (see Figure)

Answer: pp.7-9 and Figure 1.

Sample size 14
Estimated number of participants needed to achieve study objectives and how it was determined, including clinical and statistical assumptions supporting any sample size calculations

Answer: pp.11-12

Recruitment 15
Strategies for achieving adequate participant enrolment to reach target sample size

Answer: pp.9,11-12

Methods: Assignment of interventions (for controlled trials)

Allocation:

Sequence generation 16a
Method of generating the allocation sequence (eg, computer-generated random numbers), and list of any factors for stratification. To reduce predictability of a random sequence, details of any planned restriction (eg, blocking) should be provided in a separate document that is unavailable to those who enrol participants or assign interventions

Allocation concealment mechanism 16b
Mechanism of implementing the allocation sequence (eg, central telephone; sequentially numbered, opaque, sealed envelopes), describing any steps to conceal the sequence until interventions are assigned

Implementation 16c
Who will generate the allocation sequence, who will enrol participants, and who will assign participants to interventions

Answer: pp.7-8

Blinding (masking) 17a
Who will be blinded after assignment to interventions (eg, trial participants, care providers, outcome assessors, data analysts), and how
17b If blinded, circumstances under which unblinding is permissible, and procedure for revealing a participant’s allocated intervention during the trial

Answer: Not applicable

Methods: Data collection, management, and analysis

Data collection methods

18a Plans for assessment and collection of outcome, baseline, and other trial data, including any related processes to promote data quality (eg, duplicate measurements, training of assessors) and a description of study instruments (eg, questionnaires, laboratory tests) along with their reliability and validity, if known. Reference to where data collection forms can be found, if not in the protocol

Answer: pp.7-9

18b Plans to promote participant retention and complete follow-up, including list of any outcome data to be collected for participants who discontinue or deviate from intervention protocols

Answer: p.11

Data management

19 Plans for data entry, coding, security, and storage, including any related processes to promote data quality (eg, double data entry; range checks for data values). Reference to where details of data management procedures can be found, if not in the protocol

Answer: pp.12-13

Statistical methods

20a Statistical methods for analysing primary and secondary outcomes. Reference to where other details of the statistical analysis plan can be found, if not in the protocol

Answer: pp.12-13

20b Methods for any additional analyses (eg, subgroup and adjusted analyses)

Answer: Not applicable

20c Definition of analysis population relating to protocol non-adherence (eg, as randomised analysis), and any statistical methods to handle missing data (eg, multiple imputation)

Answer: pp.10, 12-13

Methods: Monitoring

Data monitoring

21a Composition of data monitoring committee (DMC); summary of its role and reporting structure; statement of whether it is independent from the sponsor and competing interests; and reference to where further details about its charter can be found, if not in the protocol. Alternatively, an explanation of why a DMC is not needed
21b Description of any interim analyses and stopping guidelines, including who will have access to these interim results and make the final decision to terminate the trial

Answer: Not applicable

Harms 22 Plans for collecting, assessing, reporting, and managing solicited and spontaneously reported adverse events and other unintended effects of trial interventions or trial conduct

Answer: p.12-13

Auditing 23 Frequency and procedures for auditing trial conduct, if any, and whether the process will be independent from investigators and the sponsor

Answer: Not applicable

Ethics and dissemination

Research ethics approval 24 Plans for seeking research ethics committee/institutional review board (REC/IRB) approval

Answer: pp.4 and 13

Protocol amendments 25 Plans for communicating important protocol modifications (eg, changes to eligibility criteria, outcomes, analyses) to relevant parties (eg, investigators, REC/IRBs, trial participants, trial registries, journals, regulators)

Answer: pp.12-13

Consent or assent 26a Who will obtain informed consent or assent from potential trial participants or authorised surrogates, and how (see Item 32)

Answer: p.10

26b Additional consent provisions for collection and use of participant data and biological specimens in ancillary studies, if applicable

Answer: Not applicable

Confidentiality 27 How personal information about potential and enrolled participants will be collected, shared, and maintained in order to protect confidentiality before, during, and after the trial

Answer: pp.13-14

Declaration of interests 28 Financial and other competing interests for principal investigators for the overall trial and each study site

