Abstract This research is aimed at evaluating the potential abilities of the natural acaricide of *F. suspense* oil against *Tyrophagus putrescentiae* and *Dermatophagoides* spp. Based on the LD₅₀ values, in contact bioassay, *F. suspense* oil (8.19, 3.28, and 4.35 µg/cm²) showed acaricidal effects against *T. putrescentiae*, *D. farinae*, and *D. pteronyssinus*, respectively. Fumigant toxicities of *F. suspense* oil showed similar patterns as those observed with contact toxicities. GC/MS analysis showed the major components of *F. suspense* oil to be β-pinene (45.88%), myrtenol (13.86%), (+)-α-pinene (13.09%), (−)-trans-pinocarveol (7.34%), sabine (6.64%) and pinocarvone (4.13%). These findings indicate that *F. suspense* oil has potential as a natural acaricide.

Keywords acaricidal effect · *Dermatophagoides farinae* · *Dermatophagoides pteronyssinus* · *Forsythia suspense* · *Tyrophagus putrescentiae*

Storage and pyroglyphid mites are major allergens worldwide causing bronchial asthma, rhinitis and atopic dermatitis (Kim et al., 2003; Lee, 2004; Saad et al., 2006; Song et al., 2011). Pyroglyphid mites found in indoor apartments belong to the genus *Dermatophagoides* (Lim et al., 2008). In particular, *D. farinae* and *D. pteronyssimus* are the major factors causing sudden infant death syndrome (Rim and Jee, 2006). The typical storage mite, *Tyrophagus putrescentiae*, lives in preserved eggs, cheese and grain (Gulati and Mathur, 1995). Moreover, storage mites have been recognized as an etiological factor in allergic diseases affecting food workers and farmers (Song et al., 2011). Controlling mite populations has been done mainly through the use of pirimiphos-methyl and benzene hexachloride (Wu et al., 2012). Although effective, these resulted in resistance and mammal toxicity (Kang et al., 2006). In more recent studies, natural substances of plant oils are reported to be good alternatives (Pasay et al., 2010).

*Forsythia suspense* (Thunb.), a member of the Oleaceae family, is widely distributed in Asia (China, Korea and Japan) and many European nations. (Qu et al., 2008). It contains isolariresinol, succinic acid, erythritol and wogonin-7-O-glucoside (Liu et al., 2003). Furthermore, it is reported to have biological effects including antibacterial (Bae et al., 2005; Qu et al., 2008), antioxidant (Qu et al., 2008; Wang et al., 2008) and antihypertensive (Nishibe et al., 1982). However, the acaricidal activities of *F. suspense* fruits against *T. putrescentiae*, *D. farinae* and *D. pteronyssimus* have not been reported. In this study, we aimed to look into the potent ability of *F. suspense* oil against storage and pyroglyphid mites.

*F. suspense* fruits were ground into powder and extracted by the simultaneous steam distillation-extraction method (Boutekeджет et al., 2003). The analysis of *F. suspense* fruit oil was performed using GC-Mass (6890; Agilent Technologies) (5973; Agilent) with a DB-5 (0.25 mm) fused capillary column (30 m×0.25 mm i.d.). The GC injector temperature was 210°C. The initial temperature of the column was 50°C and it was programmed to rise to 201°C at a ramp rate of 1.9°C/min and stay at this temperature for 16 min. The ion source temperature was 231°C and helium gas flow was set at 0.81 mL/min. The GC effluent entered the mass spectra electron ionization (70 eV) chamber. The mass analyzer was set to scan from 49 to 602 amu for 2 s. Volatile constituents were identified by comparison to retention indices, retention times and mass spectra in the Wiley Registry of Mass Spectral Data.

