The Effect of Country-of-Origin Image on Purchase Intention. The Mediating Role of Perceived Quality and Perceived Price

Amina Merabet

Abstract — This study aims to evaluate the impact of Country-of-origin image on purchase intention through two mediating variables (perceived quality and perceived price).

After a short literature review, an empirical study was conducted among 120 participants. Results indicate that the country-of-origin Image has a positive impact on perceived quality and perceived price. They also highlight the mediating role of perceived price in the relationship between Country-of-origin image and purchase intention.

Index Terms — Country-of-origin image - perceived quality- perceived price- purchase intention.

I. INTRODUCTION

The changes in the economic environment due to globalization and the development of Internet have fully changed consumer behavior. Today, Consumers are faced to an ample supply and a significant rise of brands. In fact, they must choose between many products with different origins [1]. As a result, connotations of images of products, brands, and countries are developed and affect their perceptions and purchasing behavior. It refers to Country-of-origin image or "made-in" which represents the country of production or assembly. It can be explained by the tendency of consumers to stereotype countries. For example, French products with luxury, products from the tendency of consumers to stereotype countries. For country of production or assembly. It can be explained by connotations of images of products, national characteristics, economic and political background; history and traditions.” It represents the set of descriptive, differential and informational beliefs that an individual might have toward a given country" [10].

This image generally finds its sources in direct experience with the country through travel but also on the basis of word of mouth, readings, media, etc. [11].

The effects of the country of origin on consumer behavior vary from country to country due to differences in economic, socio-cultural, and other factors.

B. Perceived Quality and Country-of-Origin

The perceived quality represents all the perceptible, sensitive, and sensory dimensions of the product or service. So, it refers to a global system of judgment and lead to consumer satisfaction.

According to Zeithaml [12] perceived quality can be defined as "an overall judgment concerning the excellence or superiority of a product or service". Consumers are increasingly demanding quality, and they are ready to pay more for better products. Consumer decision is based on product quality according to an acquisition and integration process of information about products or services.

In fact, the country of origin be a quality indicator.

C. Perceived Price and Country-of-Origin Image

Zeithaml [12] has defined Perceived price as “customer’s subjective perception of what is given up or sacrificed to acquire the product”. It is the nominal value charged to the customer in order to acquire products and to be benefited from the ownership or use of products [13].

Most of customers give subjective value for products like: “expensive” or “cheap” and do not recall or recognize the objective price.

Thus, the sacrifice of something made by customers in order to acquire product or service include nominal monetary price, and non-monetary costs (time cost, physical effort or energy, and learning cost) made during purchasing [12].

The effect of the country-of-origin image on the perceived price has been studied many times.
D. Purchase Intention

The purchase intention is a very complex concept. Some researchers consider it as a component of the attitude which is relative to the conative dimension [14], [15]. While others examine it as an independent variable [16], [17]. According to Duhaime et al. [18], the purchase intention consists of the stage of the decision-making process where the customer is able to specify his preference for a product based on his experience, beliefs and attitudes.

Two different approaches can explain the purchase intention: the planning approach and the probabilistic approach.

- The planning approach [19]-[22]: It reflects the dynamic side of this concept and the degree which a person has formulated conscious plans to perform or not perform some specified future behavior”[23]. For Howard [21], purchase intention is the process of planning a purchase. It is the result of a cognitively processed desire or need that leads to purchase planning [20].

- The probabilistic approach

Other researchers (e.g. [24]-[27] etc.) prefer the probabilistic dimension of intention. It is "the subjective probability of purchasing a given product or a given brand" [26]. Everyone determines this probability by himself [28]. We will adopt this approach in our research.

There is no doubt that Country-of-origin image influences consumers’ perception of products, and which subsequently influences the decision to buy a product or service.

In view of the above, we can propose the following hypotheses:

- H1: Country-of-origin image has a positive impact on the perceived quality of products.
- H2: Country-of-origin image have a positive impact on perceived price
- H3: Perceived quality has a positive impact on purchase intention.
- H4: Perceived price has a positive impact on purchase intention
- H5: Perceived quality is a mediator variable in the relationship between Country-of-origin image and purchase intention.
- H6: Perceived price is a mediator variable in the relationship between Country-of-origin image and purchase intention.