Answer: pp.17-18
| Access to data          | 29 | Statement of who will have access to the final trial dataset, and disclosure of contractual agreements that limit such access for investigators |
|------------------------|----|-----------------------------------------------------------------------------------------------------------------------------|
|                        |    | Answer: p.19                                                                                                                  |
| Ancillary and          | 30 | Provisions, if any, for ancillary and post-trial care, and for compensation to those who suffer harm from trial participation   |
| post-trial care        |    | Answer: pp.13-14                                                                                                              |
| Dissemination policy   | 31a| Plans for investigators and sponsor to communicate trial results to participants, healthcare professionals, the public, and other relevant groups (eg, via publication, reporting in results databases, or other data sharing arrangements), including any publication restrictions |
|                        |    | Answer: p.10                                                                                                                  |

Keywords: dipeptidyl peptidase-4 inhibitor, glucagon-like peptide-1 receptor agonist, type 2 diabetes mellitus
ABSTRACT

Introduction Incretin-based therapies exert anti-hyperglycemic effects in patients with type 2 diabetes (T2D) in a blood glucose concentration-dependent fashion. The first-in-class oral glucagon-like peptide-1 receptor agonist semaglutide has potent effects on glycemic and weight control, but little evidence has been published for the superiority of semaglutide for glycemic control in patients after switching from a dipeptidyl peptidase-4 (DPP-4) inhibitor. Therefore, we aim to verify the efficacy of oral semaglutide in patients with T2D being treated with a DPP-4 inhibitor.

Methods and analysis This study is a multi-center, prospective, randomized, open-label, parallel-group trial. In total, 172 participants with T2D who have been treated with a DPP-4 inhibitor for more than 12 weeks and who have a glycated hemoglobin (HbA1c) level of 7.0%–9.9% will be randomized to continue using their existing DPP-4 inhibitor or switch to oral semaglutide for 24 weeks. Biochemical analyses and physical assessment will be performed and adverse events will be recorded at baseline and at the end of the study. The primary endpoint will be the effect of oral semaglutide on the change in HbA1c. The secondary endpoints will be the mean changes in body weight, abdominal circumference, systolic and diastolic blood pressure, pulse rate, the relationship between
improvement of metabolic parameters including HbA1c and patient background characteristics, side-effects, and other laboratory parameters.

**Ethics and dissemination** This will be the first study to compare the effects of switching from a DPP-4 inhibitor to oral semaglutide on glycemic control in patients with T2D. The results will be disseminated in peer-reviewed journals and at scientific conferences.

Hokkaido University Certified Review Board (CRB no.1180001) has approved the protocol (No.020-013).

UMIN000045270 in the University Hospital Medical Information Network (UMIN);

jRCT1011210032 in the Japan Registry of Clinical Trials (jRCT)
Strengths and limitations of this study

- The study is a multi-center, prospective, randomized, open-label, parallel-group trial.
- The study will be conducted in a standard clinical practice setting, at eight medical centers, and will include broad eligibility criteria, reflecting the real-world situation.
- The limitation of the study is the open-label aspect of the study design, which can create a bias toward observing a favorable result for oral semaglutide.
A goal in the treatment of patients with diabetes is to reduce mortality by preventing diabetic macro- and microvascular complications. Strict glycemic control has been shown to reduce those complications; however, intensive interventions can increase body weight as well as the risk of hypoglycemia. Therefore, comprehensive interventions targeting multiple risks, including obesity, lipid metabolism, and blood pressure without causing hypoglycemia are required to achieve better outcomes. As a consequence, treatment strategies that have potent anti-hyperglycemic effects without causing body weight gain and hypoglycemia are sought after.

Incretin-based therapies have been shown to have ideal glucose-lowering effects in patients with type 2 diabetes (T2D) because their effects are blood glucose concentration-dependent. Currently, anti-hyperglycemic treatment regimens including a dipeptidyl peptidase-4 (DPP-4) inhibitor are well recognized for patients with T2D all over the world. DPP-4 inhibitors are one of the most frequently prescribed anti-hyperglycemic drugs, especially in Japan, because of their safety and high efficacy in Asian populations. Glucagon-like peptide-1 receptor agonists (GLP-1RAs) have stronger anti-hyperglycemic effects than conventional oral antihyperglycemic agents.
and importantly, certain GLP-1RAs have been shown to have beneficial effects on cardiovascular outcomes in high-risk patients with T2D\textsuperscript{11-13}, albeit that they require inconvenient parenteral administration.