Storage and pyroglyphid mites were sustained on yeast (1:1 by
weight) and fry forage no. 1 (Korea Special Feed Meal Co. Ltd., Korea) in a completely dark area. They were reared in a cage (15×12×6 cm) containing the diet and kept at 74% relative humidity and 25°C. Acaricidal effect against three storage and pyroglyphid mites was evaluated using both fumigant and contact bioassays. Fumigant bioassay was modified and performed following the method described by Yang et al. (2014). Different quantities (40–1 µg/cm²) of F. suspense oil were applied to paper disks (0.8 cm diameter and 0.1 cm thick). Each treated disk was dried in a fume hood for 14 min and then placed in the top of a microtube, which was then sealed using the cap containing the treated disk. The acaricidal effects of F. suspense oil were measured using contact bioassay modified as indicated by Yang et al. (2014). Contact bioassay results showed that the mode of acaricidal action of F. suspense oil was suggested by insect’s skin. Our study is the first to report the acaricidal effects of F. suspense oil against three acaridae and pyroglyphid mites.

Volatile compounds of F. suspense oil were recognized by GC-MS and matched the retention indices and mass spectra of compounds in the literature (Wenlu and Benlian, 2008). As shown in Table 2 and Fig. 1, the composition (%) of the volatile constituents of F. suspense oil was found to be: β-pinene (45.88%), myrtenol (13.86%), (+)-α-pinene (13.09%), (−)-trans-pinocarveol (7.34%), sabine (6.64%), pinocarvone (4.13%), (−)-terpinen-4-ol (2.69%), dipentene (1.02%), (S)-cis-verbenol (0.74%), γ-terpinene (0.60%), (1S)-(−)-verbenone (0.55%), cyrene (0.53%), myrcene (0.45%), α-terpinol (0.44%), α-phellandrene (0.42%), camphene (0.40%), 2,5-cyclooctadien-1-ol (0.36%), α-terpinene (0.31%), eucalyptol (0.30%) and campholene aldehyde (0.27%). The volatile constituents were grouped as alcohols (2,5-cyclooctadien-1-ol, eucalyptol, myrtenol, (−)-trans-pinocarveol, (−)-terpinen-4-ol, α-terpinol and (S)-cis-verbenol), aldehydes (campholene aldehyde), monoterpenes hydrocarbons (camphene, α-cyrene, dipentene, myrcene, (−)-α-pinene, β-pinene, α-phellandrene, sabine, α-terpinene and γ-terpinene) and monoterpenes ketones (pinocarvone and (1S)-(−)-verbenone). Compared with the previous study (Wenlu and Benlian, 2008), the major compounds of F. suspense oil were geraniol, linalool, myrtenol, α-terpinol and α-phellandrene. Some constituents derived from plants are affected by geographic location, harvest time, extraction procedures and geographic location, harvest time, extraction procedures and geographic location, harvest time, extraction procedures and geographic location, harvest time, extraction procedures and geographic location, harvest time, extraction procedures and extracted parts of herbs (Yang and Lee, 2013).

Current results indicate that F. suspense oil could be useful in the development of plant acaricide against three acaridae and pyroglyphid mites. Further study should be conducted on human health safety of F. suspense oil to increase acaricidal potency and stability.

**Table 1** Acaricidal activities of F. suspense oil and a synthetic acaricide against D. farinae, D. pteronyssinus, and T. putrescentiae

| Samples         | Bioassay       | Mite species     | LD₅₀         | 95% CL        | RT⁺ |
|-----------------|----------------|-----------------|--------------|--------------|-----|
| **F. suspense oil** |                |                 |              |              |     |
| Fumigant (µg/cm²) | D. farinae     | 6.80            | 6.21-7.39    | 1.79         |
|                 | D. pteronyssinus | 9.21            | 8.60-9.82    | 1.28         |
|                 | T. putrescentiae | 10.63           | 13.41-13.85  | 0.82         |
| Contact (µg/cm²) | D. farinae     | 3.28            | 2.68-3.88    | 2.59         |
|                 | D. pteronyssinus | 4.35            | 3.84-4.86    | 1.77         |
|                 | T. putrescentiae | 8.19            | 8.64-9.94    | 0.89         |
| **Benzyl benzoate** |                |                 |              |              |     |
| Fumigant (µg/cm²) | D. farinae     | 12.18           | 11.15-13.21  | 1.00         |
|                 | D. pteronyssinus | 11.75           | 11.06-12.44  | 1.00         |
|                 | T. putrescentiae | 11.13           | 10.45-11.81  | 1.00         |