The conceptual model is illustrated in Fig. 1.

III. EMPIRICAL STUDY

A. Research Method

We have choice Raylan brand. It is an Algerian brand of electrical household appliances. The scales used are taken from the literature:

- Perceived quality: Yoo and Donthu[29] scale (2 items).
- Purchasing intention (PI): Dodds et al. [30] scale (3 items).
- Perceived price: Berkowitz and Walton [31] scale (3 items).
- Country-of-origin image: inspired from (5 items).

The data are collected by online survey from a random sample of 120 Algerian people aged over 18 years ago.

B. Results and Discussion

We have tested our hypotheses using structural equations modeling. The PLS approach with the maximum likelihood method was chosen because it is highly used in marketing research and it is adapted to small sample.

After deleting 2 items (PP1 and COI5) we obtained a very satisfactory reliability and validity indices. It is shown the internal consistency of all the scales (See Table I and Table II).

![Table I: Reliability and Validity of the Constructs](image)

| Constructs | Average Reliability (AVE) | Composite Reliability | Rho-a | Cronbach’s alpha |
|------------|---------------------------|-----------------------|-------|------------------|
| COI        | 0.587                     | 0.850                 | 0.768 | 0.765            |
| PI         | 0.680                     | 0.862                 | 0.842 | 0.764            |
| PP         | 0.855                     | 0.922                 | 0.831 | 0.830            |
| PQ         | 0.782                     | 0.878                 | 0.745 | 0.724            |

![Table II: Discriminant Validity (Fornell-Larcker Criterion)](image)

| Constructs | COI  | PI   | PP   | PQ   |
|------------|------|------|------|------|
| Rho-a      | 0.766| 0.556| 0.510| 0.704|
| Cronbach’s alpha | 0.884| 0.824| 0.924| 0.650|

The values of R2 (COI-PQ = 0.496; COI-PP = 0.260; PQ-PI= 0.959; PP-PI=0.959) are above the recommended threshold by researchers (R2=0.2) (see Table III). So, we can undertake the analysis.

![Table III: R Square](image)

| Constructs | R Square | R Square Adjusted |
|------------|----------|-------------------|
| PI         | 0.959    | 0.958             |
| PP         | 0.260    | 0.251             |
| PQ         | 0.496    | 0.491             |

The results in Fig. 2 and 3 and Table IV and V indicate that:

- Country-of-origin image has a positive influence on perceived quality (R² = 0.497, β = 0.704, T=13.058, P=0.000). These results support the conclusions of several researchers: [32], [33], so H1 is confirmed.

- There is a positive link between country-of-origin image and perceived price (R² = 0.260; β = 0.510, T=7.303,
P=0.000). Consequently, H2 is confirmed. These finding support the conclusions of several researchers [34], [35].

- Purchase intention is influenced by perceived price ($R^2 = 0.959$, $β = 0.915$, $T=34.142$, $P=0.000$) unlike perceived quality ($R^2 = 0.959$, $β = 0.094$, $T=2.694$, $P=0.000$) which is in contrast with previous studies. So H3 is confirmed while H4 is rejected.

- The mediating role of perceived price is confirmed ($β = 0.466$) (see Table VI).

- That Perceived quality is not a mediator variable in the relationship between Country-of-origin image and purchase intention as the direct effect of Perceived quality on purchase intention is rejected ($β = 0.066$) (see Table VI).

IV. CONCLUSION

The concept of Country-of-origin image has attracted increasing attention from researchers for several years nevertheless few studies were focused on Algerian brand.

The purpose of our study was to evaluate the effect of Country-of-origin image on the purchasing intention of Algerian consumers.

The results have shown the positive impact of country-of-origin image on perceived quality and perceived price as well as the mediating role of perceived price in the relationship between Country-of-origin image and the purchase intention. They indicate that Algerian consumers take in consideration perceived price than perceived quality for this product.

Our study agrees with most previous studies that the country of origin has a great importance in the purchase of some products in particularly technologically complex products such as electrical household appliances and cars.

Future research may:

- Test the effect of the country of origin on other variables such as: the perceived value of the product, attitude towards the brand, etc.
- Test role of moderating variables such as (brand familiarity, product involvement).