Recently, oral semaglutide—the first-in-class oral GLP-1RA—has been approved with the report of its remarkable effects on hyperglycemia and body weight, compared with either placebo, once-weekly semaglutide\textsuperscript{14}, or a DPP-4 inhibitor\textsuperscript{15}.

However, notably, these comparisons were performed during a phase III trial, and it is not known whether oral semaglutide administration is superior to that of a conventional DPP-4 inhibitor with respect to glycemic control in daily clinical practice, and especially in patients that were previously treated using a DPP-4 inhibitor. Therefore, in this prospective, randomized, open-label, parallel-group trial, we will compare the effects of oral semaglutide administration to that of a DPP-4 inhibitor with respect to glycemic control in Japanese patients with T2D.

\textbf{METHODS}

\textbf{Study design}

This is a multi-center, open-label prospective, randomized, parallel-group
comparison study that will compare the glycemic control of patients taking a DPP-4 inhibitor or the oral GLP-1RA semaglutide daily. Following enrollment and the provision of written informed consent, the participants will undergo serum and urine analyses and physical examination to obtain baseline data. At each study visit, clinic blood pressure (BP), pulse rate, body weight, and abdominal circumference will be measured. After the initial assessment, all the participants will be randomly assigned to continue their DPP-4 inhibitor or to switch to oral semaglutide at a ratio of 1:1, according to their age, body mass index (BMI), HbA1c, and institution. The randomization and allocation of the participants will be performed using a web-based automated system that is independent of the participating sites (NorthNet; https://crnic.huhp.hokudai.ac.jp/page/?content=31), as described previously. The glycemic target is to be determined for each patient based on the recommendations of the Japan Diabetes Society. Serum and urine metabolic parameters, clinic BP, pulse rate, body weight, and abdominal circumference will be measured at each study visit.

Oral semaglutide will be initiated at 3 mg once daily, which will be escalated to 7 mg after 4 weeks and then up to 14 mg if the glycemic control is insufficient to reach the glycemic target based on the recommendations of the Japan Diabetes Society and the participants agree. Participants will be instructed to take the oral semaglutide in the
morning in a fasted state, with 120 mL of water, at least 30 min before breakfast and any other oral medication. They will also be encouraged to continue their diet and exercise therapy during the study. The treatments will be supervised through the appropriate medical care center for 24 weeks, then the baseline serum and urine measurements and physical examination will be repeated (Figure 1). The doses of anti-hyperglycemic agents other than sulfonylureas, glinides, and insulin, and concomitant treatments for metabolic disorders, will not be basically adjusted during the study period; however, if the glycemic control does not reach the appropriate target and/or becomes worse despite suitable interventions in lifestyle behaviors, adjustment or addition of anti-hyperglycemic agents will be considered. To avoid hypoglycemia, the doses of sulfonylureas, glinides, and insulin will be able to be adjusted, based on the recommendations of the Japan Diabetes Society. Participant enrollment will take place between 9th July 2021 and 31st December 2023 at eight medical centers and clinics located in Hokkaido, Japan.

Sample selection

The inclusion criteria are as follows: Japanese patients with T2D who are aged 20–89 years, with HbA1c 7.0%–9.9% and BMI ≥ 18.5 kg/m², and who have been treated with a DPP-4 inhibitor for at least 12 weeks before enrollment, without being...
discontinued for more than 1 week (see Box 1). The key exclusion criteria are as follows: 1) treatment with any GLP-1RA, 2) allergy to semaglutide, 3) unstable diabetic retinopathy, 4) current severe liver dysfunction or nephropathy, 5) severe infection, trauma, and/or recent or planned surgery, 6) severe ketosis, 7) diabetic coma or pre-coma, 8) pregnancy, 9) poor compliance with medication, 10) inability to consume an appropriate diet and/or perform exercise, and 11) incompatibility with the trial for other reasons, as determined by a physician (see Box 2).

Physicians in the research team will obtain written informed consent from all the eligible participants. The written material, consisting of a participant information leaflet and consent documentation, has been approved by the Research Committee. There will be an opportunity for the participants to freely ask questions of members of the research team, and their consent will be able to be withheld at any time during the study period, should they so wish. Patients will be withdrawn from the trial if any of the following criteria apply: 1) withdrawal of consent, 2) physician’s decision, based on the patient’s condition, 3) discontinuation of the study, or 4) physician’s decision, based on another reason.

Patient and public involvement statement
Participants were not directly involved in the design nor development of the study, and will not be involved in the recruitment nor conduct of the trial. The results of their investigations will be provided to the participants after the study, during a medical consultation in their participating center.

**TRIAL ENDPOINT**

**Primary and secondary endpoints**

The primary endpoint of the study is the change in HbA1c from baseline to week 24, which will be compared between the semaglutide group and control group. The secondary endpoints are as follows: the mean changes in 1) body weight, 2) abdominal circumference, 3) systolic and diastolic BP, 4) pulse rate, 5) laboratory parameters reflecting glucose and lipid metabolism, and liver and renal function, 6) the relationship between improvement of metabolic parameters including HbA1c and patient background characteristics, and 7) any side-effects. Hypoglycemia is defined as symptomatic hypoglycemic events or blood glucose levels <70 mg/dL. We will prepare a time-course sheet for each study visit to minimize the risk of participants dropping out.
Sample size calculation

The sample size was calculated on the basis that oral semaglutide (3–14 mg/day) will improve HbA1c by at least a further 0.70% (SD 1.585%), compared with sitagliptin (100 mg/day), as shown in a phase III trial conducted in patients with T2D. A power calculation determined that a sample size of 82 individuals per group would be required to achieve a power of at least 80% for the detection of superiority of oral semaglutide over DPP-4 inhibitor. \( P < 0.05 \) will be considered to represent statistical significance and all tests will be two-sided. On the basis of an assumption that four participants (5%) will drop out from each group, the sample size has been set at 86 participants per group. To ensure that enough participants enroll to achieve the target sample size, we will conduct the study at eight medical centers in Hokkaido.

Data analysis

Analysis of the primary and secondary endpoint data will be principally performed using the full analysis set (FAS), which will comprise the participants who are enrolled in the study and assigned to treatment groups. Patients who do not meet the inclusion criteria, those with insufficient primary endpoint data, or those appreciably deviated from the study protocol will be excluded from the FAS. Differences between the
two groups will be analyzed using the unpaired \( t \)-test or Mann–Whitney U-test for continuous data, and Pearson’s chi-square test or Fisher’s exact test for categorical data. The factors associated with any improvements in HbA1c or other metabolic parameters will be identified using analysis of covariance and multivariate analysis. We will analyze the data using JMP Pro (SAS Institute, Cary, NC, USA), BellCurve for Excel (Social Survey Research Information Co., Ltd., JP), and GraphPad Prism (GraphPad Software, Inc. San Diego, CA, USA).

ETHICS AND DISSEMINATION

Ethics approval

The trial was registered with the Japan Registry of Clinical Trials (jRCT1011210032) and the University Hospital Medical Information Network (UMIN) Center (UMIN000045270) before enrollment commenced. The study protocol was approved by the Hokkaido University Certified Review Board (CRB no. 1180001; approval number 020-013), and the current version is 1.7 (approved on February 3, 2022). The study will be carried out in accordance with the principles of the Declaration of Helsinki and its amendments.
Data protection and management

Data management, including coding, security, storage, and cleaning, will be performed by researchers throughout the trial. The study data will be archived at Hokkaido University for 5 years after study completion. The participants will also be able to obtain the final results of the study. The UMIN and jRCT databases will contain detailed information regarding the study. Study conduct will be evaluated by a monitor who will be independent of the investigators. Monitoring will be performed on the first and fifth participants at Hokkaido University Hospital, and the first participant at each of the other study sites. In line with the provisions of the Clinical Trials Act in Japan, adverse events and other information, including modifications to the trial, will be disclosed publicly.

Availability of data and materials

The data analyzed during this study will be available from the corresponding author of this article upon reasonable request.

DISCUSSION
To our knowledge, this will be the first prospective clinical trial to be conducted in a real-world setting, comparing the efficacy of oral semaglutide after switching from DPP-4 inhibitors with respect to glycemic control in Asian patients with T2D. Oral semaglutide has been shown to exert a potent anti-hyperglycemic effect. A recent network meta-analysis that compared the relative efficacy of oral semaglutide and injectable GLP-1RAs revealed that 14 mg/day oral semaglutide was associated with a significantly larger reduction in HbA1c than most of the comparators, with the exception of weekly semaglutide \(^9\). Furthermore, a previous phase III trial showed that the administration of oral semaglutide at 7 mg or 14 mg/day resulted in a larger reduction in HbA1c than sitagliptin at 100 mg/day \(^15\). Because it has been demonstrated that DPP-4 inhibitors have potent anti-hyperglycemic effects in Asian populations \(^9\), however, it is important to confirm that similar differences exist in the Japanese population.

The management of obesity during the treatment of diabetes is important but presents a difficult challenge. A treatment strategy not causing body weight gain would be ideal. DPP-4 inhibitors have no effect on body weight, whereas other insulin secretagogues tend to cause body weight gain \(^20\). One of the advantages of using a GLP-
IRA would be related with appetite. Notably, a phase III trial that assessed the dose-response and efficacy of oral semaglutide in Japanese patients showed that the weight loss induced by semaglutide was greater than that induced by liraglutide at 0.9 mg/day, although the incidence of gastrointestinal events was comparable between the groups.21

A switch from a DPP-4 inhibitor to oral semaglutide may represent a promising “step-up” therapeutic strategy. However, most patients being treated in routine clinical practice who are receiving a DPP-4 inhibitor are also taking other oral antihyperglycemic agents.8 Because semaglutide must be taken at least 30 min before breakfast and any other oral medication, a switch to oral semaglutide forces patients to take their medication at two separate times, leading to poorer compliance and diminished efficacy of the therapy. Therefore, it is important to confirm the efficacy and safety of oral semaglutide in a study conducted in a real-world clinical practice setting.

In conclusion, the present study will be the first clinical trial to evaluate the efficacy of oral semaglutide for glycemic control in patients with T2D who were previously being treated using a DPP-4 inhibitor in a real-world clinical practice setting. Therefore, the results should provide new insights into the efficacy of oral semaglutide in patients with T2D.

Figure legends

Figure 1. Patient recruitment scheme

Participants will be randomly assigned to either continue to use their existing DPP-4 inhibitor or to be switched to oral semaglutide (starting dose 3 mg/day). All the participants will undergo physical and biochemical examinations at baseline and at the end of the study. DPP-4, dipeptidyl peptidase-4 inhibitor; GLP-1, glucagon-like peptidase-1; T2D, type 2 diabetes.
Box 1. Inclusion criteria

- Japanese patients with T2D
- Age 20–89 years
- HbA1c 7.0%–9.9%
- Body mass index $\geq$ 18.5 kg/m$^2$
- Treatment with a DPP-4 inhibitor for at least 12 weeks before enrollment, without discontinuation for more than 1 week
Box 2. Exclusion criteria

- Treatment with any GLP-1 receptor agonist within the 12 weeks prior to enrollment
- Allergy to semaglutide
- Unstable diabetic retinopathy
- Current severe liver dysfunction or nephropathy
- Severe infection, trauma, and/or recent or planned surgery
- Severe ketosis
- Diabetic coma or pre-coma
- Pregnancy
- Low drug compliance rate
- Inability to consume an appropriate diet and/or perform exercise
- Incompatibility with the trial for other reasons, as determined by the physician
Assessment for Eligibility
Patients with T2D being treated with a DPP-4 inhibitor

Enrollment and First Examination
- Informed consent
- Height
- Body weight
- Abdominal circumference
- Blood pressure and pulse rate
- Laboratory data assessment

Randomization (1:1)

Once-daily Semaglutide
- Switch from current DPP-4 inhibitor to once-daily semaglutide (starting at 3 mg/day and increasing up to 14 mg/day)

Continue DPP-4 inhibitor
- Continue current DPP-4 inhibitor

Second Examination
- Body weight
- Abdominal circumference
- Blood pressure and pulse rate
- Laboratory data assessment

Final Examination
- Body weight
- Abdominal circumference
- Blood pressure and pulse rate
- Laboratory data assessment

End of Study
## SPIRIT 2013 Checklist: Recommended items to address in a clinical trial protocol and related documents*

| Section/item                        | Item No | Description                                                                                                                                                                                                 |
|-------------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| **Administrative information**      |         |                                                                                                                                                                                                            |
| Title                               | 1       | Descriptive title identifying the study design, population, interventions, and, if applicable, trial acronym                                                                                               |
|                                     |         | Answer: p.1                                                                                                                                                                                                  |
| Trial registration                  | 2a      | Trial identifier and registry name. If not yet registered, name of intended registry                                                                                                                       |
|                                     | 2b      | All items from the World Health Organization Trial Registration Data Set                                                                                                                                     |
|                                     |         | Answer: p.4                                                                                                                                                                                                  |
| Protocol version                    | 3       | Date and version identifier                                                                                                                                                                                  |
|                                     |         | Answer: p.13                                                                                                                                                                                                  |
| Funding                             | 4       | Sources and types of financial, material, and other support                                                                                                                                                   |
|                                     |         | Answer: p.18                                                                                                                                                                                                  |
| Roles and responsibilities          | 5a      | Names, affiliations, and roles of protocol contributors                                                                                                                                                       |
|                                     | 5b      | Name and contact information for the trial sponsor                                                                                                                                                            |
|                                     |         | Answer: pp.18-19                                                                                                                                                                                             |
|                                     | 5c      | Role of study sponsor and funders, if any, in study design; collection, management, analysis, and interpretation of data; writing of the report; and the decision to submit the report for publication, including whether they will have ultimate authority over any of these activities |
|                                     |         | Answer: p.18                                                                                                                                                                                                  |
|                                     | 5d      | Composition, roles, and responsibilities of the coordinating centre, steering committee, endpoint adjudication committee, data management team, and other individuals or groups overseeing the trial, if applicable (see Item 21a for data monitoring committee) |
|                                     |         | Answer: Not applicable                                                                                                                                                                                       |
| **Introduction**                    |         |                                                                                                                                                                                                            |
Background and rationale  

6a Description of research question and justification for undertaking the trial, including summary of relevant studies (published and unpublished) examining benefits and harms for each intervention

Answer: pp.6-7

6b Explanation for choice of comparators

Answer: pp.6-7

Objectives  

7 Specific objectives or hypotheses

Answer: pp.6-7

Trial design  

8 Description of trial design including type of trial (eg, parallel group, crossover, factorial, single group), allocation ratio, and framework (eg, superiority, equivalence, noninferiority, exploratory)

Answer: pp.7-9

Methods: Participants, interventions, and outcomes

Study setting  

9 Description of study settings (eg, community clinic, academic hospital) and list of countries where data will be collected. Reference to where list of study sites can be obtained

Answer: pp.7-8, UMIN and jRCT web site

Eligibility criteria  

10 Inclusion and exclusion criteria for participants. If applicable, eligibility criteria for study centres and individuals who will perform the interventions (eg, surgeons, psychotherapists)

Answer: pp.9-10

Interventions  

11a Interventions for each group with sufficient detail to allow replication, including how and when they will be administered

11b Criteria for discontinuing or modifying allocated interventions for a given trial participant (eg, drug dose change in response to harms, participant request, or improving/worsening disease)

11c Strategies to improve adherence to intervention protocols, and any procedures for monitoring adherence (eg, drug tablet return, laboratory tests)

11d Relevant concomitant care and interventions that are permitted or prohibited during the trial

Answer: pp.7-10
Outcomes 12 Primary, secondary, and other outcomes, including the specific measurement variable (eg, systolic blood pressure), analysis metric (eg, change from baseline, final value, time to event), method of aggregation (eg, median, proportion), and time point for each outcome. Explanation of the clinical relevance of chosen efficacy and harm outcomes is strongly recommended

Answer: p.11

Participant timeline 13 Time schedule of enrolment, interventions (including any run-ins and washouts), assessments, and visits for participants. A schematic diagram is highly recommended (see Figure).

Answer: pp.7-9 and Figure 1.

Sample size 14 Estimated number of participants needed to achieve study objectives and how it was determined, including clinical and statistical assumptions supporting any sample size calculations

Answer: pp.11-12

Recruitment 15 Strategies for achieving adequate participant enrolment to reach target sample size

Answer: pp.9,11-12

Methods: Assignment of interventions (for controlled trials)

Allocation:

Sequence generation 16a Method of generating the allocation sequence (eg, computer-generated random numbers), and list of any factors for stratification. To reduce predictability of a random sequence, details of any planned restriction (eg, blocking) should be provided in a separate document that is unavailable to those who enrol participants or assign interventions

Allocation concealment mechanism 16b Mechanism of implementing the allocation sequence (eg, central telephone; sequentially numbered, opaque, sealed envelopes), describing any steps to conceal the sequence until interventions are assigned

Implementation 16c Who will generate the allocation sequence, who will enrol participants, and who will assign participants to interventions

Answer: pp.7-8

Blinding (masking) 17a Who will be blinded after assignment to interventions (eg, trial participants, care providers, outcome assessors, data analysts), and how
17b If blinded, circumstances under which unblinding is permissible, and procedure for revealing a participant’s allocated intervention during the trial

Answer: Not applicable

Methods: Data collection, management, and analysis

Data collection methods

18a Plans for assessment and collection of outcome, baseline, and other trial data, including any related processes to promote data quality (eg, duplicate measurements, training of assessors) and a description of study instruments (eg, questionnaires, laboratory tests) along with their reliability and validity, if known. Reference to where data collection forms can be found, if not in the protocol

Answer: pp.7-9

18b Plans to promote participant retention and complete follow-up, including list of any outcome data to be collected for participants who discontinue or deviate from intervention protocols

Answer: p.11

Data management

19 Plans for data entry, coding, security, and storage, including any related processes to promote data quality (eg, double data entry; range checks for data values). Reference to where details of data management procedures can be found, if not in the protocol

Answer: pp.12-13

Statistical methods

20a Statistical methods for analysing primary and secondary outcomes. Reference to where other details of the statistical analysis plan can be found, if not in the protocol

Answer: pp.12-13

20b Methods for any additional analyses (eg, subgroup and adjusted analyses)

Answer: Not applicable

20c Definition of analysis population relating to protocol non-adherence (eg, as randomised analysis), and any statistical methods to handle missing data (eg, multiple imputation)

Answer: pp.10, 12-13

Methods: Monitoring

Data monitoring

21a Composition of data monitoring committee (DMC); summary of its role and reporting structure; statement of whether it is independent from the sponsor and competing interests; and reference to where further details about its charter can be found, if not in the protocol. Alternatively, an explanation of why a DMC is not needed
Answer: pp.13-14

21b Description of any interim analyses and stopping guidelines, including who will have access to these interim results and make the final decision to terminate the trial
Answer: Not applicable

Harms 22 Plans for collecting, assessing, reporting, and managing solicited and spontaneously reported adverse events and other unintended effects of trial interventions or trial conduct
Answer: p.12-13

Auditing 23 Frequency and procedures for auditing trial conduct, if any, and whether the process will be independent from investigators and the sponsor
Answer: Not applicable

Ethics and dissemination

Research ethics approval 24 Plans for seeking research ethics committee/institutional review board (REC/IRB) approval
Answer: pp.4 and 13

Protocol amendments 25 Plans for communicating important protocol modifications (eg, changes to eligibility criteria, outcomes, analyses) to relevant parties (eg, investigators, REC/IRBs, trial participants, trial registries, journals, regulators)
Answer: pp.12-13

Consent or assent 26a Who will obtain informed consent or assent from potential trial participants or authorised surrogates, and how (see Item 32)
Answer: p.10

26b Additional consent provisions for collection and use of participant data and biological specimens in ancillary studies, if applicable
Answer: Not applicable

Confidentiality 27 How personal information about potential and enrolled participants will be collected, shared, and maintained in order to protect confidentiality before, during, and after the trial
Answer: pp.13-14

Declaration of interests 28 Financial and other competing interests for principal investigators for the overall trial and each study site
Answer: pp.17-18
Access to data 29 Statement of who will have access to the final trial dataset, and disclosure of contractual agreements that limit such access for investigators

Answer: p.19

Ancillary and post-trial care 30 Provisions, if any, for ancillary and post-trial care, and for compensation to those who suffer harm from trial participation

Answer: pp.13-14

Dissemination policy 31a Plans for investigators and sponsor to communicate trial results to participants, healthcare professionals, the public, and other relevant groups (eg, via publication, reporting in results databases, or other data sharing arrangements), including any publication restrictions

Answer: p.10

31b Authorship eligibility guidelines and any intended use of professional writers

Answer: pp.18-19

31c Plans, if any, for granting public access to the full protocol, participant-level dataset, and statistical code

Answer: Not applicable

Appendices

Informed consent materials 32 Model consent form and other related documentation given to participants and authorised surrogates

Answer: pp.10 and 13

Biological specimens 33 Plans for collection, laboratory evaluation, and storage of biological specimens for genetic or molecular analysis in the current trial and for future use in ancillary studies, if applicable

Answer: Not applicable

*It is strongly recommended that this checklist be read in conjunction with the SPIRIT 2013 Explanation & Elaboration for important clarification on the items. Amendments to the protocol should be tracked and dated. The SPIRIT checklist is copyrighted by the SPIRIT Group under the Creative Commons “Attribution-NonCommercial-NoDerivs 3.0 Unported” license.
